4. Maximum pressure differential is 100 kPa (14.5 psi).
5. Check compression for all cylinders.

Installation Procedure

Fig. 9: Engine Compression Test Tool
Courtesy of GENERAL MOTORS COMPANY

1. Remove the suitable engine compression test tool to the spark plug hole.
2. Install the fuel pump relay.
3. Install the relay carrier cover.
4. Install the spark plugs and tighten the spark plug to 20 (14.7 lb ft).
5. Install the ignition coil cover (2). Refer to **Ignition Coil Cover Replacement (LL0)**, **Ignition Coil Cover Replacement (LFM)**.

CAUTION: Refer to Fastener Caution .

6. Tighten the bolts (1) to 10 (89 lb in).

DRIVE BELT CHIRPING, SQUEAL AND WHINE DIAGNOSIS

Diagnostic Aids

- A chirping or squeal noise may be intermittent due to moisture on the drive belts or the pulleys. It may be necessary to spray a small amount of water on the drive belts in order to duplicate the customers concern.

If spraying water on the drive belt duplicates the symptom, cleaning the belt pulleys may be the probable solution.

- If the noise is intermittent, verify the accessory drive components by varying their loads making sure they are operated to their maximum capacity. An overcharged A/C system, power steering system with a pinched hose or wrong fluid or a generator failing are suggested items to inspect.
- A chirping, squeal or whine noise may be caused by a loose or improper installation of a body or suspension component. Other items of the vehicle may also cause the noise.
- The drive belts will not cause a whine noise.

Test Description

The numbers below refer to the step numbers on the diagnostic table.

2

The noise may not be engine related. This step is to verify that the engine is making the noise. If the engine is not making the noise do not proceed further with this table.

3

The noise may be an internal engine noise. Removing the drive belts one at a time and operating the engine for a brief period will verify the noise is related to the drive belt. When removing the drive belt the water pump may not be operating and the engine may overheat. Also DTCs may set when the engine is operating with the drive belts removed.

4

Inspect all drive belt pulleys for pilling. Pilling is the small balls or pills or it can be strings in the drive belt grooves from the accumulation of rubber dust.

6

Misalignment of the pulleys may be caused from improper mounting of the accessory drive component, incorrect installation of the accessory drive component pulley or the pulley bent inward or outward from a previous repair. Test for a misaligned pulley using a straight edge in the pulley grooves across two or three pulleys. If a misaligned pulley is found refer to that accessory drive component for the proper installation procedure for that pulley.

10

Inspecting of the fasteners can eliminate the possibility that a wrong bolt, nut, spacer or washer was installed.

12

Inspecting the pulleys for being bent should include inspecting for a dent or other damage to the pulleys that would prevent the drive belt from not seating properly in all of the pulley grooves or on the smooth

surface of a pulley when the back side of the belt is used to drive the pulley.

14

This test is to verify that the drive belt tensioner operates properly. If the drive belt tensioner is not operating properly, proper belt tension may not be achieved to keep the drive belt from slipping which could cause a squeal noise.

15

This test is to verify that the drive belt is not too long, which would prevent the drive belt tensioner from working properly. Also if an incorrect length drive belt was installed, it may not be routed properly and may be turning an accessory drive component in the wrong direction.

16

Misalignment of the pulleys may be caused from improper mounting of the accessory drive component, incorrect installation of the accessory drive component pulley or the pulley bent inward or outward from a previous repair. Test for a misaligned pulley using a straight edge in the pulley grooves across two or three pulleys. If a misaligned pulley is found refer to that accessory drive component for the proper installation procedure for that pulley.

17

This test is to verify that the pulleys are the correct diameter or width. Using a known good vehicle compare the pulley sizes.

19

Replacing the drive belt when it is not damaged or there is not excessive pilling will only be a temporary repair.

Drive Belt Chirping, Squeal and Whine Diagnosis

Step	Action	Yes	No
CAUTION: Refer to <u>Belt Dressing Caution</u> .			
DEFINITION: The following items are indications of chirping: • A high pitched noise that is heard once per revolution of the drive belt or a pulley. • Chirping may occur on cold damp start-ups and will subside once the vehicle reaches normal operating temp.			
DEFINITION: The following items are indications of drive belt squeal: • A loud screeching noise that is caused by a slipping drive belt. This is unusual for a drive belt with			

multiple ribs.

- The noise occurs when a heavy load is applied to the drive belt, such as an air conditioning compressor engagement snapping the throttle or slipping on a seized pulley or a faulty accessory drive component.

DEFINITION: The following items are indications of drive belt whine:

- A high pitched continuous noise.
- The noise may be caused by an accessory drive component failed bearing.

1	Did you review the drive belt symptom operation and perform the necessary inspections?	Go to Step 2	Go to <u>Symptoms - Engine Mechanical</u>
2	Verify that there is a chirping, squeal or whine noise. Does the engine make the chirping squeal or whine noise?	Go to Step 3	Go to Diagnostic Aids
3	1. Remove the drive belt. If the engine has multiple drive belts, remove the belts one at a time and perform the test below each time a belt is removed. 2. Operate the engine for no longer than 30-40 seconds. 3. Repeat this test if necessary by removing the remaining belt(s). Does the chirping, squeal or whine noise still exist?	Go to <u>Symptoms - Engine Mechanical</u>	Go to Step 4
4	If diagnosing a chirping noise, inspect for severe pilling exceeding 1/3 of the belt groove depth. If diagnosing a squeal or whine noise, proceed to step 13. Do the belt grooves have pilling?	Go to Step 5	Go to Step 6
5	Clean the drive belt pulleys with a suitable wire brush. Did you complete the repair?	Go to Step 20	Go to Step 6
6	Inspect for misalignment of the pulleys. Are any of the pulleys misaligned?	Go to Step 7	Go to Step 8
7	Replace or repair any misaligned pulleys. Did you complete the repair?	Go to Step 20	Go to Step 8
8	Inspect for bent or cracked brackets. Did you find any bent or cracked brackets?	Go to Step 9	Go to Step 10
9	Replace any bent or cracked brackets. Did you complete the repair?	Go to Step 20	Go to Step 10
10	Inspect for improper, loose or missing fasteners. Did you find the condition?	Go to Step 11	Go to Step 12

	CAUTION: Refer to <u>Fastener Caution</u>		
11	1. Tighten any loose fasteners. Refer to <u>Fastener Tightening Specifications (LL0)</u> , <u>Fastener Tightening Specifications (LFM)</u> . 2. Replace any improper or missing fasteners.		
	Did you complete the repair?	Go to Step 20	Go to Step 12
12	Inspect for a bent pulley. Did you find the condition?	Go to Step 18	Go to Step 19
13	- Inspect for an accessory drive component seized bearing or a faulty accessory drive component. - If diagnosing a whine noise and the condition still exist, proceed to Diagnostic Aids.		
	Did you find and correct the condition?	Go to Step 20	Go to Step 14
14	Test the drive belt tensioner for proper operation. Did you find and correct the condition?	Go to Step 20	Go to Step 15
15	Inspect for the correct drive belt length. Did you find and correct the condition?	Go to Step 20	Go to Step 16
16	Inspect for misalignment of a pulley. Did you find and correct the condition?	Go to Step 20	Go to Step 17
17	Inspect for the correct pulley size. Did you find and correct the condition?	Go to Step 20	Go to Diagnostic Aids
18	Replace the bent pulley. Did you complete the repair?	Go to Step 20	Go to Step 19
19	Replace the drive belt. Refer to <u>Water Pump and Generator Belt Replacement</u> . Did you complete the repair?	Go to Step 20	Go to Diagnostic Aids
20	Operate the system in order to verify the repair. Did you correct the condition?	System OK	Go to Step 3

DRIVE BELT RUMBLING AND VIBRATION DIAGNOSIS

Diagnostic Aids

The accessory drive components can have an affect on engine vibration. Vibration from the engine operating may cause a body component or another part of the vehicle to make rumbling noise. Vibration can be caused by, but not limited to the A/C system over charged, the power steering system restricted or the incorrect fluid or an extra load on the generator. To help identify an intermittent or an improper condition, vary the loads on the accessory drive components.

The drive belt may have a rumbling condition that can not be seen or felt. Sometimes replacing the drive belt

may be the only repair for the symptom.

If replacing the drive belt, completing the diagnostic table and the noise is only heard when the drive belts are installed, there might be an accessory drive component with a failure. Varying the load on the different accessory drive components may aid in identifying which component is causing the rumbling noise.

Test Description

The numbers below refer to the step numbers on the diagnostic table.

2

This test is to verify that the symptom is present during diagnosing. Other vehicle components may cause a similar symptom.

3

This test is to verify that one of the drive belts is causing the rumbling noise or vibration. Rumbling noise may be confused with an internal engine noise due to the similarity in the description. Remove only one drive belt at a time if the vehicle has multiple drive belts. When removing the drive belts the water pump may not be operating and the engine may overheat. Also DTCs may set when the engine is operating with the drive belts removed.

4

Inspecting the drive belts is to ensure that they are not causing the noise. Small cracks across the ribs of the drive belt will not cause the noise. Belt separation is identified by the plies of the belt separating and may be seen at the edge of the belt or felt as a lump in the belt.

5

Small amounts of pilling is normal condition and acceptable. When the pilling is severe the drive belt does not have a smooth surface for proper operation.

9

Inspecting of the fasteners can eliminate the possibility that the wrong bolt, nut, spacer or washer was installed.

11

This step should only be performed if the water pump is driven by the drive belt. Inspect the water pump shaft for being bent. Also inspect the water pump bearings for smooth operation and excessive play. Compare the water pump with a known good water pump.

12

Accessory drive component brackets that are bent, cracked or loose may put extra strain on that accessory component causing it to vibrate.

Drive Belt Rumbling and Vibration Diagnosis

Step	Action	Yes	No
CAUTION: Refer to <u>Belt Dressing Caution</u> .			
DEFINITION: The following items are indications of drive belt rumbling: • A low pitch tapping, knocking or thumping noise heard at or just above idle. • Heard once per revolution of the drive belt or a pulley. • Rumbling may be caused from: ○ Pilling, the accumulation of rubber dust that forms small balls (pills) or strings in the drive belt pulley groove ○ The separation of the drive belt ○ A damaged drive belt ○ A worn drive belt idler pulley			
DEFINITION: The following items are indications of drive belt vibration: • The vibration is engine-speed related. • The vibration may be sensitive to accessory load.			
1	Did you review the Drive Belt Symptom operation and perform the necessary inspections?	Go to Step 2	Go to <u>Symptoms - Engine Mechanical</u>
2	Verify that there is a rumbling noise or that the vibration is engine related. Does the engine make the rumbling noise or vibration?	Go to Step 3	Go to Diagnostic Aids
3	1. Remove the drive belt. If the engine has multiple drive belts, remove the belts one at a time and perform the test below each time a belt is removed. 2. Operate the engine for no longer than 30-40 seconds. 3. Repeat this test if necessary by removing the remaining belt(s). Does the rumbling or vibration still exist?	Go to <u>Symptoms - Engine Mechanical</u>	Go to Step 4
4	Inspect the drive belts for wear, damage, separation, sections of missing ribs and debris build-up. Did you find any of these conditions?	Go to Step 7	Go to Step 5

5	Inspect for severe pilling of more than 1/3 of the drive belt pulley grooves. Did you find severe pilling?	Go to Step 6	Go to Step 7
6	1. Clean the drive belt pulleys using a suitable wire brush. 2. Reinstall a drive belt. Refer to <u>Water Pump and Generator Belt Replacement</u> . Did you correct the condition?	Go to Step 8	Go to Step 7
7	Install a drive belt. Refer to <u>Water Pump and Generator Belt Replacement</u> . Did you complete the replacement?	Go to Step 8	Go to Step 9
8	Operate the system in order to verify the repair. Did you correct the condition?	System OK	Go to Step 9
9	Inspect for improper, loose or missing fasteners. Did you find any of these conditions?	Go to Step 10	Go to Step 11
10	CAUTION: Refer to <u>Fastener Caution</u> . 1. Tighten any loose fasteners. Refer to <u>Fastener Tightening Specifications (LL0)</u> , <u>Fastener Tightening Specifications (LFM)</u> . 2. Replace improper or missing fasteners. Did you complete the repair?	Go to Step 13	Go to Step 11
11	Inspect for a bent water pump shaft. Refer to <u>Water Pump Replacement</u> . Did you find and correct the condition?	Go to Step 13	Go to Step 12
12	Inspect for bent or cracked brackets. Did you find and correct the condition?	Go to Step 13	Go to Diagnostic Aids
13	Operate the system in order to verify the repair. Did you correct the condition?	System OK	Go to Step 3

DRIVE BELT FALLS OFF AND EXCESSIVE WEAR DIAGNOSIS

Diagnostic Aids

If the drive belt repeatedly falls off the drive belt pulleys, this is because of pulley misalignment.

An extra load that is quickly applied on released by an accessory drive component may cause the drive belt to fall off the pulleys. Verify the accessory drive components operate properly.

If the drive belt is the incorrect length, the drive belt tensioner may not keep the proper tension on the drive belt.

Excessive wear on a drive belt is usually caused by an incorrect installation or the wrong drive belt for the

application.

Minor misalignment of the drive belt pulleys will not cause excessive wear, but will probably cause the drive belt to make a noise or to fall off.

Excessive misalignment of the drive belt pulleys will cause excessive wear but may also make the drive belt fall off.

Test Description

The numbers below refer to the step numbers on the diagnostic table.

2

This inspection is to verify the condition of the drive belt. Damage may have occurred to the drive belt when the drive belt fell off. The drive belt may have been damaged, which caused the drive belt to fall off. Inspect the belt for cuts, tears, sections of ribs missing or damaged belt plies.

4

Misalignment of the pulleys may be caused from improper mounting of the accessory drive component, incorrect installation of the accessory drive component pulley or the pulley bent inward or outward from a previous repair. Test for a misaligned pulley using a straight edge in the pulley grooves across two or three pulleys. If a misaligned pulley is found refer to that accessory drive component for the proper installation procedure of that pulley.

5

Inspecting the pulleys for being bent should include inspecting for a dent or other damage to the pulleys that would prevent the drive belt from not seating properly in all of the pulley grooves or on the smooth surface of a pulley when the back side of the belt is used to drive the pulley.

6

Accessory drive component brackets that are bent or cracked will let the drive belt fall off.

7

Inspecting of the fasteners can eliminate the possibility that a wrong bolt, nut, spacer or washer was installed. Missing, loose or the wrong fasteners may cause pulley misalignment from the bracket moving under load. Over tightening of the fasteners may cause misalignment of the accessory component bracket.

13

The inspection is to verify the drive belt is correctly installed on all of the drive belt pulleys. Wear on the drive belt may be caused by mis-positioning the drive belt by one groove on a pulley.

14

The installation of a drive belt that is too wide or too narrow will cause wear on the drive belt. The drive belt ribs should match all of the grooves on all of the pulleys.

15

This inspection is to verify the drive belt is not contacting any parts of the engine or body while the engine is operating. There should be sufficient clearance when the drive belt accessory drive components load varies. The drive belt should not come in contact with an engine or a body component when snapping the throttle.

Drive Belt Falls Off and Excessive Wear Diagnosis

Step	Action	Yes	No
CAUTION: Refer to <u>Belt Dressing Caution</u> .			
DEFINITION: The drive belt falls off the pulleys or may not ride correctly on the pulleys. DEFINITION: Wear at the outside ribs of the drive belt due to an incorrectly installed drive belt.			
1	Did you review the drive belt symptom operation and perform the necessary inspections?	Go to Step 2	Go to <u>Symptoms - Engine Mechanical</u>
2	• If diagnosing excessive wear, proceed to step 13. • If diagnosing a drive belt that falls off, inspect for a damaged drive belt. Did you find the condition?	Go to Step 3	Go to Step 4
3	Replace the drive belt. Refer to <u>Water Pump and Generator Belt Replacement</u> . Does the drive belt continue to fall off?	Go to Step 4	System OK
4	Inspect for misalignment of the pulleys. Did you find and repair the condition?	Go to Step 12	Go to Step 5
5	Inspect for a bent or dented pulley. Did you find and repair the condition?	Go to Step 12	Go to Step 6
6	Inspect for a bent or a cracked bracket. Did you find and repair the condition?	Go to Step 12	Go to Step 7
7	Inspect for improper, loose or missing fasteners. Did you find loose or missing fasteners?	Go to Step 8	Go to Step 9
8	CAUTION: Refer to <u>Fastener Caution</u> . 1. Tighten any loose fasteners. Refer to <u>Fastener Tightening Specifications (LL0)</u> , <u>Fastener Tightening Specifications (LFM)</u> .		

	2. Replace improper or missing fasteners.		
	Does the drive belt continue to fall off?	Go to Step 9	System OK
9	Test the drive belt tensioner for operating correctly. Does the drive belt tensioner operate correctly?	Go to Step 11	Go to Step 10
10	Replace the drive belt tensioner. Refer to <u>Generator Bracket Replacement</u> . Does the drive belt continue to fall off?	Go to Step 11	System OK
11	Inspect for failed drive belt idler and drive belt tensioner pulley bearings. Did you find and repair the condition?	Go to Step 12	Go to Diagnostic Aids
12	Operate the system in order to verify the repair. Did you correct the condition?	System OK	Go to Step 2
13	Replace the drive belt. Refer to <u>Water Pump and Generator Belt Replacement</u> . Did you find this condition?	Go to Step 16	Go to Step 14
14	Inspect for the proper drive belt. Did you find this condition?	Go to Step 16	Go to Step 15
15	Inspect for the drive belt rubbing against a bracket, hose or wiring harness. Did you find and repair the condition?	Go to Step 17	Go to Diagnostic Aids
16	Replace the drive belt. Refer to <u>Water Pump and Generator Belt Replacement</u> . Did you complete the replacement?	Go to Step 17	-
17	Operate the system in order to verify the repair. Did you correct the condition?	System OK	-

OIL LEAK DIAGNOSIS

Oil Leak Diagnosis

Step	Action	Yes	No
DEFINITION: You can repair most fluid leaks by first, visually locating the leak, repairing or replacing the component or by resealing the gasket surface. Once the leak is identified, determine the cause of the leak. Repair the leak and the cause of the leak.			
1	1. Operate the vehicle until it reaches normal operating temperature. Refer to <u>Engine Mechanical Specifications (LL0)</u> , <u>Engine Mechanical Specifications (LFM)</u> . 2. Park the vehicle on a level surface over a large sheet of paper or other clean surface. 3. Wait 15 minutes. 4. Inspect for drippings.		
	Are drippings present?	Go to Step 2	System OK

2	Can you identify the type of fluid and the approximate location of the leak?	Go to Step 10	Go to Step 3
3	1. Visually inspect the suspected area. Use a small mirror to assist in looking at hard to see areas. 2. Inspect for leaks at the following locations: • Sealing surfaces • Fittings • Cracked or damaged components Can you identify the type of fluid and the approximate location of the leak?	Go to Step 10	Go to Step 4
4	1. Completely clean the entire engine and surrounding components. 2. Operate the vehicle for several miles at normal operating temperature and at varying speeds. 3. Park the vehicle on a level surface over a large sheet of paper or other clean surface. 4. Wait 15 minutes. 5. Identify the type of fluid and the approximate location of the leak. Can you identify the type of fluid and the approximate location of the leak?	Go to Step 10	Go to Step 5
5	1. Visually inspect the suspected area. Use a small mirror to assist in looking at hard to see areas. 2. Inspect for leaks at the following locations: • Sealing surfaces • Fittings • Cracked or damaged components Can you identify the type of fluid and the approximate location of the leak?	Go to Step 10	Go to Step 6
6	1. Completely clean the entire engine and surrounding components. 2. Apply an aerosol-type powder, for example, baby powder or foot powder, to the suspected area. 3. Operate the vehicle for several miles at normal operating temperature and at varying speeds. 4. Identify the type of fluid and the approximate location of the leak from the discolorations in the powder surface.		

	Can you identify the type of fluid and the approximate location of the leak?	Go to Step 10	Go to Step 7
7	1. Visually inspect the suspected area. Use a small mirror to assist in looking at hard to see areas. 2. Inspect for leaks at the following locations: • Sealing surfaces • Fittings • Cracked or damaged components Can you identify the type of fluid and the approximate location of the leak?	Go to Step 10	Go to Step 8
8	Identify the type of fluid and the approximate location of the leak. Can you identify the type of fluid and the approximate location of the leak?	Go to Step 10	Go to Step 9
9	1. Visually inspect the suspected area. Use a small mirror to assist in looking at hard to see areas. 2. Inspect for leaks at the following locations: • Sealing surfaces • Fittings • Cracked or damaged components Can you identify the type of fluid and the approximate location of the leak?	Go to Step 10	System OK
10	1. Inspect the engine for mechanical damage. 2. Special interest should be shown to the following areas: • Higher than recommended fluid levels • Higher than recommended fluid pressures • Plugged or malfunctioning fluid filters or pressure bypass valves • Plugged or malfunctioning engine ventilation system • Improperly tightened or damaged fasteners • Cracked or porous components • Improper sealants or gaskets, where required • Improper sealant or gasket installation • Damaged or worn gaskets or seals • Damaged or worn sealing surfaces 3. Inspect the engine for customer modifications.		

	Is there mechanical damage or customer modifications to the engine?	Go to Step 11	System OK
11	Repair or replace all damaged or modified components. Did you complete the repair?	Go to Step 1	-

OIL CONSUMPTION DIAGNOSIS

Oil Consumption Diagnosis

Checks	Causes
The causes of excessive oil consumption may include the following conditions:	
Preliminary	• External oil leaks. • Incorrect oil level or improper reading of the oil level indicator. With the vehicle on a level surface, run the engine for a few minutes, allow adequate drain down time (2-3 minutes) and check for the correct engine oil level. • Improper oil viscosity. Refer to the vehicle owners manual and use the recommended SAE grade and viscosity for the prevailing temperatures. • Continuous high speed driving and/or severe usage. • Crankcase ventilation system restrictions or malfunctioning components. • Worn valve guides and/or valve stems. • Worn, missing or improperly installed valve stem oil seals. • Piston rings broken, worn, not seated properly. Allow adequate time for the rings to seat. Replace worn piston rings as necessary. • Piston and rings improperly installed or miss-fitted to the cylinder bore.

COOLANT IN ENGINE OIL

Coolant in Engine Oil

Cause	Correction
DEFINITION: Foamy or discolored oil or an engine oil overfill condition may indicate coolant entering the engine crankcase. Low coolant levels, an inoperative cooling fan or a faulty thermostat may lead to an overtemperature condition which may cause engine component damage. Contaminated engine oil and oil filter should be changed.	

1. Inspect the oil for excessive foaming or an overfill condition. Oil diluted by coolant may not properly lubricate the crankshaft bearings and may lead to component damage. Refer to lower engine noise, regardless of engine speed **Lower Engine Noise, Regardless of Engine Speed**.
2. Inspect by performing a cylinder leak-down test. During this test, excessive air bubbles within the cooling system may indicate a faulty gasket or damaged component.
3. Inspect by performing a cylinder compression test. Two cylinders side-by-side on the engine block with low compression may indicate a failed cylinder head gasket. Refer to **Engine Compression Test**.

Faulty cylinder head gasket	Replace the head gasket and components as required. Refer to <u>Engine Component Description</u> .
Warped cylinder head	Replace the cylinder head and gasket. Refer to <u>Engine Component Description</u> .
Cracked cylinder head	Replace the cylinder head and gasket.
Cracked cylinder liner	Replace the components as required.
Cylinder head or block porosity	Replace the components as required.

ENGINE NOISE UNDER LOAD

Engine Noise Under Load

Cause	Correction
Low oil pressure	1. Perform an oil pressure test. Refer to <u>Oil Pressure Diagnosis and Testing</u>. 2. Repair or replace as required.
Detonation or spark knock	Verify the correct operation of the ignition. Refer to <u>Symptoms - Engine Controls</u> .
Loose torque converter bolts	1. Inspect the torque converter bolts and flywheel. 2. Repair as required.
Cracked flywheel - automatic transmission	1. Inspect the flywheel bolts and flywheel. 2. Repair as required.
Excessive connecting rod bearing clearance	Inspect the following components and repair as required: 1. The connecting rod bearings 2. The connecting rods 3. The crankshaft
Excessive crankshaft bearing clearance	Inspect the following components and repair as required: 1. The crankshaft bearings 2. The crankshaft journals 3. The cylinder block crankshaft bearing bore

ENGINE NOISE ON START-UP, BUT ONLY LASTING A FEW SECONDS

Engine Noise on Start-Up, but Only Lasting a Few Seconds

Cause	Correction
Incorrect oil filter without anti-drainback feature	Install the correct oil filter.
Incorrect oil viscosity	1. Drain the oil. 2. Install the correct viscosity oil.
High valve lash adjuster leak down rate	Replace the lash adjusters as required.
Worn crankshaft thrust bearing	1. Inspect the thrust bearing and crankshaft. 2. Repair or replace as required.
Damaged or faulty oil filter by-pass valve	1. Inspect the oil filter by-pass valve for proper operation. 2. Repair or replace as required.
Malfunctioning camshaft position actuators - improper oil viscosity or contamination. The result is camshaft actuator locking pin does not lock	1. Verify correct engine oil viscosity by changing the engine oil and filter. Reevaluate the concern. 2. Isolate the noise to a specific camshaft position actuator. 3. Replace the camshaft actuator, oil and filter.

BASE ENGINE MISFIRE WITHOUT INTERNAL ENGINE NOISES

Base Engine Misfire without Internal Engine Noises

Cause	Correction
• Abnormalities, severe cracking, bumps or missing areas in the accessory drive belt • Abnormalities in the accessory drive system and/or components may cause engine revolutions per minute (RPM) variations and lead to a misfire diagnostic trouble code (DTC). A misfire code may be present without an actual misfire condition.	Replace the drive belt.
• Worn, damaged or mis-aligned accessory drive components or excessive pulley runout may lead to a misfire DTC. • A misfire code may be present without an actual misfire condition.	Inspect the components and repair or replace as required.
• A loose or improperly installed engine flywheel or crankshaft balancer • A misfire code may be present without an actual misfire condition.	Repair or replace the flywheel and/or balancer as required.
	Repair or replace as required.

• Restricted exhaust system • A severe restriction in the exhaust flow can cause significant loss of engine performance and may set a DTC. Possible causes of restrictions include collapsed or dented pipes or plugged mufflers and/or catalytic converters.	
Improperly installed or damaged vacuum hoses	Repair or replace as required.
Improper sealing between the intake manifold and cylinder heads or throttle body	Replace the intake manifold, gaskets, cylinder heads, and/or throttle body as required.
• Improperly installed or damaged manifold absolute pressure (MAP) sensor • The sealing grommet of the MAP sensor should not be torn or damaged.	Repair or replace the MAP sensor as required.
Damage to the MAP sensor housing	Replace the intake manifold.
• Worn or loose rocker arms • The rocker arm bearing end caps and/or needle bearings should be intact and in the proper position.	Replace the valve rocker arms as required.
• Stuck valves • Carbon buildup on the valve stem can cause the valve not to close properly.	Repair or replace as required.
Excessively worn or mis-aligned timing chain	Replace the timing chain and sprockets as required.
Worn camshaft lobes	Replace the camshaft and valve lifters.
• Excessive oil pressure • A lubrication system with excessive oil pressure may lead to excessive valve lifter pump up and loss of compression.	1. Perform an oil pressure test. Refer to <u>Oil Pressure Diagnosis and Testing</u>. 2. Repair or replace the oil pump as required.
• Faulty cylinder head gaskets and/or cracking or other damage to the cylinder heads and engine block cooling system passages • Coolant consumption may or may not cause the engine to overheat.	1. Inspect for spark plugs saturated by coolant. 2. Inspect the cylinder heads, engine block, and/or head gaskets. 3. Repair or replace as required.
• Worn piston rings • Oil consumption may or may not cause the engine to misfire.	1. Inspect the spark plugs for oil deposits. 2. Inspect the cylinders for a loss of compression. Refer to <u>Engine Compression Test</u>. 3. Perform cylinder leak down and compression testing to identify the cause. 4. Repair or replace as required.
1. A damaged crankshaft reluctor wheel. 2. A damaged crankshaft reluctor wheel can	Replace the sensor and/or crankshaft as required.

result in different symptoms depending on the severity and location of the damage.

- Systems with electronic communications, DIS or coil per cylinder and severe reluctor ring damage may exhibit periodic loss of crankshaft position, stop delivering a signal and then re-sync the crankshaft position.
- Systems with electronic communication, DIS or coil per cylinder and slight reluctor ring damage may exhibit no loss of crankshaft position and no misfire may occur. However, a DTC P0300 may be set.
- Systems with mechanical communications, high voltage switch and severe reluctor ring damage may cause additional pulses and effect fuel and spark delivery to the point of generating a DTC P0300 or P0336.

BASE ENGINE MISFIRE WITH ABNORMAL INTERNAL LOWER ENGINE NOISES

Base Engine Misfire with Abnormal Internal Lower Engine Noises

Cause	Correction
• Abnormalities, severe cracking, bumps or missing areas in the accessory drive belt. • Abnormalities in the accessory drive system and/or components may cause engine revolutions per minute (RPM) variations, noises similar to a faulty lower engine and also lead to a misfire condition. A misfire code may be present without an actual misfire condition.	Replace the drive belt.
• Worn, damaged or mis-aligned accessory drive components or excessive pulley runout. • A misfire code may be present without an actual misfire condition.	Inspect the components, repair or replace as required.
• Loose or improperly installed engine flywheel or crankshaft balancer. • A misfire code may be present without an actual misfire condition.	Repair or replace the flywheel and/or balancer as required.
• Worn piston rings. • Oil consumption may or may not cause the engine to misfire.	1. Inspect the spark plugs for oil deposits. 2. Inspect the cylinders for a loss of compression. Refer to <u>Engine Compression Test</u>.

	3. Perform cylinder leak down and compression testing to determine the cause. 4. Repair or replace as required.
• Worn crankshaft thrust bearings. • Severely worn thrust surfaces on the crankshaft and/or thrust bearing may permit fore and aft movement of the crankshaft and create a diagnostic trouble code (DTC) without an actual misfire condition.	Replace the crankshaft and bearings as required.

BASE ENGINE MISFIRE WITH ABNORMAL VALVE TRAIN NOISE

Base Engine Misfire with Abnormal Valve Train Noise

Cause	Correction
• Worn or loose rocker arms. • The rocker arm bearing end caps and/or needle bearings should intact within the rocker arm assembly.	Replace the valve rocker arms as required.
• Stuck valves • Carbon buildup on the valve stem can cause the valve to not close properly.	Repair or replace as required.
Excessively worn or mis-aligned timing chain	Replace the timing chain and sprockets as required.
Worn camshaft lobes	Replace the camshaft and valve lash adjusters.
Sticking lifters	Replace as required.

BASE ENGINE MISFIRE WITH COOLANT CONSUMPTION

Base Engine Misfire with Coolant Consumption

Cause	Correction
• Faulty cylinder head gasket and/or cracking or other damage to the cylinder head and engine block cooling system passages. • Coolant consumption may or may not cause the engine to overheat.	1. Inspect for spark plugs saturated by coolant. 2. Perform a cylinder leak down test. 3. Inspect the cylinder head and engine block for damage to the coolant passages and/or a faulty head gasket. 4. Repair or replace as required.

BASE ENGINE MISFIRE WITH EXCESSIVE OIL CONSUMPTION

Base Engine Misfire with Excessive Oil Consumption

Cause	Correction
Worn valves, valve guides, and/or valve stem oil seals	1. Inspect the spark plugs for oil deposits.

	2. Repair or replace as required.
- Worn piston rings - Oil consumption may or may not cause the engine to misfire.	1. Inspect the spark plugs for oil deposits. 2. Inspect the cylinders for a loss of compression. Refer to <u>Engine Compression Test</u> . 3. Perform cylinder leak down and compression testing to determine the cause. 4. Repair or replace as required.

UPPER ENGINE NOISE, REGARDLESS OF ENGINE SPEED

Upper Engine Noise, Regardless of Engine Speed

Cause	Correction
Low oil pressure	1. Perform an oil pressure test. Refer to <u>Oil Pressure Diagnosis and Testing</u> . 2. Repair or replace as required.
Loose and/or worn valve rocker arm attachments	1. Inspect the valve rocker arm stud, nut or bolt. 2. Repair or replace as required.
Worn valve rocker arm	Replace the valve rocker arm.
Improper lubrication to the valve rocker arms	Inspect the following components and repair or replace as required: - The valve rocker arm - The valve lifter - The oil filter bypass valve - The oil pump and pump screen - The engine block oil galleries
Broken valve spring	Replace the valve spring.
Worn or dirty valve lifters	Replace the valve lifters.
Stretched or broken timing belt and/or damaged sprocket teeth	Replace the timing belt and sprockets.
Worn, damaged or faulty timing belt tensioners	Replace tensioners
Worn engine camshaft lobes	1. Inspect the engine camshaft lobes. 2. Replace the camshaft and valve lifters as required.
Worn valve guides or valve stems	Inspect the following components and repair as required: - The valves - The valve guides
	Inspect the following components and repair as

• Stuck valves • Carbon on the valve stem or valve seat may cause the valve to stay open.	required: 1. The valves 2. The valve guides
--	--

LOWER ENGINE NOISE, REGARDLESS OF ENGINE SPEED

Lower Engine Noise, Regardless of Engine Speed

Cause	Correction
Low oil pressure	1. Perform an oil pressure test. Refer to <u>Oil Pressure Diagnosis and Testing</u>. 2. Repair or replace damaged components as required.
Worn accessory drive components- abnormalities, such as severe cracking, bumps or missing areas in the accessory drive belt and/or misalignment of system components	1. Inspect the accessory drive system. 2. Repair or replace as required.
Loose or damaged crankshaft balancer	1. Inspect the crankshaft balancer. 2. Repair or replace as required.
Detonation or spark knock	Verify the correct operation of the ignition system. Refer to <u>Symptoms - Engine Controls</u> .
Loose torque converter bolts	1. Inspect the torque converter bolts and flywheel. 2. Repair or replace as required.
Loose or damaged flywheel	Repair or replace the flywheel.
• Damaged oil pan, contacting the oil pump screen • An oil pan that has been damaged, may improperly position the oil pump screen, preventing proper oil flow to the oil pump.	1. Inspect the oil pan. 2. Inspect the oil pump screen. 3. Repair or replace as required.
Oil pump screen loose, damaged or restricted	1. Inspect the oil pump screen. 2. Repair or replace as required.
Excessive piston-to-cylinder bore clearance	1. Inspect the piston and cylinder bore. 2. Repair as required.
Excessive piston pin-to-bore clearance	1. Inspect the piston, piston pin and the connecting rod. 2. Repair or replace as required.
Excessive connecting rod bearing clearance	Inspect the following components and repair as required: 1. The connecting rod bearings

	2. The connecting rods 3. The crankshaft 4. The crankshaft journals
Excessive crankshaft bearing clearance	Inspect the following components and repair as required: 1. The crankshaft bearings 2. The crankshaft journals
• Incorrect piston, piston pin and connecting rod installation • Pistons must be installed with the mark or dimple, on the top of the piston, facing the front of the engine. Piston pins must be centered in the connecting rod pin bore.	1. Verify the pistons, piston pins and connecting rods are installed correctly. 2. Repair as required.

ENGINE WILL NOT CRANK - CRANKSHAFT WILL NOT ROTATE

Engine Will Not Crank - Crankshaft Will Not Rotate

Cause	Correction
Seized accessory drive system component	1. Remove accessory drive belts. 2. Rotate crankshaft by hand at the balancer or flywheel location.
Hydraulically locked cylinder 1. Coolant/antifreeze in cylinder 2. Oil in cylinder 3. Fuel in cylinder	1. Remove spark plugs and check for fluid. 2. Inspect for broken head gasket. 3. Inspect for cracked engine block or cylinder head. 4. Inspect for a sticking fuel injector. 5. Inspect for cracked cylinder wall.
Seized automatic transmission torque converter	1. Remove the torque converter bolts. 2. Rotate crankshaft by hand at the balancer or flywheel location.
Seized manual transmission	1. Disengage the clutch. 2. Rotate crankshaft by hand at the balancer or flywheel location.
Broken timing chain and/or gears	1. Inspect timing chain and gears. 2. Repair as required.
Seized balance shaft	1. Inspect balance shaft. 2. Repair as required.
Material in cylinder	1. Inspect cylinder for damaged components

1. Broken valve 2. Piston material 3. Foreign material 4. Cracked cylinder wall	and/or foreign materials. 2. Inspect for fallen cylinder wall. 3. Repair or replace as required.
Seized crankshaft or connecting rod bearings	1. Inspect crankshaft and connecting rod bearings. 2. Inspect for fallen cylinder wall. 3. Repair as required.
Bent or broken connecting rod	1. Inspect connecting rods. 2. Repair as required.
Broken crankshaft	1. Inspect crankshaft. 2. Repair as required.

CRANKCASE VENTILATION SYSTEM INSPECTION/DIAGNOSIS

Results of Incorrect Operation

A plugged positive crankcase ventilation (PCV) orifice or hose may cause the following conditions:

- Rough idle
- Stalling or slow idle speed
- Oil leaks
- Oil in the throttle body
- Sludge in the engine

Functional Check

With these systems, any blow-by in excess of the system capacity, from a badly worn engine, sustained heavy load, etc., is exhausted into the throttle body and is drawn into the engine.

Proper operation of the crankcase ventilation system depends upon a sealed engine. If oil slugging or dilution is noted and the crankcase ventilation system is functioning properly, check the engine for a possible cause. Correct any problems.

If an engine is idling rough, inspect for a clogged PCV orifice, a dirty vent filter, air cleaner element or plugged hose. Replace as required. Use the following procedure:

1. Remove the PCV hose from the cylinder head cover.
2. Operate the engine at idle.
3. Place your thumb over the end of the hose in order to check for a vacuum. If there is no vacuum at the hose, inspect for the following items:
 - Plugged hoses

- The manifold port
4. Turn OFF the engine.
 5. Inspect the PCV orifice in the cylinder head cover for debris or blockage.

REPAIR INSTRUCTIONS - ON VEHICLE

WATER PUMP AND GENERATOR BELT REPLACEMENT

Removal Procedure

1. Support and raise the vehicle. Refer to Lifting and Jacking the Vehicle .

Fig. 10: Drive Belt Routing

Courtesy of GENERAL MOTORS COMPANY

2. Note the routing of the water pump and generator belt.

Fig. 11: Retainers And Water Deflector
Courtesy of GENERAL MOTORS COMPANY

3. Remove the retainers (2) and the water deflector (1).

Fig. 12: Front Compartment Splash Shield Retainers And Bolt
Courtesy of GENERAL MOTORS COMPANY

4. Remove the front compartment splash shield retainers (2) and bolt (3).
5. Remove the front compartment splash shield (1).
6. Remove the air conditioning compressor belt. Refer to **Air Conditioning Compressor Belt Replacement**.

Fig. 13: Generator Bracket With Tensioner Bolts
Courtesy of GENERAL MOTORS COMPANY

7. Loosen the generator bracket with tensioner bolts (2).
8. Rotate the generator bracket arm (3) counterclockwise by using an extensional tool or suitable tool.
9. Remove the water pump and generator belt (1).

Installation Procedure

Fig. 14: Water Pump And Generator Belt
Courtesy of GENERAL MOTORS COMPANY

NOTE: Make sure the water pump and generator belt is correctly aligned and seated into the grooves of the generator pulley, crankshaft balancer and water pump pulley.

1. Install the water pump and generator belt (1).
2. Rotate the generator bracket arm (3) clockwise by using an extensional tool or suitable tool.
3. Keep turning the bracket arm until the indicator lines (4) are located at collinear position.

CAUTION: Refer to Fastener Caution .

4. Tighten the generator bracket with tensioner bolts (2) to 55 (41 lb ft).
5. Install the air conditioning compressor belt. Refer to Air Conditioning Compressor Belt Replacement.
6. Rotate engine one full revolution.

Fig. 15: Retainers And Water Deflector
Courtesy of GENERAL MOTORS COMPANY

7. Install the retainers (2) and the water deflector (1).

Fig. 16: Front Compartment Splash Shield Retainers And Bolt
Courtesy of GENERAL MOTORS COMPANY

8. Install the front compartment splash shield (1).
9. Install the front compartment splash shield retainers (2) and bolt (3).
10. Tighten the bolt (3) to 9 (80 lb in).
11. Lower the vehicle.

WATER PUMP AND GENERATOR BELT TENSION INSPECTION

Special Tools

GE-50576 Acoustic Belt Tension Tester

For equivalent regional tools, refer to **Special Tools**.

1. Support and raise the vehicle. Refer to **Lifting and Jacking the Vehicle** .

Fig. 17: Front Compartment Splash Shield Retainers And Bolt
Courtesy of GENERAL MOTORS COMPANY

2. Remove the front compartment splash shield retainers (2) and bolt (3).
3. Remove the front compartment splash shield (1).

Fig. 18: Locating Finger On Center Of Belt Span Between Water Pump Pulley And Crankshaft Pulley

Courtesy of GENERAL MOTORS COMPANY

WARNING: Always allow the engine to cool before servicing the engine system. Failure to follow this instruction may result in serious personal injury.

NOTE: Space between tension gauge and the belt should be around 10 mm apart.

4. Use **GE-50576** acoustic belt tension tester to measure the water pump and generator belt tension.
 1. Locate **GE-50576** acoustic belt tension tester near the center of the belt span between the water pump pulley and crankshaft pulley.
 2. Locate a finger on the center of the belt span between water pump pulley (1) and crankshaft pulley (2). Pluck the belt between the water pump pulley and the crankshaft pulley. Repeat 3 times to get an average tension result on **GE-50576** acoustic belt tension tester.
 3. If water pump and generator belt tension is over 158 Hz the belt tension is within specification. Go to step 5.
 4. If water pump and generator belt tension is not within the specification, below 158 Hz, inspect the belt for excessive wear, fraying or cracking. Replace the belt as necessary. Refer to **Water Pump and Generator Belt Replacement**.

Fig. 19: Front Compartment Splash Shield Retainers And Bolt
Courtesy of GENERAL MOTORS COMPANY

5. Install the front compartment splash shield (1).
6. Install the front compartment splash shield retainers (2) and bolt (3). Tighten the bolt (3) to 9 (80 lb in).
7. Lower the vehicle.

ENGINE MOUNT REPLACEMENT

Removal Procedure

Fig. 20: Electrical Connector And Bracket Nut
Courtesy of GENERAL MOTORS COMPANY

1. Remove the radiator surge tank. Refer to **Radiator Surge Tank Replacement (LL0)** , **Radiator Surge Tank Replacement (LFM)** .
2. Remove the electrical connector (3) from the electronic brake control module (EBCM).
3. Remove the EBCM/BPMV (brake pressure modular valve) bracket nut (1), bolt (2).
4. Reposition the EBCM/BPMV assembly (4) aside.
5. Install the engine support fixture. Refer to **Engine Support Fixture**.
6. Prior to removing the mount, mark the mount location using spray paint or a marker for correct positioning during installation.

Fig. 21: Engine Mount Nuts

Courtesy of GENERAL MOTORS COMPANY

7. Remove the engine mount nuts (1).
8. Remove the engine mount bolt (2).
9. Remove the engine mount to body retaining bolts (3).
10. Remove the engine mount (4).
11. Transfer parts as necessary.

Installation Procedure

Fig. 22: Engine Mount Nuts

Courtesy of GENERAL MOTORS COMPANY

1. Install the engine mount (4).

CAUTION: Refer to Fastener Caution .

2. Install the engine mount to body retaining bolts (3) and tighten to 50 (37 lb ft).
3. Install the engine mount bolt (2), nuts (1) and tighten to 66 (49 lb ft).
4. Remove the engine support fixture. Refer to Engine Support Fixture.

Fig. 23: Electrical Connector And Bracket Nut
Courtesy of GENERAL MOTORS COMPANY

5. Install the EBCM/BPMV assembly (4).
6. Install the EBCM/BPMV (brake pressure modular valve) bracket nut (1), bolt (2) and tighten to 22 (16 lb ft).
7. Connect the EBCM electrical connector (3) to the EBCM.
8. Install the radiator surge tank. Refer to **Radiator Surge Tank Replacement (LL0)** , **Radiator Surge Tank Replacement (LFM)** .

UPPER INTAKE MANIFOLD REPLACEMENT (LFM)

Removal Procedure

1. Open the hood.
2. Disconnect the battery negative cable. Refer to **Battery Negative Cable Disconnection and Connection** .
3. Remove the air cleaner assembly. Refer to **Air Cleaner Assembly Replacement** .
4. Remove the throttle body assembly. Refer to **Throttle Body Assembly Replacement (LL0)** , **Throttle Body Assembly Replacement (LFM)** .
5. Remove the manifold absolute pressure sensor. Refer to **Manifold Absolute Pressure Sensor**

Replacement (LL0) , Manifold Absolute Pressure Sensor Replacement (LFM) .

6. Remove the evaporative emission canister purge solenoid valve. Refer to **Evaporative Emission Canister Purge Solenoid Valve Replacement (LL0) , Evaporative Emission Canister Purge Solenoid Valve Replacement (LFM) .**
7. Disconnect the power brake booster vacuum hose from intake manifold. Refer to **Power Brake Booster Vacuum Hose Replacement .**

Fig. 24: Upper Intake Manifold Side Bracket Bolts
Courtesy of GENERAL MOTORS COMPANY

8. Remove the upper intake manifold side bracket bolts (2).
9. Remove the upper intake manifold side bracket bolt (3).
10. Remove the upper intake manifold side bracket (1).

Fig. 25: Upper Intake Manifold Front Bracket Bolts
Courtesy of GENERAL MOTORS COMPANY

11. Remove the upper intake manifold front bracket bolts (1).
12. Remove the upper intake manifold front bracket (2).

Fig. 26: Upper Intake Manifold 3 Bolts
Courtesy of GENERAL MOTORS COMPANY

13. Remove the upper intake manifold 3 bolts (2).
14. Remove the upper intake manifold (1).
15. Disconnect any electrical connectors as needed.
16. Transfer parts as necessary.

Installation Procedure

Fig. 27: Upper Intake Manifold 3 Bolts
Courtesy of GENERAL MOTORS COMPANY

1. Install the upper intake manifold (1).

CAUTION: Refer to Fastener Caution .

2. Install the upper intake manifold 3 bolts (2) and tighten to 10 (89 lb in).

Fig. 28: Upper Intake Manifold Front Bracket Bolts
Courtesy of GENERAL MOTORS COMPANY

3. Install the upper intake manifold front bracket (2).
4. Install the upper intake manifold front bracket bolts (1) and tighten to 25 (18 lb ft).

Fig. 29: Upper Intake Manifold Side Bracket Bolts
Courtesy of GENERAL MOTORS COMPANY

5. Install the upper intake manifold side bracket (1).
6. Install the upper intake manifold side bracket bolts (2) and tighten to 10 (89 lb in).
7. Install the upper intake manifold side bracket bolt (3) and tighten to 25 (18 lb ft)
8. Connect the power brake booster vacuum hose to intake manifold. Refer to **Power Brake Booster Vacuum Hose Replacement** .
9. Install the evaporative emission canister purge solenoid valve. Refer to **Evaporative Emission Canister Purge Solenoid Valve Replacement (LL0)** , **Evaporative Emission Canister Purge Solenoid Valve Replacement (LFM)** .
10. Install the manifold absolute pressure sensor. Refer to **Manifold Absolute Pressure Sensor Replacement (LL0)** , **Manifold Absolute Pressure Sensor Replacement (LFM)** .
11. Install the throttle body assembly. Refer to **Throttle Body Assembly Replacement (LL0)** , **Throttle Body Assembly Replacement (LFM)** .
12. Install the air cleaner assembly. Refer to **Air Cleaner Assembly Replacement** .
13. Connect the battery negative cable. Refer to **Battery Negative Cable Disconnection and Connection** .
14. Close the hood.

LOWER INTAKE MANIFOLD REPLACEMENT (LFM)

Removal Procedure

1. Open the hood.
2. Remove the upper intake manifold housing. Refer to Upper Intake Manifold Replacement (LFM).

Fig. 30: Positive Crankcase Ventilation Hose
Courtesy of GENERAL MOTORS COMPANY

3. Remove the positive crankcase ventilation hose. Refer to Positive Crankcase Ventilation Hose/Pipe/Tube Replacement (LL0), Positive Crankcase Ventilation Hose/Pipe/Tube Replacement (LFM).
4. Disconnect the ignition coil connectors. Refer to Ignition Coil Removal.
5. Disconnect the fuel feed hose (1) from the fuel rail (3).
6. Disconnect the fuel injector electrical connector and remove the fuel injector rail wiring harness (2).
7. Raise the vehicle. Refer to Lifting and Jacking the Vehicle.
8. Remove the exhaust pipe assembly. Refer to Exhaust Pipe Replacement (LFM).
9. Remove any electrical retainers as needed.
10. Disconnect the starter connector. Refer to Starter Replacement.
11. Disconnect the generator connector. Refer to Generator Replacement.

Fig. 31: Intake Manifold Rear Bracket Bolts
Courtesy of GENERAL MOTORS COMPANY

12. Remove the intake manifold rear bracket (2) and bolts (1, 3).

Fig. 32: Lower Intake Manifold And Bolts
Courtesy of GENERAL MOTORS COMPANY

13. Remove the lower intake manifold 11 bolts (2, 3).
14. Remove the lower intake manifold (1) and fuel injection fuel rail assembly.
15. Transfer parts as necessary.

Installation Procedure

Fig. 33: Lower Intake Manifold And Bolts
Courtesy of GENERAL MOTORS COMPANY

1. Install the lower intake manifold (1) and fuel injector fuel rail assembly.

CAUTION: Refer to Fastener Caution .

2. Install the lower intake manifold 11 bolts (2, 3) and tighten to 10 (89 lb in).

Fig. 34: Intake Manifold Rear Bracket Bolts
Courtesy of GENERAL MOTORS COMPANY

3. Install the intake manifold support bracket (2).
4. Install the intake manifold rear bracket bolts (1) and tighten to 22 (16 lb ft).
5. Install the intake manifold rear bracket bolt (3) and tighten to 58 (42 lb ft).
6. Connect the generator connector. Refer to **Generator Replacement** .
7. Connect the starter connector. Refer to **Starter Replacement** .
8. Install any electrical retainers.
9. Install the exhaust pipe assembly. Refer to **Exhaust Pipe Replacement (LFM)** .
10. Lower the vehicle.

Fig. 35: Positive Crankcase Ventilation Hose
Courtesy of GENERAL MOTORS COMPANY

11. Connect the ignition coil connectors. Refer to **Ignition Coil Installation**.
12. Install the fuel injector rail wiring harness (2) and connect the fuel injector electrical connector.
13. Connect the fuel feed hose (1) to the fuel rail (3).
14. Install the positive crankcase ventilation hose. Refer to **Positive Crankcase Ventilation Hose/Pipe/Tube Replacement (LL0)**, **Positive Crankcase Ventilation Hose/Pipe/Tube Replacement (LFM)**.
15. Install the upper intake manifold housing. Refer to **Upper Intake Manifold Replacement (LFM)**.
16. Close the hood.

INTAKE MANIFOLD REPLACEMENT

Removal Procedure

1. Open the hood.
2. Disconnect the battery negative cable. Refer to **Battery Negative Cable Disconnection and Connection**.
3. Drain the cooling system. Refer to **Cooling System Draining and Filling**.
4. Remove the air cleaner assembly. Refer to **Air Cleaner Assembly Replacement**.
5. Remove the throttle body assembly. Refer to **Throttle Body Assembly Replacement (LL0)**, **Throttle**

Body Assembly Replacement (LFM) .

6. Remove the positive crankcase ventilation hose. Refer to **Positive Crankcase Ventilation Hose/Pipe/Tube Replacement (LL0)**, **Positive Crankcase Ventilation Hose/Pipe/Tube Replacement (LFM)**.
7. Remove the manifold absolute pressure sensor. Refer to **Manifold Absolute Pressure Sensor Replacement (LL0)** , **Manifold Absolute Pressure Sensor Replacement (LFM)** .
8. Remove the evaporative emission canister purge solenoid valve. Refer to **Evaporative Emission Canister Purge Solenoid Valve Replacement (LL0)** , **Evaporative Emission Canister Purge Solenoid Valve Replacement (LFM)** .

Fig. 36: Block Heater Connecting Plug Holder Bolt
Courtesy of GENERAL MOTORS COMPANY

9. Remove the coolant hose and clamp (7) from the radiator surge tank and intake manifold.
10. If equipped with a block heater, remove the block heater connecting plug holder bolts (1) and reposition block heater connecting plug holder (6) aside.
11. Remove the radiator surge tank mounting bolt (2) and reposition radiator surge tank (5) aside.
12. Disconnect the power brake booster vacuum hose from intake manifold. Refer to **Power Brake Booster Vacuum Hose Replacement** .
13. Disconnect the fuel feed line quick connect fitting from the fuel rail. Refer to **Metal Collar Quick Connect Fitting Service** .

Fig. 37: Intake Manifold Upper Bracket Bolts
Courtesy of GENERAL MOTORS COMPANY

14. Remove the intake manifold upper bracket bolts (2).
15. Remove the intake manifold upper bracket (1).

Fig. 38: Intake Manifold Side Bracket And Bolts
Courtesy of GENERAL MOTORS COMPANY

16. Remove the intake manifold side bracket (1) and bolts (2, 3).
17. Raise the vehicle. Refer to **Lifting and Jacking the Vehicle** .
18. Remove the exhaust front pipe assembly. Refer to **Exhaust Front Pipe Replacement (LL0)** .

Fig. 39: Starter Connector Wiring Harness Plug
Courtesy of GENERAL MOTORS COMPANY

19. Disconnect the starter connector wiring harness plug (1).
20. Disconnect the generator connector wiring harness plug (2).
21. Remove the 2 intake manifold rear bracket bolts (up) (3).
22. Remove the intake manifold rear bracket bolt (down) (4).
23. Remove the intake manifold bracket (5).
24. Transfer parts as necessary.

Fig. 40: Heater Outlet Hose And Clamp
Courtesy of GENERAL MOTORS COMPANY

25. Disconnect the heater outlet hose and clamp (2).

Fig. 41: Lower Intake Manifold And Bolts
Courtesy of GENERAL MOTORS COMPANY

26. Remove the intake manifold 11 bolts (2, 3).
27. Lower the vehicle.
28. Remove the ignition coil cover. Refer to **Ignition Coil Cover Replacement (LL0)**, **Ignition Coil Cover Replacement (LFM)**.
29. Remove the intake manifold (1).
30. Disconnect any electrical connectors as needed.
31. Transfer parts as necessary.

Installation Procedure

Fig. 42: Lower Intake Manifold And Bolts
Courtesy of GENERAL MOTORS COMPANY

1. Install the intake manifold (1).
2. Install the ignition coil cover. Refer to **Ignition Coil Cover Replacement (LL0)**, **Ignition Coil Cover Replacement (LFM)**.
3. Raise the vehicle. Refer to **Lifting and Jacking the Vehicle** .

CAUTION: Refer to Fastener Caution .

4. Install the intake manifold 11 bolts (2, 3) and tighten to 10 (89 lb in).

Fig. 43: Heater Outlet Hose And Clamp
Courtesy of GENERAL MOTORS COMPANY

5. Connect the heater outlet hose and clamp (2).

Fig. 44: Starter Connector Wiring Harness Plug
Courtesy of GENERAL MOTORS COMPANY

6. Install the intake manifold rear bracket (5).

CAUTION: Refer to Fastener Caution .

7. Install the 2 intake manifold rear bracket bolts (up) (3) and tighten to 22 (16 lb ft)
8. Install the intake manifold rear bracket bolt (down) (4) and tighten to 58 (42 lb ft)
9. Connect the starter connector wiring harness plug (1).
10. Connect the generator connector wiring harness plug (2).
11. Install the exhaust front pipe assembly. Refer to **Exhaust Front Pipe Replacement (LL0)** .
12. Lower the vehicle.

Fig. 45: Intake Manifold Side Bracket And Bolts
Courtesy of GENERAL MOTORS COMPANY

13. Install the intake manifold side bracket (1).
14. Install the intake manifold side bracket bolts (2) and tighten to 10 (89 lb in).
15. Install the intake manifold side bracket bolt (3) and tighten to 25 (18 lb ft).

Fig. 46: Intake Manifold Upper Bracket Bolts
Courtesy of GENERAL MOTORS COMPANY

16. Install the intake manifold upper bracket (1).
17. Install the intake manifold upper bracket bolts (2) and tighten to 25 (18 lb ft).
18. Connect the fuel feed line quick connect fitting to the fuel rail. Refer to **Metal Collar Quick Connect Fitting Service** .
19. Connect the power brake booster vacuum hose to intake manifold. Refer to **Power Brake Booster Vacuum Hose Replacement** .

Fig. 47: Block Heater Connecting Plug Holder Bolt
Courtesy of GENERAL MOTORS COMPANY

20. Install the radiator surge tank mounting bolts (2) and tighten to 8 (71 lb in)
21. If equipped with a block heater, install the block heater connecting plug holder bolts (1) and tighten to 10 (89 lb in)
22. Install the coolant hose and clamp (7) to the radiator surge tank and intake manifold.
23. Install the evaporative emission canister purge solenoid valve. Refer to **Evaporative Emission Canister Purge Solenoid Valve Replacement (LL0)** , **Evaporative Emission Canister Purge Solenoid Valve Replacement (LFM)** .
24. Install the manifold absolute pressure sensor. Refer to **Manifold Absolute Pressure Sensor Replacement (LL0)** , **Manifold Absolute Pressure Sensor Replacement (LFM)** .
25. Install the positive crankcase ventilation hose. Refer to **Positive Crankcase Ventilation Hose/Pipe/Tube Replacement (LL0)**, **Positive Crankcase Ventilation Hose/Pipe/Tube Replacement (LFM)**.
26. Install the throttle body assembly. Refer to **Throttle Body Assembly Replacement (LL0)** , **Throttle Body Assembly Replacement (LFM)** .
27. Install the air cleaner assembly. Refer to **Air Cleaner Assembly Replacement** .
28. Fill the cooling system. Refer to **Cooling System Draining and Filling** .
29. Connect the battery negative cable. Refer to **Battery Negative Cable Disconnection and Connection** .
30. Close the hood.

CYLINDER HEAD REPLACEMENT (LL0)

Removal Procedure

1. Remove the engine from the vehicle. Refer to **Engine Replacement (LFM), Engine Replacement (LL0)**.
2. Remove the exhaust manifold. Refer to **Exhaust Manifold Removal**.
3. Remove the intake manifold. Refer to **Intake Manifold Removal (LL0), Intake Manifold Removal (LFM)**.
4. Remove the engine coolant outlet adapter. Refer to **Engine Water Outlet Adapter Removal**.
5. Remove the ignition coil. Refer to **Ignition Coil Removal**.
6. Remove the spark plug.
7. Remove the camshaft position actuator solenoid valve. Refer to **Camshaft Position Actuator Solenoid Valve Removal**.
8. Remove the camshaft cover. Refer to **Camshaft Cover Removal**.
9. Remove the oil level indicator and tube. Refer to **Oil Level Indicator and Tube Removal**.
10. Remove the generator. Refer to **Generator Replacement**.
11. Remove the generator bracket. Refer to **Generator Bracket Removal**.
12. Remove the water pump. Refer to **Water Pump Removal**.
13. Remove the crankshaft balancer. Refer to **Crankshaft Balancer Removal**.
14. Remove the oil pan. Refer to **Oil Pan Removal**.
15. Remove the engine front cover. Refer to **Engine Front Cover and Oil Pump Removal**.
16. Remove the timing chain tensioner. Refer to **Timing Chain Tensioner Removal**.
17. Remove the timing chain guide. Refer to **Timing Chain Guide Removal**.
18. Remove the camshaft timing chain. Refer to **Camshaft Timing Chain Removal**.
19. Remove the crankshaft sprocket. Refer to **Crankshaft Sprocket Removal**.
20. Remove the camshaft. Refer to **Camshaft Removal (LL0), Camshaft Removal (LFM)**.
21. Remove the cylinder head. Refer to **Cylinder Head and Gasket Removal**.
22. For disassembly of the cylinder head, refer to **Cylinder Head Disassemble**.
23. Clean and inspect the cylinder head. Refer to **Cylinder Head Cleaning and Inspection**.

Installation Procedure

1. For assembly of the cylinder head, refer to **Cylinder Head Assemble**.
2. Install the cylinder head. Refer to **Cylinder Head and Gasket Installation**.
3. Install the camshaft. Refer to **Camshaft Installation (LL0), Camshaft Installation (LFM)**.
4. Install the crankshaft sprocket. Refer to **Crankshaft Sprocket Installation**.
5. Install the camshaft timing chain. Refer to **Camshaft Timing Chain Installation**.
6. Install the timing chain guide. Refer to **Timing Chain Guide Installation**.
7. Install the timing chain tensioner. Refer to **Timing Chain Tensioner Installation**.

8. Install the engine front cover. Refer to **Engine Front Cover and Oil Pump Installation**.
9. Install the oil pan. Refer to **Oil Pan Installation**.
10. Install the crankshaft balancer. Refer to **Crankshaft Balancer Installation**.
11. Install the water pump. Refer to **Water Pump Installation**.
12. Install the generator bracket. Refer to **Generator Bracket Installation**.
13. Install the generator. Refer to **Generator Replacement**.
14. Install the oil level indicator and tube. Refer to **Oil Level Indicator and Tube Installation**.
15. Install the camshaft cover. Refer to **Camshaft Cover Installation**.
16. Install the camshaft position actuator solenoid valve. Refer to **Camshaft Position Actuator Solenoid Valve Installation**.

CAUTION: Refer to Fastener Caution.

17. Install the spark plug and tighten to 20 (15 lb ft).
18. Install the ignition coil. Refer to **Ignition Coil Installation**.
19. Install the engine coolant outlet adapter. Refer to **Engine Water Outlet Adapter Removal**.
20. Install the intake manifold. Refer to **Intake Manifold Installation (LL0)**, **Intake Manifold Installation (LFM)**.
21. Install the exhaust manifold. Refer to **Exhaust Manifold Installation**.
22. Install the engine to the vehicle. Refer to **Engine Replacement (LFM)**, **Engine Replacement (LL0)**.

CYLINDER HEAD REPLACEMENT (LFM)

Removal Procedure

1. Remove the engine from the vehicle. Refer to **Engine Replacement (LFM)**, **Engine Replacement (LL0)**.
2. Remove the exhaust manifold. Refer to **Exhaust Manifold Removal**.
3. Remove the intake manifold. Refer to **Intake Manifold Removal (LL0)**, **Intake Manifold Removal (LFM)**.
4. Remove the engine coolant outlet adapter. Refer to **Engine Water Outlet Adapter Removal**.
5. Remove the ignition coil. Refer to **Ignition Coil Removal**.
6. Remove the spark plug.
7. Remove the camshaft position actuator solenoid valve. Refer to **Camshaft Position Actuator Solenoid Valve Removal**.
8. Remove the camshaft cover. Refer to **Camshaft Cover Removal**.
9. Remove the oil level indicator and tube. Refer to **Oil Level Indicator and Tube Removal**.
10. Remove the generator. Refer to **Generator Replacement**.
11. Remove the generator bracket. Refer to **Generator Bracket Removal**.

12. Remove the water pump. Refer to **Water Pump Removal**.
13. Remove the crankshaft balancer. Refer to **Crankshaft Balancer Removal**.
14. Remove the oil pan. Refer to **Oil Pan Removal**.
15. Remove the engine front cover. Refer to **Engine Front Cover and Oil Pump Removal**.
16. Remove the timing chain tensioner. Refer to **Timing Chain Tensioner Removal**.
17. Remove the timing chain guide. Refer to **Timing Chain Guide Removal**.
18. Remove the camshaft timing chain. Refer to **Camshaft Timing Chain Removal**.
19. Remove the crankshaft sprocket. Refer to **Crankshaft Sprocket Removal**.
20. Remove the camshaft. Refer to **Camshaft Removal (LL0)**, **Camshaft Removal (LFM)**.
21. Remove the cylinder head. Refer to **Cylinder Head and Gasket Removal**.
22. For disassembly of the cylinder head, refer to **Cylinder Head Disassemble**.
23. Clean and inspect the cylinder head. Refer to **Cylinder Head Cleaning and Inspection**.

Installation Procedure

1. For assembly of the cylinder head, refer to **Cylinder Head Assemble**.
2. Install the cylinder head. Refer to **Cylinder Head and Gasket Installation**.
3. Install the camshaft. Refer to **Camshaft Installation (LL0)**, **Camshaft Installation (LFM)**.
4. Install the crankshaft sprocket. Refer to **Crankshaft Sprocket Installation**.
5. Install the camshaft timing chain. Refer to **Camshaft Timing Chain Installation**.
6. Install the timing chain guide. Refer to **Timing Chain Guide Installation**.
7. Install the timing chain tensioner. Refer to **Timing Chain Tensioner Installation**.
8. Install the engine front cover. Refer to **Engine Front Cover and Oil Pump Installation**.
9. Install the oil pan. Refer to **Oil Pan Installation**.
10. Install the crankshaft balancer. Refer to **Crankshaft Balancer Installation**.
11. Install the water pump. Refer to **Water Pump Installation**.
12. Install the generator bracket. Refer to **Generator Bracket Installation**.
13. Install the generator. Refer to **Generator Replacement**.
14. Install the oil level indicator and tube. Refer to **Oil Level Indicator and Tube Installation**.
15. Install the camshaft cover. Refer to **Camshaft Cover Installation**.
16. Install the camshaft position actuator solenoid valve. Refer to **Camshaft Position Actuator Solenoid Valve Installation**.

CAUTION: Refer to Fastener Caution .

17. Install the spark plug and tighten to 20 (15 lb ft).
18. Install the ignition coil. Refer to **Ignition Coil Installation**.
19. Install the engine coolant outlet adapter. Refer to **Engine Water Outlet Adapter Installation**.

20. Install the intake manifold. Refer to **Intake Manifold Installation (LL0)**, **Intake Manifold Installation (LFM)**.
21. Install the exhaust manifold. Refer to **Exhaust Manifold Installation**.
22. Install the engine to the vehicle. Refer to **Engine Replacement (LFM)**, **Engine Replacement (LL0)**.

OIL PAN REPLACEMENT

Removal Procedure

1. Open the hood.
2. Raise the vehicle by its full height. Refer to **Lifting and Jacking the Vehicle** .
3. Place collecting basin underneath.
4. Remove the oil drain bolt.
5. Collect the engine oil.
6. Install the oil drain bolt.
7. Lower the vehicle by its full height.
8. Remove the oil level indicator tube. Refer to **Oil Level Indicator Tube Replacement**.
9. Raise the vehicle by its full height.
10. Remove the front compartment splash shield. Refer to **Front Compartment Splash Shield Replacement** .
11. If equipped with an exhaust front pipe assembly, refer to **Exhaust Front Pipe Replacement (LL0)** .
12. If equipped with an exhaust pipe assembly, refer to **Exhaust Pipe Replacement (LFM)** .

Fig. 48: Housing Lower Plate Bolts
Courtesy of GENERAL MOTORS COMPANY

13. Remove the 3 housing lower plate bolts (1) from the transmission (2).
14. Remove the transmission housing lower plate (3).

Fig. 49: Oil Pan Bolts And Nuts
Courtesy of GENERAL MOTORS COMPANY

NOTE: Remove the oil pan evenly all the way around with a suitable tool. Do not damage sealing surfaces on block.

15. Remove the 16 oil pan bolts (2), 2 nuts (1) and remove the oil pan (3) and discard oil pan.

Installation Procedure

NOTE: Cleaning of the sealing surfaces (1-4): Refer to Replacing Engine Gaskets.

1. Remove any old thread sealant, gasket material or sealant.
2. Clean the sealing surfaces of front cover and front cover components with solvent.

NOTE: Ensure that the sealing surface is clear of oil, grease and oil sealant material.

3. Clean out debris from the bolt holes.

WARNING: Refer to Safety Glasses and Compressed Air Warning .

4. Dry the front cover and front cover components with compressed air.

Fig. 50: Oil Pan Sealant
Courtesy of GENERAL MOTORS COMPANY

NOTE: Use a new oil pan.

NOTE: Do not coat sealant (RTV) on the front cover bolt holes and bolt threads

5. Apply approximately a 4.5 mm (0.177 in) thick bead of oil pan sealant (1) to the oil pan.

Fig. 51: Oil Pan Bolts And Nuts

Courtesy of GENERAL MOTORS COMPANY

CAUTION: Refer to Fastener Caution .

NOTE: After sealant (RTV) dispensing, the assembly completion time including torque check must be done within 8 minutes.

6. Install the 16 oil pan bolts (2), 2 nuts (1) to the oil pan (3) and tighten to 10 (89 lb in).
7. Install the oil drain bolt, tighten to 25 (18 lb ft).

Fig. 52: Housing Lower Plate Bolts
Courtesy of GENERAL MOTORS COMPANY

8. Install the transmission housing lower plate (3).
9. Install the 3 housing lower plate bolts (1) to the transmission (2) and tighten to 9 (80 lb in).
10. If equipped with an exhaust front pipe assembly, refer to **Exhaust Front Pipe Replacement (LL0)** .
11. If equipped with an exhaust pipe assembly, refer to **Exhaust Pipe Replacement (LFM)** .
12. Install the front compartment splash shield. Refer to **Front Compartment Splash Shield Replacement** .
13. Lower the vehicle.
14. Install the oil level indicator tube. Refer to **Oil Level Indicator Tube Replacement**.

NOTE: **Inspect the engine oil level and correct if necessary.**

15. Refill the collected engine oil.
16. Close the hood.

AUTOMATIC TRANSMISSION FLEX PLATE REPLACEMENT

Removal Procedure

1. Remove the automatic transmission. Refer to **Transmission Replacement** .

2. Remove the automatic transmission flex plate. Refer to **Automatic Transmission Flex Plate Removal**.

Installation Procedure

1. Install the automatic transmission flex plate. Refer to **Automatic Transmission Flex Plate Installation**.
2. Install the automatic transmission. Refer to **Transmission Replacement** .

ENGINE FLYWHEEL REPLACEMENT

Removal Procedure

1. Remove the manual transmission. Refer to **Transmission Replacement (MX2, MFM)** .
2. Remove the clutch pressure and driven plate. Refer to **Clutch Pressure and Driven Plate Replacement** .
3. Remove the engine flywheel. Refer to **Engine Flywheel Removal**.

Installation Procedure

1. Install the engine flywheel. Refer to **Engine Flywheel Installation**.
2. Install the clutch pressure and driven plate. Refer to **Clutch Pressure and Driven Plate Replacement** .
3. Install the manual transmission. Refer to **Transmission Replacement (MX2, MFM)** .

AIR CONDITIONING COMPRESSOR BELT REPLACEMENT

Removal Procedure

1. Remove the right front compartment splash. Refer to **Front Compartment Splash Shield Replacement**

Fig. 53: Air Conditioning (A/C) Belt
Courtesy of GENERAL MOTORS COMPANY

2. Cut the air conditioning (A/C) belt (1) with a appropriate cutting tool as shown.
3. Remove and discard the air conditioning (A/C) belt (1).

Installation Procedure

Fig. 54: New Air Conditioning (A/C) Belt
Courtesy of GENERAL MOTORS COMPANY

1. Position a NEW air conditioning (A/C) belt (1) on the crankshaft pulley (3) and air conditioning (A/C) compressor (2) as shown.

NOTE: Push the on belt while rotating the crankshaft pulley.

2. Using a socket and ratchet on the crankshaft pulley bolt (4), rotate the crankshaft in the direction of the arrow until the belt (1) is fully installed on the air conditioning (A/C) compressor (2).
3. After the belt is on the air conditioning (A/C) compressor pulley (2), rotate the crankshaft (3) an additional complete revolution and ensure the air conditioning (A/C) belt (1) is fully seated on the crankshaft (3) and air conditioning (A/C) compressor (2).
4. Install the front wheelhouse liner inner front extension. Refer to **Front Compartment Splash Shield Replacement** .

CRANKSHAFT BALANCER REPLACEMENT

Special Tools

- EN 50175 Crankshaft Locking Device
- EN-51218 Crankshaft Balancer Installer

- **J-22888-20A** Crankshaft Balancer Puller

For equivalent regional tools, refer to **Special Tools**.

Removal Procedure

1. Open the hood.
2. Raise the vehicle by its full height. Refer to **Lifting and Jacking the Vehicle** .

Fig. 55: Compartment Splash Shield
Courtesy of GENERAL MOTORS COMPANY

3. Remove the compartment splash shield (1) right side only. Refer to **Front Compartment Splash Shield Replacement** .
4. Remove the water pump and generator belt. Refer to **Water Pump and Generator Belt Replacement**.

Fig. 56: Housing Lower Plate Bolts
Courtesy of GENERAL MOTORS COMPANY

5. Remove the 3 housing lower plate bolts from the transmission.
6. Remove the transmission housing lower plate.

Fig. 57: EN-50175 Crankshaft Locking Device
Courtesy of GENERAL MOTORS COMPANY

7. Install the **EN-50175** crankshaft locking device (1) to lock the crankshaft.
8. Install the bolt (2).

Fig. 58: Crankshaft Balancer Bolt
Courtesy of GENERAL MOTORS COMPANY

9. Remove the crankshaft balancer bolt (1).
10. Install **J-22888-20A** crankshaft balancer puller to the crankshaft balancer (2).
11. Remove the crankshaft balancer (2).

Installation Procedure

Fig. 59: Crankshaft Balancer Bolt
Courtesy of GENERAL MOTORS COMPANY

1. Install **EN-51218** crankshaft balancer installer or equivalent to the crankshaft balancer (2).
2. Install the crankshaft balancer (2).

CAUTION: Refer to Fastener Caution .

3. Install the NEW crankshaft balancer bolt (1) and tighten to $95 + 55^\circ$ (70 lb ft + 55°).

Fig. 60: EN-50175 Crankshaft Locking Device
Courtesy of GENERAL MOTORS COMPANY

4. Remove the bolt (1).
5. Remove the **EN 50175** crankshaft locking device (1).

Fig. 61: Housing Lower Plate Bolts
Courtesy of GENERAL MOTORS COMPANY

6. Install the transmission housing lower plate.
7. Install the 3 housing lower plate bolts to the transmission and tighten to 9 (80 lb in).
8. Install the water pump and generator belt. Refer to **Water Pump and Generator Belt Replacement**.

Fig. 62: Compartment Splash Shield
Courtesy of GENERAL MOTORS COMPANY

9. Install the compartment splash shield (1) right side only. Refer to **Front Compartment Splash Shield Replacement** .
10. Lower the vehicle. Refer to **Lifting and Jacking the Vehicle** .
11. Close the hood.

CRANKSHAFT FRONT OIL SEAL REPLACEMENT

Special Tool

J-50172 Crankshaft Front Oil Seal Installer

For equivalent regional tools, refer to **Special Tools**.

Removal Procedure

1. Remove the crankshaft balancer. Refer to **Crankshaft Balancer Replacement**.

Fig. 63: Using Flat-Bladed Tool To Remove Seal From Front Cover
Courtesy of GENERAL MOTORS COMPANY

2. Use a flat-bladed tool to remove the seal from the front cover.

Installation Procedure

Fig. 64: Crankshaft Bolt And Crankshaft Front Oil Seal Installer
Courtesy of GENERAL MOTORS COMPANY

NOTE: Use the J-50172 crankshaft front oil seal installer in order to install the crankshaft front oil seal to the engine front cover.

1. Install the new crankshaft front oil seal to crankshaft with J-50172 crankshaft front oil seal installer (1).
2. Tighten the crankshaft bolt (2) till the J-50172 crankshaft front oil seal installer seats on the engine front cover.
3. Remove the crankshaft bolt (2).
4. Install the crankshaft balancer. Refer to **Crankshaft Balancer Replacement**.

POSITIVE CRANKCASE VENTILATION HOSE/PIPE/TUBE REPLACEMENT (LL0)

Fig. 65: Positive Crankcase Ventilation Hose/Pipe/Tube
Courtesy of GENERAL MOTORS COMPANY

Positive Crankcase Ventilation Hose/Pipe/Tube Replacement (LL0)

Callout	Component Name
1	Positive Crankcase Ventilation Hose Clamp (Qty: 2) Procedure Remove the positive crankcase ventilation hose clamp.
2	Positive Crankcase Ventilation Hose

POSITIVE CRANKCASE VENTILATION HOSE/PIPE/TUBE REPLACEMENT (LFM)

Fig. 66: Positive Crankcase Ventilation Hose/Pipe/Tube (LFM)
 Courtesy of GENERAL MOTORS COMPANY

Positive Crankcase Ventilation Hose/Pipe/Tube Replacement (LFM)

Callout	Component Name
1	Positive Crankcase Ventilation Hose Clamp (Qty: 2) Procedure Remove the positive crankcase ventilation hose clamp.
2	Positive Crankcase Ventilation Hose

ENGINE FRONT COVER WITH OIL PUMP REPLACEMENT

Removal Procedure

1. Remove the engine from the vehicle. Refer to **Engine Replacement (LFM)**, **Engine Replacement (LL0)**.
2. Remove the intake manifold. Refer to **Intake Manifold Removal (LL0)**, **Intake Manifold Removal (LFM)**.
3. Remove the ignition coil. Refer to **Ignition Coil Removal**.
4. Remove the camshaft position actuator solenoid valve. Refer to **Camshaft Position Actuator Solenoid Valve Removal**.
5. Remove the camshaft cover. Refer to **Camshaft Cover Removal**.
6. Remove the engine oil level indicator and tube. Refer to **Oil Level Indicator and Tube Removal**.
7. Remove the engine lift rear bracket. Refer to **Engine Lift Rear Bracket Removal**.
8. Remove the generator. Refer to **Generator Replacement** .

9. Remove the generator bracket. Refer to Generator Bracket Removal.
10. Remove the water pump. Refer to Water Pump Removal.
11. Remove the crankshaft balancer. Refer to Crankshaft Balancer Removal.
12. Remove the oil pan and discard. Refer to Oil Pan Removal.

Fig. 67: Engine Front Cover Bolts
Courtesy of GENERAL MOTORS COMPANY

13. Remove the engine front cover bolts (1, 2, 3, 4).

Fig. 68: View Of Pry Points

Courtesy of GENERAL MOTORS COMPANY

NOTE: Use the pry points and a bolt in the jackscrew hole in order to remove the engine front cover.

14. Using the pry points (1) located at the edge of the front cover, shear the room temperature vulcanizing (RTV) sealant.
15. Remove the engine front cover evenly all the way around with a suitable tool.
16. Disassemble the engine front cover and inspect the oil pump. Refer to **Oil Pump Disassemble**.

Installation Procedure

NOTE: DO NOT use sharp and/or gasket scrapers in order to clean the sealing surfaces.

NOTE: Cleaning of the sealing surfaces (1-4): Refer to **Replacing Engine Gaskets**.

1. Remove any old thread sealant, gasket material or sealant using remover such as chisel or scraper.
2. Clean the sealing surfaces of front cover and front cover components with solvent.

NOTE: Ensure that the sealing surface is clear of oil, grease and oil sealant material.

3. Clean out debris from the bolt holes.

WARNING: Refer to Safety Glasses and Compressed Air Warning .

4. Dry the front cover and front cover components with compressed air.
5. Assemble the engine front cover with the oil pump. Refer to Oil Pump Assemble.

Fig. 69: Engine Front Cover Bolts
Courtesy of GENERAL MOTORS COMPANY

NOTE: Apply sealant (RTV) on lines (1) and 2 hole faces (2). Apply sealant (RTV) to the edges of top and bottom step chamfers.

6. Apply approximately a 4.5 mm (0.177 in) thick bead of front cover sealant.

Fig. 70: Engine Front Cover Bolts
Courtesy of GENERAL MOTORS COMPANY

7. Install the engine front cover.

NOTE: Check the different screw lengths.

8. Install the engine front cover bolts (1, 2, 3, 4).

CAUTION: Refer to Fastener Caution .

9. Tighten the engine front cover bolts (1, 4) to 10 (89 lb in).

NOTE: After sealant (RTV) dispensing, the assembly completion time including torque check must be done within 8 minutes.

10. Tighten the engine front cover bolts (2, 3) to 22 (16 lb ft).
11. Install a new oil pan. Refer to Oil Pan Installation.
12. Install the crankshaft balancer. Refer to Crankshaft Balancer Installation.
13. Install the water pump. Refer to Water Pump Installation.

14. Install the generator bracket. Refer to **Generator Bracket Installation**.
15. Install the generator. Refer to **Generator Replacement**.
16. Install the engine lift rear bracket. Refer to **Engine Lift Rear Bracket Installation**.
17. Install the engine oil level indicator and tube. Refer to **Oil Level Indicator and Tube Installation**.
18. Install the camshaft cover. Refer to **Camshaft Cover Installation**.
19. Install the camshaft position actuator solenoid valve. Refer to **Camshaft Position Actuator Solenoid Valve Installation**.
20. Install the ignition coil. Refer to **Ignition Coil Installation**.
21. Install the intake manifold. Refer to **Intake Manifold Installation (LL0)**, **Intake Manifold Installation (LFM)**.
22. Install the engine to the vehicle. Refer to **Engine Replacement (LFM)**, **Engine Replacement (LL0)**.

CAMSHAFT TIMING CHAIN REPLACEMENT AND ADJUSTMENT

Removal Procedure

1. Remove the engine front cover evenly all the way around with a suitable tool. Refer to **Engine Front Cover with Oil Pump Replacement**.
2. Install the crankshaft balancer bolt to crankshaft.

Fig. 71: Rotating Crankshaft To TDC (Top Dead Center) Position
Courtesy of GENERAL MOTORS COMPANY

3. Rotate the crankshaft to the TDC (Top Dead Center) position.

Fig. 72: Timing Chain Tensioner Bolts And Tensioner
Courtesy of GENERAL MOTORS COMPANY

4. Remove the timing chain tensioner bolts (3) and the timing chain tensioner (2) with the timing chain tensioner gasket (1).

Fig. 73: Left Timing Chain Shoe Retaining Bolt
Courtesy of GENERAL MOTORS COMPANY

5. Remove the left timing chain shoe retaining bolt (2) and the left timing chain shoe (1).
6. Remove the right timing chain guide retaining bolts (4) and the right timing chain guide (3).

Fig. 74: Timing Chain
Courtesy of GENERAL MOTORS COMPANY

7. Remove the timing chain (1).

Installation Procedure

Fig. 75: Camshaft Lobes

Courtesy of GENERAL MOTORS COMPANY

1. Ensure that the camshaft lobes (1) are in a neutral position.

Fig. 76: Rotating Crankshaft To TDC (Top Dead Center) Position
Courtesy of GENERAL MOTORS COMPANY

2. Install the timing chain after aligning both the marks (1) on the camshaft sprockets and on the timing chain.
3. Align the colored link with the timing mark on the camshaft sprocket (2).

Fig. 77: Left Timing Chain Shoe Retaining Bolt
Courtesy of GENERAL MOTORS COMPANY

CAUTION: Refer to Fastener Caution .

4. Install the timing chain guide (3) and tighten the timing chain guide retaining bolts (4) to 10 (89 lb in).
5. Install the timing chain shoe (1) and tighten the timing chain shoe retaining bolt (2) to 10 (89 lb in).

Fig. 78: Timing Chain Tensioner

Courtesy of GENERAL MOTORS COMPANY

6. Push the timing chain shoe towards the timing chain and hold the timing chain shoe. Using the other hand, push the timing chain tensioner (1) with a new timing chain tensioner gasket towards the timing chain shoe. The timing chain tensioner plunger might be pushed into the timing chain tensioner housing. While holding the timing chain tensioner, install the timing chain tensioner bolts and tighten the timing chain tensioner retaining bolts to 10 (89 lb in). - Old Tensioner

Fig. 79: New Timing Tensioner

Courtesy of GENERAL MOTORS COMPANY

7. Install a new timing tensioner (2) with a new timing chain tensioner gasket and tighten the timing tensioner retaining bolts (3) to 10 (89 lb in). - New Tensioner
8. Remove the timing tensioner plunger holder (1).
9. Remove the crankshaft balancer bolt.
10. Install the engine front cover. Refer to **Engine Front Cover with Oil Pump Replacement**.

OIL PUMP REPLACEMENT

Removal Procedure

1. Remove the engine front cover. Refer to **Engine Front Cover with Oil Pump Replacement**.

NOTE: There are no serviceable components within the oil pump. Disassemble the pump only to diagnose an oiling concern. A disassembled oil pump must not be reused. A disassembled oil pump must be replaced.

2. Remove the oil pump bolts and the oil pump.
3. Perform the following steps as necessary:

- Disassemble the oil pump. Refer to Oil Pump Disassemble
- Clean and inspect the oil pump. Refer to Oil Pump Disassemble

Installation Procedure

1. Assemble the oil pump as necessary. Refer to Oil Pump Assemble.
2. Install the oil pump. Refer to Oil Pump Assemble.
3. Install the engine front cover. Refer to Engine Front Cover with Oil Pump Replacement.

OIL LEVEL INDICATOR TUBE REPLACEMENT

Removal Procedure

1. Open the hood.

NOTE: If the engine oil level is at maximum, some oil may emerge when drawing out the oil dipstick guide tube.

2. Place collecting basin underneath.

Fig. 80: Oil Level Indicator

Courtesy of GENERAL MOTORS COMPANY

3. Remove the oil level indicator (1).
4. Remove the oil level indicator tube bolt (2).
5. Remove the oil level indicator tube (3).

Installation Procedure

Fig. 81: Oil Level Indicator

Courtesy of GENERAL MOTORS COMPANY

1. Install the oil level indicator tube (3).

Use a NEW oil level indicator tube gasket.

CAUTION: Refer to Fastener Caution .

2. Install the oil level indicator tube bolt (2) and tighten to 10 (89 lb in).
3. Install the oil level indicator (1).
4. Close the hood.

ENGINE REPLACEMENT (LFM)

Removal Procedure

1. Open the hood.
2. Relieve the fuel system pressure. Refer to Fuel Pressure Relief .
3. Disconnect the battery negative cable. Refer to Battery Negative Cable Disconnection and Connection .
4. Raise and support the vehicle. Refer to Lifting and Jacking the Vehicle .
5. Drain the cooling system. Refer to Cooling System Draining and Filling .
6. Recover the refrigerant. Refer to Refrigerant Recovery and Recharging .
7. Remove the front wheels and tires. Refer to Tire and Wheel Removal and Installation .
8. Remove the air cleaner assembly. Refer to Air Cleaner Assembly Replacement .
9. Remove the battery. Refer to Battery Replacement .
10. Remove the engine control module. Refer to Engine Control Module Replacement .
11. Remove the battery tray. Refer to Battery Tray Replacement .

Fig. 82: Lower Intermediate Steering Shaft Bolt
Courtesy of GENERAL MOTORS COMPANY

12. Remove the lower intermediate steering shaft bolt (1) and detach the lower intermediate steering shaft (2).

Fig. 83: Engine Wiring Harnesses Connectors
Courtesy of GENERAL MOTORS COMPANY

13. Disconnect 4 engine wiring harnesses connectors (1) from under dash, left of the steering shaft and pull out the engine wiring harnesses through the front of dash to the engine compartment.

Fig. 84: Front Compartment Fuse Block Cover
Courtesy of GENERAL MOTORS COMPANY

14. Remove the engine wiring harness fuse block cover.

Fig. 85: Positive Battery Cable Nut
Courtesy of GENERAL MOTORS COMPANY

15. Remove the positive cable retaining nut (1, 2) and the positive cable (3).

Fig. 86: Detaching Upper Plate With Suitable Tool
Courtesy of GENERAL MOTORS COMPANY

16. Detach the upper plate with suitable tool.

Fig. 87: Front Compartment Fuse Block
Courtesy of GENERAL MOTORS COMPANY

17. Lift up the engine wiring harness fuse block from the lower plate.
18. Loosen the wiring harness connector retaining bolt (2) and disconnect the wiring harness connector (1) from the engine wiring harness fuse block. Repeat for remaining connector.
19. Disconnect remaining wiring harness.

Fig. 88: Ground Bolt And Put Wiring Harness
Courtesy of GENERAL MOTORS COMPANY

20. Remove the ground bolt (1) and put the wiring harness (2) aside.
21. Disconnect the wheel speed sensor connector (3).
22. Remove the wiring harness retainer (4).
23. Disconnect the heater inlet hose. Refer to **Heater Inlet Hose Replacement (1.0L LMT, 1.19L LC5 and 1.2L LMU)** .
24. Disconnect the heater outlet hose. Refer to **Heater Outlet Hose Replacement (1.0L LMT, 1.19L LC5 and 1.2L LMU)** .
25. Plug or cap the cooling system hoses and inlets.

Fig. 89: Transmission Range Selector Lever Cable Terminal
Courtesy of GENERAL MOTORS COMPANY

26. Disconnect the transmission range selector lever cable terminal from the transmission lever pin.
27. Press the locking tabs inward in order to release the transmission range selector lever cable from the cable bracket.

Fig. 90: Vacuum Hose
Courtesy of GENERAL MOTORS COMPANY

28. Disconnect the vacuum hose (1) from the intake manifold.
29. Disconnect the evaporative canister purge solenoid valve hose (2).
30. Disconnect the fuel feed hose (3).

Fig. 91: Vacuum Pump Hose And Vacuum Pump
Courtesy of GENERAL MOTORS COMPANY

31. Remove the vacuum pump hose (1) from the vacuum pump (2).

Fig. 92: Ambient Air Temperature Sensor Connector
Courtesy of GENERAL MOTORS COMPANY

32. Disconnect the wiring harness connector (3) from the engine cooling fan harness connector.
33. Disconnect the ambient air temperature sensor connector (1) from the ambient air temperature sensor if equipped.
34. Disconnect the coolant hose (2) from the radiator.

Fig. 93: Compartment Splash Shield

Courtesy of GENERAL MOTORS COMPANY

35. Remove the compartment splash shield (1, 2). Refer to **Front Compartment Splash Shield Replacement** .
36. Remove the front bumper fascia. Refer to **Front Bumper Fascia Replacement** .

Fig. 94: Front Side Air Baffle Retainers
Courtesy of GENERAL MOTORS COMPANY

37. Remove the front side air baffle retainers (1, 3) and the front side air baffles (2, 4).

Fig. 95: Front Lower Air Baffle Retainers
Courtesy of GENERAL MOTORS COMPANY

38. Remove the front lower air baffle retainers (1) and the front lower air baffle (2).

Fig. 96: Upper Air Guard Retainers
Courtesy of GENERAL MOTORS COMPANY

39. Remove the upper air guard retainers (1) and the upper air guard (2).

Fig. 97: Retainers And Water Deflector
Courtesy of GENERAL MOTORS COMPANY

40. Remove the retainers (2) and the water deflector (1).

Fig. 98: Coolant Surge Tank

Courtesy of GENERAL MOTORS COMPANY

41. Remove coolant surge tank retaining bolts (1).
42. Remove the coolant hose clips (3, 4, 5) and coolant surge tank (2).
43. Plug or cap the cooling system hoses and inlets.

Fig. 99: Suction Pipe Bolt

Courtesy of GENERAL MOTORS COMPANY

44. Remove the suction pipe bolt (2) from the A/C compressor.
45. Remove the suction pipe (1) from the A/C compressor.
46. Remove the discharge pipe nut (5) from the A/C condenser.
47. Remove the discharge pipe (4) from the A/C condenser.
48. Disconnect the coolant temperature sensor wiring connector (3) from the radiator.

Fig. 100: Oxygen Sensor Connector

Courtesy of GENERAL MOTORS COMPANY

49. Disconnect the oxygen sensor connector (1).
50. Remove the exhaust pipe. Refer to **Exhaust Pipe Replacement (LFM)** .
51. Remove the transmission rear mount bracket. Refer to **Transmission Rear Mount Bracket Replacement** .

Fig. 101: Lower Transmission Housing Bolt
Courtesy of GENERAL MOTORS COMPANY

52. Remove the transmission dust cover bolts (3) and the transmission dust cover (4).

Fig. 102: Front Brake Hose And Front Brake Caliper Retaining Bolts
Courtesy of GENERAL MOTORS COMPANY

NOTE: **DO NOT** disconnect the hydraulic brake flexible hose from the brake caliper otherwise complete bleeding of the braking system will be necessary.

53. Detach the front brake hose (2) from the strut mounted brake hose retaining bracket and remove the front brake caliper retaining bolts (1) from the front steering knuckle. Repeat for opposite side.

Fig. 103: View Of Hub, Wheel Nuts, Front Brake Disc, Heavy Mechanic's Wire & Front Brake Caliper

Courtesy of GENERAL MOTORS COMPANY

CAUTION: Support the brake caliper with heavy mechanic wire or equivalent, whenever it is separated from its mount and the hydraulic flexible brake hose is still connected. Failure to support the caliper in this manner will cause the flexible brake hose to bear the weight of the caliper, which may cause damage to the brake hose and in turn may cause a brake fluid leak.

54. Support the front brake caliper (1) with heavy mechanics wire or equivalent (2). Repeat for opposite side.
55. Disconnect the outer tie rod assembly from the steering knuckle. Repeat for opposite side. Refer to **Steering Linkage Outer Tie Rod Replacement** .
56. Remove the wheel drive shaft nut and washer from the wheel drive shaft and discard. Repeat for opposite side. Refer to **Front Wheel Drive Shaft Replacement** .
57. Separate the control arm ball joint from the steering knuckle. Repeat for opposite side. Refer to **Lower Control Arm Replacement** .

Fig. 104: Front Upper Stabilizer Shaft Link Nut
Courtesy of GENERAL MOTORS COMPANY

58. Remove the front upper stabilizer shaft link nut (1) and push the front upper stabilizer shaft link (2) aside. Repeat for opposite side.
59. Disconnect any additional electrical connections as necessary.

Fig. 105: View Of Cradle Bolts

Courtesy of GENERAL MOTORS COMPANY

60. Position the engine assembly on a suitable powertrain table or an engine lifter below the cradle with suitable woodblocks or suitable rubber blocks as shown.
61. Lower the vehicle until the suitable powertrain table or the engine lifter with suitable woodblocks or suitable rubber blocks.
62. Remove the 4 cradle bolts (1).

Fig. 106: Engine Mount Nuts

Courtesy of GENERAL MOTORS COMPANY

63. Mark the location of the bolts before removing.
64. Remove the engine mount retaining bolts (2, 3), nuts (1) and the engine mount.

Fig. 107: Location Of Bolts And Nut
Courtesy of GENERAL MOTORS COMPANY

NOTE: Mark the location of the bolts (1) and nut (2) before removing.

65. Remove the left transmission mount bolts (1) and nut (2) from the transmission mount bracket.

Fig. 108: Left Transmission Mount And Body Bolts
Courtesy of GENERAL MOTORS COMPANY

NOTE: Mark the location of the bolts (1) and nut (2) before removing.

66. Remove the transmission mount retaining bolts (1) and the transmission mount (2).
67. Transfer parts as needed.

NOTE: Make sure that all the hoses, wires, pipes and front struts clear the vehicle during the removal process.

68. With the aid of an assistant, lower the engine lifter or raise the vehicle to remove the engine, transmission and cradle assembly from the vehicle.
69. Remove the starter. Refer to **Starter Replacement** .

Fig. 109: Lower Transmission Housing Bolt
Courtesy of GENERAL MOTORS COMPANY

70. Remove the lower transmission housing bolt (1) and nut (2).

Fig. 110: Torque Converter Bolts
Courtesy of GENERAL MOTORS COMPANY

NOTE: Only rotate the engine in a clockwise direction only or engine damage will occur.

71. Remove the 3 torque converter bolts (1).

Fig. 111: Upper Transmission Housing Bolts
Courtesy of GENERAL MOTORS COMPANY

72. Remove the upper transmission housing bolts (1) and separate the transmission from the engine.
73. Install the engine to an engine stand. (Using M10 x 1.25 approximately 130 mm long)
74. Transfer parts as needed.

Installation Procedure

1. Remove the engine from the engine stand.

Fig. 112: Upper Transmission Housing Bolts
Courtesy of GENERAL MOTORS COMPANY

2. Combine the engine with the transmission and tighten upper auto transmission housing bolts (1) to 61 (44 lb ft).

Fig. 113: Torque Converter Bolts
Courtesy of GENERAL MOTORS COMPANY

NOTE: Only rotate the engine in a clockwise direction only or engine damage will occur.

3. Install the torque converter bolts (1) and tighten to 60 (44 lb ft).

Fig. 114: Lower Transmission Housing Bolt
Courtesy of GENERAL MOTORS COMPANY

4. Install the lower transmission housing bolt (1) and nut (2) and tighten to 61 (45 lb ft).
5. Install the starter. Refer to **Starter Replacement** .

Fig. 115: View Of Cradle Bolts

Courtesy of GENERAL MOTORS COMPANY

6. With the aid of an assistant, raise the engine lifter or lower the vehicle to install the engine, transmission and cradle assembly to the vehicle.
7. Tighten the 4 cradle bolt (1) to 135 (100 lb ft).

Fig. 116: Engine Mount Nuts

Courtesy of GENERAL MOTORS COMPANY

8. Install the engine mount and the engine mount bolts and nuts.
9. Tighten the engine mount retaining nuts (1) to 66 (49 lb ft).
10. Tighten the engine mount retaining bolt (2) to 66 (49 lb ft).
11. Tighten the engine mount retaining bolts (3) to 50 (37 lb ft).

Fig. 117: Left Transmission Mount And Body Bolts
Courtesy of GENERAL MOTORS COMPANY

12. Install the transmission mount (2) and the transmission mount bolts (1).
13. Tighten to 50 (37 lb ft).

Fig. 118: Location Of Bolts And Nut
Courtesy of GENERAL MOTORS COMPANY

14. Install the left transmission mount bolts (1) and nut (2) to the transmission mount bracket (2) and tighten to 95 (70 lb ft).
15. Connect additional electrical connections as necessary.

Fig. 119: Front Upper Stabilizer Shaft Link Nut
Courtesy of GENERAL MOTORS COMPANY

16. Install the front upper stabilizer shaft link (2) and the front upper stabilizer shaft link nut (1).
17. Tighten to 43 (32 lb ft). Repeat for opposite side.

Fig. 120: Front Brake Hose And Front Brake Caliper Retaining Bolts
Courtesy of GENERAL MOTORS COMPANY

18. Install the front brake caliper and tighten the front brake caliper bolts (1) to 95 (70 lb ft).
19. Install the front brake hose (2) to the strut mounted brake hose retaining bracket. Repeat for opposite side.
20. Install the outer tie rod assembly from the steering knuckle. Repeat for opposite side. Refer to **Steering Linkage Outer Tie Rod Replacement** .
21. Install the wheel drive shaft to the front steering knuckle. Refer to **Front Wheel Drive Shaft Replacement** .
22. Install the wheel drive shaft nut and washer to the wheel drive shaft. Repeat for opposite side. Refer to **Front Wheel Drive Shaft Replacement** .
23. Install the control arm ball joint to the steering knuckle. Repeat for opposite side. Refer to **Lower Control Arm Replacement** .

Fig. 121: Lower Transmission Housing Bolt
Courtesy of GENERAL MOTORS COMPANY

24. Install the transmission dust cover (4) and tighten the transmission dust cover bolts (3) to 9 (80 lb ft).
25. Install the transmission rear mount bracket. Refer to **Transmission Rear Mount Bracket Replacement** .
26. Install the exhaust pipe. Refer to **Exhaust Pipe Replacement (LFM)** .

Fig. 122: Oxygen Sensor Connector
Courtesy of GENERAL MOTORS COMPANY

27. Connect the oxygen sensor connector.

Fig. 123: Suction Pipe Bolt

Courtesy of GENERAL MOTORS COMPANY

28. Install the suction pipe (1) to the A/C compressor.
29. Install the suction pipe bolt (2) to the A/C compressor and tighten to 22 (16 lb ft).
30. Install the discharge pipe (4) to the A/C condenser.
31. Install the discharge pipe nut (5) to the A/C condenser and tighten to 10 (89 lb in).
32. Connect the coolant temperature sensor wiring connector (3) from the radiator.

Fig. 124: Coolant Surge Tank

Courtesy of GENERAL MOTORS COMPANY

33. Install the coolant surge tank (2) and coolant hoses with the coolant hose clips (3, 4, 5).
34. Install the coolant surge tank retaining bolts (1) and tighten to 8 (71 lb in).

Fig. 125: Retainers And Water Deflector
Courtesy of GENERAL MOTORS COMPANY

35. Install the water deflector (1) with retainers (2).

Fig. 126: Upper Air Guard Retainers
Courtesy of GENERAL MOTORS COMPANY

36. Install the upper air guard (2) and the upper air guard retainers (1).

Fig. 127: Front Lower Air Baffle Retainers
Courtesy of GENERAL MOTORS COMPANY

37. Install the front lower air baffles (2) and the front lower air baffle retainers (1).

Fig. 128: Front Side Air Baffle Retainers
Courtesy of GENERAL MOTORS COMPANY

38. Install the front side air baffles (2, 4) and the front side air baffle retainers (1, 3).
39. Install the front bumper fascia. Refer to **Front Bumper Fascia Replacement** .

Fig. 129: Compartment Splash Shield
Courtesy of GENERAL MOTORS COMPANY

40. Install the compartment splash shield (1, 2). Refer to **Front Compartment Splash Shield Replacement** .

Fig. 130: Ambient Air Temperature Sensor Connector
Courtesy of GENERAL MOTORS COMPANY

41. Connect the coolant hose (2) to the radiator.
42. Connect the ambient air temperature sensor connector (1) to the ambient air temperature sensor if equipped.
43. Install the wiring harness connector (3) to the engine cooling fan harness connector.

Fig. 131: Vacuum Pump Hose And Vacuum Pump
Courtesy of GENERAL MOTORS COMPANY

44. Install the vacuum pump hose (1) to the vacuum pump (2).

Fig. 132: Vacuum Hose

Courtesy of GENERAL MOTORS COMPANY

45. Connect the fuel feed hose (3).
46. Connect the evaporative canister purge solenoid valve hose (2).
47. Connect the vacuum hose (1) to the intake manifold.

Fig. 133: Transmission Range Selector Lever Cable Terminal
Courtesy of GENERAL MOTORS COMPANY

48. Connect the transmission range selector lever cable terminal to the transmission lever pin.
49. Install the transmission range selector lever cable to the cable bracket.
50. Install the heater inlet hose. Refer to **Heater Inlet Hose Replacement (1.0L LMT, 1.19L LC5 and 1.2L LMU)** .
51. Install the heater outlet hose. Refer to **Heater Outlet Hose Replacement (1.0L LMT, 1.19L LC5 and 1.2L LMU)** .

Fig. 134: Ground Bolt And Put Wiring Harness
Courtesy of GENERAL MOTORS COMPANY

52. Install the wiring harness retainer (4).
53. Connect the wheel speed sensor connector (3).
54. Install the ground wiring harness and bolt (1) and tighten to 10 (89 lb in).

Fig. 135: Front Compartment Fuse Block
Courtesy of GENERAL MOTORS COMPANY

55. Connect the engine wiring harness connector (1) to the fuse block and tighten the wiring harness connector retaining bolt (2) to 6 (53 lb in). Repeat for remaining connector.
56. Connect the remaining wiring harness to the compartment fuse block.
57. Install the engine wiring harness fuse block to the lower plate.

Fig. 136: Positive Battery Cable Nut

Courtesy of GENERAL MOTORS COMPANY

58. Install the positive cable (3) to the engine wiring harness fuse block and tighten the positive cable retaining nut (1, 2) to 10 (89 lb in).

Fig. 137: Front Compartment Fuse Block Cover
Courtesy of GENERAL MOTORS COMPANY

59. Install the engine wiring harness fuse block cover.

Fig. 138: Engine Wiring Harnesses Connectors
Courtesy of GENERAL MOTORS COMPANY

60. Install the engine wiring harness through the front of dash on the left of the steering shaft under the dash and connect the 4 engine wiring harnesses connectors (1).

Fig. 139: Lower Intermediate Steering Shaft Bolt
Courtesy of GENERAL MOTORS COMPANY

61. Install the lower intermediate steering shaft (2) and tighten the lower intermediate steering shaft bolt (1) to 27 (20 lb ft).
62. Install the battery tray. Refer to **Battery Tray Replacement** .
63. Install the engine control module. Refer to **Engine Control Module Replacement** .
64. Install the battery. Refer to **Battery Replacement** .
65. Install the air cleaner assembly. Refer to **Air Cleaner Assembly Replacement** .
66. Install the front wheels and tires. Refer to **Tire and Wheel Removal and Installation** .
67. Recharge the refrigerant. Refer to **Refrigerant Recovery and Recharging** .
68. Refill the cooling system. Refer to **Cooling System Draining and Filling** .
69. Check the engine oil level and fill new engine oil up if necessary.
70. Connect the battery negative cable. Refer to **Battery Negative Cable Disconnection and Connection** .
71. Close the hood.

ENGINE REPLACEMENT (LL0)

Removal Procedure

1. Open the hood.
2. Relieve the fuel system pressure. Refer to Fuel Pressure Relief .
3. Disconnect the battery negative cable. Refer to Battery Negative Cable Disconnection and Connection .
4. Raise and support the vehicle. Refer to Lifting and Jacking the Vehicle .
5. Drain the cooling system. Refer to Cooling System Draining and Filling .
6. Recover the refrigerant. Refer to Refrigerant Recovery and Recharging .
7. Remove the front wheels and tires. Refer to Tire and Wheel Removal and Installation .
8. Remove the air cleaner assembly. Refer to Air Cleaner Assembly Replacement .
9. Remove the battery. Refer to Battery Replacement .
10. Remove the engine control module. Refer to Engine Control Module Replacement .
11. Remove the battery tray. Refer to Battery Tray Replacement .

Fig. 140: Lower Intermediate Steering Shaft Bolt
Courtesy of GENERAL MOTORS COMPANY

12. Remove the lower intermediate steering shaft bolt (1) and detach the lower Intermediate steering shaft (2).

Fig. 141: Engine Wiring Harnesses Connectors
Courtesy of GENERAL MOTORS COMPANY

13. Disconnect 4 engine wiring harnesses connectors (1) from under dash, left of the steering shaft and pull out the engine wiring harnesses through the front of dash to the engine compartment.

Fig. 142: Front Compartment Fuse Block Cover
Courtesy of GENERAL MOTORS COMPANY

14. Remove the engine wiring harness fuse block cover.

Fig. 143: Positive Battery Cable Nut
Courtesy of GENERAL MOTORS COMPANY

15. Remove the positive cable retaining nut (1, 2) and the positive cable (3).

Fig. 144: Detaching Upper Plate With Suitable Tool
Courtesy of GENERAL MOTORS COMPANY

16. Detach the upper plate with suitable tool.

Fig. 145: Front Compartment Fuse Block
Courtesy of GENERAL MOTORS COMPANY

17. Lift up the engine wiring harness fuse block from the lower plate.
18. Loosen the wiring harness connector retaining bolt (2) and disconnect the wiring harness connector (1) from the engine wiring harness fuse block. Repeat for remaining connector.
19. Disconnect remaining wiring harness.

Fig. 146: Ground Bolt And Put Wiring Harness
Courtesy of GENERAL MOTORS COMPANY

20. Remove the ground bolt (1) and put the wiring harness (2) aside.
21. Disconnect the wheel speed sensor connector (3).
22. Remove the wiring harness retainer (4).
23. Disconnect the heater inlet hose. Refer to **Heater Inlet Hose Replacement (1.0L LMT, 1.19L LC5 and 1.2L LMU)** .
24. Disconnect the heater outlet hose. Refer to **Heater Outlet Hose Replacement (1.0L LMT, 1.19L LC5 and 1.2L LMU)** .
25. Plug or cap the cooling system hoses and inlets.

Fig. 147: Transmission Range Selector Lever Cable Terminal
Courtesy of GENERAL MOTORS COMPANY

26. Disconnect the transmission range selector lever cable terminal from the transmission lever pin. For manual transmission refer to **Manual Transmission Shift Lever and Selector Lever Cable Replacement (MX2, MFM)** .
27. Press the locking tabs inward in order to release the transmission range selector lever cable from the cable bracket.
28. Remove the clutch actuator cylinder if equipped. Refer to **Clutch Actuator Cylinder Replacement** .

Fig. 148: Vacuum Hose

Courtesy of GENERAL MOTORS COMPANY

29. Disconnect the vacuum hose (1) from the intake manifold.
30. Disconnect the evaporative canister purge solenoid valve hose (2).
31. Remove the fuel feed hose retaining clip (4) and disconnect the fuel feed hose (3). Refer to **Metal Collar Quick Connect Fitting Service** .

Fig. 149: Vacuum Pump Hose And Vacuum Pump
Courtesy of GENERAL MOTORS COMPANY

32. Remove the vacuum pump hose (1) from the vacuum pump (2).

Fig. 150: Ambient Air Temperature Sensor Connector
Courtesy of GENERAL MOTORS COMPANY

33. Disconnect the wiring harness connector (3) from the engine cooling fan harness connector.
34. Disconnect the ambient air temperature sensor connector (1) from the ambient air temperature sensor if equipped.
35. Disconnect the coolant hose (2) from the radiator.

Fig. 151: Compartment Splash Shield
Courtesy of GENERAL MOTORS COMPANY

36. Remove the compartment splash shield (1, 2). Refer to **Front Compartment Splash Shield Replacement** .
37. Remove the front bumper fascia. Refer to **Front Bumper Fascia Replacement** .

Fig. 152: Front Side Air Baffle Retainers
Courtesy of GENERAL MOTORS COMPANY

38. Remove the front side air baffle retainers (1, 3) and the front side air baffles (2, 4).

Fig. 153: Front Lower Air Baffle Retainers
Courtesy of GENERAL MOTORS COMPANY

39. Remove the front lower air baffle retainers (1) and the front lower air baffle (2).

Fig. 154: Upper Air Guard Retainers
Courtesy of GENERAL MOTORS COMPANY

40. Remove the upper air guard retainers (1) and the upper air guard (2).

Fig. 155: Retainers And Water Deflector
Courtesy of GENERAL MOTORS COMPANY

41. Remove the retainers (2) and the water deflector (1).

Fig. 156: Block Heater Connecting Plug Holder Bolt
Courtesy of GENERAL MOTORS COMPANY

42. Remove the block heater cord container bolts (1) if equipped and coolant surge tank retaining bolts (2).
43. Remove the block heater code container (6) if equipped.
44. Remove the coolant hose clips (3, 4, 7) and coolant surge tank (5).
45. Plug or cap the cooling system hoses and inlets.

Fig. 157: Suction Pipe Bolt

Courtesy of GENERAL MOTORS COMPANY

46. Remove the suction pipe bolt (2) from the A/C compressor.
47. Remove the suction pipe (1) from the A/C compressor.
48. Remove the discharge pipe nut (5) from the A/C condenser.
49. Remove the discharge pipe (4) from the A/C condenser.
50. Disconnect the coolant temperature sensor wiring connector (3) from the radiator.

Fig. 158: Oxygen Sensor Connector
Courtesy of GENERAL MOTORS COMPANY

51. Disconnect the oxygen sensor connector (1).
52. Remove the exhaust front pipe. Refer to **Exhaust Front Pipe Replacement (LL0)** .
53. Remove the transmission rear mount bracket. Refer to **Transmission Rear Mount Bracket Replacement** .

Fig. 159: Lower Transmission Housing Bolt
Courtesy of GENERAL MOTORS COMPANY

54. Remove the transmission dust cover bolts (3) and the transmission dust cover (4).

Fig. 160: Front Brake Hose And Front Brake Caliper Retaining Bolts
Courtesy of GENERAL MOTORS COMPANY

NOTE: **DO NOT** disconnect the hydraulic brake flexible hose from the brake caliper otherwise complete bleeding of the braking system will be necessary.

55. Detach the front brake hose (2) from the strut mounted brake hose retaining bracket and remove the front brake caliper retaining bolts (1) from the front steering knuckle. Repeat for opposite side.

Fig. 161: View Of Hub, Wheel Nuts, Front Brake Disc, Heavy Mechanic's Wire & Front Brake Caliper

Courtesy of GENERAL MOTORS COMPANY

CAUTION: Support the brake caliper with heavy mechanic wire or equivalent, whenever it is separated from its mount and the hydraulic flexible brake hose is still connected. Failure to support the caliper in this manner will cause the flexible brake hose to bear the weight of the caliper, which may cause damage to the brake hose and in turn may cause a brake fluid leak.

56. Support the front brake caliper (1) with heavy mechanics wire or equivalent (2). Repeat for opposite side.
57. Disconnect the outer tie rod assembly from the steering knuckle. Repeat for opposite side. Refer to **Steering Linkage Outer Tie Rod Replacement** .
58. Remove the wheel drive shaft nut and washer from the wheel drive shaft and discard. Repeat for opposite side. Refer to **Front Wheel Drive Shaft Replacement** .
59. Separate the control arm ball joint from the steering knuckle. Repeat for opposite side. Refer to **Lower Control Arm Replacement** .

Fig. 162: Front Upper Stabilizer Shaft Link Nut
Courtesy of GENERAL MOTORS COMPANY

60. Remove the front upper stabilizer shaft link nut (1) and push the front upper stabilizer shaft link (2) aside. Repeat for opposite side.
61. Disconnect any additional electrical connections as necessary.

Fig. 163: View Of Cradle Bolts

Courtesy of GENERAL MOTORS COMPANY

62. Position the engine assembly on a suitable powertrain table or an engine lifter below the cradle with suitable woodblocks or suitable rubber blocks as shown.
63. Lower the vehicle until the suitable powertrain table or the engine lifter with suitable woodblocks or suitable rubber blocks.
64. Remove the 4 cradle bolts (1).

Fig. 164: Engine Mount Nuts

Courtesy of GENERAL MOTORS COMPANY

65. Mark the location of the bolts before removing.
66. Remove the engine mount retaining bolts (2, 3), nuts (1) and the engine mount.

Fig. 165: Location Of Bolts And Nut
Courtesy of GENERAL MOTORS COMPANY

NOTE: Mark the location of the bolts (1) and nut (2) before removing.

67. Remove the left transmission mount bolts (1) and nut (2) from the transmission mount bracket.

Fig. 166: Left Transmission Mount And Body Bolts
Courtesy of GENERAL MOTORS COMPANY

NOTE: Mark the location of the bolts (1) and nut (2) before removing.

68. Remove the transmission mount retaining bolts (1) and the transmission mount (2).
69. Transfer parts as needed.

NOTE: Make sure that all the hoses, wires, pipes and front struts clear the vehicle during the removal process.

70. With the aid of an assistant, lower the engine lifter or raise the vehicle to remove the engine, transmission and cradle assembly from the vehicle.
71. Remove the starter. Refer to **Starter Replacement** .

Fig. 167: Lower Transmission Housing Bolt
Courtesy of GENERAL MOTORS COMPANY

72. Remove the lower transmission housing bolt (1) and nut (2). (M/T)

Fig. 168: Lower Transmission Housing Bolt And Nut
Courtesy of GENERAL MOTORS COMPANY

73. Remove the lower transmission housing bolt (1) and nut (2). (A/T)

Fig. 169: Torque Converter Bolts
Courtesy of GENERAL MOTORS COMPANY

NOTE: Only rotate the engine in a clockwise direction only or engine damage will occur.

74. Remove the torque converter bolts (1). (A/T)

Fig. 170: Upper Transmission Housing Bolts
Courtesy of GENERAL MOTORS COMPANY

75. Remove the upper transmission housing bolts (1) and separate the transmission from the engine.
76. Install the engine to an engine stand. (Using M10 x 1.25 approximately 130 mm long)
77. Transfer parts as needed.

Installation Procedure

1. Remove the engine from the engine stand.

Fig. 171: Upper Transmission Housing Bolts
Courtesy of GENERAL MOTORS COMPANY

2. Combine the engine with the transmission and tighten upper auto transmission housing bolts (1) to 61 (44 lb ft).

Fig. 172: Torque Converter Bolts

Courtesy of GENERAL MOTORS COMPANY

NOTE: Only rotate the engine in a clockwise direction only or engine damage will occur.

3. Install the torque converter bolts (1) and tighten to 60 (44 lb ft). (A/T)

Fig. 173: Lower Transmission Housing Bolt
Courtesy of GENERAL MOTORS COMPANY

4. Install the lower transmission housing bolt (1) and nut (2) and tighten to 61 (45 lb ft). (M/T)

Fig. 174: Lower Transmission Housing Bolt And Nut
Courtesy of GENERAL MOTORS COMPANY

5. Install the lower transmission housing bolt (1) and nut (2) and tighten to 61 (45 lb ft). (A/T)
6. Install the starter. Refer to **Starter Replacement** .

Fig. 175: View Of Cradle Bolts

Courtesy of GENERAL MOTORS COMPANY

7. With the aid of an assistant, raise the engine lifter or lower the vehicle to install the engine, transmission and cradle assembly to the vehicle.
8. Tighten the 4 cradle bolt (1) to 135 (100 lb ft).

Fig. 176: Engine Mount Nuts

Courtesy of GENERAL MOTORS COMPANY

9. Install the engine mount and the engine mount bolts and nuts.
10. Tighten the engine mount retaining nuts (1) to 66 (49 lb ft).
11. Tighten the engine mount retaining bolt (2) to 66 (49 lb ft).
12. Tighten the engine mount retaining bolts (3) to 50 (37 lb ft).

Fig. 177: Left Transmission Mount And Body Bolts
Courtesy of GENERAL MOTORS COMPANY

13. Install the transmission mount (2) and the transmission mount bolts (1).
14. Tighten to 50 (37 lb ft).

Fig. 178: Location Of Bolts And Nut
Courtesy of GENERAL MOTORS COMPANY

15. Install the left transmission mount bolts (1) and nut (2) to the transmission mount bracket (2) and tighten to 95 (70 lb ft).
16. Connect additional electrical connections as necessary.

Fig. 179: Front Upper Stabilizer Shaft Link Nut
Courtesy of GENERAL MOTORS COMPANY

17. Install the front upper stabilizer shaft link (2) and the front upper stabilizer shaft link nut (1).
18. Tighten to 43 (32 lb ft). Repeat for opposite side.

Fig. 180: Front Brake Hose And Front Brake Caliper Retaining Bolts
Courtesy of GENERAL MOTORS COMPANY

19. Install the front brake caliper and tighten the front brake caliper bolts (1) to 95 (70 lb ft).
20. Install the front brake hose (2) to the strut mounted brake hose retaining bracket. Repeat for opposite side.
21. Install the outer tie rod assembly from the steering knuckle. Repeat for opposite side. Refer to **Steering Linkage Outer Tie Rod Replacement** .
22. Install the wheel drive shaft to the front steering knuckle. Refer to **Front Wheel Drive Shaft Replacement** .
23. Install the wheel drive shaft nut and washer to the wheel drive shaft. Repeat for opposite side. Refer to **Front Wheel Drive Shaft Replacement** .
24. Install the control arm ball joint to the steering knuckle. Repeat for opposite side. Refer to **Lower Control Arm Replacement** .

Fig. 181: Lower Transmission Housing Bolt
Courtesy of GENERAL MOTORS COMPANY

25. Install the transmission dust cover (4) and tighten the transmission dust cover bolts (3) to 9 (80 lb ft).
26. Install the transmission rear mount bracket. Refer to **Transmission Rear Mount Bracket Replacement** .
27. Install the exhaust front pipe. Refer to **Exhaust Front Pipe Replacement (LL0)** .

Fig. 182: Oxygen Sensor Connector
Courtesy of GENERAL MOTORS COMPANY

28. Connect the oxygen sensor connector.

Fig. 183: Suction Pipe Bolt

Courtesy of GENERAL MOTORS COMPANY

29. Install the suction pipe (1) to the A/C compressor.
30. Install the suction pipe bolt (2) to the A/C compressor and tighten to 22 (16 lb ft).
31. Install the discharge pipe (4) to the A/C condenser.
32. Install the discharge pipe nut (5) to the A/C condenser and tighten to 10 (89 lb in).
33. Connect the coolant temperature sensor wiring connector (3) from the radiator.

Fig. 184: Block Heater Connecting Plug Holder Bolt
Courtesy of GENERAL MOTORS COMPANY

34. Install the coolant surge tank (5) and coolant hoses with the coolant hose clips (3, 4, 7).
35. Install the coolant surge tank retaining bolts (2) and tighten to 8 (71 lb in).
36. Install the block heater cord container and tighten the block heater code container bolts (1) to 8 (71 lb in).

Fig. 185: Retainers And Water Deflector
Courtesy of GENERAL MOTORS COMPANY

37. Install the water deflector (1) with retainers (2).

Fig. 186: Upper Air Guard Retainers
Courtesy of GENERAL MOTORS COMPANY

38. Install the upper air guard (2) and the upper air guard retainers (1).

Fig. 187: Front Lower Air Baffle Retainers
Courtesy of GENERAL MOTORS COMPANY

39. Install the front lower air baffles (2) and the front lower air baffle retainers (1).

Fig. 188: Front Side Air Baffle Retainers
Courtesy of GENERAL MOTORS COMPANY

40. Install the front side air baffles (2, 4) and the front side air baffle retainers (1, 3).
41. Install the front bumper fascia. Refer to **Front Bumper Fascia Replacement** .

Fig. 189: Compartment Splash Shield
Courtesy of GENERAL MOTORS COMPANY

42. Install the compartment splash shield (1, 2). Refer to **Front Compartment Splash Shield Replacement** .

Fig. 190: Ambient Air Temperature Sensor Connector
Courtesy of GENERAL MOTORS COMPANY

43. Connect the coolant hose (2) to the radiator.
44. Connect the ambient air temperature sensor connector (1) to the ambient air temperature sensor if equipped.
45. Install the wiring harness connector (3) to the engine cooling fan harness connector.

Fig. 191: Vacuum Pump Hose And Vacuum Pump
Courtesy of GENERAL MOTORS COMPANY

46. Install the vacuum pump hose (1) to the vacuum pump (2).

Fig. 192: Vacuum Hose

Courtesy of GENERAL MOTORS COMPANY

47. Connect the fuel feed hose (3) and install the fuel feed hose retaining clip (4). Refer to **Metal Collar Quick Connect Fitting Service** .
48. Connect the evaporative canister purge solenoid valve hose (2).
49. Connect the vacuum hose (1) to the intake manifold.

Fig. 193: Transmission Range Selector Lever Cable Terminal
Courtesy of GENERAL MOTORS COMPANY

50. Connect the transmission range selector lever cable terminal to the transmission lever pin. For manual transmission refer to **Manual Transmission Shift Lever and Selector Lever Cable Replacement (MX2, MFM)** .
51. Install the transmission range selector lever cable to the cable bracket.
52. Install the clutch actuator cylinder if equipped. Refer to **Clutch Actuator Cylinder Replacement** . (M/T)
53. Install the heater inlet hose. Refer to **Heater Inlet Hose Replacement (1.0L LMT, 1.19L LC5 and 1.2L LMU)** .
54. Install the heater outlet hose. Refer to **Heater Outlet Hose Replacement (1.0L LMT, 1.19L LC5 and 1.2L LMU)** .

Fig. 194: Ground Bolt And Put Wiring Harness
Courtesy of GENERAL MOTORS COMPANY

55. Install the wiring harness retainer (4).
56. Connect the wheel speed sensor connector (3).
57. Install the ground wiring harness and bolt (1) and tighten to 10 (89 lb in).

Fig. 195: Front Compartment Fuse Block
Courtesy of GENERAL MOTORS COMPANY

58. Connect the engine wiring harness connector (1) to the fuse block and tighten the wiring harness connector retaining bolt (2) to 6 (53 lb in). Repeat for remaining connector.
59. Connect the remaining wiring harness to the compartment fuse block.
60. Install the engine wiring harness fuse block to the lower plate.

Fig. 196: Positive Battery Cable Nut

Courtesy of GENERAL MOTORS COMPANY

61. Install the positive cable (3) to the engine wiring harness fuse block and tighten the positive cable retaining nut (1, 2) to 10 (89 lb in).

Fig. 197: Front Compartment Fuse Block Cover
Courtesy of GENERAL MOTORS COMPANY

62. Install the engine wiring harness fuse block cover.

Fig. 198: Engine Wiring Harnesses Connectors
Courtesy of GENERAL MOTORS COMPANY

63. Install the engine wiring harness through the front of dash on the left of the steering shaft under the dash and connect the 4 engine wiring harnesses connectors (1).

Fig. 199: Lower Intermediate Steering Shaft Bolt
Courtesy of GENERAL MOTORS COMPANY

64. Install the lower intermediate steering shaft (2) and tighten the lower Intermediate steering shaft bolt (1) to 27 (20 lb ft).
65. Install the battery tray. Refer to **Battery Tray Replacement** .
66. Install the engine control module. Refer to **Engine Control Module Replacement** .
67. Install the battery. Refer to **Battery Replacement** .
68. Install the air cleaner assembly. Refer to **Air Cleaner Assembly Replacement** .
69. Install the front wheels and tires. Refer to **Tire and Wheel Removal and Installation** .
70. Recharge the refrigerant. Refer to **Refrigerant Recovery and Recharging** .
71. Refill the cooling system. Refer to **Cooling System Draining and Filling** .
72. Check the engine oil level and fill new engine oil up if necessary.
73. Connect the battery negative cable. Refer to **Battery Negative Cable Disconnection and Connection** .
74. Close the hood.

ENGINE BLOCK HEATER REPLACEMENT (LL0)

Fig. 200: Engine Block Heater
 Courtesy of GENERAL MOTORS COMPANY

Engine Block Heater Replacement (LL0)

Callout	Component Name
Preliminary Procedure 1. Drain the cooling system. Refer to <u>Cooling System Draining and Filling</u> . 2. Disconnect the negative battery cable. Refer to <u>Battery Negative Cable Disconnection and Connection</u> 3. Disconnect the engine block heater electrical connector.	
1	Engine Block Heater CAUTION: Refer to <u>Component Fastener Tightening Caution</u> . Procedure Remove the engine block heater. Tighten 60 (44 lb ft)

ENGINE OIL AND OIL FILTER REPLACEMENT

Removal Procedure

1. Turn the ignition OFF.
2. Raise and support the vehicle. Refer to Lifting and Jacking the Vehicle .

Fig. 201: Oil Filter

Courtesy of GENERAL MOTORS COMPANY

3. Remove the oil filter, using suitable tool.
4. Discard the oil filter.

Fig. 202: Oil Pan Drain Plug

Courtesy of GENERAL MOTORS COMPANY

5. Place a suitable container below the oil pan drain plug (1).
6. Remove the oil pan drain plug (1) from the oil pan (2).
7. Allow the oil to drain completely.

Installation Procedure

Fig. 203: Oil Pan Drain Plug

Courtesy of GENERAL MOTORS COMPANY

CAUTION: Refer to Fastener Caution .

1. Install the oil pan drain plug (1) to the oil pan (2) and tighten the oil pan drain plug to 25 (18 lb ft).

Fig. 204: Oil Filter

Courtesy of GENERAL MOTORS COMPANY

2. Install the NEW oil filter.
3. Install the oil filter using suitable tool.
4. Tighten the oil filter to 16 (12 lb ft).
5. Lower the vehicle.
6. Fill the engine with the appropriate oil type and quantity. Refer to **Fluid and Lubricant Recommendations** and **Approximate Fluid Capacities** .

PISTON, CONNECTING ROD AND BEARING REPLACEMENT

Special Tools

- **EN-50174** Piston Ring Compressor (1.0L only)
- **J-8037** Piston Ring Compressor

For equivalent regional tools, refer to **Special Tools**

Removal Procedure

1. Remove the cylinder head. Refer to **Cylinder Head Replacement (LL0)**, **Cylinder Head Replacement**

(LFM).

2. Remove the oil pan. Refer to **Oil Pan Replacement**
3. Raise the vehicle by its full height. Refer to **Lifting and Jacking the Vehicle** .
4. Install the crankshaft balancer bolt.
5. Set the pistons 1 and 4 to TDC in direction of engine rotation.

Fig. 205: View Of Con-Rod Bearing Caps
Courtesy of GENERAL MOTORS COMPANY

6. Mark the connecting rod with the connecting rod bearing cover (1).

Fig. 206: Rod Bearing Caps Nuts

Courtesy of GENERAL MOTORS COMPANY

7. Remove the 4 connecting rod bearing caps nuts (2) of cylinder 1 and 4.
8. Remove the connecting rod bearing caps (1) and the connecting rod bearing (3).

Fig. 207: Pistons 1, 4 And Cylinder Bore
Courtesy of GENERAL MOTORS COMPANY

9. Push the pistons 1 and 4 (1) out of the cylinder bore (2).
10. Lower the vehicle.

NOTE: The shear surfaces of the con-rod and the con-rod bearing cover form a unique fit and must not be swapped or damaged. Do not lay down on the shear surfaces.

11. Remove the pistons 1 and 4 (1).
12. Raise the vehicle by its full height.
13. Turn crankshaft on crankshaft balancer through 180 degrees in direction of rotation of engine.
14. Repeat for the piston 2 and 3.

Fig. 208: Connecting Rod Bearing
Courtesy of GENERAL MOTORS COMPANY

NOTE: Observe correct fitting position, observe alignment.

15. Remove the connecting rod bearing (1, 2).
16. Check the components. Refer to **Piston, Connecting Rod and Bearing Cleaning and Inspection (LL0)**, **Piston, Connecting Rod and Bearing Cleaning and Inspection (LFM)**.

Installation Procedure

Fig. 209: Connecting Rod Bearing
Courtesy of GENERAL MOTORS COMPANY

NOTE: Lubricate the connection rod bearing with NEW engine oil.

1. Install the connecting rod bearing (1, 2).

Fig. 210: View Of Piston Ring Joint Positions
Courtesy of GENERAL MOTORS COMPANY

2. Set piston ring joints.
 - Piston compression upper ring in position (1).
 - Piston compression lower ring in position (4).
 - Interim ring of the piston oil ring rail in position (5), steel band rings of the piston oil ring rail in position (2) and/or (3).

Fig. 211: Piston Rings, Piston And Cylinder Bore
Courtesy of GENERAL MOTORS COMPANY

3. Lubricate the piston rings, piston (1), inner cylinder bore surface and **EN-50174 (J-8037)** piston ring compressor (2) with clean engine oil.

Fig. 212: Pistons 2, 3 And Cylinder Bore
Courtesy of GENERAL MOTORS COMPANY

NOTE: Arrow on piston head points to engine timing side, bead on connecting rod points to transmission side of engine.

4. Push the pistons 2 and 3 (1) into the cylinder bore (2).
5. Raise the vehicle by its full height.

Fig. 213: Rod Bearing Caps Nuts

Courtesy of GENERAL MOTORS COMPANY

6. Install the connecting rod bearing caps (1) and the connecting rod bearing (3).

CAUTION: Refer to Fastener Caution .

7. Install 4 NEW connecting rod bearing caps bolts (2) of cylinder 2 and 3 and tighten to $20 + 90^\circ$ (15 lb ft + 90°).
8. Turn crankshaft on crankshaft balancer through 180 degrees in direction of rotation of engine.
9. Repeat for the piston 1 and 4.
10. Set the crankshaft in direction of engine rotation to 60 degrees before UDC.
11. Install the oil pan. Refer to Oil Pan Replacement.
12. Install the cylinder head. Refer to Cylinder Head Replacement (LL0), Cylinder Head Replacement (LFM).

CAMSHAFT COVER REPLACEMENT (LL0)

Removal Procedure

1. Open the hood.
2. Disconnect the negative battery cable. Refer to **Battery Negative Cable Disconnection and Connection** .
3. Remove the intake manifold. Refer to **Intake Manifold Replacement**.
4. Remove the ignition coil cover. Refer to **Ignition Coil Cover Replacement (LL0)**, **Ignition Coil Cover Replacement (LFM)**.

Fig. 214: Ignition Coil

Courtesy of GENERAL MOTORS COMPANY

5. Disconnect the fuel injector connectors. Refer to **Fuel Injection Fuel Rail Assembly Replacement (LFM)** , **Fuel Injection Fuel Rail Assembly Replacement (LL0)** .
6. Remove the ignition coil (1). Refer to **Ignition Coil Replacement (LL0)** , **Ignition Coil Replacement (LFM)** .
7. Remove the camshaft position sensor. Refer to **Camshaft Position Sensor Replacement (LFM)** , **Camshaft Position Sensor Replacement (LL0)** .
8. Remove the camshaft position actuator solenoid valve. Refer to **Camshaft Position Actuator Solenoid Valve Removal**.
9. Remove the oil filler cap.

Fig. 215: Engine Injection And Ignition Bracket Bolt
Courtesy of GENERAL MOTORS COMPANY

10. Remove The 1 Engine Injection And Ignition Bracket Bolt (3).
11. Remove the engine injection and ignition bracket (2).
12. Remove the 1 camshaft cover front bracket bolt (4).
13. Remove the camshaft cover front bracket (7).
14. Remove the 2 camshaft cover bolts (5).
15. Remove the 10 camshaft cover bolts (1).
16. Remove the camshaft cover (6).

Fig. 216: Camshaft Cover Gasket

Courtesy of GENERAL MOTORS COMPANY

17. Remove the camshaft cover gasket (1).
18. Remove the camshaft cover seals (2).

Installation Procedure

Fig. 217: Cured RTV Carefully

Courtesy of GENERAL MOTORS COMPANY

1. Remove the cured RTV carefully (1) and then clean the sealing surfaces.

NOTE: After RTV applying, the assembly completion time including torque check must be done within 8 minutes.

2. Apply RTV sealant to T-joint between cylinder head and front cover (1).

Fig. 218: Camshaft Cover Gasket

Courtesy of GENERAL MOTORS COMPANY

3. Install the camshaft cover seals (2) to the camshaft cover.
4. Install the camshaft cover gasket (1) to the camshaft cover.

Fig. 219: Engine Injection And Ignition Bracket Bolt
Courtesy of GENERAL MOTORS COMPANY

5. Install the camshaft cover (6).

CAUTION: Refer to Fastener Caution .

6. Install the 2 camshaft cover bolts (5) and tighten to 10 (89 lb in).
7. Install the 10 camshaft cover bolts (1) and tighten to 10 (89 lb in).
8. Install the camshaft cover front bracket (7).
9. Install the 1 camshaft cover front bracket bolt (4) and tighten to 10 (89 lb in).
10. Install the engine injection and ignition bracket (2).
11. Install the 1 engine injection and ignition bracket bolt (3) and tighten to 10 (89 lb in).
12. Install the oil filler cap.

Fig. 220: Ignition Coil

Courtesy of GENERAL MOTORS COMPANY

13. Install the ignition coil (1). Refer to **Ignition Coil Replacement (LL0)** , **Ignition Coil Replacement (LFM)** .
14. Connect the fuel injector connectors. Refer to **Fuel Injection Fuel Rail Assembly Replacement (LFM)** , **Fuel Injection Fuel Rail Assembly Replacement (LL0)** .
15. Install the camshaft position sensor. Refer to **Camshaft Position Sensor Replacement (LFM)** , **Camshaft Position Sensor Replacement (LL0)** .
16. Install the camshaft position actuator solenoid valve. Refer **Camshaft Position Actuator Solenoid Valve Installation**.
17. Install the ignition coil cover. Refer to **Ignition Coil Cover Replacement (LL0)**, **Ignition Coil Cover Replacement (LFM)**.
18. Install the intake manifold. Refer to **Intake Manifold Replacement**.
19. Connect the negative battery cable. Refer to **Battery Negative Cable Disconnection and Connection** .
20. Close the hood.

CAMSHAFT COVER REPLACEMENT (LFM)

Removal Procedure

1. Open the hood.
2. Disconnect the negative battery cable. Refer to Battery Negative Cable Disconnection and Connection .
3. Remove the upper intake manifold. Refer to Upper Intake Manifold Replacement (LFM).
4. Remove the positive crankcase ventilation tube. Refer to Positive Crankcase Ventilation Hose/Pipe/Tube Replacement (LL0), Positive Crankcase Ventilation Hose/Pipe/Tube Replacement (LFM).
5. Remove the ignition coil cover. Refer to Ignition Coil Cover Replacement (LL0), Ignition Coil Cover Replacement (LFM).

Fig. 221: Ignition Coil
Courtesy of GENERAL MOTORS COMPANY

6. Disconnect the fuel injector connectors. Refer to Fuel Injection Fuel Rail Assembly Replacement (LFM) , Fuel Injection Fuel Rail Assembly Replacement (LL0) .
7. Remove the ignition coil. Refer to Ignition Coil Replacement (LL0) , Ignition Coil Replacement (LFM) .
8. Remove the camshaft position sensor. Refer to Camshaft Position Sensor Replacement (LFM) , Camshaft Position Sensor Replacement (LL0) .
9. Remove the camshaft position actuator solenoid valve. Refer to Camshaft Position Actuator Solenoid Valve Removal.

10. Remove the oil filler cap.

Fig. 222: Engine Injection And Ignition Bracket Bolt
Courtesy of GENERAL MOTORS COMPANY

11. Remove the 1 engine injection and ignition bracket bolt (3).
12. Remove the engine injection and ignition bracket (2).
13. Remove the 1 camshaft cover front bracket bolt (4).
14. Remove the camshaft cover front bracket (7).
15. Remove the 2 camshaft cover bolts (5).
16. Remove the 10 camshaft cover bolts (1).
17. Remove the camshaft cover (6).

Fig. 223: Camshaft Cover Gasket

Courtesy of GENERAL MOTORS COMPANY

18. Remove the camshaft cover gasket (1).
19. Remove the camshaft cover seals (2).

Installation Procedure

Fig. 224: Cured RTV Carefully

Courtesy of GENERAL MOTORS COMPANY

1. Remove the cured RTV carefully (1) and then clean the sealing surfaces.

NOTE: After RTV applying, the assembly completion time including torque check must be done within 8 minutes.

2. Apply RTV sealant to T-joint between cylinder head and front cover (1).

Fig. 225: Camshaft Cover Gasket

Courtesy of GENERAL MOTORS COMPANY

3. Install the camshaft cover seals (2) to the camshaft cover.
4. Install the camshaft cover gasket (1) to the camshaft cover.

Fig. 226: Engine Injection And Ignition Bracket Bolt
Courtesy of GENERAL MOTORS COMPANY

5. Install the camshaft cover (3).

CAUTION: Refer to Fastener Caution .

6. Install the 2 camshaft cover bolts (5) and tighten to 10 (89 lb in).
7. Install the 10 camshaft cover bolts (1) and tighten to 10 (89 lb in).
8. Install the camshaft cover front bracket (7).
9. Install the 1 camshaft cover front bracket bolt (4) and tighten to 10 (89 lb in).
10. Install the engine injection and ignition bracket (2).
11. Install the 1 engine injection and ignition bracket bolt (3) and tighten to 10 (89 lb in).
12. Install the oil filler cap.

Fig. 227: Ignition Coil

Courtesy of GENERAL MOTORS COMPANY

13. Install the ignition coil (1). Refer to **Ignition Coil Replacement (LL0)** , **Ignition Coil Replacement (LFM)** .
14. Connect the fuel injector connectors. Refer to **Fuel Injection Fuel Rail Assembly Replacement (LFM)** , **Fuel Injection Fuel Rail Assembly Replacement (LL0)** .
15. Install the camshaft position sensor. Refer to **Camshaft Position Sensor Replacement (LFM)** , **Camshaft Position Sensor Replacement (LL0)** .
16. Install the camshaft position actuator solenoid valve. Refer **Camshaft Position Actuator Solenoid Valve Installation**.
17. Install the ignition coil cover. Refer to **Ignition Coil Cover Replacement (LL0)**, **Ignition Coil Cover Replacement (LFM)**.
18. Remove the positive crankcase ventilation tube. Refer to **Positive Crankcase Ventilation Hose/Pipe/Tube Replacement (LL0)**, **Positive Crankcase Ventilation Hose/Pipe/Tube Replacement (LFM)**.
19. Install the upper intake manifold. Refer to **Upper Intake Manifold Replacement (LFM)**.
20. Connect the negative battery cable. Refer to **Battery Negative Cable Disconnection and Connection** .
21. Close the hood.

CAMSHAFT EXHAUST SPROCKET REPLACEMENT

Removal Procedure

1. Remove the engine front cover. Refer to Engine Front Cover with Oil Pump Replacement.
2. Remove the timing chain. Refer to Camshaft Timing Chain Replacement and Adjustment.

Fig. 228: Intake And Exhaust Camshaft
Courtesy of GENERAL MOTORS COMPANY

CAUTION: Use extreme care when installing the camshaft not to nick, scratch or damage the camshaft lobes or bearing surfaces.

3. While holding the intake camshaft firmly in place, loosen the intake camshaft sprocket bolt.
4. While holding the exhaust camshaft firmly in place, loosen the exhaust camshaft sprocket bolt.

Fig. 229: Intake And Exhaust Camshaft Sprocket Bolts
Courtesy of GENERAL MOTORS COMPANY

5. Remove the intake and exhaust camshaft sprocket bolts (1).
6. Remove the intake camshaft sprocket (2).
7. Remove the exhaust camshaft sprocket (3).

Installation Procedure

Fig. 230: Intake And Exhaust Camshaft Sprocket Bolts
Courtesy of GENERAL MOTORS COMPANY

1. Install the exhaust camshaft sprocket (3).
2. Install the intake camshaft sprocket (2).

CAUTION: Refer to Fastener Caution .

3. Install the intake and exhaust camshaft sprocket bolts (1).

Fig. 231: Intake And Exhaust Camshaft
Courtesy of GENERAL MOTORS COMPANY

CAUTION: Use extreme care when installing the camshaft not to nick, scratch or damage the camshaft lobes or bearing surfaces.

4. While holding the intake camshaft firmly in place, install the intake camshaft sprocket bolt and tighten to $32 + 50^\circ$ (24 lb ft + 50°).
5. While holding the exhaust camshaft firmly in place, tighten the exhaust camshaft sprocket bolt to $32 + 50^\circ$ (24 lb ft + 50°).
6. Install the timing chain. Refer to **Camshaft Timing Chain Replacement and Adjustment.**
7. Install the engine front cover. Refer to **Engine Front Cover with Oil Pump Replacement.**

ENGINE OIL PRESSURE INDICATOR SWITCH REPLACEMENT

Fig. 232: Engine Oil Pressure Indicator Switch
 Courtesy of GENERAL MOTORS COMPANY

Engine Oil Pressure Indicator Switch Replacement

Callout	Component Name
Preliminary Procedure Disconnect the negative battery cable. Refer to <u>Battery Negative Cable Disconnection and Connection</u> .	
1	Oil Pressure Indicator Switch CAUTION: Refer to <u>Fastener Caution</u> . Procedure Disconnect the oil pressure indicator switch electrical wiring harness connector and remove the oil pressure indicator switch. Tighten 35 (26 lb ft)

CAMSHAFT REPLACEMENT (LL0)

Removal Procedure

1. Remove the camshaft sprocket. Refer to **Camshaft Exhaust Sprocket Replacement**.

Fig. 233: Camshaft Lobes

Courtesy of GENERAL MOTORS COMPANY

2. Position the camshaft lobes (1) in a neutral position.

Fig. 234: View Of Markings On Bearing Caps
Courtesy of GENERAL MOTORS COMPANY

3. Observe the markings on the bearing caps. Each bearing cap is marked in order to identify its location. The markings have the following meanings:
 - The raised feature must always be oriented toward the center of the cylinder head.
 - The I indicates the intake camshaft.
 - The E indicates the exhaust camshaft.
 - The number indicates the journal position from the front of the cylinder block.

Fig. 235: Camshaft Bearing Cap Bolts
Courtesy of GENERAL MOTORS COMPANY

4. Loosen the 20 camshaft bearing cap bolts (3) working from outside to inside in a spiral in steps of 1/2 up to 1 turn.
5. Remove the 20 camshaft bearing cap bolts (3).

NOTE: Mark camshaft bearing caps before removal.

6. Remove the camshaft bearing caps (1, 2) from the cylinder head.

Fig. 236: Camshafts

Courtesy of GENERAL MOTORS COMPANY

NOTE: The exhaust camshaft has a groove between the No. 3 journal and No. 4 journal. The intake camshaft has no groove.

7. Remove the camshafts (1).

Installation Procedure

Fig. 237: Camshafts

Courtesy of GENERAL MOTORS COMPANY

NOTE: The exhaust camshaft has a groove between the No. 3 journal and No. 4 journal. The intake camshaft has no groove.

1. Install the camshafts (1).

Fig. 238: Camshaft Lobes

Courtesy of GENERAL MOTORS COMPANY

2. Check the camshaft lobes (1) are in a neutral position.

Fig. 239: Camshaft Bearing Cap Bolts
Courtesy of GENERAL MOTORS COMPANY

3. Install the camshaft bearing thrust cap (1) in the first journal of the right cylinder head.
4. Install the remaining bearing caps (2) with their orientation mark toward the center of the cylinder head.
5. Hand start to tighten the all cylinder head retaining bolts (3).
6. Tighten the 20 camshaft bearing cap bolts (3) working from inside to outside in a spiral.
7. Tighten the 20 camshaft bearing cap bolts to 10 (89 lb in).

Fig. 240: View Of Markings On Bearing Caps
Courtesy of GENERAL MOTORS COMPANY

8. Observe the markings on the bearing caps. Each bearing cap is marked in order to identify its location. The markings have the following meanings:
 - The raised feature must always be oriented toward the center of the cylinder head.
 - The I indicates the intake camshaft.
 - The E indicates the exhaust camshaft.
 - The number indicates the journal position from the front of the cylinder block.
9. Install the camshaft sprocket. Refer to **Camshaft Exhaust Sprocket Replacement**.

CAMSHAFT REPLACEMENT (LFM)

Removal Procedure

1. Remove the camshaft sprocket. Refer to **Camshaft Exhaust Sprocket Replacement**.

Fig. 241: Camshaft Lobes

Courtesy of GENERAL MOTORS COMPANY

2. Position the camshaft lobes (1) in a neutral position.

Fig. 242: View Of Markings On Bearing Caps
Courtesy of GENERAL MOTORS COMPANY

3. Observe the markings on the bearing caps. Each bearing cap is marked in order to identify its location. The markings have the following meanings:
 - The raised feature must always be oriented toward the center of the cylinder head.
 - The I indicates the intake camshaft.
 - The E indicates the exhaust camshaft.
 - The number indicates the journal position from the front of the cylinder block.

Fig. 243: Camshaft Bearing Cap Bolts
Courtesy of GENERAL MOTORS COMPANY

4. Loosen the 20 camshaft bearing cap bolts (3) working from outside to inside in a spiral in steps of 1/2 up to 1 turn.
5. Remove the 20 camshaft bearing cap bolts (3).

NOTE: Mark camshaft bearing caps before removal.

6. Remove the camshaft bearing caps (1, 2) from the cylinder head.

Fig. 244: Intake Camshaft

Courtesy of GENERAL MOTORS COMPANY

NOTE: The exhaust camshaft has 2 grooves between the No. 3 journal and No. 4 journal. The intake camshaft has 1 groove.

7. Remove the intake camshaft (1) and exhaust camshaft (2).

Installation Procedure

Fig. 245: Intake Camshaft

Courtesy of GENERAL MOTORS COMPANY

NOTE: The exhaust camshaft has 2 grooves between the No. 3 journal and No. 4 journal. The intake camshaft has 1 groove.

1. Install the intake camshaft (1) and exhaust camshaft (2).

Fig. 246: Camshaft Lobes

Courtesy of GENERAL MOTORS COMPANY

2. Check the camshaft lobes (1) are in a neutral position.

Fig. 247: Camshaft Bearing Cap Bolts
Courtesy of GENERAL MOTORS COMPANY

3. Install the camshaft bearing thrust cap (1) in the first journal of the right cylinder head.
4. Install the remaining bearing caps (2) with their orientation mark toward the center of the cylinder head.
5. Hand start to tighten all cylinder head retaining bolts (3).
6. Tighten the 20 camshaft bearing cap bolts (3) working from inside to outside in a spiral.
7. Tighten the 20 camshaft bearing cap bolts to 10 (89 lb in).

Fig. 248: View Of Markings On Bearing Caps
Courtesy of GENERAL MOTORS COMPANY

8. Observe the markings on the bearing caps. Each bearing cap is marked in order to identify its location. The markings have the following meanings:
 - The raised feature must always be oriented toward the center of the cylinder head.
 - The I indicates the intake camshaft.
 - The E indicates the exhaust camshaft.
 - The number indicates the journal position from the front of the cylinder block.
9. Install the camshaft sprocket. Refer to **Camshaft Exhaust Sprocket Replacement**.

ENGINE SUPPORT FIXTURE

Fig. 249: Engine Support Fixture
 Courtesy of GENERAL MOTORS COMPANY

Engine Support Fixture

Callout	Component Name
Preliminary Procedure 1. Open the hood. 2. Disconnect the 2 hood muckets from the fender frame. • EN-28467-300 Engine Support Fixture Adapter • J-28467-518 Main Support Beam • J-28467-1A Cross Bracket • J-28467-5A Strut Tower Support Assembly • J-28467-2A Radiator Tube Shelf Assembly • J-28467-8A Hook Assembly • J-36857 Engine Lift Bracket	
For equivalent regional tools, refer to Special Tools .	
1	Engine Support Fixture Adapter Leg (Qty: 2) Procedure Install the bracket to fender frame. Do not install on top of fender lip.
2	Main Support Beam
3	Cross Bracket
	Strut Tower Support Assembly

4	Procedure Adjust the length of the strut tower support assembly.
5	Radiator Tube Shelf Assembly
6	Hook Assembly (Qty: 2) Procedure Use a grade 10.9 bolt to install the engine lift bracket. NOTE: If the engine is not equipped with engine lift bracket, install J-36857 in place.

VALVE STEM OIL SEAL AND VALVE SPRING REPLACEMENT

Special Tools

- **EN 46116** Valve Stem Seal Remover/Installer
- **EN-49075** Valve Spring Compressor Adapter
- **EN-49076** Cylinder Pressure Adapter
- **EN-50173** Universal Valve Spring Compressor
- **KM-845** Tappet Suction Device

For equivalent regional tools, refer to **Special Tools**.

Removal Procedure

1. Remove the camshaft. Refer to **Camshaft Replacement (LL0)**, **Camshaft Replacement (LFM)**.

Fig. 250: View Of Camshaft Bearing Cap
Courtesy of GENERAL MOTORS COMPANY

2. Remove the valve tappet (1) using **KM-845** tappet suction device.

Fig. 251: Universal Valve Spring Compressor
Courtesy of GENERAL MOTORS COMPANY

3. Install the **EN-50173** universal valve spring compressor (1) and **EN-49075** valve spring compressor adapter (2).
4. Remove the spark plug and install the **EN-49076** cylinder pressure adapter.
5. Connect the compressed air hose to **EN-49076** cylinder pressure adapter. It keeps the valve not slip into the cylinder by blowing compressed air into the cylinder.
6. Use the magnet in order to remove the valve collet.

Fig. 252: Retainer And Valve Spring
Courtesy of GENERAL MOTORS COMPANY

7. Remove the retainer (1) and valve spring (2).

Fig. 253: View Of EN 46116 & Valve Stem Seal
Courtesy of GENERAL MOTORS COMPANY

8. Remove the valve stem seal (2) using EN 46116 valve stem seal remover/installer (1).

Installation Procedure

Fig. 254: View Of EN 46116 & Valve Stem Seal
Courtesy of GENERAL MOTORS COMPANY

1. Remove the valve stem seal (2) using EN 46116 valve stem seal remover/installer (1).

Fig. 255: Retainer And Valve Spring
Courtesy of GENERAL MOTORS COMPANY

2. Install the valve spring (2), retainer (1) and seal.

Fig. 256: Universal Valve Spring Compressor
Courtesy of GENERAL MOTORS COMPANY

3. Disconnect the compressed air hose from EN 49076 cylinder pressure adapter.

CAUTION: Refer to Fastener Caution .

4. Remove the EN 49076 cylinder pressure adapter (3), install the spark plug and tighten the spark plug to 20 (15 lb ft).
5. Remove the EN-50173 universal valve spring compressor (1) and EN-49075 valve spring compressor adapter (2).

Fig. 257: View Of Camshaft Bearing Cap
Courtesy of GENERAL MOTORS COMPANY

6. Install the valve tappet (1).
7. Install the camshaft. Refer to Camshaft Replacement (LL0), Camshaft Replacement (LFM).

VALVE CLEARANCE ADJUSTMENT (LFM)

Measurement

1. Remove the camshaft cover. Refer to Camshaft Cover Replacement (LL0), Camshaft Cover Replacement (LFM).

Fig. 258: Crankshaft Pulley

Courtesy of GENERAL MOTORS COMPANY

2. Rotate the crankshaft pulley in direction of engine rotation, aligning the pulley groove with the 0 point on the cover, in order to set engine to TDC.

Fig. 259: Measuring valve clearance At positions (1), (2), (6) and (8)
Courtesy of GENERAL MOTORS COMPANY

3. Measure the valve clearance at positions (1), (2), (6) and (8).
4. Rotate the crankshaft pulley 360 degrees in direction of engine rotation.
5. Measure the valve clearance at positions (3), (4), (5) and (7).
6. If the measured values are not within specifications, replace the valve tappets.

Specifications

- Intake Side: 0.075-0.125 mm
- Exhaust Side: 0.245-0.295 mm

Fig. 260: Measuring Old Tappet
 Courtesy of GENERAL MOTORS COMPANY

7. Determine the tappet size. Refer to determining replacement tappet size.
 1. Remove the old tappet. Refer to Valve Stem Oil Seal and Valve Spring Replacement.
 2. Measure the old tappet.
 3. Perform the following calculation to determine the replacement tappet size:

Specifications

- Intake: value of removed tappet + measured clearance - 0.1 mm = new tappet size
- Exhaust: value of removed tappet + measured clearance - 0.27 mm = new tappet size

Example:

- Old tappet = 3.20 mm, clearance was 0.30 mm, Intake clearance value is 0.1 mm
- $3.20 \text{ mm} + 0.30 \text{ mm} - 0.1 \text{ mm} = 3.40 \text{ mm}$
- 3.40 mm = 96449615 (part number)

Tappet Selection

Part Number	ID Number	Value (mm)
-------------	-----------	------------

VALVE STEM AND VALVE GUIDE CLEARANCE INSPECTION

Fig. 261: Valve Stem and Valve Guide Clearance Inspection

Courtesy of GENERAL MOTORS COMPANY

1. Inspect the valve for damage from the head to tip for the following conditions:
 - Pitting in the valve seat area (1)
 - Lack of valve margin (2)
 - Bending in the valve stem (3)
 - Pitting or excessive wear in the stem (4)
 - Worn valve key grooves (5)
 - Worn valve tip (6)
2. Replace the valve if any of these conditions exist.

NOTE: **Valve guide is not removable. Replace the cylinder head if it is out of specification.**

3. Measure the valve stem diameter (1) and valve guide inside diameter. If it is out of specification, replace it. Refer to **Engine Mechanical Specifications (LL0)**, **Engine Mechanical Specifications (LFM)**.

CRANKSHAFT REAR OIL SEAL AND HOUSING REPLACEMENT

Special Tools

J 45507 Crankshaft Rear Oil Seal Installer

For equivalent regional tools, refer to Special Tools.

Removal Procedure

1. If equipped with a manual transmission remove the flywheel. Refer to Engine Flywheel Replacement.
2. If equipped with an automatic transmission, remove the automatic transmission flex plate. Refer to Automatic Transmission Flex Plate Replacement.
3. Place a collecting container under the vehicle.
4. Remove the oil pan. Refer to Oil Pan Replacement.

Fig. 262: Fasteners, Oil Seal And Housing
Courtesy of GENERAL MOTORS COMPANY

5. Remove the 6 fasteners (1) from the oil seal and housing (2).
6. Clean the threads of the 6 fasteners (1).

NOTE: Take care when removing the oil seal and housing to avoid damage to the crankshaft and oil pan.

7. Remove the oil seal and housing using a suitable tool.

Installation Procedure

Fig. 263: Crankshaft Rear Oil Seal And Housing
Courtesy of GENERAL MOTORS COMPANY

1. Apply sealant to the crankshaft rear oil seal and housing. Refer to **Adhesives, Fluids, Lubricants and Sealers**.
2. Install the J 45507 Crankshaft Rear Oil Seal Installer (3) to the crankshaft rear oil seal and housing (2).
3. Push the crankshaft rear oil seal and housing (2) until the crankshaft rear oil seal and housing is flush and sits evenly in the cylinder block.
4. Remove the J 45507 Crankshaft Rear Oil Seal Installer (3) from the crankshaft.
5. Apply thread locker to the threads of the 6 fasteners (1). Refer to **Adhesives, Fluids, Lubricants and Sealers**.

CAUTION: Refer to Fastener Caution .

6. Install the 6 fasteners (1) and tighten to 10 (89 lb in).
7. Install the oil pan. Refer to **Oil Pan Replacement**.

8. If equipped with a manual transmission, install the flywheel. Refer to **Engine Flywheel Replacement**.
9. If equipped with an automatic transmission, install the automatic transmission flex plate. Refer to **Automatic Transmission Flex Plate Replacement**.

IGNITION COIL COVER REPLACEMENT (LL0)

Removal Procedure

Fig. 264: Engine Compression Test Tool
Courtesy of GENERAL MOTORS COMPANY

1. Open the hood.
2. Disconnect the breather hose and clamp from the ignition coil cover.
3. Remove the 6 ignition coil cover bolts (1).
4. Remove the ignition coil cover (2).

Installation Procedure

Fig. 265: Engine Compression Test Tool
Courtesy of GENERAL MOTORS COMPANY

1. Install the ignition coil cover (2).
2. Install the 6 ignition coil cover bolts (1) and tighten to 10 (80 lb in).
3. Connect the breather hose and clamp to the ignition coil cover.
4. Close the hood.

IGNITION COIL COVER REPLACEMENT (LFM)

Removal Procedure

1. Open the hood.
2. Remove the upper intake manifold. Refer to **Upper Intake Manifold Replacement (LFM)**.

Fig. 266: Breather Hose

Courtesy of GENERAL MOTORS COMPANY

3. Disconnect the breather hose (4) and clamp (3) from the ignition coil cover.
4. Remove the 6 ignition coil cover bolts (1).
5. Remove the ignition coil cover (2).

Installation Procedure

Fig. 267: Breather Hose

Courtesy of GENERAL MOTORS COMPANY

1. Install the ignition coil cover (2).
2. Install the 6 ignition coil cover bolts (1) and tighten to 10 (80 lb in).
3. Connect the breather hose (4) and clamp (3) to the ignition coil cover.
4. Install the upper intake manifold housing. Refer to Upper Intake Manifold Replacement (LFM).
5. Close the hood.

REPAIR INSTRUCTIONS - OFF VEHICLE

CAMSHAFT CLEANING AND INSPECTION

1. Clean the camshaft in solvent.

WARNING: Refer to Safety Glasses Warning .

2. Dry the camshaft with compressed air.

Fig. 268: Bearing Journals

Courtesy of GENERAL MOTORS COMPANY

3. Inspect the camshaft for the following conditions:
 - Camshaft bearing journals (1) that are:
 - Worn
 - Scored
 - Damaged
 - Worn camshaft lobes (2)
 - Damaged sprocket bolt threads (3)
 - Damaged sprocket pin

Fig. 269: Measuring Outer Diameter Of Each Journal
Courtesy of GENERAL MOTORS COMPANY

4. Measure the outer diameter of each journal (1) at the 4 different places.
5. Replace the camshaft if the measured value is not as specified.

Fig. 270: Measuring Excessive Camshaft Runout Using Indicator
Courtesy of GENERAL MOTORS COMPANY

6. Measure for excessive camshaft runout, using the indicator.
 1. Mount the camshaft in a suitable fixture.
 2. Use the indicator in order to measure for a bent camshaft. Refer to **Engine Mechanical Specifications (LL0)**, **Engine Mechanical Specifications (LFM)**.
7. Replace the camshaft if runout exceeds specifications.

CAMSHAFT POSITION ACTUATOR SOLENOID VALVE REMOVAL

Fig. 271: Camshaft Position Actuator Solenoid Valve Bolts And Valves
Courtesy of GENERAL MOTORS COMPANY

1. Remove the camshaft position actuator solenoid valve bolts (1).
2. Remove the camshaft position actuator solenoid valves (2).
3. Remove the camshaft position actuator solenoid valve seals (3).

GENERATOR BRACKET REMOVAL

Fig. 272: Generator Bracket Retaining Bolts
Courtesy of GENERAL MOTORS COMPANY

1. Remove the generator bracket retaining bolts (2).
2. Remove the generator bracket (1).

AIR CONDITIONING COMPRESSOR BRACKET REMOVAL

Fig. 273: Air Conditioning Compressor Bolts And Bracket
Courtesy of GENERAL MOTORS COMPANY

1. Remove the 3 air conditioning compressor bolts (1).
2. Remove the air conditioning compressor bracket (2).

CRANKSHAFT BALANCER REMOVAL

Special Tools

- **EN 50175** Crankshaft Locking Device
- **J-22888-20A** Crankshaft Balancer Puller

For equivalent regional tools, refer to **Special Tools**.

Fig. 274: EN 50050 Crankshaft Locking Device
Courtesy of GENERAL MOTORS COMPANY

1. Install the **EN 50050** crankshaft locking device. Lock the flywheel via the starter ring gear.

Fig. 275: Crankshaft Balancer Bolt
Courtesy of GENERAL MOTORS COMPANY

2. Remove the bolt (1).
3. Install **J-22888-20A** crankshaft balancer puller to the crankshaft balancer (2).
4. Remove the crankshaft balancer (2).
5. Remove the **EN 50050** crankshaft locking device.

CRANKSHAFT SPROCKET REMOVAL

Fig. 276: Crankshaft Sprocket
Courtesy of GENERAL MOTORS COMPANY

Remove the crankshaft sprocket (1).

ENGINE FLYWHEEL REMOVAL

Special Tools

EN-50050 Crankshaft Locking Device

For equivalent regional tools, refer to **Special Tools**.

Fig. 277: EN-50050 Crankshaft Locking Device
Courtesy of GENERAL MOTORS COMPANY

1. Install the **EN-50050** crankshaft locking device, lock the flywheel via the starter ring gear.
2. Loosen the flywheel bolts.
3. Remove the **EN-50050** crankshaft locking device.

Fig. 278: Flywheel And Bolts

Courtesy of GENERAL MOTORS COMPANY

4. Remove the 6 flywheel bolts (2).
5. Remove the flywheel.

AUTOMATIC TRANSMISSION FLEX PLATE REMOVAL

Special Tools

EN 50050 Crankshaft Locking Device

For equivalent regional tools, refer to **Special Tools**.

Fig. 279: EN 50050 Crankshaft Locking Device
Courtesy of GENERAL MOTORS COMPANY

1. Install the **EN 50050** crankshaft locking device, lock the automatic transmission flex plate via the starter ring gear.
2. Loosen the 6 automatic transmission flex plate bolts.
3. Remove the **EN 50050** crankshaft locking device.

Fig. 280: Automatic Transmission Flex Plate Bolts And Automatic Transmission Flex Plate Retainer

Courtesy of GENERAL MOTORS COMPANY

4. Remove the 6 automatic transmission flex plate bolts (1).
5. Remove the automatic transmission flex plate retainer (2).
6. Remove the automatic transmission flex plate (3).
7. Remove the automatic transmission flex plate spacer (4).

OIL LEVEL INDICATOR AND TUBE REMOVAL

Fig. 281: Oil Dipstick And Oil Level Indicator Tube Bolt
Courtesy of GENERAL MOTORS COMPANY

1. Remove the oil dipstick (1).
2. Remove the oil level indicator tube bolt (2).

NOTE: **If the engine oil level is at maximum, oil may emerge while removing the oil dipstick guide tube.**

3. Remove the oil level indicator tube (3) and oil level indicator seal.

ENGINE COOLANT THERMOSTAT REMOVAL

Fig. 282: Engine Coolant Thermostat Bolts
Courtesy of GENERAL MOTORS COMPANY

1. Remove the 3 engine coolant thermostat bolts (1).
2. Remove the engine coolant thermostat assembly (2).

ENGINE WATER OUTLET ADAPTER REMOVAL

Fig. 283: Engine Water Outlet Adapter Housing Bolts
Courtesy of GENERAL MOTORS COMPANY

1. Remove the 4 engine water outlet adapter housing bolts (1).

NOTE: Replace the engine water outlet housing if it is porous or cracked.

2. Remove the engine water outlet adapter housing (2).
3. Inspect the engine water outlet adapter gasket (3).

THROTTLE BODY ASSEMBLY REMOVAL

Fig. 284: Throttle Body Assembly
Courtesy of GENERAL MOTORS COMPANY

1. Remove the 4 throttle body bolts (2).
2. Remove the throttle body (1).
3. Remove the throttle body seal (3).

INTAKE MANIFOLD REMOVAL (LL0)

Fig. 285: Intake Manifold Upper Bracket
Courtesy of GENERAL MOTORS COMPANY

1. Remove the intake manifold rear bracket (1) and bolts (2, 3).
2. Remove the upper intake manifold side bracket (4) and bolts (5, 6).

Fig. 286: Intake Manifold Upper Bracket Bolts
Courtesy of GENERAL MOTORS COMPANY

3. Remove the intake manifold upper bracket bolts (2).
4. Remove the intake manifold upper bracket (1).

Fig. 287: Intake Manifold 10 Bolts
Courtesy of GENERAL MOTORS COMPANY

5. Remove the lower intake manifold 10 bolts (2).
6. Remove the intake manifold (1).

INTAKE MANIFOLD REMOVAL (LFM)

Fig. 288: Intake Manifold Rear Bracket

Courtesy of GENERAL MOTORS COMPANY

1. Remove the intake manifold rear bracket (1) and bolts (2, 3).
2. Remove the upper intake manifold side bracket (4) and bolts (5, 6).

Fig. 289: Upper Intake Manifold Front Bracket Bolts
Courtesy of GENERAL MOTORS COMPANY

3. Remove the upper intake manifold front bracket bolts (1).
4. Remove the upper intake manifold front bracket (2).

Fig. 290: Lower Intake Manifold And Bolts
Courtesy of GENERAL MOTORS COMPANY

5. Remove the lower intake manifold 10 bolts (2, 3).
6. Remove the lower intake manifold (1).

IGNITION COIL REMOVAL

Fig. 291: Ignition Coil Cover Bolts
Courtesy of GENERAL MOTORS COMPANY

1. Remove the ignition coil cover bolts (1).
2. Remove the ignition coil cover (2).

Fig. 292: Ignition Coil
Courtesy of GENERAL MOTORS COMPANY

3. Remove the ignition coil bolts (2).
4. Remove the ignition coil (1).

CAMSHAFT COVER REMOVAL

Fig. 293: Camshaft Cover Bolts

Courtesy of GENERAL MOTORS COMPANY

1. Remove the camshaft cover bolts (1, 2).
2. Remove the camshaft cover (3).
3. Remove the camshaft cover gasket (4).

WATER PUMP REMOVAL

Fig. 294: Water Pump Bolts

Courtesy of GENERAL MOTORS COMPANY

1. Remove the 4 water pump bolts (1).
2. Remove the water pump (2).

ENGINE FRONT COVER AND OIL PUMP REMOVAL

Fig. 295: Engine Front Cover Bolts
Courtesy of GENERAL MOTORS COMPANY

NOTE: Note the different screw lengths.

1. Remove the bolts (1, 2, 3, 4).

NOTE: Do not damage the sealing surfaces.

2. Remove the engine front cover with the included oil pump.

NOTE: There are no serviceable components within the oil pump. Disassemble the pump only to diagnose an oiling concern. A disassembled oil pump must not be reused. A disassembled oil pump must be replaced.

3. Clean the sealing surface.

Fig. 296: Oil Pump Screws

Courtesy of GENERAL MOTORS COMPANY

4. Remove the oil pump screws (3).
5. Remove the oil pump (1).
6. Remove the plug, holding the plug for the oil relief valve components.
7. Remove the plug, spring and plunger (2), from the oil pump housing (1).

CAMSHAFT TIMING CHAIN REMOVAL

Fig. 297: Timing Chain

Courtesy of GENERAL MOTORS COMPANY

Remove the timing chain (1).

TIMING CHAIN TENSIONER REMOVAL

Fig. 298: Timing Chain Tensioner Retaining Bolts
Courtesy of GENERAL MOTORS COMPANY

1. Remove the timing chain tensioner retaining bolts (2).
2. Remove the timing chain tensioner (1).
3. Inspect the timing chain tensioner mounting surface on the cylinder head for burrs or any defects that may degrade the sealing.

TIMING CHAIN GUIDE REMOVAL

Fig. 299: Left Timing Chain Shoe Retaining Bolt
Courtesy of GENERAL MOTORS COMPANY

1. Remove the timing chain guide retaining bolts (4).
2. Remove the timing chain guide (3).
3. Remove the timing chain shoe retaining bolt (2).
4. Remove the timing chain shoe (1).

ENGINE LIFT FRONT BRACKET REMOVAL

Fig. 300: Engine Lift Front Bracket Bolts
Courtesy of GENERAL MOTORS COMPANY

1. Remove the engine lift front bracket bolts (2) from the cylinder head.
2. Remove the engine lift front bracket (1).

ENGINE LIFT REAR BRACKET REMOVAL

Fig. 301: Engine Lift Rear Bracket And Bolts
Courtesy of GENERAL MOTORS COMPANY

1. Remove the engine lift rear bracket bolts (2) from the timing chain cover.
2. Remove the engine lift rear bracket (1).

CAMSHAFT REMOVAL (LL0)

Fig. 302: First Camshaft Bearing Cap Bolts
Courtesy of GENERAL MOTORS COMPANY

1. Remove the first camshaft bearing cap bolts (2).
2. Remove the first camshaft bearing cap (1) and dowel pin (3).

Fig. 303: Exhaust Camshaft Bearing Cap Bolts Loosening Sequence
Courtesy of GENERAL MOTORS COMPANY

NOTE: **Note removal sequence 1-4.**

3. Loosen the 8 exhaust camshaft bearing cap bolts working from outside to inside in a spiral in steps of 1/2 up to 1 turn.

NOTE: **Mark camshaft bearing caps before removal.**

4. Remove the 8 exhaust camshaft bearing cap bolts.
5. Remove the 4 exhaust camshaft bearing caps numbers 6-9 from the cylinder head.
6. Remove the exhaust camshaft.

Fig. 304: Intake Camshaft Bearing Cap Bolts Loosening Sequence
Courtesy of GENERAL MOTORS COMPANY

NOTE: Note removal sequence 1-4.

7. Loosen the 8 intake camshaft bearing cap bolts working from outside to inside in a spiral in steps of 1/2 up to 1 turn.
8. Remove the 8 intake camshaft bearing cap bolts.

NOTE: Mark camshaft bearing caps before removal.

9. Remove the 4 intake camshaft bearing caps numbers 2-5 from the cylinder head.

Fig. 305: Camshafts

Courtesy of GENERAL MOTORS COMPANY

NOTE: The exhaust camshaft has a groove between the No. 3 journal and No. 4 journal. The intake camshaft has no groove.

10. Remove the intake camshaft and the exhaust camshaft (1).

CAMSHAFT REMOVAL (LFM)

Fig. 306: First Camshaft Bearing Cap Bolts
Courtesy of GENERAL MOTORS COMPANY

1. Remove the first camshaft bearing cap bolts (2).
2. Remove the first camshaft bearing cap (1) and dowel pin (3).

Fig. 307: Exhaust Camshaft Bearing Cap Bolts Loosening Sequence
Courtesy of GENERAL MOTORS COMPANY

NOTE: Note removal sequence 1-4.

3. Loosen the 8 exhaust camshaft bearing cap bolts working from outside to inside in a spiral in steps of 1/2 up to 1 turn.

NOTE: Mark camshaft bearing caps before removal.

4. Remove the 8 exhaust camshaft bearing cap bolts.
5. Remove the 4 exhaust camshaft bearing caps numbers 6-9 from the cylinder head.
6. Remove the exhaust camshaft.

Fig. 308: Intake Camshaft Bearing Cap Bolts Loosening Sequence
Courtesy of GENERAL MOTORS COMPANY

NOTE: Note removal sequence 1-4.

7. Loosen the 8 intake camshaft bearing cap bolts working from outside to inside in a spiral in steps of 1/2 up to 1 turn.
8. Remove the 8 intake camshaft bearing cap bolts.

NOTE: Mark camshaft bearing caps before removal.

9. Remove the 4 intake camshaft bearing caps numbers 2-5 from the cylinder head.

Fig. 309: Intake Camshaft

Courtesy of GENERAL MOTORS COMPANY

NOTE: The exhaust camshaft has 2 grooves between the No. 3 journal and No. 4 journal. The intake camshaft has 1 groove.

10. Remove the intake camshaft (1) and the exhaust camshaft (2).

CYLINDER HEAD AND GASKET REMOVAL

Special Tools

GE-42072 Cylinder Head Bolt Remover/Installer

For equivalent regional tools, refer to **Special Tools**.

Fig. 310: Identifying Cylinder Head Bolts With GE-42072 Cylinder Head Bolt Remover/Installer In Sequence

Courtesy of GENERAL MOTORS COMPANY

NOTE: The cylinder head bolts require a 10 mm 12 point triple square tool for proper servicing. Use GE-42072 Cylinder Head Bolt Remover/Installer or equivalent when servicing head bolts.

1. Remove the 10 cylinder head bolts with the **GE-42072** cylinder head bolt remover/installer (1) in sequence as shown
 1. Loosen the 10 bolts 90°.
 2. Loosen the 10 bolts 180°.
2. Remove the cylinder head and place on a suitable base.
3. Remove the cylinder head gasket.

OIL PUMP DISASSEMBLE

NOTE: There are no serviceable components within the oil pump. Disassemble the pump only to diagnose an oiling concern. A disassembled oil pump must not be reused. A disassembled oil pump must be replaced.

Fig. 311: Oil Pump Screws

Courtesy of GENERAL MOTORS COMPANY

1. Remove the oil pump housing retaining bolts (3).
2. Remove the oil pump housing (1).
3. Remove the inner oil pump drive gear.
4. Remove the outer oil pump driven gear.
5. Remove the plug (2), holding the plug, for the oil relief valve components.
6. Remove the plug, spring and plunger from the oil pump housing (1).

OIL PUMP ASSEMBLE

Fig. 312: Oil Pump Screws

Courtesy of GENERAL MOTORS COMPANY

1. Install the oil relief components to oil pump housing (1).
2. Install the plug (2).

NOTE: The dimpled surface must be face-up in the pump body.

3. Install the inner oil pump drive gear and the outer oil pump driven gear in the engine front cover in the same orientation as removed.
4. Install the oil pump housing (1) to the engine front cover.

CAUTION: Refer to Fastener Caution .

5. Install the oil pump housing retaining bolts (3) and tighten to 10 (89 lb in).

OIL PAN REMOVAL

Fig. 313: Oil Pan Bolts And Nuts

Courtesy of GENERAL MOTORS COMPANY

1. Remove the 16 oil pan bolts (2) and 2 nuts (1) from the engine block.
2. Use a suitable tool to remove the oil pan (3) evenly all the way around.
3. Discard the oil pan.

PISTON, CONNECTING ROD AND BEARING REMOVAL

1. Install the crankshaft balancer bolt.
2. Set the pistons 1 and 4 to BDC in direction of engine rotation.

Fig. 314: View Of Con-Rod Bearing Caps
Courtesy of GENERAL MOTORS COMPANY

3. Mark the connecting rod with the connecting rod bearing cover (1).

Fig. 315: Rod Bearing Caps Nuts

Courtesy of GENERAL MOTORS COMPANY

4. Remove the 4 connecting rod bearing caps bolts (2) of cylinder 1 and 4.
5. Remove the connecting rod bearing caps (1) and the connecting rod bearing (3).

Fig. 316: Pistons 1, 4 And Cylinder Bore
Courtesy of GENERAL MOTORS COMPANY

6. Push the pistons 1 and 4 (1) out of the cylinder bore (2).
7. Remove the pistons 1 and 4 (1).
8. Turn crankshaft on crankshaft balancer through 180 degrees in direction of rotation of engine.
9. Repeat for the piston 2 and 3.

Fig. 317: Connecting Rod Bearing
Courtesy of GENERAL MOTORS COMPANY

NOTE: **Observe correct fitting position, observe alignment.**

10. Remove the connecting rod bearing (1, 2).

CRANKSHAFT FRONT OIL SEAL REMOVAL

Fig. 318: Using Flat-Bladed Tool To Remove Seal From Front Cover
Courtesy of GENERAL MOTORS COMPANY

CAUTION: Clean the crankshaft sealing surface with a clean, lint-free towel. Inspect lead-in edge of crankshaft for burrs/sharp edges that could damage the rear main oil seal. Remove burrs/sharp edges with crocus cloth before proceeding.

Using the suitable tool, remove the crankshaft front oil seal from the crankshaft.

CRANKSHAFT REAR OIL SEAL AND HOUSING REMOVAL

Fig. 319: Crankshaft Rear Oil Seal Housing Bolts
Courtesy of GENERAL MOTORS COMPANY

1. Remove the crankshaft rear oil seal housing bolts (1).

Fig. 320: Edge Of Crankshaft Rear Oil Seal Housing
Courtesy of GENERAL MOTORS COMPANY

2. Use the pry points located at the edge of the crankshaft rear oil seal housing to separate the RTV sealant.

Fig. 321: Crankshaft Rear Oil Seal And Housing
Courtesy of GENERAL MOTORS COMPANY

3. Remove and discard the crankshaft rear oil seal and housing (1).

CRANKSHAFT AND BEARING REMOVAL

NOTE: Take extreme care to prevent any scratches, nicks or damage to the inner side of the cylinder and bearings.

NOTE: Check and confirm the sequence of the crankshaft caps and bearings.

Fig. 322: Crankshaft Rear Oil Seal With Housing
Courtesy of GENERAL MOTORS COMPANY

1. Remove the crankshaft rear oil seal with housing.

Fig. 323: Rod Bearing Caps Nuts

Courtesy of GENERAL MOTORS COMPANY

2. Remove the connecting rod bearing cap bolts (2).
3. Remove the connecting rod bearing caps (1) and bearing (3).

Fig. 324: Crankshaft Bearing Caps
Courtesy of GENERAL MOTORS COMPANY

4. Identify the crankshaft bearing caps.
5. Remove the 10 bolts (1).
6. Remove the crankshaft bearing caps (2).
7. Remove the crankshaft bearing cap bearing (3).
8. Remove the crankshaft.

ENGINE BLOCK DISASSEMBLE (LL0)

Fig. 325: Oil Pressure Switch And Block Heater
Courtesy of GENERAL MOTORS COMPANY

1. Remove the oil pressure switch (1) and block heater (2).

Fig. 326: Knock Sensor Bolt And Knock Sensor
Courtesy of GENERAL MOTORS COMPANY

2. Remove the knock sensor bolt (1) and the knock sensor (2).
3. Clean the thread.

Fig. 327: Cylinder Head Locating

Courtesy of GENERAL MOTORS COMPANY

4. Remove the cylinder head locating (1).
5. Remove the engine block oil gallery plugs (2, 3).

Fig. 328: Engine Block Oil Gallery Plug
Courtesy of GENERAL MOTORS COMPANY

6. Remove the engine block oil gallery plug (1).

ENGINE BLOCK DISASSEMBLE (LFM)

Fig. 329: Oil Pressure Switch

Courtesy of GENERAL MOTORS COMPANY

1. Remove the oil pressure switch (1).

Fig. 330: Knock Sensor Bolt And Knock Sensor
Courtesy of GENERAL MOTORS COMPANY

2. Remove the knock sensor bolt (1) and the knock sensor (2).
3. Clean the thread.

Fig. 331: Cylinder Head Locating

Courtesy of GENERAL MOTORS COMPANY

4. Remove the cylinder head locating (1).
5. Remove the engine block oil gallery plugs (2, 3).

Fig. 332: Engine Block Oil Gallery Plug
Courtesy of GENERAL MOTORS COMPANY

6. Remove the engine block oil gallery plug (1).

PISTON, CONNECTING ROD AND BEARING CLEANING AND INSPECTION (LL0)

Cleaning Procedure

NOTE: **DO NOT use a wire brush any part of the piston.**

1. Clean the piston skirts and the pins with a cleaning solvent.
2. Clean the piston ring grooves with a groove cleaner. Ensure that the oil ring holes and slots are clean.

WARNING: Refer to Safety Glasses and Compressed Air Warning .

3. Dry the piston with compressed air.

Piston Inspection Procedure

Fig. 333: Identifying Piston

Courtesy of GENERAL MOTORS COMPANY

1. Inspect the pistons for the following conditions:
 - Ring grooves for nicks, burrs that may cause binding (5)
 - Warped or worn ring lands (5)
 - Piston pin retainer grooves for burrs (2)
 - Eroded areas at the top of the piston (1)
 - Scuffed or damaged skirt coating (4)
 - Worn piston pin bores or worn piston pins (3)
2. Replace pistons that show any signs of damage or wear above acceptable tolerances.

Piston Measurement Procedure

Fig. 334: View Of Piston Measurement
Courtesy of GENERAL MOTORS COMPANY

1. Measure piston width using the following procedure:
 1. Using an outside micrometer, measure the width of the piston at 8.5 mm (0.335 in) from the skirt bottom end (1), at the thrust surfaces of the piston, perpendicular to the piston pin centerline.
 2. Compare your results with the engine mechanical specifications. Refer to **Engine Mechanical Specifications (LL0)**, **Engine Mechanical Specifications (LFM)**.
 3. If the clearance obtained through measurement is greater than the provided specifications and the cylinder bores are within specification, replace the piston.

Fig. 335: Identifying Piston Pin Bore To Piston Pin Measurement From Outside Micrometer
Courtesy of GENERAL MOTORS COMPANY

2. Measure the piston pin bore to piston pin (2) clearances using the following procedure:
 1. Piston pin bores and pins must be free of varnish or scuffing.
 2. Use an outside micrometer (1) to measure the piston pin in the piston contact areas.

Piston Ring Measurement Procedure

Fig. 336: Piston Ring

Courtesy of GENERAL MOTORS COMPANY

1. Measure the piston ring (1) side clearance using the following procedure:
 1. Roll the piston ring (1) entirely around the piston ring groove. If any binding is caused by the ring groove, dress the groove with a fine file. If any binding is caused by a distorted piston ring (1), replace the piston ring (1).
 2. With the piston ring (1) on the piston, use feeler gauges (2) to check clearance at multiple locations.
 3. Compare the measurements with piston ring side clearance listed in the.
 4. If the clearance is greater than specifications, replace the piston ring (1).

Fig. 337: Identifying Locating Dimple
Courtesy of GENERAL MOTORS COMPANY

2. There is a locating marking 'R' (1) on the compression rings near the end for identification. Install the compression rings with the dimple facing up.
3. If the new ring does not reduce the clearance to the correct specification, install a new piston.
4. If the new piston does not meet clearance specifications, the cylinder block may need to be oversized to 0.25 mm (0.010 in). There is only one size of oversized pistons and rings available for service.

Connecting Rod Cleaning Procedure

1. Clean the connecting rods in solvent.

WARNING: Refer to Safety Glasses and Compressed Air Warning .

2. Dry the connecting rod using compressed air.

Connecting Rod Visual Inspection Procedure

Fig. 338: Identifying Piston Pin Bushing, Connecting Rod Beam, Rod Cap & Bolts
Courtesy of GENERAL MOTORS COMPANY

1. Inspect the piston pin bushing (4) for scoring or damage.
2. Inspect the connecting rod beam (1) for twisting or bending.
3. Inspect the rod cap (2) for any nicks or damage caused by possible interference.
4. Inspect for scratches or abrasion on the rod bearing seating surface.

NOTE: DO NOT scrape the rod or rod cap.

5. If the connecting rod bores contain minor scratches or abrasions, clean the bores in a circular direction with a light emery paper.
6. Inspect the connecting rod bolts (3) for damage or stretching.

Connecting Rod Measurement Procedure

Fig. 339: Identifying Connecting Rod Piston Pin Bore
Courtesy of GENERAL MOTORS COMPANY

1. Using an inside micrometer, measure the connecting rod piston pin bore (1).
2. Subtract the piston pin diameter from the piston pin bore (1).
3. Compare the clearance measurements with the.
4. If the clearance is above acceptable tolerances, replace the piston pin. If a new pin does not resolve the clearance condition, replace the connecting rod.

Fig. 340: Identifying Connecting Rod Crankshaft Bearing Bore Measurement From Inside Micrometer

Courtesy of GENERAL MOTORS COMPANY

5. Using an inside micrometer, measure the connecting rod crankshaft bearing bore (1).
6. Compare the bore measurements with the.
7. Replace the connecting rod if the connecting rod crankshaft bearing bore (1) is out of specifications. DO NOT recondition the connecting rod.

Connecting Rod Bearing Clearance Measurement Procedure - Using Plastic Gaging

Fig. 341: Plastic Gauge

Courtesy of GENERAL MOTORS COMPANY

1. Cut the plastic gauge (1) the same length as the bearing width and put it on the crankshaft bearing. It should be parallel with the crankshaft.

CAUTION: Refer to Fastener Caution .

2. Install the connecting rod bearing and caps, tighten to 20 + 90° (15 lb ft + 90°).
3. Remove the connecting rod cap and bearing.

Fig. 342: View Of Crankshaft Bearing Clearance
Courtesy of GENERAL MOTORS COMPANY

4. Determine the connecting rod bearing clearance by comparing the width of the flattened plastic gauging material (1) at its widest point with the graduation on the gauging material container (2).
5. Compare your measurements with the engine mechanical specifications. Refer to **Engine Mechanical Specifications (LL0)**, **Engine Mechanical Specifications (LFM)**. If the new bearings DO NOT provide the proper crankshaft to connecting rod bearing clearance, inspect the following: **Engine Mechanical Specifications (LL0)**, **Engine Mechanical Specifications (LFM)**.
6. Clean the plastic gaging material from the connecting rod bearing journals using a soft lint-free cloth.

PISTON, CONNECTING ROD AND BEARING CLEANING AND INSPECTION (LFM)

Cleaning Procedure

NOTE: **DO NOT use a wire brush any part of the piston.**

1. Clean the piston skirts and the pins with a cleaning solvent.
2. Clean the piston ring grooves with a groove cleaner. Ensure that the oil ring holes and slots are clean.

WARNING: Refer to **Safety Glasses and Compressed Air Warning** .

3. Dry the piston with compressed air.

Piston Inspection Procedure

Fig. 343: Identifying Piston

Courtesy of GENERAL MOTORS COMPANY

1. Inspect the pistons for the following conditions:
 - Ring grooves for nicks, burrs that may cause binding (5)
 - Warped or worn ring lands (5)
 - Piston pin retainer grooves for burrs (2)
 - Eroded areas at the top of the piston (1)
 - Scuffed or damaged skirt coating (4)
 - Worn piston pin bores or worn piston pins (3)
2. Replace pistons that show any signs of damage or wear above acceptable tolerances.

Piston Measurement Procedure

Fig. 344: View Of Piston Measurement
Courtesy of GENERAL MOTORS COMPANY

1. Measure piston width using the following procedure:
 1. Using an outside micrometer, measure the width of the piston at 7.5 mm (0.295 in) from the skirt bottom end (1), at the thrust surfaces of the piston, perpendicular to the piston pin centerline.
 2. Compare your results with the engine mechanical specifications. Refer to **Engine Mechanical Specifications (LL0)**, **Engine Mechanical Specifications (LFM)**.
 3. If the piston clearance to bore obtained through measurement is greater than the provided specifications (0.023-0.053 mm) and the cylinder bores are within specification (68.502-68.518), replace the piston.

Fig. 345: Identifying Piston Pin Bore To Piston Pin Measurement From Outside Micrometer
Courtesy of GENERAL MOTORS COMPANY

2. Measure the piston pin bore to piston pin (2) clearances using the following procedure:
 1. Piston pin bores and pins must be free of varnish or scuffing.
 2. Use an outside micrometer (1) to measure the piston pin in the piston contact areas.
 3. If the result is out of specification (17.996-18.0), replace the pin.

Piston Ring Measurement Procedure

Fig. 346: Piston Ring

Courtesy of GENERAL MOTORS COMPANY

1. Measure the piston ring (1) side clearance using the following procedure:
 1. Roll the piston ring (1) entirely around the piston ring groove. If any binding is caused by the ring groove, dress the groove with a fine file. If any binding is caused by a distorted piston ring (1), replace the piston ring (1).
 2. With the piston ring (1) on the piston, use feeler gauges (2) to check clearance at multiple locations.
 3. Compare the measurements with piston ring side clearance listed in the.
 4. If the clearance is greater than the following specifications, replace the piston ring (1).
 - Top and 2nd: 0.03-0.07
 - Oil: 0.04-0.12

Fig. 347: Identifying Locating Dimple
Courtesy of GENERAL MOTORS COMPANY

2. There is a locating marking 'R' (1) on the compression rings near the end for identification. Install the compression rings with the dimple facing up.
3. If the new ring does not reduce the clearance to the correct specification, install a new piston.
4. If the new piston does not meet clearance specifications, the cylinder block may need to be oversized to 0.25 mm (0.010 in). There is only one size of oversized pistons and rings available for service.

Connecting Rod Cleaning Procedure

1. Clean the connecting rods in solvent.

WARNING: Refer to Safety Glasses and Compressed Air Warning .

2. Dry the connecting rod using compressed air.

Connecting Rod Visual Inspection Procedure

Fig. 348: Identifying Piston Pin Bushing, Connecting Rod Beam, Rod Cap & Bolts
Courtesy of GENERAL MOTORS COMPANY

1. Inspect the piston pin bushing (4) for scoring or damage.
2. Inspect the connecting rod beam (1) for twisting or bending.
3. Inspect the rod cap (2) for any nicks or damage caused by possible interference.
4. Inspect for scratches or abrasion on the rod bearing seating surface.

NOTE: DO NOT scrape the rod or rod cap.

5. If the connecting rod bores contain minor scratches or abrasions, clean the bores in a circular direction with a light emery paper.
6. Inspect the connecting rod bolts (3) for damage or stretching.

Connecting Rod Measurement Procedure

Fig. 349: Identifying Connecting Rod Piston Pin Bore
Courtesy of GENERAL MOTORS COMPANY

1. Using an inside micrometer, measure the connecting rod piston pin bore (1).
2. Subtract the piston pin diameter from the piston pin bore (1).
3. Compare the clearance measurements with the.
4. If the clearance is above acceptable tolerances (0.006-0.018), replace the piston pin. If a new pin does not resolve the clearance condition, replace the connecting rod.

Fig. 350: Identifying Connecting Rod Crankshaft Bearing Bore Measurement From Inside Micrometer

Courtesy of GENERAL MOTORS COMPANY

5. Using an inside micrometer, measure the connecting rod crankshaft bearing bore (1).
6. Compare the bore measurements with the.
7. Replace the connecting rod if the connecting rod crankshaft bearing bore (1) is out of specifications. DO NOT recondition the connecting rod.

Connecting Rod Bearing Clearance Measurement Procedure - Using Plastic Gaging

Fig. 351: Plastic Gauge

Courtesy of GENERAL MOTORS COMPANY

1. Cut the plastic gauge (1) the same length as the bearing width and put it on the crankshaft bearing. It should be parallel with the crankshaft.

CAUTION: Refer to Fastener Caution .

2. Install the connecting rod bearing and caps, tighten the connecting rod bearing cap bolts to $20 + 90^\circ$ (15 lb ft + 90°).
3. Remove the connecting rod cap and bearing.

Fig. 353: Cylinder Head Locating
Courtesy of GENERAL MOTORS COMPANY

NOTE: Use a new engine block oil gallery plug.

1. Install the cylinder head locating (1).
2. Clean the thread of engine block and apply sealant to all plugs prior to installation. Refer to **Adhesives, Fluids, Lubricants and Sealers**.

CAUTION: Refer to **Fastener Caution** .

3. Install the new engine block oil gallery plugs (2, 3) and tighten to 12.5 (9 lb ft).

Fig. 354: Engine Block Oil Gallery Plug
Courtesy of GENERAL MOTORS COMPANY

NOTE: Use a new engine block oil gallery plug.

4. Install the new engine block oil gallery plug (1) and tighten to 12.5 (9 lb ft).

Fig. 355: Knock Sensor Bolt And Knock Sensor
Courtesy of GENERAL MOTORS COMPANY

5. Install the knock sensor (2) and the knock sensor bolt (1) and tighten to 25 (18 lb ft).

Fig. 356: Oil Pressure Switch And Block Heater
Courtesy of GENERAL MOTORS COMPANY

6. Install the oil pressure switch (1) and tighten to 35 (26 lb ft).
7. Install the block heater (2) and tighten to 60 (44 lb ft).

ENGINE BLOCK ASSEMBLE (LFM)

Fig. 357: Cylinder Head Locating
Courtesy of GENERAL MOTORS COMPANY

NOTE: Use a new engine block oil gallery plug.

1. Install the cylinder head locating (1).
2. Clean the thread of engine block and apply sealant to all plugs prior to installation. Refer to **Adhesives, Fluids, Lubricants and Sealers**.

CAUTION: Refer to **Fastener Caution** .

3. Install the new engine block oil gallery plugs (2, 3) and tighten to 12.5 (9 lb ft).

Fig. 358: Engine Block Oil Gallery Plug
Courtesy of GENERAL MOTORS COMPANY

NOTE: Use a new engine block oil gallery plug.

4. Install the new engine block oil gallery plug (1) and tighten to 12.5 (9 lb ft).

Fig. 359: Knock Sensor Bolt And Knock Sensor
Courtesy of GENERAL MOTORS COMPANY

5. Install the knock sensor (2) and the knock sensor bolt (1) and tighten to 25 (18 lb ft).

Fig. 360: Oil Pressure Switch

Courtesy of GENERAL MOTORS COMPANY

6. Install the oil pressure switch (1) and tighten to 35 (26 lb ft).

CRANKSHAFT AND BEARING INSTALLATION

Fig. 361: Crankshaft Bearing Caps
Courtesy of GENERAL MOTORS COMPANY

NOTE: **Inspect the installation position.**

1. Install the crankshaft.

NOTE: **Inspect the installation position.**

2. Install the crankshaft bearing (3).

NOTE: **Inspect the installation position.**

3. Install the crankshaft bearing cap (2).

CAUTION: Refer to Fastener Caution .

4. Install the crankshaft bearing cap bolts (1) and tighten to 30 + 30° (22 lb ft + 30°).

Fig. 362: Connecting Rod Bearing
Courtesy of GENERAL MOTORS COMPANY

NOTE: **Inspect the installation position.**

5. Install the connecting rod bearing (3) and connecting rod bearing caps (1) and tighten the 8 connecting rod bearing cap bolts to 20 + 90° (15 lb ft + 90°).

Fig. 363: Crankshaft Rear Oil Seal Housing
Courtesy of GENERAL MOTORS COMPANY

6. Install the crankshaft rear oil seal housing (1) with the new gasket (2) and tighten to 10 (89 lb in).

CRANKSHAFT REAR OIL SEAL AND HOUSING INSTALLATION

Special Tools

J 45507 Crankshaft Rear Oil Seal Installer

For equivalent regional tools, refer to **Special Tools**.

Fig. 364: Crankshaft Rear Oil Seal Housing
Courtesy of GENERAL MOTORS COMPANY

1. Place a 3 mm (0.118 in) bead of RTV sealant to the NEW crankshaft rear oil seal housing as shown (1). Refer to **Adhesives, Fluids, Lubricants and Sealers** for recommended sealant.

Fig. 365: Crankshaft Rear Oil Seal And Housing
Courtesy of GENERAL MOTORS COMPANY

NOTE: **DO NOT** allow any engine oil on the area where the crankshaft rear oil seal housing is to be installed.

2. Install the **J 45507** Crankshaft Rear Oil Seal Installer (2) to the crankshaft rear oil seal and housing (1).
3. Push the crankshaft rear oil seal and housing (1) until the crankshaft rear oil seal and housing is flush and sits evenly in the cylinder block.
4. Remove the **J 45507** Crankshaft Rear Oil Seal Installer (2) from the crankshaft.

Fig. 366: Crankshaft Rear Oil Seal Housing Bolts
Courtesy of GENERAL MOTORS COMPANY

CAUTION: Refer to Fastener Caution .

5. Install the crankshaft rear oil seal housing bolts (1) and tighten to 10 (89 lb in).

PISTON, CONNECTING ROD AND BEARING INSTALLATION

Fig. 367: Piston And Rod Assembly
Courtesy of GENERAL MOTORS COMPANY

1. Rotate the crankshaft to a position where the connecting rod bolts are in the best situation for install.

NOTE: **Arrow on piston head points to engine timing side, bead on connecting rod points to transmission side of engine.**

2. Install the piston and connecting rod assembly (1).
3. Install the connecting rod bearing (2).
4. Assemble the caps and connecting rods in the marked position. Install the connecting rod cap (3).

CAUTION: Refer to Fastener Caution .

5. Install the connecting rod bearing bolts (4) and tighten to 20 + 90° (15 lb ft + 90°).

CAMSHAFT TIMING CHAIN INSTALLATION

Fig. 368: Camshaft Lobes

Courtesy of GENERAL MOTORS COMPANY

1. Position the camshaft lobes in a neutral position.

Fig. 369: Camshaft Sprockets And Timing Chain
Courtesy of GENERAL MOTORS COMPANY

2. Install the timing chain after aligning both the marks (1) on the camshaft sprockets and on the timing chain.
3. Align both the timing marks on the crankshaft sprocket and on the timing chain (2).

TIMING CHAIN TENSIONER INSTALLATION

Fig. 370: Timing Chain Tensioner

Courtesy of GENERAL MOTORS COMPANY

1. Inspect the timing chain tensioner mounting surface on the cylinder block for burrs or any defects that may degrade the sealing of the timing chain tensioner.

CAUTION: Refer to Fastener Caution .

2. Push the timing chain shoe towards the timing chain and hold the timing chain shoe. Using the other hand, push the timing chain tensioner towards the timing chain shoe. The timing chain tensioner plunger might be pushed into the timing chain tensioner housing. While holding the timing chain tensioner, install the timing chain tensioner bolts and tighten the timing chain tensioner retaining bolts to 10 (89 lb in).
3. Pull out the shipping clip.

TIMING CHAIN GUIDE INSTALLATION

Fig. 371: Left Timing Chain Shoe Retaining Bolt
Courtesy of GENERAL MOTORS COMPANY

1. Install the timing chain shoe (1).

CAUTION: Refer to Fastener Caution .

2. Tighten the timing chain shoe retaining bolt (2) to 10 (89 lb in)
3. Install the timing chain guide (3).
4. Install the timing chain guide retaining bolts (4) to 10 (89 lb in).

CAMSHAFT INSTALLATION (LL0)

Fig. 372: Camshafts

Courtesy of GENERAL MOTORS COMPANY

NOTE: The exhaust camshaft has a groove between the No. 3 journal and No. 4 journal. The intake camshaft has no groove.

1. Install the intake camshaft and the exhaust camshaft (1).

Fig. 373: Camshaft Lobes

Courtesy of GENERAL MOTORS COMPANY

2. Position the camshaft lobes in a neutral position.

NOTE: Note the identification marking on the camshaft bearing cover.

3. Install the 4 intake camshaft bearing caps numbers 2-5 from the cylinder head.

CAUTION: Refer to Fastener Caution .

4. Tighten the 8 intake camshaft bearing cap bolts working from inside to outside in a spiral to 10 (89 lb in).

Fig. 374: Exhaust Camshaft Bearing Cap
Courtesy of GENERAL MOTORS COMPANY

NOTE: Note the identification marking on the camshaft bearing cover.

5. Install the 4 exhaust camshaft bearing caps numbers 6-9 from the cylinder head.
6. Tighten the 8 exhaust camshaft bearing cap bolts working from inside to outside in a spiral to 10 (89 lb in).

Fig. 375: First Camshaft Bearing Cap Bolts
Courtesy of GENERAL MOTORS COMPANY

7. Clean sealing surfaces of the first camshaft bearing support and the cylinder head with a suitable tool.
8. Clean oil duct from any sealant residue.
9. Install the first camshaft bearing cap (1) and dowel pin (3).
10. Tighten camshaft bearing cap bolts (2) to 10 (89 lb in).

CAMSHAFT INSTALLATION (LFM)

Fig. 376: Intake Camshaft

Courtesy of GENERAL MOTORS COMPANY

NOTE: The exhaust camshaft has 2 grooves between the No. 3 journal and No. 4 journal. The intake camshaft has 1 groove.

1. Install the intake camshaft (1) and the exhaust camshaft (2).

Fig. 377: Camshaft Lobes

Courtesy of GENERAL MOTORS COMPANY

2. Position the camshaft lobes in a neutral position.

NOTE: **Note the identification marking on the camshaft bearing cover.**

3. Install the 4 intake camshaft bearing caps numbers 2-5 from the cylinder head.

CAUTION: Refer to Fastener Caution .

4. Tighten the 8 intake camshaft bearing cap bolts working from inside to outside in a spiral to 10 (89 lb in).

Fig. 378: Exhaust Camshaft Bearing Cap
Courtesy of GENERAL MOTORS COMPANY

NOTE: Note the identification marking on the camshaft bearing cover.

5. Install the 4 exhaust camshaft bearing caps numbers 6-9 from the cylinder head.
6. Tighten the 8 exhaust camshaft bearing cap bolts working from inside to outside in a spiral to 10 (89 lb in).

Fig. 379: First Camshaft Bearing Cap Bolts
Courtesy of GENERAL MOTORS COMPANY

7. Clean sealing surfaces of the first camshaft bearing support and the cylinder head with a suitable tool.
8. Clean oil duct from any sealant residue.
9. Install the first camshaft bearing cap (1) and dowel pin (3).
10. Tighten camshaft bearing cap bolts (2) to 10 (89 lb in).

ENGINE LIFT REAR BRACKET INSTALLATION

Fig. 380: Engine Lift Rear Bracket And Bolts
Courtesy of GENERAL MOTORS COMPANY

1. Install the engine lift rear bracket (1).

CAUTION: Refer to Fastener Caution .

2. Install the engine lift rear bracket bolts (2) to the engine lift rear bracket (1) and tighten to 25 (18 lb ft).

ENGINE LIFT FRONT BRACKET INSTALLATION

Fig. 381: Engine Lift Front Bracket Bolts
Courtesy of GENERAL MOTORS COMPANY

1. Install the engine lift front bracket (1).

CAUTION: Refer to Fastener Caution .

2. Install the engine lift front bracket bolts (2) to the engine lift front bracket and tighten to 25 (18 lb ft).

CYLINDER HEAD AND GASKET INSTALLATION

Special Tools

GE-42072 Cylinder Head Bolt Remover/Installer

For equivalent regional tools, refer to Special Tools.

Fig. 382: Cylinder Head Bolts In Sequence
 Courtesy of GENERAL MOTORS COMPANY

NOTE: The cylinder head bolts require a 10 mm 12 point triple square tool for proper servicing. Use GE-42072 Cylinder Head Bolt Remover/Installer or equivalent when servicing head bolts.

1. Clean the sealing surfaces.
2. Inspect for plane surface.
 - Cylinder block, cylinder head
 - Straight-edge, feeler gauge
3. Install the cylinder head gasket.
4. Install the cylinder head.

CAUTION: Refer to Fastener Caution .

5. Install the 10 cylinder head bolts with the GE-42072 cylinder head bolt remover/installer (1) in sequence as shown.

Tighten to 22 + 82° (16 lb ft + 82°)

1. 10 bolts 22 (16 lb ft)
2. Recheck for 10 bolts tightening torque for getting 22 balance.
3. 10 bolts 82°

ENGINE FRONT COVER AND OIL PUMP INSTALLATION

NOTE: There are no serviceable components within the oil pump. Disassemble the pump only to diagnose an oiling concern. A disassembled oil pump must not be reused. A disassembled oil pump must be replaced.

Fig. 383: Oil Pump Screws
Courtesy of GENERAL MOTORS COMPANY

1. Install the oil relief valve components and plug to oil pump housing (1).

CAUTION: Refer to Fastener Caution .

2. Tighten the oil pump housing retaining bolts (3) to 10 (89 lb in).

Fig. 384: Engine Front Cover Bolts
Courtesy of GENERAL MOTORS COMPANY

NOTE: Do not damage the sealing surfaces.

NOTE: Cleaning of the sealing surfaces (3-6): Refer to Replacing Engine Gaskets.

3. Remove any old thread sealant, gasket material or sealant using remover such as chisel or scraper.
4. Clean the sealing surfaces of front cover and front cover components with solvent.

NOTE: Ensure that the sealing surface is clear of oil, grease and oil sealant material.

5. Clean out debris from the bolt holes.

WARNING: Refer to Safety Glasses and Compressed Air Warning .

6. Dry the front cover and front cover components with compressed air.

NOTE: Do not coat sealant (RTV) on the front cover bolt holes and bolt threads.

NOTE: Apply sealant (RTV) on lines (1) and 2 hole faces (2). Apply sealant (RTV) to the edges of top and bottom step chamfers.

7. Apply approximately a 4.5 mm (0.177 in) thick bead of oil pan sealant (1) to the oil pan.

Fig. 385: Engine Front Cover Bolts
Courtesy of GENERAL MOTORS COMPANY

8. Install the engine front cover with the included oil pump.

NOTE: Check the different screw lengths.

9. Install the engine front cover bolts (2, 3) and tighten to 22 (16 lb ft).

NOTE: After sealant (RTV) dispensing, the assembly completion time including torque check must be done within 8 minutes.

10. Install the engine front cover bolts (1, 4) and tighten to.10 (89 lb in).

WATER PUMP INSTALLATION

Fig. 386: Water Pump Bolts

Courtesy of GENERAL MOTORS COMPANY

1. Clean the sealing surfaces and the water pump threads.

CAUTION: Refer to Fastener Caution .

CAUTION: Refer to Torque-to-Yield Fastener Caution .

2. Install the water pump (2) and the 4 NEW water pump bolts (1).
3. Tighten the water pump bolts to 25 (89 lb ft).

CRANKSHAFT FRONT OIL SEAL INSTALLATION

Special Tools

EN 50172 Crankshaft Front Oil Seal Installer

For equivalent regional tools, refer to Special Tools.

Fig. 387: Crankshaft Bolt And Crankshaft Front Oil Seal Installer
Courtesy of GENERAL MOTORS COMPANY

1. Position the NEW crankshaft front oil seal.
 1. Position the crankshaft front oil seal in such a way that the engine front cover is over the corresponding cut-out on the cylinder block.

NOTE: Do not press in the seal ring all the way.

2. Slide the crankshaft front oil seal over the crankshaft. Push, until the crankshaft front oil seal is flush and sits evenly in the cylinder block.
2. Install the **EN 50172** crankshaft front oil seal installer (1) to the crankshaft.
3. Tighten the **EN 50172** crankshaft front oil seal installer to crankshaft pulley retaining bolt (2).
4. Using the **EN 50172** crankshaft front oil seal installer, install the crankshaft front oil seal.
5. Remove the **EN 50172** crankshaft front oil seal installer (1).

OIL PAN INSTALLATION

NOTE: Cleaning of the sealing surfaces (1-4): Refer to Replacing Engine Gaskets.

1. Remove any old thread sealant, gasket material or sealant.
2. Clean the sealing surfaces of front cover and front cover components with solvent.

NOTE: Ensure that the sealing surface is clear of oil, grease and oil sealant material.

3. Clean out debris from the bolt holes.

WARNING: Refer to Safety Glasses and Compressed Air Warning .

4. Dry the front cover and front cover components with compressed air.

Fig. 388: Oil Pan Sealant
Courtesy of GENERAL MOTORS COMPANY

NOTE: Use a new oil pan.

NOTE: Do not coat sealant (RTV) on the front cover bolt holes and bolt threads

5. Apply approximately a 4.5 mm (0.177 in) thick bead of oil pan sealant (1) to the oil pan.

Fig. 389: Oil Pan Bolts And Nuts
Courtesy of GENERAL MOTORS COMPANY

6. Install the oil pan (3).
7. Install the 16 oil pan bolts (2) and 2 nuts (1).

CAUTION: Refer to Fastener Caution .

NOTE: After sealant (RTV) dispensing, the assembly completion time including torque check must be done within 8 minutes.

8. Tighten the oil pan bolts and nuts on the cylinder block to 10 (89 lb in).

CAMSHAFT COVER INSTALLATION

Fig. 390: Cured RTV Carefully

Courtesy of GENERAL MOTORS COMPANY

1. Remove the cured RTV carefully (1) and then clean the sealing surfaces.

NOTE: After RTV applying, the assembly completion time including torque check must be done within 8 minutes.

2. Apply RTV sealant to T-joint between cylinder head and front cover (1).

Fig. 391: Camshaft Cover Bolts

Courtesy of GENERAL MOTORS COMPANY

3. Insert a NEW gasket (4) in the camshaft cover.
4. Install the camshaft cover (3).

CAUTION: Refer to Fastener Caution .

5. Install the camshaft cover 12 bolts (1, 2) and tighten to 10 (89 lb in).

IGNITION COIL INSTALLATION

Fig. 392: Ignition Coil
Courtesy of GENERAL MOTORS COMPANY

1. Install the ignition coil (1).

CAUTION: Refer to Fastener Caution .

2. Install the ignition coil bolts (2) and tighten to 10 (89 lb in).

Fig. 393: Ignition Coil Cover Bolts
Courtesy of GENERAL MOTORS COMPANY

3. Install the ignition coil cover (2) and tighten the ignition coil cover bolts (1) to 10 (89 lb in).

OIL LEVEL INDICATOR AND TUBE INSTALLATION

Fig. 394: Oil Dipstick And Oil Level Indicator Tube Bolt
Courtesy of GENERAL MOTORS COMPANY

CAUTION: Refer to Fastener Caution .

1. Install the oil level indicator tube (3) and oil level indicator seal and tighten the oil level indicator tube bolt (2) to 10 (89 lb in).
2. Install the oil dipstick (1).

INTAKE MANIFOLD INSTALLATION (LL0)

Fig. 395: Intake Manifold 10 Bolts
Courtesy of GENERAL MOTORS COMPANY

CAUTION: Refer to Fastener Caution .

1. Install the lower intake manifold (1) and tighten the bolts (2) to 10 (89 lb in)

Fig. 396: Intake Manifold Upper Bracket
Courtesy of GENERAL MOTORS COMPANY

2. Install the intake manifold rear bracket (1) and tighten the bolts (2) to 22 (18 lb ft).
3. Install the intake manifold rear bracket bolt (3) and tighten to 58 (42 lb ft).
4. Install the upper intake manifold side bracket (4) and tighten the bolts (5) to 10 (89 lb in).
5. Install the upper intake manifold side bracket bolt (6) and tighten to 10 (89 lb in)

Fig. 397: Intake Manifold Upper Bracket Bolts
Courtesy of GENERAL MOTORS COMPANY

6. Install the intake manifold upper bracket (1) tighten the bolts (2) to 25 (18 lb ft).

INTAKE MANIFOLD INSTALLATION (LFM)

Fig. 398: Lower Intake Manifold And Bolts
Courtesy of GENERAL MOTORS COMPANY

CAUTION: Refer to Fastener Caution .

1. Install the lower intake manifold (1) and tighten the lower intake manifold bolts (2, 3) to 10 (89 lb in).

Fig. 399: Intake Manifold Rear Bracket
Courtesy of GENERAL MOTORS COMPANY

2. Install the intake manifold rear bracket (1) and tighten the intake manifold rear bracket bolts (up) (2) to 22 (16 lb ft).
3. Install the intake manifold rear bracket bolt (down) (3) and tighten to 58 (42 lb ft).
4. Install the upper intake manifold side bracket (4) and tighten the upper intake manifold side bracket bolts (5) to 10 (89 lb in).
5. Install the upper intake manifold side bracket bolt (6) and tighten to 25 (18 lb ft).

Fig. 400: Upper Intake Manifold Front Bracket Bolts
Courtesy of GENERAL MOTORS COMPANY

6. Install the upper intake manifold front bracket (2), tighten the upper intake manifold front bracket bolts (1) to 25 (18 lb ft).

THROTTLE BODY ASSEMBLY INSTALLATION

Fig. 401: Throttle Body Assembly
Courtesy of GENERAL MOTORS COMPANY

1. Install the new throttle body seal (3).
2. Install the throttle body (1).

CAUTION: Refer to Fastener Caution .

3. Install the 4 throttle body bolts (2) and tighten to 10 (89 lb in).

ENGINE WATER OUTLET ADAPTER INSTALLATION

Fig. 402: Engine Water Outlet Adapter Housing Bolts
Courtesy of GENERAL MOTORS COMPANY

1. Install the engine coolant outlet adapter housing (2) and a NEW gasket (3).

CAUTION: Refer to Fastener Caution .

2. Install the 4 engine coolant outlet adapter housing bolts (1) and tighten to 25 (18 lb ft).

ENGINE COOLANT THERMOSTAT INSTALLATION

1. Clean the engine coolant sealing surfaces.

Fig. 403: Engine Coolant Thermostat Bolts
Courtesy of GENERAL MOTORS COMPANY

2. Install the engine coolant thermostat assembly (2).

WARNING: Refer to Safety Glasses and Compressed Air Warning .

CAUTION: Refer to Fastener Caution .

3. Install the 3 engine coolant thermostat bolts (1) and tighten to 10 (89 lb ft).

AIR CONDITIONING COMPRESSOR BRACKET INSTALLATION

Fig. 404: Air Conditioning Compressor Bolts And Bracket
Courtesy of GENERAL MOTORS COMPANY

1. Install the air conditioning compressor bracket (2).

CAUTION: Refer to Fastener Caution .

2. Install the 3 air conditioning compressor bracket bolts (1) and tighten to 22 (16 lb ft).

GENERATOR BRACKET INSTALLATION

Fig. 405: Generator Bracket Retaining Bolts
Courtesy of GENERAL MOTORS COMPANY

CAUTION: Refer to Fastener Caution .

Install the generator bracket (1), generator retaining bolts (2) and tighten to 22 (16 lb ft).

CAMSHAFT POSITION ACTUATOR SOLENOID VALVE INSTALLATION

Fig. 406: Camshaft Position Actuator Solenoid Valve Bolts And Valves
Courtesy of GENERAL MOTORS COMPANY

NOTE: Lubricate the NEW camshaft position actuator solenoid valve seals with NEW engine oil. Refer to Adhesives, Fluids, Lubricants and Sealers.

1. Install NEW camshaft position actuator solenoid valve seals (3).
2. Install the camshaft position actuator solenoid valves (2).

CAUTION: Refer to Fastener Caution .

3. Install the camshaft position actuator solenoid valve bolts (1) and tighten to 10 (89 lb in).

CRANKSHAFT SPROCKET INSTALLATION

Fig. 407: Crankshaft Sprocket
Courtesy of GENERAL MOTORS COMPANY

NOTE: When installing the crankshaft sprocket, the cam and the groove must align (2).

Install the crankshaft sprocket (1).

CRANKSHAFT BALANCER INSTALLATION

Special Tools

- **EN 50175** Crankshaft Locking Device
- **EN-51218** Crankshaft Balancer Installer

Fig. 408: EN-50050 Crankshaft Locking Device
Courtesy of GENERAL MOTORS COMPANY

1. Install the **EN 50050** crankshaft locking device. Lock the flywheel via the starter ring gear.

Fig. 409: Crankshaft Balancer Bolt
Courtesy of GENERAL MOTORS COMPANY

2. Install **EN-51218** crankshaft balancer installer or equivalent to the crankshaft balancer (2).

CAUTION: Refer to Fastener Caution .

NOTE: When installing the crankshaft balancer, the cam and the groove must align.

3. Install the crankshaft balancer (2) to the crankshaft and tighten the bolt (1) to $95 + 55^\circ$ (70 lb ft + 55°).

AUTOMATIC TRANSMISSION FLEX PLATE INSTALLATION

Special Tools

EN 50050 Crankshaft Locking Device

For equivalent regional tools, refer to Special Tools.

Fig. 410: Automatic Transmission Flex Plate Bolts And Automatic Transmission Flex Plate Retainer

Courtesy of GENERAL MOTORS COMPANY

1. Install the automatic transmission flex plate spacer (4).
2. Install the automatic transmission flex plate (3).
3. Install the automatic transmission flex plate retainer (2).
4. Install the 6 automatic transmission flex plate bolts (1).

Fig. 411: EN 50050 Crankshaft Locking Device
Courtesy of GENERAL MOTORS COMPANY

5. Install the **EN 50050** crankshaft locking device, lock the automatic transmission flex plate via the starter ring gear.

CAUTION: Refer to Fastener Caution .

6. Tighten the 6 automatic transmission flex plate bolts to 20 + 25° (15 lb ft + 25°).
7. Remove the **EN 50050** crankshaft locking device.

ENGINE FLYWHEEL INSTALLATION

Special Tools

EN-50050 Crankshaft Locking Device

For equivalent regional tools, refer to **Special Tools**.

Fig. 412: Flywheel And Bolts

Courtesy of GENERAL MOTORS COMPANY

1. Install the flywheel (1).
2. Install the 6 flywheel bolts (2).
3. Install the **EN-50050** crankshaft locking device and lock the flywheel via the starter ring gear.

CAUTION: Refer to Fastener Caution .

4. Tighten the 6 flywheel bolts to 20 (15 lb ft + 25°).
5. Remove the **EN-50050** crankshaft locking device.

EXHAUST MANIFOLD HEAT SHIELD REMOVAL

Fig. 413: Exhaust Manifold Heat Shield Bolts
Courtesy of GENERAL MOTORS COMPANY

1. Remove the 4 exhaust manifold heat shield bolts (1).
2. Remove the exhaust manifold heat shield (2).

EXHAUST MANIFOLD REMOVAL

Fig. 414: Exhaust Manifold Bolts

Courtesy of GENERAL MOTORS COMPANY

1. Remove the 10 exhaust manifold bolts (2).
2. Remove the exhaust manifold (3) and gasket (1).
3. Clean all of the gasket surfaces.

CYLINDER HEAD DISASSEMBLE

Special Tools

- EN 46116 Valve Stem Seal Remover/Installer
- EN 46569 Valve Spring Compressor - Head Off
- EN 49075 Valve Spring Compressor Adapter

For equivalent regional tools, refer to **Special Tools**.

Fig. 415: EN 46569 Valve Spring Compressor
Courtesy of GENERAL MOTORS COMPANY

WARNING: Compressed valve springs have high tension against the valve spring compressor. Valve springs that are not properly compressed by or released from the valve spring compressor can be ejected from the valve spring compressor with intense force. Use care when compressing or releasing the valve spring with the valve spring compressor and when removing or installing the valve stem keys. Failing to use care may cause personal injury.

CAUTION: Do not compress the valve springs to less than 24.0 mm (0.943 in). Contact between the valve spring retainer and the valve stem oil seal can cause potential valve stem oil seal damage.

1. Compress the valve spring using the **EN 46569** valve spring compressor - head off and the **EN 49075** valve spring compressor adapter.
2. Use the magnet of the in order to remove the valve collets.
3. Remove the valve spring compressor and the adapter.

Fig. 416: Retainer And Valve Spring
Courtesy of GENERAL MOTORS COMPANY

4. Remove the valve spring retainer (1).
5. Remove the valve spring (2).

Fig. 417: View of Special Tool EN 46116 & Cylinder Head
Courtesy of GENERAL MOTORS COMPANY

NOTE: **NEVER** reuse a valve stem oil seal.

6. Remove the valve stem oil seal using the **EN 46116** valve stem seal remover/installer.
7. Discard the valve stem oil seals.

Fig. 418: Valve

Courtesy of GENERAL MOTORS COMPANY

8. Remove the valve (1).
9. Repeat these procedures for the remaining valves.

CYLINDER HEAD CLEANING AND INSPECTION

Cleaning Procedure

1. Remove any old thread sealant, gasket material or sealant.
2. Clean all cylinder head surfaces with non-corrosive solvent.

WARNING: Refer to Safety Glasses and Compressed Air Warning .

3. Blow out all the oil galleries using compressed air.
4. Remove any carbon deposits from the combustion chambers.
5. Clean any debris or build-up from the lifter pockets.

Visual Inspection

1. Inspect the cylinder head camshaft bearing surfaces for the following conditions:
 - Scoring or pitting above acceptable tolerances
 - Discoloration from overheating
 - Deformation from wear above acceptable tolerances
 - If the camshaft bearing journals appear to be scored or damaged, you must replace the cylinder head. DO NOT machine the camshaft bearing journals.
2. If any of the above conditions exist on the camshaft bearing surfaces, replace the cylinder head.
3. Inspect the cylinder head for the following:
 - Cracks, damage or pitting in the combustion chambers
 - Debris in the oil galleries-Continue to clean the galleries until all debris is removed.
 - Coolant leaks or damage to the deck face sealing surface-If coolant leaks are present, measure the surface warpage as described under Cylinder Head Measurement - Deck Flatness Inspection.
 - Burrs or any defects that may degrade the sealing of the NEW secondary camshaft drive chain tensioner gasket
 - Damage to any gasket surfaces
 - Damage to any threaded bolt holes
 - Burnt or eroded areas in the combustion chamber
 - Cracks in the exhaust ports and combustion chambers
 - External cracks in the water passages
 - Restrictions in the intake or exhaust passages
 - Restrictions in the cooling system passages
 - Rusted, damaged or leaking core plugs
4. If the cylinder head is cracked or damaged, it must be replaced. No welding or patching of the cylinder head is recommended.

Cylinder Head Measurement

Deck Flatness Inspection

Fig. 419: Cylinder Head And Straight-Edge
Courtesy of GENERAL MOTORS COMPANY

1. Ensure the cylinder head (1) decks are clean and free of gasket material.
2. Inspect the surface for any imperfections or scratches that may inhibit correct cylinder head gasket sealing.
3. Place a straight-edge (2) diagonally across the cylinder head (1) deck face surface.
4. Measure the clearance between the straight-edge (2) and the cylinder head (1) deck face using a feeler gage at 4 points along the straight-edge (2).
 - If the warpage is less than 0.05 mm (0.002 in), the cylinder head (1) deck surface does not require resurfacing.
 - If the warpage is between 0.05-0.20 mm (0.002-0.008 in) or any imperfections or scratches that may inhibit correct cylinder head gasket sealing are present, the cylinder head (1) deck surface requires resurfacing.
 - If the cylinder head (1) deck surface requires more than 0.25 mm (0.010 in) material removal the cylinder head (1) must be replaced.

CYLINDER HEAD ASSEMBLE

Special Tools

- **EN 46116** Valve Stem Seal Remover/Installer
- **EN 46569** Valve Spring Compressor - Head Off
- **EN 49075** Valve Spring Compressor Adapter

For equivalent regional tools, refer to **Special Tools**.

Fig. 420: View Of EN 46116 & Valve Stem Seal
 Courtesy of GENERAL MOTORS COMPANY

NOTE: NEVER reuse a valve stem oil seal (2). Always use new seals when assembling the cylinder head.

1. Mount a new valve stem oil seal (2) using the **EN 46116** valve stem seal remover/installer.

NOTE: Force should only be applied to the valve spring contact area of the new valve stem oil seal (2) during installation.

2. Push and twist the valve stem oil seal (2) into position on the valve guide until the seal positively locks on the guide using the **EN 46116** valve stem seal remover/installer.
3. Lubricate the valve stem and valve guide ID with clean engine oil.

Fig. 421: Valve

Courtesy of GENERAL MOTORS COMPANY

NOTE: The valve stem oil seal must not come loose from the valve guide when the valve is installed.

4. Insert the valve (1) into the valve guide until it bottoms on the valve seat.

Fig. 422: Retainer And Valve Spring
Courtesy of GENERAL MOTORS COMPANY

5. Install the valve spring (2).
6. Place the valve spring retainer (1) onto the valve spring (2).

Fig. 423: EN 46569 Valve Spring Compressor
Courtesy of GENERAL MOTORS COMPANY

WARNING: Compressed valve springs have high tension against the valve spring compressor. Valve springs that are not properly compressed by or released from the valve spring compressor can be ejected from the valve spring compressor with intense force. Use care when compressing or releasing the valve spring with the valve spring compressor and when removing or installing the valve stem keys. Failing to use care may cause personal injury.

CAUTION: Do not compress the valve springs to less than 24.0 mm (0.943 in). Contact between the valve spring retainer and the valve stem oil seal can cause potential valve stem oil seal damage.

7. Compress the valve spring using the **EN 46569** valve spring compressor - head off and the **EN 49075** valve spring compressor adapter.

NOTE: Ensure correct directional placement of valve collets. The valve collets must be installed with the tapered end towards the valve stem seal.

8. With the spring compressed, install the valve collets.

9. Remove the **EN 46569** valve spring compressor - head off and the **EN 49075** valve spring compressor adapter.
10. Verify that the valve collets are installed by placing a rag over the valve tip and tapping with a dead-blow hammer. The valve keepers and the spring should remain in place.

EXHAUST MANIFOLD INSTALLATION

1. Clean the exhaust manifold sealing surface.

Fig. 424: Exhaust Manifold Bolts
Courtesy of GENERAL MOTORS COMPANY

2. Install a NEW exhaust manifold gasket (1) to the exhaust manifold.
3. Install the exhaust manifold (3).

CAUTION: Refer to Fastener Caution .

4. Install the new exhaust manifold bolts (2) and tighten to 20 (15 lb ft).

EXHAUST MANIFOLD HEAT SHIELD INSTALLATION

Fig. 425: Exhaust Manifold Heat Shield Bolts
Courtesy of GENERAL MOTORS COMPANY

1. Install the exhaust manifold heat shield (2).

CAUTION: Refer to Fastener Caution .

2. Install the 4 exhaust manifold heat shield bolts (1) and tighten to 9 (80 lb in).

DESCRIPTION AND OPERATION

ENGINE COMPONENT DESCRIPTION

Cylinder Block

The cylinder hollow frame structured 4 cylinder in-line. The block has 5 crankshaft bearings with the thrust bearing located on the third bearing from the front of the engine.

Crankshaft

The crankshaft is a steel crankshaft. It is supported in 5 main journals with main bearings which have oil

clearance for lubricating. The 3rd bearing of the 5 main bearing is the thrust bearing whose the crankshaft has properly axial end play. A harmonic damper is used to control torsional vibration.

Oil Pump

The oil pump is a crankshaft driven oil pump integrated in pump module. The oil pump draws engine oil from the oil pan and feeds it under pressure to the various parts of the engine. An oil strainer is mounted before the inlet of the oil pump to remove impurities which could clog or damage the oil pump or other engine components. When the crankshaft rotates, the oil pump driven gear rotates. This causes the space between the gears to constantly open and narrow, pulling oil in from the oil pan when the space opens and pumping the oil out to the engine as it narrows. At high engine speeds, the oil pump supplies a much higher amount of oil than required for lubrication of the engine. The oil pressure regulator prevents too much oil from entering the engine lubrication passages.

Oil Pan

The oil pan is a stamping (steel) component include baffle and oil drain plug. The oil pan is attached at the engine block.

Piston and Connecting Rod

The pistons are aluminum pistons with anodized top ring groove. The connecting rods are fractured steel connecting rods with bushing and floating pin type.

Cylinder Head

This cylinder head is double over head camshaft (DOHC) type and has 2 camshafts that open 4 valves per cylinder with tappets. The camshaft sprocket wheels are installed in front of the camshafts. The cylinder head is made of cast aluminum alloy for better strength in hardness with light weight. The combustion chamber of the cylinder head is designed for increasing of squish and swirl efficiency and then this is maximized to gasoline combustion efficiency.

Valves

There are 2 intake and 2 exhaust valves with tappets per cylinder.

Camshaft

Two camshafts are used, one for all intake valves, the other for all exhaust valves. The camshafts are cast iron. The camshafts are driven by the crankshaft over the timing belt.

Camshaft Drive

A timing chain is used for camshaft drive. There is a tensioner to control the tension of the chain.

Intake Manifold

The intake manifold is the air flow passage to the cylinder combustion chamber through the throttle body and has an effect on engine torque, power, noise, driveability, emission, fuel economy and performance. It is made of plastic for better strength in hardness with little weight.

Exhaust Manifold

The exhaust manifold is located to the cylinder head and channels the exhaust gas out of the combustion chamber. It is designed to endure on high pressure and high temperature.

Positive Crankcase Ventilation System

The crankcase ventilation system is used to consume crankcase vapors in the combustion process instead of venting vapors to the atmosphere. Fresh air from the intake system is supplied to the crankcase, mixed with blow-by gases and then passed through a calibrated orifice into the throttle body. The primary control is through the positive crankcase ventilation (PCV) orifice which meters the flow at a rate depending on inlet vacuum. The PCV orifice is an integral part of the camshaft cover. If abnormal operating conditions occur, the system is designed to allow excessive amounts of blow-by gases to back flow through the crankcase vent into the intake system to be consumed by normal combustion.

CLEANLINESS AND CARE

An automobile engine is a combination of many machined, honed, polished and lapped surfaces with tolerances that are measured in ten thousandths of an inch. When any internal engine parts are serviced, care and cleanliness are important. A liberal coating of engine oil should be applied to friction areas during assembly to protect and lubricate the surfaces during initial operation. Throughout this section, it should be understood that proper cleaning and protection of machined surfaces and friction areas are part of the repair procedure. This is considered standard shop practice even if not specifically stated.

When valve train components are removed for service, they should be retained in order. At the time of installation, they should be installed in the same locations and with the same mating surfaces as when removed.

SEPARATING PARTS

NOTE:

- **Disassembly of the piston, press fit design piston pin and connecting rod may create scoring or damage to the piston pin and piston pin bore. If the piston, pin and connecting rod have been disassembled, replace the components as an assembly.**
- **Many internal engine components will develop specific wear patterns on their friction surfaces.**
- **When disassembling the engine, internal components MUST be separated, marked or organized in a way to ensure installation to their original location and position.**

Separate, mark or organize the following components:

- Piston and the piston pin

- Piston to the specific cylinder bore
- Piston rings to the piston
- Connecting rod to the crankshaft journal
- Connecting rod to the bearing cap-A paint stick or etching/engraving type tool are recommended. Stamping the connecting rod or cap near the bearing bore may affect component geometry.
- Crankshaft main and connecting rod bearings
- Camshaft and valve tappets
- Valve to the valve guide
- Valve spring and shim to the cylinder head location
- Engine block main bearing cap location and direction
- Oil pump drive and driven gears

REPLACING ENGINE GASKETS

Gasket Reuse and Applying Sealants

- Do not reuse any gasket unless specified.
- Gaskets that can be reused will be identified in the service procedure.
- Do not apply sealant to any gasket or sealing surface unless called out in the service information.

Separating Components

- Use a rubber mallet to separate components.
- Bump the part sideways to loosen the components.
- Bumping should be done at bends or reinforced areas to prevent distortion of parts.

Cleaning Gasket Surfaces

- Remove all gasket and sealing material from the part using a scraping tool.
- Care must be used to avoid gouging or scraping the sealing surfaces.
- Do not use any other method or technique to remove sealant or gasket material from a part.
- Do not use abrasive pads, sand paper or power tools to clean the gasket surfaces.
 - These methods of cleaning can cause damage to the component sealing surfaces.
 - Abrasive pads also produce a fine grit that the oil filter cannot remove from the oil.
 - This grit is abrasive and has been known to cause internal engine damage.

Assembling Components

- When assembling components, use only the sealant specified or equivalent in the service procedure.
- Sealing surfaces should be clean and free of debris or oil.
- Specific components such as crankshaft oil seals or valve stem oil seals may require lubrication during assembly.

- Components requiring lubrication will be identified in the service procedure.
- When applying sealant to a component, apply the amount specified in the service procedure.
- Do not allow the sealant to enter into any blind threaded holes, as it may prevent the bolt from clamping properly or cause component damage when tightened.
- Tighten bolts to specifications. Do not over tighten.

Cleaning Sealant (RTV) Surface and Application

- Sealant (RTV) sealing surface and mating surface must be free of any evidence oils, machining fluids and any liquid or solid residue on sealing surface to assure sealant (RTV) adhesion.
- Clean approved solvent based cleaner (LPS Precision, Zero TRI cleaner (PN03520) with dry lint-free clothes to wipe surface. Lint-free cloths cannot be reused.
- In case of maximum open time (8 minutes) with joint not closed after RTV dispensing, Remove cured sealant (RTV) squeeze-out carefully.

Pipe Joint Compound

NOTE: Three types of sealer are commonly used in engines. These are RTV sealer, anaerobic gasket eliminator sealer and pipe joint compound. The correct sealer and amount must be used in the proper location to prevent oil leaks. DO NOT interchange the 3 types of sealers. Use only the specific sealer or the equivalent as recommended in the service procedure.

- Pipe joint compound is a pliable sealer that does not completely harden. This type sealer is used where 2 non-rigid parts, such as the oil pan and the engine block, are assembled together.
- Do not use pipe joint compound in areas where extreme temperatures are expected. These areas include: exhaust manifold, head gasket or other surfaces where gasket eliminator is specified.
- Follow all safety recommendations and directions that are on the container.

To remove the sealant or the gasket material.

- Apply the pipe joint compound to a clean surface. Use a bead size or quantity as specified in the procedure. Run the bead to the inside of any bolt holes. Do not allow the sealer to enter any blind threaded holes, as it may prevent the bolt from clamping properly or cause component damage when the bolt is tightened.
- Apply a continuous bead of pipe joint compound to one sealing surface. Sealing surfaces to be resealed must be clean and dry.
- Tighten the bolts to specifications. Do not over tighten.

TOOLS AND EQUIPMENT

Special tools are listed and illustrated throughout this section with a complete listing at the end of the section. These tools or their equivalents, are specially designed to quickly and safely accomplish the operations for which they are intended. The use of these special tools will also minimize possible damage to engine components. Some precision measuring tools are required for inspection of certain critical components. Torque

wrenches and a torque angle meter are necessary for the proper tightening of various fasteners.

To properly service the engine assembly, the following items should be readily available:

- Approved eye protection and safety gloves
- A clean, well lit, work area
- A suitable parts cleaning tank
- A compressed air supply
- Trays or storage containers to keep parts and fasteners organized
- An adequate set of hand tools
- Approved engine repair stand
- An approved engine lifting device that will adequately support the weight of the components

REPAIR INSTRUCTIONS

CENTER PILLAR APPLIQUE REPLACEMENT

Fig. 1: Center Pillar Applique

Courtesy of GENERAL MOTORS COMPANY

Center Pillar Applique Replacement

Callout	Component Name
Preliminary Procedure Open the front and rear side doors.	
1	Center Pillar Applique Procedure 1. Fit the tape pre-mask line to the panel character line. 2. Peel off the inside paper. 3. Attach the tape to the door panel. 4. Press the tape by using the squeegee or equivalent. 5. Peel off the outside paper. 6. Inspect the tape is properly attached. NOTE: This applique is an adhesive tape.

FRONT SIDE DOOR WINDOW FRAME FRONT APPLIQUE REPLACEMENT

Fig. 2: Front Side Door Window Frame Front Applique
Courtesy of GENERAL MOTORS COMPANY

Front Side Door Window Frame Front Applique Replacement

Callout	Component Name
Preliminary Procedures 1. Remove the outside rearview mirror. Refer to <u>Outside Rearview Mirror Replacement</u> . 2. Remove the front side door stationary window. Refer to <u>Front Side Door Stationary Window Replacement</u> .	
1	Front Side Door Window Frame Front Applique Procedure 1. Fit the tape pre-mask line to the panel character line. 2. Peel off the inside paper. 3. Attach the tape to the door panel. 4. Press the tape by using a squeegee or equivalent. 5. Peel off the outside paper. 6. Wrap the corner areas of the tape. 7. Inspect the tape is properly attached. NOTE: This applique is an adhesive tape.

FRONT SIDE DOOR WINDOW FRAME REAR APPLIQUE REPLACEMENT

Fig. 3: NO CONTENT

Courtesy of GENERAL MOTORS COMPANY

Front Side Door Window Frame Rear Applique Replacement

Callout	Component Name
Preliminary Procedures 1. Remove the front side door window outer sealing strip. Refer to <u>Front Side Door Window Outer Sealing Strip Replacement</u> . 2. Grasp upper corner of the window weatherstrip, pull downward releasing the assembly from the door frame. NOTE: Do not need to remove the weatherstrip assembly. Just partially peel off the weatherstrip to attach the tape.	
1	Front Side Door Window Frame Rear Applique Procedure 1. Fit the tape pre-mask line to the panel character line. 2. Peel off the inside paper. 3. Attach the tape to the door panel. 4. Press the tape by using a squeegee or equivalent. 5. Peel off the outside paper. 6. Wrap the corner areas of the tape. 7. Inspect the tape is properly attached. NOTE: This applique is an adhesive tape.

FRONT FOG LAMP BEZEL REPLACEMENT

Fig. 4: Front Fog Lamp Bezel
 Courtesy of GENERAL MOTORS COMPANY

Front Fog Lamp Bezel Replacement

Callout	Component Name
1	Front Fog Lamp Bezel Screw (Qty: 8) CAUTION: Refer to <u>Fastener Caution</u> . Tighten 2.5 (23 lb in)
2	Front Fog Lamp Bezel Assembly Procedure 1. Lift the vehicle. 2. Remove the tire and wheel. Refer to <u>Tire and Wheel Removal and Installation</u> . 3. Remove the front wheelhouse liner. Refer to <u>Front Wheelhouse Liner Replacement</u> . 4. Release the bezel assembly taps. 5. Remove the front fog lamp bezel assembly.
3	Front Bumper Fascia Lower Molding
4	Front Fog Lamp Chrome Insert

FRONT LICENSE PLATE BRACKET REPLACEMENT**Fig. 5: Front License Plate Bracket**

Courtesy of GENERAL MOTORS COMPANY

Front License Plate Bracket Replacement

Callout	Component Name
1	Front License Plate Bracket Screw (Qty: 4) CAUTION: Refer to <u>Fastener Caution</u> . Tighten 2.5 (23 lb in)
2	Front License Plate Bracket

DECAL OR STRIPE REPLACEMENT**Decal Work Overview**

1. Wash the car.
2. Check the car surface.
3. If the metal or underlying painted surfaces are damaged, repair and refinish the metal as needed before

you install the stripes or decals.

CAUTION: Striping material highlights vehicle surface imperfection. All dings, rough metal, paint defects and uneven two-tone paint breaklines must be eliminated before stripe/decals application. Freshly painted surfaces must be allowed to dry thoroughly before installing stripe or decal. Residual solvents in fresh painted surfaces can lead to subsequent blistering problems if stripe or decal is applied before complete release of solvents.

4. Maintain body surface and decal temperature between 21-38°C (70 -100°F) during installation.

NOTE: DO NOT apply the decals when the body surface and the decal temperatures are below 21°C (70°F).

5. Use auxiliary heat sources to warm the body surface and decals if the temperature is less than 21°C (70°F).
6. Follow the decal installation order.
 - Liftgate Decal - Spoiler Decal - Roof Decal
 - Hood Decal is not related to installation order.
7. Dry decals at least 20 minute.
8. DO NOT wash the car for 72 hours after decal installation.

Necessary Equipment and Materials

- Soap and water solution
- Isopropyl alcohol
- Squeegee about 75-100 mm (3-4 in) wide, plastic or hard rubber. Deburr any sharp or rough edges in order to prevent scratching of the stripe or decal
- Water bucket and sponge or spray bottle
- Heat gun
- Clean, lint-free wiping cloth
- Sharp knife or razor blade
- Fine pin or needle
- Marking pencil
- Roof decal template (attached at the end of the decal installation procedure)

Decal Composition

Fig. 6: Identifying Premask Carrier Stripe And Release Liner
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
1	Premask Carrier
2	Stripe (Decal)
3	Release Liner
4	Carrier Extension Locating Fixture

Decal Location

Fig. 7: Identifying Hood Decal And Roof Decal (Stripe)
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
1	Hood Decal (Stripe)
2	Roof Decal (Stripe)
3	Liftgate Decal (Stripe)
4	Spoiler Decal (Stripe)

Removal Procedure

1. Wash and clean the following items using Liquid Wash and Wax GM P/N 1052870 or the equivalent:
 - The repair surfaces
 - The adjacent panel

CAUTION: To avoid damaging the paint finish, do not use pointed or sharp instruments to remove the stripe or the decal.

2. Use heat in order to remove the stripe or decal.

Start at one edge and peel the stripe or decal from the panel surface.

3. Remove all traces of adhesive residue from the painted surfaces using the following items:

- Silicone, wax and grease remover
- Varnish makers and painters (VM&P) naphtha

Installation Procedure

Hood Stripe

Fig. 8: Hood Stripe

Courtesy of GENERAL MOTORS COMPANY

1. Clean the hood area where you apply the stripe or decal. Use a 70/30 mixture of isopropyl alcohol and water.

2. Wipe the panel surface with a clean cloth while the solvent dries.
3. Spray the surface of the hood with the soap and water solution.
4. Place the stripe on a flat surface with the premask side down (the smooth white liner will be facing up).
5. Remove the liner from the stripe. This will expose the adhesive layer of the stripe.
6. Spray the adhesive layer with the soap and water solution.
7. Slide the stripe into place, aligning the holes in the stripe around the nozzles (2) while aligning the rear premask edge to the rear of the hood panel (1).
8. Spray the soap and water solution on the surface of the premask and use a squeegee to press the stripe into place. Begin at the center and press into place across the width (side to side).
9. Use the squeegee to press the rear portions into place.
10. Press each of the front stripe portions into place independently of each other. Note that the center cut line (3) in the premask in the front of the stripe will align together, leaving the stripe in the proper position.
11. Carefully remove the premask from the stripe. Do not pull off at a 90 degree angle, remove it at 180 degrees (back on top of itself).
12. Inspect the stripe for bubbles and repress into place with the squeegee or use the pin to put a small hole into the side of the bubble and press the solution out.

Liftgate Stripe

Fig. 9: Liftgate Stripe

Courtesy of GENERAL MOTORS COMPANY

1. Clean the liftgate area where you apply the stripe or decal. Use a 70/30 mixture of isopropyl alcohol and water.
2. Wipe the panel surface with a clean cloth while the solvent dries.
3. Spray the surface of the liftgate with the soap and water solution.
4. The side to side center-point and mark with panel must be determined. Use a tape measure to find the center-point and mark with a grease pencil or a piece of masking tape.

5. Place the stripe on a flat surface with the premask side down (the smooth white liner will be facing up).
6. Remove the liner from the stripe. This will expose the adhesive layer of the stripe.
7. Spray the adhesive layer with the soap and water solution.
8. Slide the stripe into place, aligning the front and side premask edges to the liftgate panel edges (1) and to the "arrow (2)" in the center of the premask with the center-point.
9. Spray the soap and water solution on the surface of the premask and use a squeegee to press the stripe into place. Begin at the center and press into place across the width (side to side).
10. Carefully remove the premask from the stripe. Do not pull off at a 90 degree angle, remove it at 180 degrees (back on top of itself).
11. Inspect the stripe for bubbles and repress into place with the squeegee or use the pin to put a small hole into the side of the bubble and press the solution out.

Spoiler Stripe

Fig. 10: Liftgate Stripe And Spoiler Panel Edge
Courtesy of GENERAL MOTORS COMPANY

1. Install after the liftgate stripe.
2. Clean the spoiler area where you apply the stripe or decal. Use a 70/30 mixture of isopropyl alcohol and water.
3. Wipe the panel surface with a clean cloth while the solvent dries.
4. Spray the surface of the spoiler with the soap and water solution.

5. Place the stripe on a flat surface with the premask side down (the smooth white liner will be facing up).
6. Remove the liner from the stripe. This will expose the adhesive layer of the stripe.
7. Spray the adhesive layer with the soap and water solution.
8. Slide the stripe into place, aligning the front premask edge to the spoiler panel edge (1) and the premask extension tabs in alignment with the installed liftgate stripe (2).
9. Spray the soap and water solution on the surface of the premask and use a squeegee to press the stripe into place. Begin at the center and press into place across the width (side to side).
10. Carefully remove the premask from the stripe. Do not pull off at a 90 degree angle, remove it at 180 degrees (back on top of itself).
11. Inspect the stripe for bubbles and repress into place with the squeegee or use the pin to put a small hole into the side of the bubble and then press the solution out.

Roof Stripe

Fig. 11: Roof Stripe

Courtesy of GENERAL MOTORS COMPANY

1. Install after the liftgate and spoiler stripes.

NOTE: Print and use the attached roof decal template when installing the roof decal.

2. Use a tape measure to find the center point of the roof at the front and mark with a grease pencil or with masking tape.
3. Clean the roof area where you apply the stripe or decal. Use a 70/30 mixture of isopropyl alcohol and water.
4. Wipe the panel surface with a clean cloth while the solvent dries.
5. Align a roof decal template (1) at the marked front - center points and mark side edge of roof decal template with a grease pencil.
6. Spray the surface of the spoiler with the soap and water solution.
7. Place the stripe on a flat surface with the premask side down (the smooth white liner will be facing up).
8. Remove the liner from the left roof stripe. This will expose the adhesive layer of the stripe.
9. Spray the adhesive layer with the soap and water solution.
10. Slide the roof stripe into place, aligning the inner edge (2) of the premask to the side edges of the roof decal template. The front premask edges should also align to the panel edges (3). And align the roof stripe premask extension tabs to the installed liftgate stripe (4).
11. Spray the soap and water solution on the surface of the premask and use a squeegee to press the stripe into place. Begin at the center and press into place across the width (side to side) and then toward the front and rear of the stripe.
12. Carefully remove the premask from the left roof stripe. Do not pull off at a 90 degree angle, remove it at 180 degrees (back on top of itself).
13. Inspect the left roof stripe for bubbles and repress into place with the squeegee or use the pin to put a small hole into the side of the bubble and press the solution out.
14. Repeat for the other side roof stripe.

Fig. 12: Measuring Center Point Of Roof
 Courtesy of GENERAL MOTORS COMPANY

RADIATOR GRILLE EMBLEM/NAMEPLATE REPLACEMENT

Fig. 13: Radiator Grille Emblem Assembly
 Courtesy of GENERAL MOTORS COMPANY

Radiator Grille Emblem/Nameplate Replacement

Callout	Component Name
Preliminary Procedure Remove the front bumper fascia. Refer to <u>Front Bumper Fascia Replacement</u> .	
1	Radiator Grille Emblem Screw (Qty: 2) CAUTION: Refer to <u>Fastener Caution</u> . Tighten 2.5 N.m (23 lb in)
2	Radiator Grille Emblem Assembly

LIFTGATE EMBLEM/NAMEPLATE REPLACEMENT

Fig. 14: Liftgate Emblem/Nameplate
 Courtesy of GENERAL MOTORS COMPANY

Liftgate Emblem/Nameplate Replacement

Callout	Component Name
1	Liftgate Emblem Assembly CAUTION: Refer to <u>Exterior Trim Emblem Removal Caution</u> . Procedure 1. The part and surface should be 21°C (70°F) prior to installation. The vehicle should remain 21°C (70°F) for one hour after assembly to allow adhesive to develop sufficient bond strength. 2. Use a Heat Gun or equivalent to remove the old nameplate. Clean all adhesive from the rear compartment panel and wipe the surface dry with a clean lint-free towel prior to installing the new nameplate. 3. When removing protective liners from the adhesive tape, be careful not to touch tape with hands and do not allow tape to come in contact with dirt or any foreign matter prior to adhesion. 4. Close the rear compartment lid prior to adhesion. 5. Using the palm of the hand, wet out the emblem to the rear compartment lid to ensure full adhesion of the emblem is made.

FRONT GRILLE REPLACEMENT

Fig. 15: Radiator Grille Assembly
Courtesy of GENERAL MOTORS COMPANY

Front Grille Replacement

Callout	Component Name
Preliminary Procedure Remove the front bumper fascia. Refer to Front Bumper Fascia Replacement .	
1	Radiator Grille Screw (Qty: 6) CAUTION: Refer to Fastener Caution . Tighten 2.0 N.m (18 lb in)
2	Radiator Grille Assembly

FRONT UPPER GRILLE REPLACEMENT

Fig. 16: Front Upper Grille
 Courtesy of GENERAL MOTORS COMPANY

Front Upper Grille Replacement

Callout	Component Name
Preliminary Procedure Remove the front bumper fascia. Refer to Front Bumper Fascia Replacement .	
1	Radiator Upper Grille Screw (Qty: 8) CAUTION: Refer to <u>Fastener Caution</u> . Tighten 2 (18 lb in)
2	Radiator Upper Grille Assembly

FRONT LOWER GRILLE REPLACEMENT

Fig. 17: Front Lower Grille
 Courtesy of GENERAL MOTORS COMPANY

Front Lower Grille Replacement

Callout	Component Name
Preliminary Procedure Remove the front bumper fascia. Refer to Front Bumper Fascia Replacement .	
1	Radiator Lower Grille Screw (Qty: 8) CAUTION: Refer to Fastener Caution . Tighten 2 (18 lb in)
2	Radiator Lower Grille Assembly

ROCKER PANEL MOLDING REPLACEMENT

Fig. 18: Rocker Panel Molding
Courtesy of GENERAL MOTORS COMPANY

Rocker Panel Molding Replacement

Callout	Component Name
Preliminary Procedures	
1. Raise and support the vehicle. Refer to <u>Lifting and Jacking the Vehicle</u> . 2. Remove the wheel and wheel assemblies. Refer to <u>Tire and Wheel Removal and Installation</u> .	
1	Rocker Panel Molding Screw (Qty: 5) CAUTION: Refer to <u>Fastener Caution</u> . Tighten 1.5 (13 lb in)
2	Rear Wheelhouse Extension
3	Rocker Panel Molding Retaining Clip (Qty: 6)
4	Rocker Panel Molding
5	Front Rocker Panel Molding Protect Film NOTE: When installing new parts, attach the protect film to molding.
6	Front Rocker Panel Molding Inside Clip (Qty: 9)

7

Front Rocker Panel Molding Double-Sided Adhesive Tape (Qty: 3)

NOTE:

When installing new parts, attach the double-sided adhesive tape to molding.

ROOF PANEL JOINT FINISH MOLDING REPLACEMENT**Fig. 19: Roof Panel Joint Finish Molding**

Courtesy of GENERAL MOTORS COMPANY

Roof Panel Joint Finish Molding Replacement

Callout	Component Name
Preliminary Procedure Begin at the rear window and lift the molding from the ditch, disengaging the molding from the four integral ditch retaining clips.	
1	Roof Panel Joint Finish Molding Assembly Procedure 1. Begin at the front windshield, tuck the finish molding tab to the front roof header. 2. Using a roller-type tool, roll the ditch molding into the ditch securing the molding to each of the four integral ditch retainers. 3. Inspect the levelness of the ditch molding to the roof panel. 4. If not level, roll the area again to achieve a smooth fit to the ditch.

REAR END SPOILER REPLACEMENT

Fig. 20: Rear End Spoiler
Courtesy of GENERAL MOTORS COMPANY

Rear End Spoiler Replacement

Callout	Component Name
Preliminary Procedures 1. Open the liftgate. 2. Detach the nut cover tape.	
1	Rear End Spoiler Nut (Qty: 8) CAUTION: Refer to <u>Fastener Caution</u> . Tighten 5 (44 lb in)
2	Rear End Spoiler NOTE: If the stop lamp is equipped, disconnect the center high mount stop lamp wiring harness before removing the rear end spoiler.

DIAGNOSTIC INFORMATION AND PROCEDURES

DIAGNOSTIC CODE INDEX

DIAGNOSTIC CODE INDEX

DTC	Description
<u>DTC B0283</u>	DTC B0283 02 Rear Defrost Circuit Short To Ground DTC B0283 05 Rear Defrost Circuit High Voltage/Open
<u>DTC B0969</u>	DTC B0969 Rear Defog Indicator Circuit

DTC B0283: REAR DEFROST CIRCUIT

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

DTC Descriptors

DTC B0283 02

Rear Defrost Circuit Short To Ground

DTC B0283 05

Rear Defrost Circuit High Voltage/Open

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Control	B0283 02	B0283 05	B0283 05	-
Ground	-	B0283 05	-	-

Circuit/System Description

Battery positive voltage is supplied through a 30A fuse in the underhood fuse block, to the rear defogger relay switched input. When the rear window defogger switch is pressed, The Body Control Module commands the rear window defogger system by supplying voltage to the rear defogger relay coil. The rear defogger relay is energized and the defogger indicator is illuminated. With the relay energized, battery positive voltage is allowed from the relay switched input through the switch contacts and out the relay switched output to the rear window defogger grid.

Conditions for Running the DTC

Battery voltage must be between 9-16 V.

Conditions for Setting the DTC

B0283 02

The Body Control Module detects a short to ground in the relay control circuit.

B0283 05

The Body Control Module detects a short to voltage or an open/high resistance in the relay control circuit.

Action Taken When the DTC Sets

The Body Control Module will attempt to command the rear defog relay, but the rear window defogger grid will

remain inoperative.

Conditions for Clearing the DTC

- The DTC will be current for as long as the fault is present.
- When the fault is no longer present, the DTC will be a history DTC.
- A history DTC will clear after 50 ignition cycles.

Description and Operation

Rear Window Defogger Description and Operation

Electrical Information Reference

- **Circuit Testing**
- **Connector Repairs**
- **Testing for Intermittent Conditions and Poor Connections**
- **Wiring Repairs**

Scan Tool Reference

Control Module References for scan tool information

Circuit/System Verification

1. Engine Running.
2. Verify the E18 Rear Defogger Grid turns ON and OFF when commanding the Rear Defogger Active and Inactive with a scan tool.
 - **If the E18 Rear Defogger Grid does not turn ON or OFF**

Refer to Circuit/System Testing

- **If the E18 Rear Defogger Grid turns ON and OFF**

3. All OK.

Circuit/System Testing

1. Ignition OFF and all vehicle systems OFF, disconnect the KR5 Rear Defogger Relay. It may take up to 2 minutes for all vehicle systems to power down.
2. Test for less than 10 ohms between the ground circuit terminal 85 and ground.
 - **If 10 ohms or greater**
 1. Ignition OFF.
 2. Test for less than 2 ohms in the ground circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - **If less than 10 ohms**
3. Connect a test lamp between the control circuit terminal 86 and the ground circuit terminal 85, Engine Running.
4. Verify the test lamp turns ON and OFF when commanding the Rear Defogger Active and Inactive with a scan tool.
 - **If the test lamp is always OFF**
 1. Ignition OFF, remove the test lamp, disconnect the harness connector at the K9 Body Control Module.
 2. Test for infinite resistance between the control circuit and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance
 3. Test for less than 2 ohms in the control circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, replace the K9 Body Control Module.
 - **If the test lamp is always ON**
 1. Ignition OFF, remove the test lamp, disconnect the harness connector at the K9 Body Control Module, Engine Running.
 2. Test for less than 1 V between the control circuit and ground.
 - If 1 V or greater, repair the short to voltage on the circuit.
 - If less than 1 V, replace the K9 Body Control Module.
 - **If the test lamp turns ON and OFF**
5. Test or replace the KR5 Rear Defogger Relay.

Component Testing

Relay Test

1. Ignition OFF, disconnect the KR5 Rear Defogger Relay.
2. Test for 60-180 ohms between terminals 85 and 86.
 - **If less than 60 ohms or greater than 180 ohms**

Replace the KR5 Rear Defogger Relay.
 - **If between 60-180 ohms**

3. Test for infinite resistance between the terminals listed below:

- 30 and 86
- 30 and 87
- 30 and 85
- 85 and 87
- **If less than infinite resistance**

Replace the KR5 Rear Defogger Relay.

- **If infinite resistance**

4. Install a 3 A fused jumper wire between relay terminal 85 and 12 V. Install a jumper wire between relay terminal 86 and ground.

5. Test for less than 2 ohms between terminals 30 and 87.

- **If 2 ohms or greater**

Replace the KR5 Rear Defogger Relay.

- **If less than 2 ohms**

6. All OK

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

- **Relay Replacement (Within an Electrical Center)** , **Relay Replacement (Attached to Wire Harness)**
- **Control Module References** for the Body Control Module replacement, programming and setup

DTC B0969: REAR DEFOG INDICATOR

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

DTC Descriptor

DTC B0969

Rear Defog Indicator Circuit

For symptom byte information refer to: **Symptom Byte List**

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Control	B0969 02	B0969 04	B0969 01	-

Circuit/System Description

The Body Control Module monitors the voltage level in the rear defog indicator control circuit. The voltage level should be low while the rear defog indicator is illuminated and the voltage will be near system voltage when the rear defog indicator is not illuminated.

Conditions for Running the DTC

When the rear defog indicator has been commanded ON.

Conditions for Setting the DTC

B0969 01

- The Body Control Module has detected a short to voltage while commanding the rear defog indicator.
- The condition must be present for greater than 2 seconds

B0969 02

- The Body Control Module has detected a short to ground while commanding the rear defog indicator.
- The condition must be present for greater than 2 seconds.

B0969 04

- The Body Control Module has detected an open/high resistance while commanding the rear defog indicator.
- The condition must be present for greater than 2 seconds.

Action Taken When the DTC Sets

B0969 01

The rear defog indicator will always be illuminated.

B0969 02 or B0969 04

The rear defog indicator will not illuminate when commanded by the Body Control Module.

Conditions for Clearing the DTC

- The DTC will be current for as long as the fault is present.
- When the fault is no longer present, the DTC will be a history DTC.

- A history DTC will clear after 50 ignition cycles.

Scan Tool Reference

Control Module References for scan tool information

Circuit/System Verification

1. Engine running.
2. Verify rear defog indicator turns ON and OFF when commanding the Rear Defog Indicator Active and Inactive with a scan tool.

- **If the rear defog indicator does not turn ON and OFF**

Refer to Circuit/System Testing.

- **If the rear defog indicator turns ON and OFF**

3. All OK.

Circuit/System Testing

1. Ignition OFF, disconnect the harness connector at the K33 HVAC Control Module. Ignition ON
2. Connect a test lamp between the control circuit terminal 3 and ground.
3. Verify the test lamp turns ON and OFF when commanding the Rear Defog Indicator Active and Inactive with a scan tool.

- **If the test lamp is always OFF**

1. Ignition OFF, remove the test lamp, disconnect the harness connector at the K9 Body Control Module.
2. Test for infinite resistance between the control circuit and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance
3. Test for less than 2 ohms in the control circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, replace the K9 Body Control Module.

- **If the test lamp is always ON**

1. Ignition OFF, remove the test lamp, disconnect the harness connector at the K9 Body Control Module, ignition ON.
2. Test for less than 1 V between the control circuit and ground.
 - If 1 V or greater, repair the short to voltage on the circuit.
 - If less than 1 V, replace the K9 Body Control Module.

- **If the test lamp turns ON and OFF**

4. Test or replace the K33 HVAC Control Module.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

Control Module References for Body Control Module and HVAC Control Module replacement, programming and setup

SYMPTOMS - FIXED AND MOVEABLE WINDOWS

Important Preliminary Checks Before Starting:

1. Perform the **Diagnostic System Check - Vehicle** before using the symptom tables in order to verify that all of the following are true:
 - There are no DTCs set.
 - The control modules can communicate via the serial data link.
2. Review the power window system operation or rear window defogger system operation in order to familiarize yourself with the system functions. Refer to the following:
 - **Rear Window Defogger Description and Operation**
 - **Power Windows Description and Operation**

Visual/Physical Inspection

- Inspect for aftermarket devices which could affect the operation of the rear window defogger. Refer to **Checking Aftermarket Accessories**.

- Inspect the easily accessible or visible system components for obvious damage or conditions which could cause the symptom.

Intermittent

NOTE:

- Inspect for proper installation of electrical components if an intermittent condition exists. Inspect for aftermarket theft deterrent devices, lights and cellular phones. Ensure that no aftermarket equipment is connected to the class 2 circuit. If you can not locate an intermittent condition, a cellular phone signal may cause the condition. Faulty electrical connections or wiring may be the cause of intermittent conditions. Refer to Testing for Intermittent Conditions and Poor Connections .
- The problem may or may not turn ON the SERVICE VEHICLE SOON indicator or store a DTC. Do not use the symptom tables to diagnose intermittent conditions. The malfunction must be present in order to locate the problem.

Poor electrical connections or wiring cause most intermittent conditions. Perform a careful visual/physical check for the following conditions:

- Poor mating of the connector halves or a terminal not fully seated in the connector body
- An improperly formed or damaged terminal
- Reform or replace connector terminals in the problem circuit in order to ensure proper contact tension.
- Poor terminal to wire connection requires removing the terminal from the connector body in order to perform the check.

Use a scan tool in order to help detect intermittent conditions. The scan tool has several features that can be used to locate an intermittent condition. The snapshot feature can capture and store data parameters within the scan tool when the malfunction occurs. This information can then be reviewed in order to see what caused the malfunction.

Symptom List

Refer to a symptom diagnostic procedure from the following list in order to diagnose the symptom:

- Rear Window Defogger Malfunction
- Power Windows Malfunction (With A32), Power Windows Malfunction (With AE3)

REAR WINDOW DEFOGGER MALFUNCTION

Diagnostic Instructions

- Perform the Diagnostic System Check - Vehicle prior to using this diagnostic procedure.
- Review Strategy Based Diagnosis for an overview of the diagnostic approach.
- Diagnostic Procedure Instructions provides an overview of each diagnostic category.

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Relay B+	1	1	-	-
Rear Defog Switch Signal	2	1	1	-
Relay Control	B0283 02	B0283 04	B0283 01	-
Rear Defogger Grid Control	1	1	2	-
Rear Defog Indicator Control	B0969 02	B0969 04	B0969 01	-
Relay Ground	-	B0283 04	-	-
Rear Defogger Grid Ground	-	1	-	-
1. Rear Defogger Grid Inoperative 2. Rear Defogger Grid Always ON				

Circuit/System Description

The Body Control Module supplies 12 V on the rear window defogger switch signal circuit to the HVAC Control Module. When the rear window defogger switch is pressed, the rear window defogger switch pulls the signal circuit low. The Body Control Module will detect the drop in voltage in the signal circuit and will supply voltage to the rear defogger relay coil. The relay coil supply voltage is also spliced off internally in the Body Control Module to the supply voltage circuit of the rear defog indicator. The rear defogger relay is energized and the rear defog indicator is illuminated. With the relay energized, battery positive voltage is allowed from the relay switched input through the switch contacts and out the relay switched output to the rear window defogger grid.

Circuit/System Verification

1. Engine running.
2. Verify the E18 Rear Defogger Grid turns ON and OFF when commanding the Rear Defogger Active and Inactive with a scan tool
 - **If the E18 Rear Defogger Grid does not turn ON and OFF**

Refer to Circuit/System Testing - Rear Window Defogger Grid Malfunction

- **If the E18 Rear Defogger Grid does turn ON and OFF**
- 3. Verify rear defog indicator turns ON and OFF when commanding the Rear Defog Indicator Active and Inactive with a scan tool.
 - **If the rear defog indicator does not turn ON and OFF**

Refer to Circuit/System Testing - Rear Defog Indicator Malfunction

- **If the rear defog indicator does turn ON and OFF**
- 4. Verify the scan tool Rear Defogger Status parameter changes between Off and On when pressing the rear window defogger switch.
 - **If the parameter does not change**

Refer to Circuit/System Testing - Rear Defogger Switch Malfunction.

- **If the parameter changes**
- 5. All OK.

Circuit/System Testing

Rear Window Defogger Grid Malfunction

1. Ignition OFF and all vehicle systems OFF, disconnect the KR5 Rear Defogger Relay. It may take up to 2 minutes for all vehicle systems to power down.
2. Test for less than 10 ohms between the ground circuit terminal 85 and ground.
 - **If 10 ohms or greater**
 1. Ignition OFF.
 2. Test for less than 2 ohms in the ground circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, repair the open/high resistance in the ground connection.
 - **If less than 10 ohms**
3. Engine Running.

4. Verify a test lamp illuminates between the B+ circuit terminal 30 and ground.
 - **If the test lamp does not illuminate**
 - Replace the X50A Fuse Block-Underhood
 - **If the test lamp illuminates**
5. Connect a test lamp between the control circuit terminal 86 and the ground circuit terminal 85.
6. Verify the test lamp turns ON and OFF when commanding the Rear Defogger Active and Inactive with a scan tool.
 - **If the test lamp is always OFF**
 1. Ignition OFF, remove the test lamp, disconnect the harness connector at the K9 Body Control Module.
 2. Test for infinite resistance between the control circuit and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance
 3. Test for less than 2 ohms in the control circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, replace the K9 Body Control Module.
 - **If the test lamp is always ON**
 1. Ignition OFF, remove the test lamp, disconnect the harness connector at the K9 Body Control Module, Engine Running.
 2. Test for less than 1 V between the control circuit and ground.
 - If 1 V or greater, repair the short to voltage on the circuit.
 - If less than 1 V, replace the K9 Body Control Module.
 - **If the test lamp turns ON and OFF**
 - 7. Verify that a test lamp does not illuminate between the control circuit terminal 87 and ground.
 - **If the test lamp illuminates**

Repair the short to voltage on the control circuit
 - **If the test lamp does not illuminate**
 - 8. Ignition OFF and all vehicle systems OFF, disconnect the X2 harness connector at the E18 Rear Defogger Grid. It may take up to 2 minutes for all vehicle systems to power down.
 - 9. Test for less than 10 ohms between the ground circuit terminal 1 and ground.
 - **If 10 ohms or greater**
 1. Ignition OFF.
 2. Test for less than 2 ohms in the ground circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, repair the open/high resistance in the ground connection.
 - **If less than 10 ohms**
 - 10. Connect the X2 harness connector at the E18 Rear Defogger Grid.

11. Engine Running, connect a 20 A fused jumper wire between the B+ circuit terminal 30 and the control circuit terminal 87.
12. Verify the E18 Rear Defogger Grid is activated.
 - **If the E18 Rear Defogger Grid does not activate**
 1. Ignition OFF, remove the jumper wire, disconnect the X1 harness connector at the E18 Rear Defogger Grid.
 2. Test for infinite resistance between the control circuit and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance
 3. Test for less than 2 ohms in the control circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, replace the E18 Rear Defogger Grid.
 - **If the E18 Rear Defogger Grid activates**
13. Test or replace the KR5 Rear Defogger Relay.

Rear Defog Indicator Malfunction

1. Ignition OFF, disconnect the harness connector at the K33 HVAC Control Module. Engine Running
2. Connect a test lamp between the control circuit terminal 3 and ground.
3. Verify the test lamp turns ON and OFF when commanding the Rear Defog Indicator Active and Inactive with a scan tool.
 - **If the test lamp is always OFF**
 1. Ignition OFF, remove the test lamp, disconnect the harness connector at the K9 Body Control Module.
 2. Test for infinite resistance between the control circuit and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance
 3. Test for less than 2 ohms in the control circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, replace the K9 Body Control Module.
 - **If the test lamp is always ON**
 1. Ignition OFF, remove the test lamp, disconnect the harness connector at the K9 Body Control Module, Engine Running.
 2. Test for less than 1 V between the control circuit and ground.
 - If 1 V or greater, repair the short to voltage on the circuit.
 - If less than 1 V, replace the K9 Body Control Module.
 - **If the test lamp turns ON and OFF**
4. Replace the K33 HVAC Control Module.

Rear Defogger Switch Malfunction

1. Ignition OFF, disconnect the harness connector at the K33 HVAC Control Module. Engine running.
2. Test for greater than 7 V between the signal circuit terminal 2 and ground.
 - **If 7 V or less**
 1. Ignition OFF, disconnect the harness connector at the K9 Body Control Module.
 2. Test for infinite resistance between the control circuit and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance
 3. Test for less than 2 ohms in the control circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance on the circuit.
 - If less than 2 ohms, replace the K9 Body Control Module.
 - **If greater than 7 V**
3. Replace the K33 HVAC Control Module.

Component Testing

Relay Test

1. Ignition OFF, disconnect the KR5 Rear Defogger Relay.
2. Test for 60-180 ohms between terminals 85 and 86.
 - **If less than 60 ohms or greater than 180 ohms**

Replace the KR5 Rear Defogger Relay.

- **If between 60-180 ohms**
3. Test for infinite resistance between the terminals listed below:
 - 30 and 86
 - 30 and 87
 - 30 and 85
 - 85 and 87
 - **If less than infinite resistance**

Replace the KR5 Rear Defogger Relay.

- **If infinite resistance**
4. Install a 3 A fused jumper wire between relay terminal 85 and 12 V. Install a jumper wire between relay terminal 86 and ground.
 5. Test for less than 2 ohms between terminals 30 and 87.
 - **If 2 ohms or greater**

Replace the KR5 Rear Defogger Relay.

- If less than 2 ohms

6. All OK

Rear Defogger Grid Test

NOTE: Lightly touch the grid lines when testing with the test lamp. If the test lamp point is scraped through the grid line it can cause an open in the circuit

1. Engine running, command the Rear Defogger ON by pressing the rear window defogger switch.
2. Verify that a test lamp illuminates between each rear window defogger grid line and ground. The test lamp should be off when testing at the ground side of the grid and get brighter as the test lamp moves closer to the voltage supply side of the grid. The test lamp should be dim when testing each grid line in the middle

- If the test lamp remains bright at the middle of the grid line.

The grid line is open between the test point and the ground side of the grid.

Replace the rear window

- If the test lamp remains off at the middle of the grid line.

The grid line is open between the test point and the voltage supply side of the grid.

Replace the rear window

- If the test lamp remains dim at the middle of each grid line.

3. All OK

Repair Instructions

Perform the Diagnostic Repair Verification after completing the repair.

- Relay Replacement (Within an Electrical Center) , Relay Replacement (Attached to Wire Harness)
- Rear Window Replacement
- Control Module References for the Body Control Module and HVAC Control Module replacement, programming and setup

POWER WINDOWS MALFUNCTION (WITH A32)

Diagnostic Instructions

- Perform the Diagnostic System Check - Vehicle prior to using this diagnostic procedure.
- Review Strategy Based Diagnosis for an overview of the diagnostic approach.
- Diagnostic Procedure Instructions provides an overview of each diagnostic category.

Diagnostic Fault Information

Circuit/System Description

The power window system will operate any time the ignition is the ACC or RUN position. The driver power window switch contains individual window switches for the passenger power window. Both windows may be controlled up and down from the driver power window switch. The passenger power window switches will only control the up and down operation of the passenger power window.

Each power window contains a reversible power window motor. The direction the window travels is dependent upon the polarity of the supply voltage. By reversing polarity of the supply voltage the window motor will move up or down. Each power window motor is internally circuit breaker protected.

Battery voltage is supplied to the power window switch through the ignition voltage supply circuit. The power window switch also receives a constant ground source. The power window motor control circuits are connected to ground through the normally closed up and down contacts of the power window switch. When the power switch is placed in the down position, the power window motor down control circuit is switched to 12 V and is applied to the down side of the power window motor. Since the other side of the power motor is connected to ground through the normally closed contacts of the up switch, the window travels down. By placing the power window switch in the up position, the polarity of the power window motor is reversed and the window travels up.

Circuit/System Verification

1. Ignition ON.
2. Verify the driver window performs the UP and DOWN functions.
 - **If the driver window does not perform the UP or DOWN functions**

Refer to Circuit/System Testing - Driver Window Inoperative
 - **If the driver window performs the UP and DOWN functions**
3. Verify the M74P Window Motor-Passenger performs the UP and DOWN functions at both the S79D Window Switch-Driver and S79P Window Switch-Passenger.
 - **If the M74P Window Motor-Passenger is inoperative from both the S79D Window Switch-Driver and S79P Window Switch-Passenger**

Refer to Circuit/System Testing - Passenger Window Inoperative From Both Switches.
 - **If the M74P Window Motor-Passenger is inoperative from the passenger window switch only**

Refer to Circuit/System Testing - Passenger Window Switch Inoperative.
 - **If the M74P Window Motor-Passenger is inoperative from the S79D Window Switch-Driver only**

Test or replace the S79D Window Switch-Driver.
 - **If the M74P Window Motor-Passenger performs the UP and DOWN functions at both switches**
4. All OK.

Circuit/System Testing

Driver Window Inoperative

1. Ignition OFF, disconnect the harness connector at the S79D Window Switch-Driver. It may take up to 2 minutes for all vehicle systems to power down.
2. Test for less than 10 ohms between the ground circuit terminal 3 and ground.
 - **If 10 ohms or greater**
 1. Ignition OFF.
 2. Test for less than 2 ohms in the ground circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, repair the open/high resistance in the ground connection.
 - **If less than 10 ohms**
3. Ignition ON.
4. Verify a test lamp illuminates between the ignition circuit terminal 6 and ground.
 - **If the test lamp does not illuminate and the circuit fuse is good**
 1. Ignition OFF.
 2. Test for less than 2 ohms in the ignition circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, refer to **Retained Accessory Power Malfunction** .
 - **If the test lamp does not illuminate and the circuit fuse is open**
 1. Ignition OFF.
 2. Test for infinite resistance between the ignition circuit and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance
 3. Test for infinite resistance between the control circuits listed below and ground:
 - Control circuit terminal 1
 - Control circuit terminal 2
 - Control circuit terminal 4
 - Control circuit terminal 5
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance, replace the S79D Window Switch-Driver.
 - **If the test lamp illuminates**
5. Ignition OFF, connect the harness connector at the S79D Window Switch-Driver and disconnect the harness connector at the M74D Window Motor-Driver. It may take up to 2 minutes for all vehicle systems to power down.
6. Test for less than 10 ohms between the control circuit terminal 1 and ground.
 - **If 10 ohms or greater**
 1. Ignition OFF, disconnect the harness connector at the S79D Window Switch-Driver.
 2. Test for less than 2 ohms in the control circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, replace the S79D Window Switch-Driver.

- **If less than 10 ohms**
- 7. Test for less than 10 ohms between the control circuit terminal 2 and ground.
 - **If 10 ohms or greater**
 1. Ignition OFF, disconnect the harness connector at the S79D Window Switch-Driver.
 2. Test for less than 2 ohms in the control circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, replace the S79D Window Switch-Driver.
 - **If less than 10 ohms**
- 8. Connect a test lamp between the control circuit terminal 1 and control circuit terminal 2, Ignition ON.
- 9. Verify the test lamp turns ON when commanding the UP and DOWN states with the S79D Window Switch-Driver.
 - **If the test lamp remains OFF during either of the commands**
 1. Ignition OFF, remove the test lamp, disconnect the harness connector at the S79D Window Switch-Driver.
 2. Test for infinite resistance between each control circuit and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance
 3. Test for less than 2 ohms in each control circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, test or replace the S79D Window Switch-Driver.
 - **If the test lamp is always ON**
 1. Ignition OFF, remove the test lamp, disconnect the harness connector at the S79D Window Switch-Driver, Ignition ON.
 2. Test for less than 1 V between each control circuit and ground.
 - If 1 V or greater, repair the short to voltage on the circuit.
 - If less than 1 V, test or replace the S79D Window Switch-Driver
 - **If the test lamp turns ON during each of the commands**
- 10. Test or replace the M74D Window Motor-Driver.

Passenger Window Inoperative From Both Switches

1. Ignition OFF, disconnect the harness connector at the S79P Window Switch-Passenger. It may take up to 2 minutes for all vehicle systems to power down.
2. Test for less than 10 ohms between the control circuit terminal 4 and ground.
 - **If 10 ohms or greater**
 1. Ignition OFF, disconnect the harness connector at the S79D Window Switch-Driver.
 2. Test for less than 2 ohms in the control circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, replace the S79D Window Switch-Driver.

- **If less than 10 ohms**
- 3. Test for less than 10 ohms between the control circuit terminal 8 and ground.
 - **If 10 ohms or greater**
 1. Ignition OFF, disconnect the harness connector at the S79D Window Switch-Driver.
 2. Test for less than 2 ohms in the control circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, replace the S79D Window Switch-Driver.
 - **If less than 10 ohms**
- 4. Connect a test lamp between the control circuit terminal 4 and control circuit terminal 8, Ignition ON.
- 5. Verify the test lamp turns ON when commanding the UP and DOWN functions with the S79D Window Switch-Driver.
 - **If the test lamp remains OFF during either of the commands**
 1. Ignition OFF, remove the test lamp, disconnect the harness connector at the S79D Window Switch-Driver.
 2. Test for infinite resistance between each control circuit and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance
 3. Test for less than 2 ohms in each control circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, test or replace the S79D Window Switch-Driver.
 - **If the test lamp is always ON**
 1. Ignition OFF, remove the test lamp, disconnect the harness connector at the S79D Window Switch-Driver, Ignition ON.
 2. Test for less than 1 V between each control circuit and ground.
 - If 1 V or greater, repair the short to voltage on the circuit.
 - If less than 1 V, test or replace the S79D Window Switch-Driver
 - **If the test lamp turns ON during each of the commands**
- 6. Ignition OFF, connect the harness connector at the S79P Window Switch-Passenger and disconnect the harness connector at the M74P Window Motor-Passenger. It may take up to 2 minutes for all vehicle systems to power down.
- 7. Test for less than 10 ohms between the control circuit terminal 1 and ground.
 - **If 10 ohms or greater**
 1. Ignition OFF, disconnect the harness connector at the S79P Window Switch-Passenger.
 2. Test for less than 2 ohms in the control circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, replace the S79P Window Switch-Passenger.
 - **If less than 10 ohms**
- 8. Test for less than 10 ohms between the control circuit terminal 2 and ground.
 - **If 10 ohms or greater**

1. Ignition OFF, disconnect the harness connector at the S79P Window Switch-Passenger.
2. Test for less than 2 ohms in the control circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, replace the S79P Window Switch-Passenger.
- **If less than 10 ohms**
9. Connect a test lamp between the control circuit terminal 1 and control circuit terminal 2, Ignition ON.
10. Verify the test lamp turns ON when commanding the UP and DOWN functions with the S79P Window Switch-Passenger.
 - **If the test lamp remains OFF during either of the commands**
 1. Ignition OFF, remove the test lamp, disconnect the harness connector at the S79P Window Switch-Passenger.
 2. Test for infinite resistance between each control circuit and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance
 3. Test for less than 2 ohms in each control circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, test or replace the S79P Window Switch-Passenger.
 - **If the test lamp is always ON**
 1. Ignition OFF, remove the test lamp, disconnect the harness connector at the S79P Window Switch-Passenger, Ignition ON.
 2. Test for less than 1 V between each control circuit and ground.
 - If 1 V or greater, repair the short to voltage on the circuit.
 - If less than 1 V, test or replace the S79P Window Switch-Passenger
 - **If the test lamp turns ON during each of the commands**
11. Test or replace the M74P Window Motor-Passenger.

Passenger Window Switch Inoperative

1. Ignition OFF, disconnect the harness connector at the S79P Window Switch-Passenger, Ignition ON
2. Verify a test lamp illuminates between the ignition circuit terminal 6 and ground.
 - **If the test lamp does not illuminate**
 1. Ignition OFF.
 2. Test for less than 2 ohms in the ignition circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, verify the fuse is OK and there is voltage at the fuse.
 - **If the test lamp illuminates**
3. Test or replace the S79P Window Switch-Passenger.

Component Testing

Window Motor

1. Ignition OFF, disconnect the harness connector at the appropriate M74 Window Motor.
2. Install a 20 A fused jumper wire between one of the control terminals and 12 V. Momentarily install a jumper wire between the other control terminal and ground. Reverse the jumper wires at least two times, the M74 Window Motor should perform the UP and DOWN functions.
 - **If the M74 Window Moto does not perform the UP and DOWN functions**

Replace the M74 Window Motor.

- **If the M74 Window Moto performs the UP and DOWN functions**

3. All OK

Driver Window Switch

1. Ignition OFF, disconnect the harness connector at the S79D Window Switch-Driver.
2. Test for infinite resistance between the terminals listed below with the switch in the open position:
 - Ignition terminal 6 and control terminal 1
 - Ignition terminal 6 and control terminal 2
 - Ignition terminal 6 and control terminal 4
 - Ignition terminal 6 and control terminal 5
 - **If less than infinite resistance**

Replace the S79D Window Switch-Driver.

- **If infinite resistance**

3. Test for less than 3 ohms between the terminals listed below with the switch in the open position:
 - Ground terminal 3 and control terminal 1
 - Ground terminal 3 and control terminal 2
 - Ground terminal 3 and control terminal 4
 - Ground terminal 3 and control terminal 5
 - **If 3 ohms or greater**

Replace the S79D Window Switch-Driver.

- **If less than 3 ohms**

4. Test for less than 3 ohms between the terminals listed below with the switch in the Up position.
 - Driver window left hand drive - ignition terminal 6 and control terminal 5
 - Driver window right hand drive - ignition terminal 6 and control terminal 1
 - Passenger window left hand drive - ignition terminal 6 and control terminal 4
 - Passenger window right hand drive - ignition terminal 6 and control terminal 2
 - **If 3 ohms or greater**

Replace the S79D Window Switch-Driver.

- **If less than 3 ohms**

5. Test for less than 3 ohms between the terminals listed below with the switch in the Down position:

- Driver window left hand drive - ignition terminal 6 and control terminal 2
- Driver window right hand drive - ignition terminal 6 and control terminal 4
- Passenger window left hand drive - ignition terminal 6 and control terminal 1
- Passenger window right hand drive - ignition terminal 6 and control terminal 5

- **If 3 ohms or greater**

Replace the S79D Window Switch-Driver.

- **If less than 3 ohms**

6. All OK

Passenger Window Switch

1. Ignition OFF, disconnect the harness connector at the S79P Window Switch-Passenger.

2. Test for infinite resistance between the terminals listed below with the switch in the open position:

- Ignition terminal 6 and control terminal 1
- Ignition terminal 6 and control terminal 3

- **If less than infinite resistance**

Replace the S79P Window Switch-Passenger.

- **If infinite resistance**

3. Test for less than 3 ohms between the control terminals listed below with the switch in the open position:

- Control terminal 4 and control terminal 1
- Control terminal 8 and control terminal 3

- **If 3 ohms or greater**

Replace the S79P Window Switch-Passenger.

- **If less than 3 ohms**

4. Test for less than 3 ohms between the ignition terminal 6 and the control terminal 1 with the switch in the Up position.

- **If 3 ohms or greater**

Replace the S79P Window Switch-Passenger.

- **If less than 3 ohms**

5. Test for less than 3 ohms between the ignition terminal 6 and the control terminal 3 with the switch in the Down position.

- **If 3 ohms or greater**

Replace the S79P Window Switch-Passenger.

- **If less than 3 ohms**

6. All OK

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

- **Front Side Door Window Switch Replacement - Right Side**
- **Front Side Door Window Switch Replacement - Left Side**
- **Front Side Door Window Regulator Replacement**

POWER WINDOWS MALFUNCTION (WITH AE3)

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.

Circuit/System Description

The driver power window switch contains individual window switches for each of power windows. All windows may be controlled up and down from the driver power window switch. The individual passenger power window switches will only control the up and down operation of their respective power window.

Each power window contains a reversible power window motor. The direction the window travels is dependent upon the polarity of the supply voltage. By reversing polarity of the supply voltage the window motor will move up or down. Each power window motor is internally circuit breaker protected.

Battery voltage is supplied to the power window switch through the accessory voltage supply circuit. The power window switch also receives a constant ground source. The power window motor control circuits are connected to ground through the normally closed up and down contacts of the power window switch. When the power switch is placed in the down position, the power window motor down control circuit is switched to 12 V and is applied to the down side of the power window motor. Since the other side of the power motor is connected to ground through the normally closed contacts of the up switch, the window travels down. By placing the power window switch in the up position, the polarity of the power window motor is reversed and the window travels up.

Circuit/System Verification

1. Ignition ON.
2. Verify the driver window performs the UP and DOWN functions.
 - **If the driver window does not perform the UP or DOWN functions**

Refer to Circuit/System Testing - Driver Window Inoperative
 - **If the driver window performs the UP and DOWN functions**
3. Verify the passenger window performs the UP and DOWN functions at both the S79D Window Switch-Driver and S79P Window Switch-Passenger.
 - **If the passenger window is inoperative from both the S79D Window Switch-Driver and S79P Window Switch-Passenger**

Refer to Circuit/System Testing - Passenger Window Inoperative From Both Switches.
 - **If the passenger window is inoperative from the S79P Window Switch-Passenger only**

Refer to Circuit/System Testing - Passenger Window Switch Inoperative.
 - **If the passenger window is inoperative from the S79D Window Switch-Driver only**

Test or replace the S79D Window Switch - Driver.
 - **If the passenger window performs the UP and DOWN functions at both switches**
4. Verify the left rear and right rear window performs the UP and DOWN functions at both the S79D Window Switch-Driver and each of the S79 Window Switch-Rear.
 - **If a rear window is inoperative from both the S79D Window Switch-Driver and S79 Window Switch-Rear.**

Refer to Circuit/System Testing - Rear Window Inoperative From Both Switches
 - **If a rear window is inoperative from the S79 Window Switch-Rear only**

Refer to Circuit/System Testing - Rear Window Lockout Malfunction

- **If a rear window is inoperative from the S79D Window Switch-Driver only**

Test or replace the S79D Window Switch - Driver.

- **If the rear window performs the UP and DOWN functions at both the S79D Window Switch-Driver and S79 Window Switch-Rear**

5. Lock out the rear window switches by pressing the lockout switch on the S79D Window Switch-Driver.
6. Verify the left rear and right rear windows are inoperative at both of the S79 Window Switch-Rear.

- **If both rear windows continue to function from the S79 Window Switch-Rear**

Refer to Circuit/System Testing - Rear Window Lockout Malfunction

- **If both rear windows are inoperative from the S79 Window Switch-Rear**

7. All OK.

Circuit/System Testing

Driver Window Inoperative

1. Ignition OFF and all vehicle systems OFF, disconnect the harness connector at the S79D Window Switch-Driver. It may take up to 2 minutes for all vehicle systems to power down.
2. Test for less than 10 ohms between the ground circuit terminal 13 and ground.

- **If 10 ohms or greater**

1. Ignition OFF.
2. Test for less than 2 ohms in the ground circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, repair the open/high resistance in the ground connection.

- **If less than 10 ohms**

3. Ignition ON.
4. Verify a test lamp illuminates between the ignition circuit terminal 8 and ground.

- **If the test lamp does not illuminate and the circuit fuse is good**

1. Ignition OFF.
2. Test for less than 2 ohms in the ignition circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, refer to **Retained Accessory Power Malfunction** .

- **If the test lamp does not illuminate and the circuit fuse is open**

1. Ignition OFF.
2. Test for infinite resistance between the ignition circuit and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.

- If infinite resistance
- 3. Test for infinite resistance between the control circuits listed below and ground:
 - Control circuit terminal 7
 - Control circuit terminal 9
 - Control circuit terminal 12
 - Control circuit terminal 14
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance, replace the S79D Window Switch-Driver.
 - **If the test lamp illuminates**
- 5. Ignition OFF and all vehicle systems OFF, connect the harness connector at the S79D Window Switch-Driver and disconnect the harness connector at the M74D Window Motor-Driver. It may take up to 2 minutes for all vehicle systems to power down
- 6. Test for less than 10 ohms between the control circuit terminal 1 and ground.
 - **If 10 ohms or greater**
 - 1. Ignition OFF, disconnect the harness connector at the S79D Window Switch-Driver.
 - 2. Test for less than 2 ohms in the control circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, replace the S79D Window Switch-Driver.
 - **If less than 10 ohms**
- 7. Test for less than 10 ohms between the control circuit terminal 2 and ground.
 - **If 10 ohms or greater**
 - 1. Ignition OFF, disconnect the harness connector at the S79D Window Switch-Driver.
 - 2. Test for less than 2 ohms in the control circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, replace the S79D Window Switch-Driver.
 - **If less than 10 ohms**
- 8. Connect a test lamp between control circuit terminal 1 and control circuit terminal 2, Ignition ON.
- 9. Verify the test lamp turns ON when commanding the UP and DOWN states with the S79D Window Switch-Driver.
 - **If the test lamp remains OFF during either of the commands**
 - 1. Ignition OFF, remove the test lamp, disconnect the harness connector at the S79D Window Switch-Driver.
 - 2. Test for infinite resistance between each control circuit and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance, replace the S79D Window Switch-Driver.
 - **If the test lamp is always ON**
 - 1. Ignition OFF, remove the test lamp, disconnect the harness connector at the S79D Window Switch-Driver, Ignition ON.
 - 2. Test for less than 1 V between the control circuit and ground.

- If 1 V or greater, repair the short to voltage on the circuit.
 - If less than 1 V, replace the S79D Window Switch-Driver.
 - **If the test lamp turns ON and OFF**
10. Test or replace the M74D Window Motor-Driver.

Passenger Window Inoperative From Both Switches

1. Ignition OFF and all vehicle systems OFF, disconnect the harness connector at the S79P Window Switch-Passenger. It may take up to 2 minutes for all vehicle systems to power down.
2. Test for less than 10 ohms between the control circuit terminal 4 and ground.
 - **If 10 ohms or greater**
 1. Ignition OFF, disconnect the harness connector at the S79D Window Switch-Driver.
 2. Test for less than 2 ohms in the control circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, replace the S79D Window Switch-Driver.
 - **If less than 10 ohms**
3. Test for less than 10 ohms between the control circuit terminal 8 and ground.
 - **If 10 ohms or greater**
 1. Ignition OFF, disconnect the harness connector at the S79D Window Switch-Driver.
 2. Test for less than 2 ohms in the control circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, replace the S79D Window Switch-Driver.
 - **If less than 10 ohms**
4. Connect a test lamp between the control circuit terminal 4 and control circuit terminal 8, Ignition ON.
5. Verify the test lamp turns ON when commanding the UP and DOWN functions with the S79D Window Switch-Driver.
 - **If the test lamp remains OFF during either of the commands**
 1. Ignition OFF, remove the test lamp, disconnect the harness connector at the S79D Window Switch-Driver.
 2. Test for infinite resistance between each control circuit and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance, replace the S79D Window Switch-Driver.
 - **If the test lamp is always ON**
 1. Ignition OFF, remove the test lamp, disconnect the harness connector at the S79D Window Switch-Driver, Ignition ON.
 2. Test for less than 1 V between the control circuit and ground.
 - If 1 V or greater, repair the short to voltage on the circuit.
 - If less than 1 V, replace the S79D Window Switch-Driver.
 - **If the test lamp turns ON and OFF**

6. Ignition OFF and all vehicle systems OFF, connect the harness connector at the S79P Window Switch-Passenger and disconnect the harness connector at the M74P Window Motor-Passenger. It may take up to 2 minutes for all vehicle systems to power down.
7. Test for less than 10 ohms between the control circuit terminal 1 and ground.
 - **If 10 ohms or greater**
 1. Ignition OFF, disconnect the harness connector at the S79P Window Switch-Passenger.
 2. Test for less than 2 ohms in the control circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, replace the S79P Window Switch-Passenger.
 - **If less than 10 ohms**
8. Test for less than 10 ohms between the control circuit terminal 2 and ground.
 - **If 10 ohms or greater**
 1. Ignition OFF, disconnect the harness connector at the S79P Window Switch-Passenger.
 2. Test for less than 2 ohms in the control circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, replace the S79P Window Switch-Passenger.
 - **If less than 10 ohms**
9. Connect a test lamp between control circuit terminal 1 and control circuit terminal 2, Ignition ON.
10. Verify the test lamp turns ON when commanding the UP and DOWN functions with the S79P Window Switch-Passenger.
 - **If the test lamp remains OFF during either of the commands**
 1. Ignition OFF, remove the test lamp, disconnect the harness connector at the S79P Window Switch-Passenger.
 2. Test for infinite resistance between each control circuit and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance, replace the S79P Window Switch-Passenger.
 - **If the test lamp is always ON**
 1. Ignition OFF, remove the test lamp, disconnect the harness connector at the S79P Window Switch-Passenger, Ignition ON.
 2. Test for less than 1 V between the control circuit and ground.
 - If 1 V or greater, repair the short to voltage on the circuit.
 - If less than 1 V, replace the S79P Window Switch-Passenger.
 - **If the test lamp turns ON and OFF**
11. Test or replace the M74P Window Motor-Passenger.

Passenger Window Switch Inoperative

1. Ignition OFF, disconnect the harness connector at the S79P Window Switch-Passenger, Ignition ON
2. Verify a test lamp illuminates between the ignition circuit terminal 6 and ground.

- **If the test lamp does not illuminate**
 1. Ignition OFF.
 2. Test for less than 2 ohms in the ignition circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, verify the fuse is OK and there is voltage at the fuse.
- **If the test lamp illuminates**
- 3. Test or replace the S79P Window Switch-Passenger.

Rear Window Inoperative From Both Switches

1. Ignition OFF, disconnect the harness connector at the S79D Window Switch-Driver. Ignition ON
2. Verify a test lamp illuminates between the ignition circuit terminal 2 and ground.
 - **If the test lamp does not illuminate and the circuit fuse is good**
 1. Ignition OFF.
 2. Test for less than 2 ohms in the ignition circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, refer to **Retained Accessory Power Malfunction** .
 - **If the test lamp does not illuminate and the circuit fuse is open**
 1. Ignition OFF.
 2. Test for infinite resistance between the ignition circuit and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance
 3. Test for infinite resistance between the control circuit terminals listed below and ground:
 - Control circuit terminal 1
 - Control circuit terminal 3
 - Control circuit terminal 4
 - Control circuit terminal 6
 - Control circuit terminal 11
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance, replace the S79D Window Switch-Driver.
 - **If the test lamp illuminates**
3. Ignition OFF, connect the harness connector at the S79D Window Switch-Driver and disconnect the harness connector at the appropriate S79 Window Switch-Rear.
4. Ignition ON, verify that a test lamp illuminates between the control circuit terminal 6 and ground.
 - **If the test lamp does not illuminate**
 1. Ignition OFF.
 2. Test for less than 2 ohms in the control circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, test or replace the S79D Window Switch-Driver

- **If the test lamp illuminates**
- 5. Ignition OFF and all vehicle systems OFF, it may take up to 2 minutes for all vehicle systems to power down
- 6. Test for less than 10 ohms between the control circuit terminal 4 and ground.
 - **If 10 ohms or greater**
 1. Ignition OFF, disconnect the harness connector at the S79D Window Switch-Driver.
 2. Test for less than 2 ohms in the control circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, replace the S79D Window Switch-Driver.
 - **If less than 10 ohms**
- 7. Test for less than 10 ohms between the control circuit terminal 8 and ground.
 - **If 10 ohms or greater**
 1. Ignition OFF, disconnect the harness connector at the S79D Window Switch-Driver.
 2. Test for less than 2 ohms in the control circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, replace the S79D Window Switch-Driver.
 - **If less than 10 ohms**
- 8. Connect a test lamp between the control circuit terminal 4 and control circuit terminal 8, Ignition ON.
- 9. Verify the test lamp turns ON when commanding the UP and DOWN states with the S79D Window Switch-Driver.
 - **If the test lamp remains OFF during either of the commands**
 1. Ignition OFF, remove the test lamp, disconnect the harness connector at the S79D Window Switch-Driver.
 2. Test for infinite resistance between each control circuit and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance, replace the S79D Window Switch-Driver.
 - **If the test lamp is always ON**
 1. Ignition OFF, remove the test lamp, disconnect the harness connector at the S79D Window Switch-Driver, Ignition ON.
 2. Test for less than 1 V between the control circuit and ground.
 - If 1 V or greater, repair the short to voltage on the circuit.
 - If less than 1 V, replace the S79D Window Switch-Driver.
 - **If the test lamp turns ON and OFF**
- 10. Ignition OFF and all vehicle systems OFF, connect the harness connector at the S79 Window Switch-Rear and disconnect the harness connector at the rear M74 Window Motor-Rear. It may take up to 2 minutes for all vehicle systems to power down.
- 11. Test for less than 10 ohms between the control circuit terminal listed below and ground:
 - Control terminal 1
 - Control terminal 2

- **If 10 ohms or greater**
 1. Ignition OFF, disconnect the harness connector at the S79 Window Switch-Rear.
 2. Test for less than 2 ohms in the control circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, replace the S79 Window Switch-Rear.
- **If less than 10 ohms**
- 12. Connect a test lamp between the control circuit terminal 1 and the control circuit terminal 2, Ignition ON.
- 13. Verify the test lamp turns ON when commanding the UP and DOWN states with the S79 Window Switch-Rear.
 - **If the test lamp remains OFF during either of the commands**
 1. Ignition OFF, remove the test lamp, disconnect the harness connector at the S79 Window Switch-Rear.
 2. Test for infinite resistance between each control circuit and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance, replace the S79 Window Switch-Rear.
 - **If the test lamp is always ON**
 1. Ignition OFF, remove the test lamp, disconnect the harness connector at the S79 Window Switch-Rear, Ignition ON.
 2. Test for less than 1 V between the control circuit and ground.
 - If 1 V or greater, repair the short to voltage on the circuit.
 - If less than 1 V, replace the S79 Window Switch-Rear.
 - **If the test lamp turns ON and OFF**
- 14. Test or replace the M74 Window Motor-Rear.

Rear Window Lockout Malfunction

1. Ignition OFF, disconnect the harness connector at the appropriate S79 Window Switch-Rear.
2. Ignition ON, connect a test lamp between the control circuit terminal 6 and ground.
3. Verify the test lamp turns ON and OFF when pressing the rear window lockout switch ON and OFF on the S79D Window Switch-Driver.
 - **If the test lamp is always OFF**
 1. Ignition OFF, remove the test lamp, disconnect the harness connector at the S79D Window Switch-Driver.
 2. Test for infinite resistance between the control circuit and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance
 3. Test for less than 2 ohms in the control circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, replace the S79D Window Switch-Driver.

- **If the test lamp is always ON**

1. Ignition OFF, remove the test lamp, disconnect the harness connector at the S79D Window Switch-Driver, Ignition ON.
2. Test for less than 1 V between the control circuit and ground.
 - If 1 V or greater, repair the short to voltage on the circuit.
 - If less than 1 V, replace the S79D Window Switch-Driver.

- **If the test lamp turns ON and OFF**

4. Test or replace the S79 Window Switch-Rear.

Component Testing

Window Motor

1. Ignition OFF, disconnect the harness connector at the appropriate M74 Window Motor.
2. Install a 25 A fused jumper wire between one of the control terminals and 12 V. Momentarily install a jumper wire between the other control terminal and ground. Reverse the jumper wires at least two times, the M74 Window Motor should perform the UP and DOWN functions.
 - **If the M74 Window Motor does not perform the UP and DOWN functions**

Replace the M74 Window Motor.

- **If the M74 Window Motor performs the UP and DOWN functions**

3. All OK

Driver Window Switch

1. Ignition OFF, disconnect the harness connector at the S79D Window Switch-Driver.
2. Test for infinite resistance between the terminals listed below with the switch in the open position:
 - Ignition terminal 8 and control terminal 7
 - Ignition terminal 8 and control terminal 9
 - Ignition terminal 8 and control terminal 12
 - Ignition terminal 8 and control terminal 14
 - Ignition terminal 2 and control terminal 1
 - Ignition terminal 2 and control terminal 3
 - Ignition terminal 2 and control terminal 4
 - Ignition terminal 2 and control terminal 6
 - **If less than infinite resistance**

Replace the S79D Window Switch-Driver.

- **If infinite resistance**

3. Test for less than 3 ohms between the terminals listed below with the switch in the open position:

- Ground terminal 13 and control terminal 1
- Ground terminal 13 and control terminal 3
- Ground terminal 13 and control terminal 4
- Ground terminal 13 and control terminal 6
- Ground terminal 13 and control terminal 7
- Ground terminal 13 and control terminal 9
- Ground terminal 13 and control terminal 12
- Ground terminal 13 and control terminal 14
- **If 3 ohms or greater**

Replace the S79D Window Switch-Driver.

- **If less than 3 ohms**

4. Test for less than 3 ohms between the terminals listed below with the switch in the Up position.

- Driver window left hand drive - Ignition terminal 8 and control terminal 9
- Driver window right hand drive - Ignition terminal 8 and control terminal 14
- Passenger window left hand drive - Ignition terminal 8 and control terminal 14
- Passenger window right hand drive - Ignition terminal 8 and control terminal 9
- Left rear - Ignition terminal 2 and control terminal 3
- Right rear - Ignition terminal 2 and control terminal 6
- **If 3 ohms or greater**

Replace the S79D Window Switch-Driver.

- **If less than 3 ohms**

5. Test for less than 3 ohms between the terminals listed below with the switch in the Down position:

- Driver window left hand drive - Ignition terminal 8 and control terminal 7
- Driver window right hand drive - Ignition terminal 8 and control terminal 12
- Passenger window left hand drive - Ignition terminal 8 and control terminal 12
- Passenger window right hand drive - Ignition terminal 8 and control terminal 7
- Left rear - Ignition terminal 2 and control terminal 1
- Right rear - Ignition terminal 2 and control terminal 4
- **If 3 ohms or greater**

Replace the S79D Window Switch-Driver.

- **If less than 3 ohms**

6. All OK

Passenger Window Switch

1. Ignition OFF, disconnect the harness connector at the S79P Window Switch-Passenger.
2. Test for infinite resistance between the terminals listed below with the switch in the open position:
 - Ignition terminal 6 and control terminal 1
 - Ignition terminal 6 and control terminal 3
 - **If less than infinite resistance**

Replace the S79P Window Switch-Passenger.

- **If infinite resistance**
3. Test for less than 3 ohms between the control terminals listed below with the switch in the open position:
 - Control terminal 4 and control terminal 1
 - Control terminal 8 and control terminal 3
 - **If 3 ohms or greater**

Replace the S79P Window Switch-Passenger.

- **If less than 3 ohms**
4. Test for less than 3 ohms between the Ignition terminal 6 and the control terminal 1 with the switch in the Up position.
 - **If 3 ohms or greater**

Replace the S79P Window Switch-Passenger.

- **If less than 3 ohms**
5. Test for less than 3 ohms between the Ignition terminal 6 and the control terminal 3 with the switch in the Down position.
 - **If 3 ohms or greater**

Replace the S79P Window Switch-Passenger.

- **If less than 3 ohms**
6. All OK

Rear Window Switch

1. Ignition OFF, disconnect the harness connector at the appropriate S79 Window Switch-Rear.
2. Test for infinite resistance between the terminals listed below with the switch in the open position:
 - Control terminal 6 and control terminal 1
 - Control terminal 6 and control terminal 3
 - **If less than infinite resistance**

Replace the S79 Window Switch-Rear.

- **If infinite resistance**

3. Test for less than 3 ohms between the control terminals listed below with the switch in the open position:

- Control terminal 4 and control terminal 1
- Control terminal 8 and control terminal 3
- **If 3 ohms or greater**

Replace the S79 Window Switch-Rear.

- **If less than 3 ohms**

4. Test for less than 3 ohms between the control terminal 6 and the control terminal 1 with the switch in the Up position.

- **If 3 ohms or greater**

Replace the S79 Window Switch-Rear.

- **If less than 3 ohms**

5. Test for less than 3 ohms between the control terminal 6 and the control terminal 3 with the switch in the Down position.

- **If 3 ohms or greater**

Replace the S79 Window Switch-Rear.

- **If less than 3 ohms**

6. All OK

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

- **Front Side Door Window Switch Replacement - Right Side**
- **Front Side Door Window Switch Replacement - Left Side**
- **Front Side Door Window Regulator Replacement**
- **Rear Side Door Window Regulator Replacement**

REPAIR INSTRUCTIONS

WINDSHIELD REPLACEMENT

Special Tools

J-24402 Glass Sealant Remover

Removal Procedure

Fig. 4: Removing Air Inlet Grille

Courtesy of GENERAL MOTORS COMPANY

WARNING: Refer to Defroster Outlet Warning .

1. Remove the air inlet grille. Refer to Air Inlet Grille Panel Replacement .
2. Remove the inside rearview mirror. Refer to Inside Rearview Mirror Replacement .
3. Remove the weatherstrip around the windshield.

Fig. 5: Cutting Adhesive Around Windshield Using J-24402
Courtesy of GENERAL MOTORS COMPANY

4. Using the J-24402 glass sealant remover (1), cut the adhesive around the windshield.

Fig. 6: Removing Windshield From Vehicle
Courtesy of GENERAL MOTORS COMPANY

5. Remove the windshield from the vehicle.
6. Using a knife, remove the adhesive from the windshield.

Installation Procedure

Fig. 7: Installing New Weatherstrip To Windshield
Courtesy of GENERAL MOTORS COMPANY

1. Install the new weatherstrip to the windshield.

Fig. 8: Applying Tape To New Weatherstrip And Windshield
Courtesy of GENERAL MOTORS COMPANY

2. Apply tape to the new weatherstrip and the windshield to hold the weatherstrip in place.
3. Apply adhesive primer to the windshield frame and the perimeter of the windshield.

Fig. 9: Applying Adhesive Primer To Windshield Frame
 Courtesy of GENERAL MOTORS COMPANY

WARNING: Insufficient curing of urethane adhesive may allow unrestrained occupants to be ejected from the vehicle resulting in personal injury.

- For the moisture-curing type of urethane adhesive, allow a minimum of 6 hours at 21°C (70°F) or greater and with at least 30 percent relative humidity. Allow at least 24 hours for the complete curing of the urethane adhesive.
- For the chemical-curing type of urethane adhesive, allow a minimum of 1 hour.

Do NOT physically disturb the repair area until after these minimum times have elapsed.

4. Apply glass adhesive to the windshield frame.

Fig. 10: Windshield And Windshield Frame
Courtesy of GENERAL MOTORS COMPANY

5. Install the windshield into the windshield frame.
6. Reposition the tape over the weatherstrip, the windshield and the windshield frame to hold the windshield in place.
7. Let the adhesive dry for 24 hours.
8. Remove the tape.

Fig. 11: Inspecting For Water Leaks

Courtesy of GENERAL MOTORS COMPANY

9. Inspect for water leaks by pouring water on the windshield. If a leak is found, dry the windshield and fill the area that leaks with adhesive. If the leak persists, remove the windshield and repeat the entire procedure.
10. Install the inside rearview mirror. Refer to **Inside Rearview Mirror Replacement** .
11. Install the air inlet grille. Refer to **Air Inlet Grille Panel Replacement** .

FRONT SIDE DOOR WINDOW REPLACEMENT

Fig. 12: Front Side Door Window
 Courtesy of GENERAL MOTORS COMPANY

Front Side Door Window Replacement

Callout	Component Name
Preliminary Procedure 1. Position the window approximately half way down in the door. 2. Remove the front side door trim panel. Refer to . 3. Remove the water deflector.	
1	Front Side Door Window Regulator Sash Screw (Qty 2) CAUTION: Refer to <u>Fastener Caution</u> . Tighten 2 (18 lb in)
2	Front Side Door Window Procedure 1. Remove the window regulator sash screws and then move the window to full down position using the window switch and regulator.

2. Rotate the front door window as necessary to remove it from the door.

REAR SIDE DOOR WINDOW REPLACEMENT

Fig. 13: Rear Side Door Window
Courtesy of GENERAL MOTORS COMPANY

Rear Side Door Window Replacement

Callout	Component Name
Preliminary Procedure	
1. Position the window approximately half way down in the door. 2. Remove the rear side door trim panel. Refer to <u>Rear Side Door Trim Panel Replacement</u> . 3. Remove the rear side door window regulator. Refer to <u>Rear Side Door Window Regulator Replacement</u>. 4. Remove the outer sealing strip. Refer to <u>Front Side Door Window Outer Sealing Strip Replacement</u>.	
1	Rear Side Door Window Regulator Sash Screw (Qty: 2) CAUTION: Refer to <u>Fastener Caution</u> . Tighten

	2 (18 lb in)
	Rear Side Door Window
2	Procedure 1. After removing the window regulator detach the window from the window frame and lower the window into the door panel. 2. Remove the rear side door window channel. Refer to <u>Rear Side Door Window Channel Replacement</u>. 3. Rotate the rear door window as necessary to remove it from the door.

REAR WINDOW REPLACEMENT

Special Tools

J-24402 Glass Sealant Remover

Removal Procedure

Fig. 14: Negative Battery Cable
Courtesy of GENERAL MOTORS COMPANY

WARNING: Refer to Defroster Outlet Warning .

1. Disconnect the negative battery cable.
2. Disconnect the rear window defogger electrical connectors.

Fig. 15: Cutting Adhesive Around Rear Window Glass
Courtesy of GENERAL MOTORS COMPANY

3. Using the J-24402 glass sealant remover (1), cut the adhesive around the rear window glass.

Fig. 16: Removing Windshield From Vehicle
Courtesy of GENERAL MOTORS COMPANY

4. Remove the rear window glass from the vehicle.
5. Using a knife, remove the adhesive from the rear window glass.

Installation Procedure

Fig. 17: Applying Tape To New Weatherstrip
Courtesy of GENERAL MOTORS COMPANY

1. Apply tape to the new weatherstrip and the rear window to hold the weatherstrip in place.
2. Apply adhesive primer to the rear window frame and the perimeter of the rear window.

Fig. 18: Applying Adhesive Primer To Rear Window Frame
 Courtesy of GENERAL MOTORS COMPANY

WARNING: Insufficient curing of urethane adhesive may allow unrestrained occupants to be ejected from the vehicle resulting in personal injury.

- For the moisture-curing type of urethane adhesive, allow a minimum of 6 hours at 21°C (70°F) or greater and with at least 30 percent relative humidity. Allow at least 24 hours for the complete curing of the urethane adhesive.
- For the chemical-curing type of urethane adhesive, allow a minimum of 1 hour.

Do NOT physically disturb the repair area until after these minimum times have elapsed.

3. Apply glass adhesive to the rear window frame.

Fig. 19: Rear Window Frame
Courtesy of GENERAL MOTORS COMPANY

4. Install the rear window into the rear window frame.
5. Reposition the tape over the weatherstrip, the rear window and the rear window frame to hold the rear window in place.
6. Let the adhesive dry for 24 hours.
7. Remove the tape.

Fig. 20: Inspecting water leaks

Courtesy of GENERAL MOTORS COMPANY

8. Inspect for water leaks by pouring water on the rear window. If a leak is found, dry the window and fill the area that leaks with adhesive. If the leak persists, remove the rear window and repeat the entire procedure.
9. Connect the rear window defogger electrical connector.
10. Connect the negative battery cable.

LIFTGATE WINDOW STRUT REPLACEMENT

Fig. 21: Liftgate Window Strut
 Courtesy of GENERAL MOTORS COMPANY

Liftgate Window Strut Replacement

Callout	Component Name
WARNING: When a lift gate hold open device is being removed or installed, provide alternate support to avoid the possibility of damage to the vehicle or personal injury.	
1	Liftgate Window Strut Bolt (Body) (Qty: 2) CAUTION: Refer to <u>Fastener Caution</u> . Tighten 25 N.m (18 lb ft)
2	Liftgate Window Strut
3	Liftgate Window Strut Securing Bolt (Door) (Qty: 1) Tighten 22 N.m (16 lb ft)

FRONT SIDE DOOR WINDOW CHANNEL REPLACEMENT

Fig. 22: Front Side Door Window Channel
 Courtesy of GENERAL MOTORS COMPANY

Front Side Door Window Channel Replacement

Callout	Component Name
Preliminary Procedure	
Remove the front side door window. Refer to Front Side Door Window Replacement .	
1	Front Side Door Window Channel Screw (Qty: 1) CAUTION: Refer to <u>Fastener Caution</u> . Tighten 1.3 N.m (12 lb in)
2	Front Side Door Window Channel Bolt (Qty: 2) Tighten 8 N.m (71 lb in)
3	Front Side Door Window Channel Assembly

REAR SIDE DOOR WINDOW CHANNEL REPLACEMENT

Fig. 23: Rear Side Door Window Channel
Courtesy of GENERAL MOTORS COMPANY

Rear Side Door Window Channel Replacement

Callout	Component Name
Preliminary Procedure 1. Detach the rear side door window from rear side door regulator and then put it down in side door panel. Refer to <u>Rear Side Door Window Replacement</u>. 2. Partially peel off the rear side door window weatherstrip from the door window opening. Refer to <u>Rear Side Door Window Weatherstrip Replacement</u>.	
1	Rear Side Door Window Channel Screw (Qty: 2) CAUTION: Refer to <u>Fastener Caution</u> . Tighten 8 (71 lb in)
2	Rear Side Door Window Channel Assembly

FRONT SIDE DOOR STATIONARY WINDOW REPLACEMENT

Fig. 24: Front Side Door Stationary Window
 Courtesy of GENERAL MOTORS COMPANY

Front Side Door Stationary Window Replacement

Callout	Component Name
Preliminary Procedure	
1. Remove the front side door window channel. Refer to Front Side Door Window Channel Replacement . 2. Remove the outside rearview mirror. Refer to Outside Rearview Mirror Replacement .	
1	Front Side Door Stationary Window Assembly

REAR SIDE DOOR WINDOW FRAME FRONT APPLIQUE REPLACEMENT

Fig. 25: Rear Side Door Window Frame Front Applique Tape
 Courtesy of GENERAL MOTORS COMPANY

Rear Side Door Window Frame Front Applique Replacement

Callout	Component Name
Preliminary Procedures 1. Remove the rear side door window outer sealing strip. Refer to <u>Rear Side Door Window Outer Sealing Strip Replacement</u>. 2. Grasp upper corner of the window weatherstrip, pull downward releasing the assembly from the door frame. NOTE: Do not need to remove the weatherstrip assembly. Just partially peel off the weatherstrip to attach the tape.	
	Rear Side Door Window Frame Front Applique Procedure 1. Fit the tape pre-mask line to the panel character line. 2. Peel off the inside paper. 3. Attach the tape to the door panel.

1

4. Press the tape by using a squeegee or equivalent.
5. Peel off the outside paper.
6. Wrap the corner areas of the tape.
7. Inspect the tape is properly attached.

NOTE:

This applique is an adhesive tape.

FRONT SIDE DOOR WINDOW SWITCH REPLACEMENT - RIGHT SIDE

Fig. 26: Front Side Door Window Switch -- Right Side
 Courtesy of GENERAL MOTORS COMPANY

Front Side Door Window Switch Replacement - Right Side

Callout	Component Name
1	Front Side Door Window Switch Bezel Refer to Front Side Door Window Switch Bezel Replacement .
2	Front Side Door Window Switch Assembly Procedure Disconnect electrical connector.

FRONT SIDE DOOR WINDOW SWITCH REPLACEMENT - LEFT SIDE

Fig. 27: Front Side Door Window Switch - Left Side
Courtesy of GENERAL MOTORS COMPANY

Front Side Door Window Switch Replacement - Left Side

Callout	Component Name
1	Front Side Door Window Switch Bezel Refer to Front Side Door Window Switch Bezel Replacement .
2	Front and Rear Side Door Window Switch Assembly Procedure Disconnect electrical connector.

REAR SIDE DOOR WINDOW SWITCH REPLACEMENT

Fig. 28: Rear Side Door Window Switch
 Courtesy of GENERAL MOTORS COMPANY

Rear Side Door Window Switch Replacement

Callout	Component Name
1	Rear Side Door Window Switch Bezel Refer to Front Side Door Trim Panel Replacement .
2	Rear Side Door Window Switch Assembly Procedure Disconnect electrical connector.

FRONT SIDE DOOR WINDOW REGULATOR REPLACEMENT

Fig. 29: Front Side Door Window Regulator
 Courtesy of GENERAL MOTORS COMPANY

Front Side Door Window Regulator Replacement

Callout	Component Name
Preliminary Procedure 1. Remove the front side door window regulator sash screw. Refer to Front Side Door Window Replacement. 2. After detaching window from regulator manually move glass to full up position and securely type off to window frame.	
1	Front Side Door Window Regulator Nut (Qty: 6) CAUTION: Refer to <u>Fastener Caution</u> . Tighten 8 (71 lb in)
2	Front Side Door Window Regulator Assembly

REAR SIDE DOOR WINDOW REGULATOR REPLACEMENT

Fig. 30: Rear Side Door Window Regulator
Courtesy of GENERAL MOTORS COMPANY

Rear Side Door Window Regulator Replacement

Callout	Component Name
Preliminary Procedure 1. Remove the rear side door window regulator sash screws. Refer to <u>Rear Side Door Window Replacement</u>. 2. After detaching window from regulator manually move glass to full up position and securely type off to window frame.	
1	Rear Side Door Window Regulator Nut (Qty: 5) CAUTION: Refer to <u>Fastener Caution</u> . Tighten 8 (71 lb in)
2	Rear Side Door Window Regulator Assembly

REAR SIDE DOOR WINDOW REGULATOR HANDLE REPLACEMENT

Fig. 31: Rear Side Door Window Regulator Handle
Courtesy of GENERAL MOTORS COMPANY

Rear Side Door Window Regulator Handle Replacement

Callout	Component Name
1	Rear Side Door Crank Clamp Procedure Use a proper tool aid in the removal of the rear side door crank.
2	Rear Side Door Window Regulator Handle

FRONT SIDE DOOR WINDOW OUTER SEALING STRIP REPLACEMENT

Fig. 32: Front Side Door Window Outer Sealing Strip
Courtesy of GENERAL MOTORS COMPANY

Front Side Door Window Outer Sealing Strip Replacement

Callout	Component Name
1	Front Side Door Window Outer Sealing Strip Screw (Qty: 1) CAUTION: Refer to <u>Fastener Caution</u> . Tighten 2 N.m (18 lb in)
2	Front Side Door Window Outer Sealing Strip Assembly

REAR SIDE DOOR WINDOW OUTER SEALING STRIP REPLACEMENT

Fig. 33: Rear Side Door Window Outer Sealing Strip (Hatchback)
 Courtesy of GENERAL MOTORS COMPANY

Rear Side Door Window Outer Sealing Strip Replacement

Callout	Component Name
1	Rear Side Door Window Outer Sealing Strip Screw CAUTION: Refer to <u>Fastener Caution</u> . Tighten 2 (18 lb in) NOTE: Open the rear door to the full open position to expose the rear side door window outer sealing strip screw that is located on the front inner edge of the door.
2	Rear Side Door Window Outer Sealing Strip Procedure 1. Use the appropriate tool, lift the front corner of the sealing strip and pull upward and away from the door flange.

- ## FRONT SIDE DOOR WINDOW WEATHERSTRIP REPLACEMENT

Callout	Component Name
Preliminary Procedures	
1. Remove the front side door trim panel. Refer to <u>Front Side Door Trim Panel Replacement</u> . 2. Remove the front side door window. Refer to <u>Front Side Door Window Replacement</u> 3. Remove the outer sealing strip. Refer to <u>Front Side Door Window Outer Sealing Strip Replacement</u>.	
	Front Side Door Window Weatherstrip Procedure 1. Grasp both upper corners of the window weatherstrip, pull downward releasing the assembly from the door frame.

1

2. Insert the weatherstrip downward in the front and rear channel until fully seated.
3. Position the window weatherstrip in the upper rear corner of the frame, work the weatherstrip around the door frame.
4. Carefully move the regulator upward for short slow intervals, while ensuring that the window remains in the channels.
5. Inspect the door window for proper operation before installing the door trim panel.

REAR SIDE DOOR WINDOW WEATHERSTRIP REPLACEMENT

Fig. 35: Rear Side Door Window Weatherstrip (Hatchback)
Courtesy of GENERAL MOTORS COMPANY

Rear Side Door Window Weatherstrip Replacement

Callout	Component Name
Preliminary Procedures	
1.	Remove the rear side door window regulator. Refer to <u>Rear Side Door Window Regulator Replacement</u> .
2.	After removing the rear side door window regulator, gently lower the window into the door panel.
	Rear Side Door Window Weatherstrip
	Procedure

1	1. Remove the weatherstrip from the front and rear lower window guides. 2. Grasp both upper corners, pull downward releasing the weatherstrip from the door frame. 3. Insert the weatherstrip downward in the window guides until fully seated. 4. Carefully move the regulator upward for short slow intervals, while ensuring that the window remains in the guides. 5. Inspect the door window for proper operation before installing the door trim panel.
---	---

DESCRIPTION AND OPERATION

POWER WINDOWS DESCRIPTION AND OPERATION

Power Window System Components

The power window system consists of the following components:

- Driver window switch
- Front passenger window switch
- Left rear window switch
- Right rear window switch
- Window regulator motors in each of the doors
- 30 amp fuse
- 25 amp fuse

Power Window System Controls

The power window system can be controlled by a power window up or down switch activation.

Window Operation and the Driver Window Switch

When the ignition switch is in the RUN or ACCY position or Retained Accessory Power (RAP) is enabled, battery positive voltage is supplied to the driver window switch. Ground for the switch is provided by a ground circuit connected to a ground stake. When the driver window switch is pressed in the down position, the voltage is applied to the driver window motor down circuit and ground is applied to the driver window motor up circuit causing the window to open. When the driver window switch is pressed in the up position, the polarity is reversed, voltage and ground are applied to the opposite circuits and the window closes. In order to control the passenger windows from the driver door, the driver window switch assembly contains a separate window switch for each passenger door window. These window switches operate in the same way as the driver window switch, except that the applied voltage and ground must also pass through the local passenger, left rear or right rear window switch in order to command the respective window motor.

The driver window switch also provides power and ground for the local rear window switches. Battery positive voltage is supplied, through the power window master switch lockout signal circuit, to each local rear window switch. The local front passenger door window switch has a separate battery positive voltage circuit, however, this circuit is spliced into the driver window switch voltage supply circuit within the IP Fuse Block. Ground for all three of the passenger door switches, is also supplied by the driver window switch.

Lockout Switch Feature

The driver window switch contains a rear window lockout switch which disconnects the battery positive voltage supply to the remote rear passenger door window switches, disabling them. The local front passenger door window switch cannot be locked out.

Window Operation and the Passenger Window Switches

When the ignition switch is in the RUN or ACCY position or Retained Accessory Power (RAP) is enabled, battery positive voltage is supplied to each of the remote passenger door window switches. When a local window switch is pressed in the down position, voltage is applied to the window motor down circuit and ground is applied to the window motor up circuit, causing the window to open. When the window switch is pressed in the up position, the polarity is reversed, voltage and ground are applied to the opposite circuits and the window closes.

REAR WINDOW DEFOGGER DESCRIPTION AND OPERATION

Rear Window Defogger System Components

The rear window defogger system consist of the following components:

- The HVAC control module
- The body control module (BCM)
- The rear defogger relay
- The rear window grid
- Driver outside rearview mirror

- Passenger outside rearview mirror
- 30A fuse

K33-K9-X50A Defogger Block Diagram

E17D	E17D Outside Rearview Mirror Glass - Driver
E18	E18 Rear Defogger Grid
E17P	E17P Outside Rearview Mirror Glass - Passenger

K33	K33 HVAC Control Module
K9	K9 Body Control Module

Rear Window Defogger Operation

The BCM supplies 12 V signal to the rear window defogger switch signal circuit to the HVAC control module. When you depress the rear window defogger switch, the rear window defogger switch pulls the signal circuit low. The BCM interprets as a request for the rear window defogger system. The BCM enables the rear window defogger system by supplying voltage to the rear defogger relay coil. The relay coil supply voltage is also spliced off internally in the BCM to the supply voltage circuit of the rear window defogger indicator. The rear defogger relay is energized and the rear window defogger indicator is illuminated. With the relay energized, battery positive voltage is allowed from the relay switched input through the switch contacts and out the relay switched output to the rear window defogger grid.

When you start the engine and press the rear window defogger switch for the first time, the defogger cycle lasts for 15 minutes. Further operation results in 7.5 minute defogger cycles. The rear defogger feature will not time out if vehicle speed is above 80 km/h (50 mph). The defogger cycle resets to 15 minutes when you cycle the ignition to the OFF position and then to the ON position.

Heated Mirrors

The heated mirrors are also controlled through the rear defogger relay. Whenever the rear window defogger is turned on battery voltage is supplied to the mirror heater elements through the left and right mirror heater element control circuits.

STATIONARY WINDOW DESCRIPTION

WARNING: Refer to Cracked Window Warning .

Stationary windows consist of all the windows on the vehicle which are immovable within its frame, such as the windshield, the rear window and the inside rearview mirror.

REPAIR INSTRUCTIONS

FLOOR CARPET DRYING

If the carpet or the pad or insulator is wet, use the following criteria for drying or for replacing the components:

- For a 1-piece carpet assembly bonded to a cotton or a fiber padding, replace the entire assembly.
- For a 2-piece carpet assembly with a cotton or a fiber padding, replace the padding only. While the carpet is out of the vehicle, dry the carpet using the method described below.
- For a 1-piece carpet assembly bonded to a foam padding or attached to a synthetic padding, dry the carpet using the method described below.
- For a 2-piece carpet assembly with a synthetic padding, dry the assembly using the method described below.

Drying Method

1. If you observe puddles of liquid on the carpet face, use a wet vacuum to remove the excess moisture.
2. Blot the face of the carpet with a towel in order to absorb as much moisture as possible.
3. Point a fan at the affected area and air dry the carpet.

FLOOR PANEL CARPET REPLACEMENT

Fig. 1: Floor Panel Carpet
 Courtesy of GENERAL MOTORS COMPANY

Floor Panel Carpet Replacement

Callout	Component Name
Preliminary Procedures	
1. Remove front seats. Refer to <u>Driver or Passenger Seat Removal and Installation</u> . 2. Remove rear seat cushion. Refer to <u>Rear Seat Cushion Removal and Installation</u> . 3. Remove the front floor console. Refer to <u>Front Floor Console Replacement</u> . 4. Remove the front side door sill trim plate. Refer to <u>Front Side Door Sill Trim Plate Replacement</u> . 5. Remove the rear side door sill trim plate. Refer to <u>Rear Side Door Sill Trim Plate Replacement</u> . 6. Remove the center pillar lower trim panels. Refer to <u>Center Pillar Lower Trim Panel Replacement</u> .	
1	Front Floor Panel Carpet Assembly Procedure Loosen the transmission control.

HEADLINING TRIM PANEL REPLACEMENT

Fig. 2: Headlining Trim Panel

Courtesy of GENERAL MOTORS COMPANY

Headlining Trim Panel Replacement

Callout	Component Name
WARNING: Do not attempt to repair or alter the head impact energy-absorbing material glued to the headliner or to the garnish trims. If the material is damaged, replace the headliner and/or the garnish trim. Failure to do so could result in personal injury. CAUTION: If a vehicle is equipped with a head curtain inflator module ensure that the inflator module and tether are undamaged. If tether or curtain airbag are damaged in any way, they must be replaced. CAUTION: Use care when working around the head curtain inflator module. Sharp tools may puncture the curtain airbag. If the head curtain inflator module is damaged in any way, it must be replaced. Preliminary Procedures 1. Disable the SIR system. Refer to <u>SIR Disabling and Enabling</u> . 2. Remove the sunshade. Refer to <u>Sunshade Replacement</u> . 3. Remove the assist handles. Refer to <u>Assist Handle Replacement</u> . 4. Remove the windshield garnish moldings. Refer to <u>Windshield Garnish Molding Replacement</u> .	

5. Remove the center pillar upper trim panels. Refer to **Center Pillar Upper Trim Panel Replacement** .
6. Remove the quarter window garnish moldings. Refer to **Quarter Window Garnish Molding Replacement** .
7. Remove the center courtesy lamp assembly. Refer to **Center Courtesy Lamp Replacement** .
8. Move the front seat fully forward and recline.

1	Headliner Trim Panel Retainer (Qty: 5)
2	Headliner Trim Panel Assembly Procedure Disconnect the electrical connectors.

15. Mark the frame to body positions (1) with a paint pen or permanent marker.

Fig. 6: Installing En-49802 Cradle Supporter To Hydraulic Jack Stand
Courtesy of GENERAL MOTORS COMPANY

16. Install the **EN-49802** cradle supporter to a hydraulic jack stand and support the frame.

Fig. 7: Body Bolts

Courtesy of GENERAL MOTORS COMPANY

17. Remove the frame to body bolts (1).
18. Slowly lower the jack stand and remove the frame from the vehicle.
19. Remove the following components if replacing the frame:
 1. Remove the stabilizer shaft from the frame. Refer to **Stabilizer Shaft Replacement** .
 2. Remove the control arms from the frame. Refer to **Lower Control Arm Replacement** .
 3. Remove the radiator brackets from the frame.
 4. Remove the front lower impact bar.

Installation Procedure

1. Install the following components to the frame if removed:
 1. Install the front lower impact bar to the frame.
 2. Install the radiator brackets to the frame.
 3. Install the control arms to the frame. Refer to **Lower Control Arm Replacement** .
 4. Install the stabilizer shaft to the frame. Refer to **Stabilizer Shaft Replacement** .

Fig. 8: Installing En-49802 Cradle Supporter To Hydraulic Jack Stand
Courtesy of GENERAL MOTORS COMPANY

2. With the frame on the **EN-49802** cradle supporter and hydraulic jack stand, raise the frame to the vehicle.

Fig. 9: Marking Frame To Body Positions
Courtesy of GENERAL MOTORS COMPANY

3. Hand start all the frame to body retaining bolts while aligning the frame to the paint marks (1).

Fig. 10: Body Bolts

Courtesy of GENERAL MOTORS COMPANY

CAUTION: Refer to Fastener Caution .

4. Tighten the frame to body retaining bolts (1) to 170 (125 lb ft).
5. Lower the jack stand and remove the **EN-49802** cradle supporter.
6. Install the steering gear assembly to the frame retaining bolts. Refer to **Steering Gear Replacement (Electric Power Steering)** .

Fig. 11: Transmission Mounting Bracket Bolt And Nut And Torque Strut
Courtesy of GENERAL MOTORS COMPANY

7. Install the torque strut (3) from the frame.
8. Install the torque strut to the frame bolt (2) and tighten to 100 (74 lb ft).
9. Install the torque strut to the transmission mounting bracket bolt and nut (1) and tighten to 80 (59 lb ft).
10. Install the exhaust pipe. Refer to **Exhaust Front Pipe Replacement (LL0)** .
11. Connect both of the stabilizer shaft links to the struts and tighten the upper stabilizer shaft link nuts. Refer to **Stabilizer Shaft Link Replacement** .
12. Install both of the control arm ball joints to the steering knuckles. Refer to **Lower Control Arm Replacement** .
13. Remove the wires which secure the cooling module to the upper body structure.
14. Install the lower wind guard.
15. Install the front bumper fascia. Refer to **Front Bumper Fascia Replacement** .
16. Install both of the front wheel house linings.
17. Install the front under cover.
18. Install both of the front compartment splash shields. Refer to **Front Compartment Splash Shield Replacement**.
19. Install the front wheel and wheel assemblies. Refer to **Tire and Wheel Removal and Installation** .
20. Lower the vehicle.

21. Road test the vehicle in order to test for the following conditions:

- Steering leads or pulls-Refer to **Wheel Alignment Measurement** .
- Abnormal powertrain noise or vibration at idle-Inspect the engine and transmission mounts for proper alignment and torque.

DRIVETRAIN AND FRONT SUSPENSION FRAME REPLACEMENT (WITH CH-49289)

Special Tools

- **CH-904** Base Frame
- **CH-49289** Centering Frame

For equivalent regional tools refer to **Special Tools**.

Removal Procedure

CAUTION: Refer to **Vehicle Lifting and Jacking Caution** .

1. Raise and support the vehicle.
2. Remove the front wheel and wheel assemblies. Refer to **Tire and Wheel Removal and Installation** .
3. Remove both front compartment splash shields. Refer to **Front Compartment Splash Shield Replacement**.
4. Remove the front under cover.
5. Remove both of the front wheel house linings.
6. Remove the front bumper fascia. Refer to **Front Bumper Fascia Replacement** .
7. Remove the lower wind guard.

Fig. 12: Securing Cooling Module To Left And Right Of Upper Body Structure With A Wire

REPAIR INSTRUCTIONS

STABILIZER SHAFT REPLACEMENT

Fig. 1: Stabilizer Shaft
 Courtesy of GENERAL MOTORS COMPANY

Stabilizer Shaft Replacement

Callout	Component Name
Preliminary Procedure 1. Raise and support the vehicle. Refer to <u>Lifting and Jacking the Vehicle</u> . 2. Remove the front tire and wheel assemblies. Refer to <u>Tire and Wheel Removal and Installation</u> . 3. Separate both of the outer tie rod ends. Refer to <u>Steering Linkage Outer Tie Rod Replacement</u> . 4. Remove both of the stabilizer shaft links. Refer to <u>Stabilizer Shaft Link Replacement</u>.	
1	Front Stabilizer Shaft Clamp Bolt (Qty: 4) CAUTION: Refer to <u>Fastener Caution</u> . Tighten 25 N.m (18 lb ft)
2	Front Stabilizer Shaft

STABILIZER SHAFT LINK REPLACEMENT

Fig. 2: Stabilizer Shaft Link
 Courtesy of GENERAL MOTORS COMPANY

Stabilizer Shaft Link Replacement

Callout	Component Name
Preliminary Procedure	
1. Raise and support the vehicle. Refer to <u>Lifting and Jacking the Vehicle</u> . 2. Remove the front tire and wheel assemblies. Refer to <u>Tire and Wheel Removal and Installation</u> .	
1	Front Stabilizer Shaft Link Nut (Qty: 2) CAUTION: Refer to <u>Fastener Caution</u> . NOTE: 1. When removing the stabilizer shaft link nuts, remove both of the upper nuts first and then lift up the stabilizer bar ends in order to get the tool access to lower nuts. 2. When removing and installing nut, fix the rotational pivot bolt with the appropriate tool. Tighten 43 (32 lb ft)

STABILIZER SHAFT INSULATOR REPLACEMENT

The stabilizer shaft insulator is not serviced separately. If the stabilizer shaft insulator is defective, it will have to be replaced as the stabilizer shaft assembly. Refer to **Stabilizer Shaft Replacement**.

FRONT WHEEL BEARING AND HUB REPLACEMENT

Special Tools

- **CH-46560-04** Thread Rod (Component of DT-50178)
- **CH-46560-05** Hex Nut (Component of DT-50178)
- **DT-47540** Wheel Hub Spacer (Hub Removal & Installation Adapter, Component of DT-50178)
- **DT-47541** Wheel Bearing Spacer (Wheel Bearing Removal Adapter, Component of DT-50178)
- **DT-47542** Wheel Bearing Spacer (Hub & Bearing Installation Plate, Component of DT-50178)
- **DT-47543** Wheel Bearing Spacer (Wheel Bearing Installation Adapter, Component of DT-50178)
- **DT-50178** Hub/Bearing Remover/Installer Kit
- **DT-50178-01** Bridge Support (Component of DT-50178)

Removal Procedure

1. Raise and support the vehicle. Refer to **Lifting and Jacking the Vehicle** .
2. Remove the front wheel and wheel assembly. Refer to **Tire and Wheel Removal and Installation** .
3. Remove the brake rotor. Refer to **Front Brake Rotor Replacement** .
4. Remove the steering knuckle assembly. Refer to **Steering Knuckle Replacement**.
5. Use a vice in order to hold the steering knuckle assembly.

Fig. 3: Removing Wheel Hub From Steering Knuckle Using Tools
Courtesy of GENERAL MOTORS COMPANY

6. Using the **DT-50178-01** bridge support, **CH-46560-04** thread rod, **CH-46560-05** hex nut, and **DT-47540** wheel hub spacer, remove the wheel hub from the steering knuckle.

Fig. 4: Wheel Bearing Retaining Ring And Steering Knuckle
Courtesy of GENERAL MOTORS COMPANY

7. Remove the wheel bearing retaining ring from the steering knuckle.

Fig. 5: Removing Wheel Bearing From Steering Knuckle

8. Using the **DT-50178-01** bridge support, **CH-46560-04** thread rod, **CH-46560-05** hex nut, and **DT-47541** wheel bearing spacer, remove the wheel bearing from the steering knuckle.

Discard the wheel bearing.

9. Clean the bore of the steering knuckle.

Installation Procedure

Fig. 6: Steering Knuckle And Wheel Bearing
Courtesy of GENERAL MOTORS COMPANY

1. Use a vice in order to hold the steering knuckle.
2. Using the **DT-47542** wheel bearing spacer, **CH-46560-04** thread rod, **CH-46560-05** hex nut, and **DT-47543** wheel bearing spacer, install the NEW wheel bearing to the steering knuckle.

Fig. 7: Wheel Bearing Retaining Ring And Steering Knuckle
Courtesy of GENERAL MOTORS COMPANY

3. Install the wheel bearing retaining ring to the steering knuckle.

Fig. 8: Wheel Hub And Steering Knuckle
Courtesy of GENERAL MOTORS COMPANY

4. Using the **DT-47542** wheel bearing spacer, **CH-46560-04** thread rod, **CH-46560-05** hex nut, and **DT-47540** wheel hub spacer, install the wheel hub to the steering knuckle.
5. Verify that the wheel hub rotates smoothly.
6. Install the steering knuckle assembly. Refer to **Steering Knuckle Replacement**.
7. Install the brake rotor. Refer to **Front Brake Rotor Replacement**.
8. Install the front wheel and wheel assembly. Refer to **Tire and Wheel Removal and Installation**.
9. Lower the vehicle.

STEERING KNUCKLE REPLACEMENT

Removal Procedure

1. Raise and support the vehicle. Refer to **Lifting and Jacking the Vehicle**.
2. Remove the front tire and wheel assembly. Refer to **Tire and Wheel Removal and Installation**.
3. Disconnect the outer tie rod end from the steering knuckle. Refer to **Steering Linkage Outer Tie Rod Replacement**.
4. Separate the control arm ball joint from the steering knuckle. Refer to **Lower Control Arm Replacement**.

5. Separate the wheel drive shaft from the steering knuckle. Refer to **Front Wheel Drive Shaft Replacement** .
6. Remove the brake rotor. Refer to **Front Brake Rotor Replacement** .
7. Remove the wheel speed sensor, if equipped with ABS. Refer to **Front Wheel Speed Sensor Replacement (Right Side)** , **Front Wheel Speed Sensor Replacement (Left Side)** .
8. Remove the brake rotor splash shield from the steering knuckle. Refer to **Front Brake Shield Replacement** .

Fig. 9: Knuckle, Bolts And Nuts

9. Remove the bolts and nuts (1) attaching the strut to the knuckle.

Fig. 10: Steering Knuckle Assembly
Courtesy of GENERAL MOTORS COMPANY

10. Remove the steering knuckle assembly (2) from the strut assembly (1).

Installation Procedure

Fig. 11: Steering Knuckle Assembly
Courtesy of GENERAL MOTORS COMPANY

1. Install the steering knuckle assembly (2) to the strut assembly (1).

Fig. 12: Knuckle, Bolts And Nuts
 Courtesy of GENERAL MOTORS COMPANY

CAUTION: Refer to Fastener Caution .

2. Install the strut to knuckle retaining bolts and nuts (1) and tighten to 80 (59 lb ft).
3. Tighten the nuts at the final pass to an additional 38 degrees.
4. Install the brake rotor splash shield to the steering knuckle. Refer to **Front Brake Shield Replacement** .
5. Install the wheel speed sensor, if equipped with ABS. Refer to **Front Wheel Speed Sensor Replacement (Right Side)** , **Front Wheel Speed Sensor Replacement (Left Side)** .
6. Install the brake rotor. Refer to **Front Brake Rotor Replacement** .
7. Install the wheel drive shaft to the steering knuckle. Refer to **Front Wheel Drive Shaft Replacement** .
8. Install the control arm ball joint to the steering knuckle. Refer to **Lower Control Arm Replacement**.
9. Install the outer tie rod end to the steering knuckle. Refer to **Steering Linkage Outer Tie Rod Replacement** .
10. Install the front tire and wheel assembly. Refer to **Tire and Wheel Removal and Installation** .
11. Lower the vehicle.

LOWER CONTROL ARM REPLACEMENT

Removal Procedure

1. Raise and support the vehicle. Refer to Lifting and Jacking the Vehicle .
2. Remove the tire and wheel assembly. Refer to Tire and Wheel Removal and Installation .

Fig. 13: Steering Knuckle Retaining Bolt
Courtesy of GENERAL MOTORS COMPANY

3. Remove the lower control arm ball joint to steering knuckle retaining bolt (1) and separate the ball joint from the steering knuckle.

Fig. 14: Cradle Bolts And Front Lower Control Bushing Brackets
Courtesy of GENERAL MOTORS COMPANY

4. Remove the front lower control arm to cradle bolts (1) and the front lower control bushing brackets (2).

Fig. 15: Rear Lower Control Arm And Cradle Bolts
Courtesy of GENERAL MOTORS COMPANY

5. Remove the rear lower control arm to cradle bolts and nuts (1).

Fig. 16: Lower Control Arm

Courtesy of GENERAL MOTORS COMPANY

6. Remove the lower control arm (1) from the cradle.

Installation Procedure

Fig. 17: Lower Control Arm

Courtesy of GENERAL MOTORS COMPANY

1. Position the lower control arm (1) in the vehicle.

Fig. 18: Rear Lower Control Arm And Cradle Bolts
Courtesy of GENERAL MOTORS COMPANY

CAUTION: Refer to Fastener Caution .

2. Install the rear lower control arm to cradle bolts and nuts (1) and tighten to 110 N.m (81 lb ft).

Fig. 19: Cradle Bolts And Front Lower Control Bushing Brackets
Courtesy of GENERAL MOTORS COMPANY

3. Install the front lower control arm bushing brackets (2) and the front lower control arm to cradle bolts (1) and tighten to 110 N.m (81 lb ft).

Fig. 20: Steering Knuckle Retaining Bolt
Courtesy of GENERAL MOTORS COMPANY

4. Install the lower control arm ball joint to the steering knuckle.
5. Install the lower control arm ball joint to steering knuckle retaining bolt (1) and tighten to 65 N.m (48 lb ft).
6. Install the tire and wheel assembly. Refer to **Tire and Wheel Removal and Installation** .
7. Lower the vehicle to the ground.

FRONT LOWER CONTROL ARM BUSHING REPLACEMENT

Fig. 21: Front Lower Control Arm Bushing
 Courtesy of GENERAL MOTORS COMPANY

Front Lower Control Arm Bushing Replacement

Callout	Component Name
Preliminary Procedure 1. Raise and support the vehicle. Refer to <u>Lifting and Jacking the Vehicle</u> . 2. Remove the front tire and wheel assemblies. Refer to <u>Tire and Wheel Removal and Installation</u> . 3. Remove the lower control arm. Refer to <u>Lower Control Arm Replacement</u>.	
1	Lower Control Arm Rear Bushing Nut CAUTION: Refer to <u>Fastener Caution</u> . TIP: Note the position of the bushing during removal. Tighten 110 N.m + 53° (81 lb ft + 53°)
2	Washer
3	Lower Control Arm Rear Bushing Procedure Hold the rear bushing when tightening the rear bushing bolt.

WHEEL STUD REPLACEMENT

Special Tools

CH-43631 Ball Joint Remover

Removal Procedure

1. Raise and support the vehicle. Refer to **Lifting and Jacking the Vehicle** .
2. Remove the tire and wheel assembly. Refer to **Tire and Wheel Removal and Installation** .
3. Without disconnecting the hydraulic brake flex hose, remove and support the brake caliper and bracket as an assembly, and remove the brake rotor. Refer to **Front Brake Rotor Replacement** .
4. Remove the front wheel hub. Refer to **Front Wheel Bearing and Hub Replacement**.

Fig. 22: Wheel Stud And Separator
Courtesy of GENERAL MOTORS COMPANY

5. Using the **CH-43631** ball joint remover (2), remove the wheel stud (1) from the hub and discard the stud.

Installation Procedure

Fig. 23: Wheel Hub Flange, Lug Nut And Washers
Courtesy of GENERAL MOTORS COMPANY

1. Install a NEW wheel stud to the wheel hub.
2. Add enough washers (3) in order to draw the stud into the hub.
3. Install the wheel nut (1).
4. Tighten the wheel nut until the head of the wheel stud is fully seated against the back of the wheel hub flange (2).
5. Remove the wheel nut (1) and the washers (3).
6. Install the front wheel hub. Refer to **Front Wheel Bearing and Hub Replacement**.
7. Install the brake rotor, and install the brake caliper and bracket as an assembly. Refer to **Front Brake Rotor Replacement** .
8. Install the tire and wheel assembly. Refer to **Tire and Wheel Removal and Installation** .
9. Lower the vehicle.

STRUT ASSEMBLY REMOVAL AND INSTALLATION

Special Tools

CH-49375 Wrench

For equivalent regional tools, refer to **Special Tools**.

Removal Procedure

1. Raise and support the vehicle. Refer to **Lifting and Jacking the Vehicle** .
2. Remove the tire and wheel assembly. Refer to **Tire and Wheel Removal and Installation** .

Fig. 24: Brake Hose Grommet

Courtesy of GENERAL MOTORS COMPANY

3. Detach the brake hose grommet (1) from the strut bracket.
4. Detach the wheel speed sensor wiring harness grommet (2) from the strut bracket, if equipped with ABS.

Fig. 25: Stabilizer Shaft Link And Strut Retaining Nut
Courtesy of GENERAL MOTORS COMPANY

5. Remove the stabilizer shaft link to strut retaining nut (1) and separate the stabilizer link from the strut.

Fig. 26: Steering Knuckle To Strut Bolts And Nuts
Courtesy of GENERAL MOTORS COMPANY

6. Remove the steering knuckle to strut bolts and nuts (1).
7. Lower the vehicle.
8. Remove the plenum lower panel. Refer to **Plenum Lower Panel Replacement** .

Fig. 27: Strut Cover

Courtesy of GENERAL MOTORS COMPANY

9. Remove the strut cover (1).

CAUTION: Completely fix the strut pivot with the special tool not to rotate when removing the strut upper mounting nut. Failure to do this could cause damage to the vehicle or component.

10. Using the **CH-49375** wrench, remove the strut upper mounting nut (2).
11. Remove the strut mounting plate (3).
12. Separate the front strut from the steering knuckle.
13. Remove the front strut assembly from the vehicle.

Installation Procedure

Fig. 28: Strut Cover

Courtesy of GENERAL MOTORS COMPANY

1. Install the front strut assembly to the vehicle.
2. Install the strut mounting plate (3).

CAUTION: Refer to Fastener Caution .

CAUTION: Completely fix the strut pivot with the special tool not to rotate when removing the strut upper mounting nut. Failure to do this could cause damage to the vehicle or component.

3. Using the **CH-49375** wrench, install the strut upper mounting nut (2) and tighten to 65 (48 lb ft).
4. Install the strut cover (1).
5. Install the plenum lower panel. Refer to Plenum Lower Panel Replacement .

CAUTION: Refer to Vehicle Lifting and Jacking Caution .

6. Raise and support the vehicle.

Fig. 29: Steering Knuckle To Strut Bolts And Nuts
Courtesy of GENERAL MOTORS COMPANY

7. Install the front strut to the steering knuckle.
8. Install the steering knuckle to strut retaining bolts and nuts (1) and tighten to 80 (59 lb ft).
9. Tighten the nuts at the final pass to an additional 38 degrees.

Fig. 30: Stabilizer Shaft Link And Strut Retaining Nut
Courtesy of GENERAL MOTORS COMPANY

10. Install the stabilizer link to the strut and install the stabilizer shaft link to strut retaining nut (1) and tighten to 43 (32 lb ft).

Fig. 31: Brake Hose Grommet

Courtesy of GENERAL MOTORS COMPANY

11. Install the wheel speed sensor wiring harness grommet (2) to the strut bracket, if equipped with ABS.
12. Install the brake hose grommet (1) to the strut bracket.
13. Install the tire and wheel assembly. Refer to **Tire and Wheel Removal and Installation** .
14. Lower the vehicle.
15. Check the front wheel alignment. Refer to **Wheel Alignment Specifications** .

SHOCK ABSORBER DISPOSAL

WARNING: Use the proper eye protection when drilling to prevent metal chips from causing physical injury.

Fig. 32: Drilling A Hole In Strut At Center Of End Cap Using Drill Bit
Courtesy of GENERAL MOTORS COMPANY

1. Clamp the strut in a vise horizontally with the rod (1) completely extended.
2. Drill a hole in the strut at the center of the end cap (3) using a 5 mm (3/16 in) drill bit. Gas or a gas/oil mixture will exhaust when the drill bit penetrates the strut. Use shop towels in order to contain the escaping oil.
3. Remove the strut from the vise.
4. Hold the strut over a drain pan vertically with the hole down.
5. Move the rod (1) in and out of the tube (2) to completely drain the oil from the strut.

STRUT, STRUT COMPONENT, OR SPRING REPLACEMENT

Special Tools

CH-46558 Front Spring Compressor

For equivalent regional tools, refer to **Special Tools**.

Disassembly Procedure

1. Remove the strut assembly. Refer to **Strut Assembly Removal and Installation**.

2. Install the strut assembly to the vise.

Fig. 33: View Of CH-46558 Front Spring Compressor
Courtesy of GENERAL MOTORS COMPANY

3. Install the **CH-46558** front spring compressor (1) to the coil spring.
4. Compress the coil spring using the **CH-46558** front spring compressor (1).

Fig. 34: Strut Nut And Strut

Courtesy of GENERAL MOTORS COMPANY

5. Remove the strut nut (1) from the strut.
6. Remove the upper strut mount (2) from the strut.

Fig. 35: Cartridge Upper Cover

Courtesy of GENERAL MOTORS COMPANY

7. Remove the cartridge upper cover (1) from the strut.
8. Remove the **CH-46558** front spring compressor from the coil spring.
9. Remove the coil spring (2) from the strut.
10. Remove the strut bumper (3) from the strut.
11. Remove the strut from the vise.

Assembly Procedure

Fig. 36: Cartridge Upper Cover
Courtesy of GENERAL MOTORS COMPANY

1. Install the strut to the vise.
2. Install the strut bumper (3) to the strut.
3. Install the coil spring (2) to the strut.
4. Install the **CH-46558** front spring compressor to the coil spring.
5. Compress the coil spring using the **CH-46558** front spring compressor.
6. Install the cartridge upper cover (1) to the strut.

Fig. 37: Strut Nut And Strut

Courtesy of GENERAL MOTORS COMPANY

7. Install the upper strut mount (2) to the strut.

CAUTION: Refer to Fastener Caution .

8. Install the strut nut (1) to the strut and tighten to 65 N.m (48 lb ft).
9. Remove the **CH-46558** front spring compressor (1) from the coil spring.
10. Remove the strut assembly from the vise.
11. Install the strut assembly to the vehicle. Refer to Strut Assembly Removal and Installation.

DESCRIPTION AND OPERATION

FRONT SUSPENSION DESCRIPTION AND OPERATION

The front suspension has 2 primary purposes:

- Isolate the driver from irregularities in the road surface.
- Define the ride and handling characteristics of the vehicle.

The front suspension absorbs the impact of the tires traveling over irregular road surfaces and dissipates this energy throughout the suspension system. This process isolates the vehicle occupants from the road surface. The rate at which the suspension dissipates the energy and the amount of energy that is absorbed is how the suspension defines the vehicles ride characteristics.

Ride characteristics are designed into the suspension system and are not adjustable. The ride characteristics are mentioned in this description in order to aid in the understanding of the functions of the suspension system. The suspension system must allow for the vertical movement of the tire and wheel assembly as the vehicle travels over irregular road surfaces while maintaining the tire's horizontal relationship to the road.

This requires that the steering knuckle be suspended between a lower control arm and a strut assembly. The lower control arm attaches from the steering knuckle at the outermost point of the control arm. The attachment is through a ball and socket type joint. The innermost end of the control arm attached at 2 points to the vehicle frame through semi-rigid bushings. The upper portion of the steering knuckle is attached to a strut assembly. The strut assembly then connects to the vehicle body by way of an upper bearing. The steering knuckle is allowed to travel up and down independent of the vehicle body structure and frame.

This up and down motion of the steering knuckle as the vehicle travels over bumps is absorbed predominantly by the coil spring. This spring is retained under tension over the strut assembly. A strut is used in conjunction with this system in order to dampen out the oscillations of the coil spring. A strut is a basic hydraulic cylinder.

The strut is filled with oil and has a moveable shaft that connects to a piston inside the strut. Valves inside the shock absorber offer resistance to oil flow and consequently inhibit rapid movement of the piston and shaft. Each end of the shock absorber is connected in such a fashion to utilize this recoil action of a spring alone. Each end of the strut is designed as the connection point of the suspension system to the vehicle and acts as the coil spring seat. This allows the strut to utilize the dampening action to reduce the recoil of a spring alone. The lower control arm is allowed to pivot at the vehicle frame in a vertical fashion. The ball joint allows the steering knuckle to maintain the perpendicular relationship to the road surface.

Front suspensions systems utilize a stabilizer shaft. The stabilizer bar connects between the left and right lower control arm assemblies through the stabilizer link and stabilizer shaft insulators. This bar controls the amount of independent movement of the suspension when the vehicle turns. Limiting the independent movement defines the vehicles handling characteristics on turns.

10	Sectioning (1:3)
11	Gas Other Than Ambient Air or Hot Air Flow
12	Lubrication Point- Grease or Jelly
13	Multidirectional Arrow

ACRONYMS AND UNITS

Acronyms

Acronym	Meaning	Definition
2WD	Two-Wheel Drive	Indicates that a vehicle has 2 driven wheels OR that a 4WD vehicle uses only 2 wheels for propulsion. So it can be the description of a vehicle configuration OR the operational mode of the drivetrain.
4WD	Four-Wheel Drive	Four-wheeled vehicle with a drivetrain that allows all four wheels to receive power from the engine simultaneously which provides better control on various surfaces. Can be used to describe the configuration of the vehicle OR as the operational mode of the drivetrain. 4WD vehicles usually can turn 2 wheels off to be in a 2WD mode. See also AWD.
A/C	Air Conditioning	The cooling and dehumidification of indoor air for thermal comfort.
A/D	Analog to Digital	Used in context of converting electrical analog signals to digital signals.
ABS	Antilock Braking System	System on motor vehicles which prevents the wheels from locking while braking which helps the driver maintain control in heavy braking conditions.
AC	Alternating Current	An electrical current whose magnitude and direction vary cyclically.
AM	Amplitude Modulation	Method of impressing data onto an alternating-current (AC) carrier waveform.
APP	Accelerator Pedal Position	A pedal that controls the throttle valve.
		All-wheel-drive systems are designed to function on

AWD	All-Wheel Drive	all types of surfaces, both on- and off-road, and most of them cannot be switched off. This can also be called full-time four wheel drive. See also 4WD.
AWG	American Wire Gauge	American wire gauge is a standardized wire gauge system used since 1857 predominantly in the United States for the diameters of round, solid, nonferrous, electrically conducting wire. E.g. a wire of AWG10 has a diameter of 2.588mm, AWG20 corresponds to a diameter of 0.812mm.
B+	Battery Positive Voltage	The electrical potential on the positive terminal of the battery.
BARO	Barometric Pressure	Atmospheric pressure as measured by a barometer.
BCM	Body Control Module	This module supplies vehicle occupants with visual and audible information and controls various vehicle functions,
BECM	Battery Energy Control Module	Control module used to regulate the battery voltage.
BPP	Brake Pedal Position	Position of the foot pedal that moves a piston in the master brake cylinder.
CAN	Controller Area Network	Serial data connection between control modules by Bosch
CCM	Chassis Control Module	The module that controls various vehicle functions on the Chassis, like Engine/Trans Mount, Active Grille Air Shutter, Load Leveling, etc...
CD	Compact Disc	A small optical disk on which data such as music, text, or graphic images is digitally encoded.
CNG	Compressed Natural Gas	This a substitute for gasoline or diesel fuel. It is made by compressing natural gas (which is mainly composed by methane (CH ₄), in a percentage range of 70% to 98%)
CO	Carbon Monoxide	This is a product of the incomplete combustion of carbon-containing compounds, at room temperature this is a gas. It consists of one carbon atom covalently bonded to one oxygen atom.
CO ₂	Carbon Dioxide	Chemical compound composed of two oxygen atoms covalently bonded to a single carbon atom.
CPA	Connector Position Assurance	Part of an electrical connector that prevents the connector from moving out of its socket. Usually needs to be pressed to unlock the connector when disconnecting it.
CPP	Clutch Pedal Position	A lever operated with the foot that controls the coupling that connects or disconnects driving and driven parts of a driving mechanism.
CV	Constant Velocity	Used in conjunction with CV joints, which connect two shafts at an angle while both shafts always have the same rotational speed without variations.

CVT	Continuously Variable Transmission	A transmission in which the ratio of the rotational speeds of two shafts, as the input shaft and output shaft of a vehicle or other machine, can be varied continuously within a given range, providing an infinite number of possible ratios which improves fuel economy.
D	Drive	D on the transmission gear selector lever.
DAB	Digital Audio Broadcast	Technology for broadcasting of audio using digital radio (carries information via digital signal) transmission.
DC	Direct Current	Continuous current, constant flow of electric charge.
DLC	Data Link Connector	This is an electronic connector typically located underneath the driver's side dashboard, just above the pedals. The connector has 16 pins.
DMM	Digital Multimeter	Electronic measuring instrument that combines several functions in one unit. The most basic instruments include an ammeter, voltmeter, and ohmmeter.
DOHC	Dual Overhead Camshaft	Dual overhead camshafts (DOHC) are higher performance engines, they produce more power, and can run at higher speeds because they allow an engine to have four valves per cylinder. Each camshaft operates two of the valves, one camshaft handles the intake valves, and one handles the exhaust valves
DPF	Diesel Particulate Filter	Device designed to remove diesel particulate matter or soot from the exhaust gas of a diesel engine.
DRL	Daytime Running Lamps	White lights mounted on the front of an automobile that automatically switch on when the key is turned and are intended for daytime use, to increase the visibility of the automobile.
DSCC	Distance Sensing Cruise Control	A type of cruise control that automatically maintains the distance between vehicles.
DSP	Digital Signal Processor	A specialized microprocessor designed specifically for digital signal processing, generally in real-time computing.
DTC	Diagnostic Trouble Code	An electronic signal stored in an automotive computer, indicating the presence of a fault detected by that computer.
DVD	DVD	A popular optical disc storage media format the size of a CD. Used mainly for movies but also for data. DVD has no spelled out version (officially it does not mean Digital Video Disc or Digital Versatile Disc, it just means DVD).
EBCM	Electronic Brake Control Module	This module contains a microprocessor and software for antilock braking system operation.

ECM	Engine Control Module	This electronic module works with a vehicle's sensors and engine control devices to insure that the engine operates at maximum efficiency and performance. It performs three vital functions. Receives electronic signals from engine sensors. Analyzes the data and makes an engine performance decision (based on the pre-set parameters within the unit). Sends an "output command" to an actuator that adjusts engine performance.
ECT	Engine Coolant Temperature	A measure of how hot or cold the fluid which flows through the engine in order to prevent its overheating, transferring the heat produced by the device to other devices that utilize or dissipate it.
EEPROM	Electrically Erasable Programmable Read-Only Memory	A non-volatile storage chip used in computers and other devices to store small amounts of volatile data, e.g. calibration tables or device configuration.
EGR	Exhaust Gas Recirculation	Is an NO _x (nitrogen oxide and nitrogen dioxide) reduction technique used in most gasoline and diesel engines. EGR works by recirculating a portion of an engine's exhaust gas back to the engine cylinders.
EMI	Electromagnetic Interference	Electromagnetic interference (also called radio frequency interference) is a disturbance that affects an electrical circuit due to either electromagnetic conduction or electromagnetic radiation emitted from an external source.
ESD	Electrostatic Discharge	The sudden and momentary electric current that flows between two objects at different electrical potentials.
EV	Electric Vehicle	A category of vehicles that only have an electric drive system.
EVAP	Evaporative Emission	A system that controls the fuel fumes in the fuel tank.
FM	Frequency Modulation	In telecommunication this is a way to convey information over a carrier wave by varying its frequency.
FWD	Front-Wheel Drive	A form of engine/transmission layout used in motor vehicles, where the engine drives the front wheels only.
GMLAN	General Motors Local Area Network	A local-area network is a computer network covering a small geographic area, like a home or vehicle. This specific type of LAN connects several controllers inside the vehicle and was developed by General Motors.
GPS	Global Positioning System	Satellite-based navigation system made up of a network of 24 satellites placed into orbit by the U.S. Department of Defense.
GSM	Global System for Mobile Communications	Globally accepted standard for digital cellular communication.

GVW	Gross Vehicle Weight	Maximum total weight of a road vehicle or trailer that is loaded, including the weight of the vehicle itself plus fuel, passengers, cargo, and trailer tongue weight.
HD	Heavy Duty	Robust design to accommodate large work loads.
HID	High Intensity Discharge	A type of light that produces a bright light by using gas filled bulbs. (gas is usually mercury, metal halide, and high-pressure sodium) Uses very little battery power and is a very "cool" light.
HO2S	Heated Oxygen Sensor	Heated oxygen sensors have an internal heater circuit that brings the sensor up to operating temperature more quickly than an unheated sensor. An oxygen sensor must be hot (about 600-650°F) before it will generate a voltage signal. The hot exhaust from the engine will provide enough heat to bring an O2 sensor up to operating temperature.
HVAC	Heating Ventilation Air Conditioning	This system is sometimes referred to as climate control. Ventilation air ducts installed throughout a vehicle that supply conditioned air to a room through rectangular or round outlet vents.
I ² C	Inter-Integrated Circuit	Serial data connection between Integrated Circuits (microchips) inside a control module invented by Phillips
IAT	Intake Air Temperature	Temperature of the air entering intake air flow system of the engine.
ICE	Internal Combustion Engine	An engine in which the combustion of fuel and an oxidizer (typically air) occurs in a confined space called a combustion chamber.
ID	Identification	Number or Code that identifies a component or control module. Can be written on the part or be transmitted on a bus or via radio.
ISP	Internet Service Provider	A company that furnishes corporations and individual consumers with various services, mainly access to the Internet.
ISS	Input Shaft Speed	Rotational speed of the input shaft of a transmission.
LAN	Local Area Network	Standard network connection PC's.
LCD	Liquid Crystal Display	A thin, flat display device made up of any number of color or monochrome pixels arrayed in front of a light source or reflector.
LED	Light Emitting Diode	Small light bulbs that fit easily into an electrical circuit they do not have a filament that will burn out, and they do not get especially hot. They are illuminated solely by the movement of electrons in a semiconductor material.
LIN	Local Interconnect Network	Computer networking bus system used within automotive network architectures. Similar to CAN,

		but cheaper and less powerful.
LPG	Liquefied Petroleum Gas	A mixture of mainly propane and butane, produced commercially and stored under pressure to keep it in a liquid state.
MAF	Mass Air Flow	The amount of air drawn into the engine
MAP	Manifold Absolute Pressure	Pressure in the engine intake system after the throttle valve referenced to a perfect vacuum.
MDI	Multiple Diagnostics Interface	A device used by GM dealers that enables a PC to communicate with the control modules in a vehicle.
MIL	Malfunction Indicator Lamp	An indicator of the internal status of a car engine.
MOST	Media Oriented Systems Transport	Serial communication bus to transmit audio and video information.
N	Neutral	A state of the transmission in which it is not engaged.
NiMH	Nickel Metal Hydride	A type of rechargeable battery that uses a hydrogen absorbing alloy for the negative electrode.
NOx	Nitrogen Oxides	Refers to any of the following oxygen compounds of nitrogen or a mixture of them. Nitric Oxide, Nitrogen dioxide, Nitrous Oxide, Dinitrogen trioxide, Dinitrogen tetroxide, Dinitrogen pentoxide.
O2	Oxygen	A colorless, odorless, tasteless, gaseous chemical element with the chemical symbol O and atomic number 8.
O2S	Oxygen Sensor	An electronic device that measures the proportion of oxygen (O2) in the gas or liquid being analyzed.
OBD	On-Board Diagnostic	A generic term referring to a vehicle's self-diagnostic and reporting capability.
OEM	Original Equipment Manufacturer	A producer that provides a product to its customers, who proceed to modify or bundle it before distributing it to their customers.
OSS	Output Shaft Speed	Rotational speed of the output shaft of a transmission.
P	Park	A state in which the transmission is set so one can leave the vehicle.
PCB	Printed Circuit Board	A thin plate on which chips and other electronic components are placed.
PCM	Powertrain Control Module	A control module that features the functions of both, the engine and the transmission control module.
PCMCIA	Personal Computer Memory Card Industry Association	An international standards body and trade association with over 100 member companies that was founded in 1989 to establish standards for Integrated Circuit cards and to promote interchangeability among mobile computers where ruggedness, low power, and small size were critical.
PIN	Personal Identification Number	A secret numeric password shared between a user and a system that can be used to authenticate the user to the system.

PPE	Personal Protective Equipment	Protective clothing, helmets, goggles, or other garment designed to protect the wearer's body from injury.
PRNDL	Park, Reverse, Neutral, Drive, Low	Park, Reverse, Neutral, Drive, Low (automatic transmission positions).
PTC	Positive Temperature Coefficient	Refers to materials that experience an increase in electrical resistance when their temperature is raised.
PTO	Power Take-Off	A splined driveshaft, usually on a tractor or truck that can be used to provide power to an attachment or separate machine. This mechanism allows implements to draw energy from the tractor's engine.
PVC	Polyvinyl Chloride	A thermoplastic copolymer.
PWM	Pulse Width Modulation	Square shaped type of signal that carries the information in the ratio between on and off times.
R	Reverse	Rearward: directed or moving toward the rear;
RAM	Random Access Memory	A type of computer data storage. It today takes the form of integrated circuits that allow the stored data to be accessed in any order.
RCT	Radiator Coolant Temperature	This is the heat intensity of the radiator coolant measured in degrees. The radiator is a part of the cooling system that removes the engine heat. Coolant is a mixture of water and antifreeze (ethylene glycol) which lowers the freezing point of the water in the coolant system, this fluid also picks up heat from the engine and transfers it to the air.
RDS	Radio Data System	A standard from the European Broadcasting Union for sending small amounts of digital information using conventional FM radio broadcasts.
RF	Radio Frequency	A frequency or rate of oscillation within the range of about 3 Hz and 300 GHz. This range corresponds to frequency of alternating current electrical signals used to produce and detect radio waves.
ROM	Read-Only Memory	A class of storage media used in computers and other electronic devices. Data stored in ROM cannot be modified.
RPO	Regular Production Option	A three digit/letter code given to parts, assemblies, and systems originally installed on the vehicle. These RPO codes designate options and are assigned by General Motors.
RSA	Rear Seat Audio	An auxiliary set of controls that operate the main audio system from the rear seat. Rear passengers can also operate a different media source than the front passengers.
RWD	Rear-Wheel Drive	A common engine/transmission layout in which the engine is in the front of the vehicle, but the front mid-engine, rear mid-engine and rear engine layouts are

		also used.
SCV	Speed Controlled Volume	The volume control is set for a desired sound level in the vehicle as the vehicle increases its speed, the sound level is adjusted.
SDM	Sensing and Diagnostic Module	The name given to air bag modules used in General Motors vehicles.
SIM	Subscriber Identity Module	Part of a removable smart card Integrated Circuit Card. This is used for mobile cellular telephone devices such as mobile computers and mobile phones. SIM cards securely store the service-subscriber key used to identify a subscriber. The SIM card allows users to change phones by simply removing the SIM card from one mobile phone and inserting it into another mobile phone or broadband telephony device.
SIR	Supplemental Inflatable Restraint	Technical term for the air bag. Air bag is a stretchable membrane, which inflates during an automobile accident to provide cushioning to the passenger's head and torso to prevent injury to the passengers.
SPI	Serial Peripheral Interface	This is an interface that enables the serial (one bit at a time) exchange of data between two devices. An SPI operates in full duplex mode. This means that data can be transferred in both directions at the same time. It is a standard bus technology like CAN or I2C.
SPS	Service Programming System	System that enables repair facilities to update the software in control modules.
SUV	Sport Utility Vehicle	A passenger vehicle which combines the towing capacity of a pickup truck with the passenger-carrying space of a minivan.
SVS	Service Vehicle Soon	Indicator lamp or symbol for a malfunction related to a vehicle component or system.
TA	Traffic Announcement	Message spoken on radio regarding the movement of vehicles or pedestrians through an area or along a route. The buttons on radios that enable this announcements are also often labeled TA.
TAC	Throttle Actuator Control	A motor which moves the engine throttle plate or valve, controlled by the engine control module. A throttle plate limits the amount of air entering a internal combustion gasoline engine.
TAP	Transmission Adaptive Pressure	The transmission control module learns each component's characteristics and adjusts fluid pressure accordingly.
TCC	Torque Converter Clutch	Resides in a torque converter to connect an engine to an automatic transmission. The clutch is applied when conditions are correct to achieve a 1:1 ratio of engine crankshaft to transmission input shaft.
		A module that controls electronic automatic

TCM	Transmission Control Module	transmissions. It uses sensors from the vehicle as well as data provided by the Engine Control Module to calculate how and when to change gears in the vehicle for optimum performance, fuel economy and shift quality.
TDC	Top Dead Center	The piston is in its highest position relative to the combustion chamber.
TIS	Techline Information System	The PC-based global dealership diagnostic software that provides the technician the ability to reference the most recent service information via the service department's computer.
TPA	Terminal Position Assurance	An additional locking mechanism inside an electric connector that holds the pins in place.
TV	Television	A telecommunication system for broadcasting and receiving moving pictures and sound over a distance.
USB	Universal Serial Bus	A type of communication bus connection between a computer and a peripheral device.
VCI	Vehicle Communications Interface	A diagnostic tool that communicates to modules of multiple communication protocols in a vehicle by converting vehicle serial data into PC serial data communication.
VIN	Vehicle Identification Number	Used by manufacturers to uniquely identify motor vehicles using 17 characters.
VSCM	Vehicle Stability Control Module	This module uses information from several sensors to detect a loss of vehicle traction, then works with the antilock brake system to apply individual brakes to help keep the vehicle on its intended path.
VSS	Vehicle Speed Sensor	Sends data regarding how fast the car is traveling at the moment of driving. It is designed to be able to record the rate at which the vehicle's crankshaft is spinning.
WOT	Wide Open Throttle	When the throttle blade or valve is at its maximum open position, allowing maximum air to enter an internal combustion gasoline engine.
WLAN	Wireless Local Area Network	Standard to transmit digital data via radio frequency.
XM	XM (Satellite Radio)	XM Satellite Radio Holdings (XM) is one of two satellite radio services in the United States and Canada. XM provides pay-for-service radio, analogous to cable television. Its service includes 73 different music channels, 39 news, sports, talk, and entertainment channels, 21 regional traffic and weather channels and 23 play-by-play sports channels (2008).
XML	Extensible Markup Language	A markup language that defines a set of rules for encoding documents in a format that is both human-readable and machine-readable.

Units

Unit	Meaning	Definition
m ²	Square Meter	Area

CUSTOMER CONCERN VERIFICATION SHEETS

The GM Customer Concern Verification Sheets have been designed to improve communications between the service customer and the technician. The more clearly the technician understands the concern and its symptoms, the more likely the concern will be fixed right the first time.

VEHICLE, ENGINE AND TRANSMISSION ID AND VIN LOCATION, DERIVATIVE AND USAGE

VIN Plate (Some Countries)

Fig. 2: View Of VIN Plate Location
Courtesy of GENERAL MOTORS COMPANY

The vehicle identification number (VIN) plate (1) is the legal identifier of the vehicle. The VIN plate is located on the upper left corner of the instrument panel (I/P) and can be seen through the windshield from the outside of the vehicle.

VIN Body Stamping

RPO CODE LIST

The following table provides the description of the Regular Production Option (RPO) codes that are available on the vehicle. The vehicle's RPO list is printed on the Service Parts Identification Label.

RPO	Description
01C	Trim Color Seat - Light Titanium
01O	Trim Color Seat - V DK Pewter
01R	Trim Color Seat - Moroccan Blue
02Q	Trim Color Seat - Rose
1AQ	Trim Color Door Panel - V DK Pewter
2BH	Molding Door Interior - Jade Black
2BI	Molding Door Interior - Super Red
2BJ	Molding Door Interior - Moroccan Blue
2BK	Molding Door Interior - V DK Pewter
2BV	Molding Door Interior - Switchblade Silver Metallic
2GB	Radio - AM/FM Stereo, Seek, CD, ETR, Fader, MP3, USB
30F	Steering Wheel Color - Jet Black
37F	Steering Wheel Color - Polar Silver
4AQ	Interior Trim - V DK Pewter
5MB	Panel - Trim, Right Rear Compartment, Side
5MC	Panel - Trim, Load Compartment, Side
A32	Window - Power Operated, Front Door
A50	Seat - Front Bucket
A60	Lock Control Right Rear Compartment - Lid, Tailgate, Key Activated
A91	Lock Control Right Rear Compartment - Tailgate, Remote Controlled Electronic Open/Close
AAR	Restraint - Knee, Bolster, Foam Type
AE3	Window - Power Operated, Front and Rear Door
AFA	Interior Trim Config - 1

AR1	Restraint System - (- Delete)
AT3	Restraint Provisions - Child, Rear Seat, Anchorage, Reinforced
AT7	Restraint System Rear - Seat, SHLDR, RETR, 3 Point, 3 SHLDR
ATZ	Seat Rear - Not Installed
AU3	Lock Control - Side Door, Electronic
AU4	Lock Control - Side Door, Electronic, Automatic
AV5	Seat - Front Bucket, High Back
AWB	Restraint System Rear - Seat, LH and RH/ELR and CTR/2 Point
AWS	Restraint - Seat Belt Tensioner, Passenger
AWT	Restraint - Seat Belt Tensioner, Driver
AY0	Restraint System - Seat, Inflatable, Driver and Passenger Front, Seat Side, Roof Side
AYF	Restraint System - Seat, Inflatable, Driver and Passenger Front, Front Seat Side & RR Seat side, Roof Side, Knee
B30	Covering Floor - Carpet
B37	Covering - Floor Mat, Front and Rear, Auxiliary
B56	Molding Rocker - Body Color
B7S	Tray - Interior, Rear, Parcel, Pull String
BA8	Compartment - Stowage, Front Seat, Passenger
DLU	Mirror I/S Front Van - Sunshade, Driver, without Mirror, Passenger, with Mirror and Cover
DLV	Mirror I/S Front Van - Sunshade, Driver and Passenger, with Mirror and Cover
DLW	Mirror O/S - LH and RH, Remote Control, Electric, Manual Folding, Heated

DP5	Mirror Provisions - Housing, Molded with Color
DQ9	Mirror Provisions - Color
DQB	Mirror I/S R/V - without Tilt
DT4	Ashtray - Cigarette Lighter
DVD	Cluster Color - INST, Polar Silver
DVE	Cluster Color - INST, Jet Black
E17	Bumper - 2.5 mph
E22	Handle - Assist, Rear
E27	Handle - Assist, Passenger
E2U	Ornamentation - Lettering, "LS"
E7Y	Fire Extinguisher - 2 kg
E91	Pocket - Front Seat Back, Passenger
EBN	Trim Seat - Cloth, Bonn
EBO	Trim Seat - Cloth, Curve
EBP	Trim Seat - PU Leather, Purisme-Embo
ELH	Pocket - Front Seat, Passenger, Side
ERI	Equipment - Battery Saver
F81	Ratio - Transaxle Final Drive 4.71
FCP	Trim Door - Polypropylene
FE4	Suspension System - Special Ride and Handling
FV5	Ratio - Transaxle Final Drive 4.19
FX2	Ratio - Transaxle Final Drive 3.91
FX3	Ride And Handling - Automatic Electronic Controlled
GAN	Primary Color - Exterior, Switchblade Silver Met (G) 636R

JM4	Brake System - Power, Front Disc, Rear Drum, Cast Iron, Antilock, Front and

	Right Rear Wheel
JM7	Booster - Brake, Hydraulic, HI Performance
K06	Fan - Electric Cooling
K12	Filter - Air, Pollutant
K97	Generator - 80 Amp
KL7	Conversion - Propane Gas (LP Gas)
KRB	Fuel Rating - Octane No. 83
KRC	Fuel Rating - Octane No. 87
KRD	Fuel Rating - Octane No. 91
KRE	Fuel Rating - Octane No. 95
LC5	Engine - Gas, 4 CYL, 1.19 L, MFI, L4, DOHC
LCP	Engine - Propane Gas, 4 CYL, 1.0 L, MFI, DOHC
LHD	Vehicle Drive - Left Hand Drive
LMT	Engine - Gas, 4 CYL, L4, 1.0 L, MFI, DOHC, Iron, GMDAT
LMU	Engine - Gas, 4 CYL, L4, 1.2 L, MFI, DOHC, GMDAT
LEB	Engine - Diesel, 3 CYL, 1.0 L, CRI, DOHC, FGT, 39KW, INDIA
LL0	Engine - Gas, 4 CYL, L4, 1.2 L, MFI, DOHC, FAM A/B, DCVCP, GEN2
MFL	Transmission - Automatic 4 Speed, Jatco, JF405E
MNG	Transmission - Automatic 4 Speed, Aisin, 80-40LE
MFM	Transmission - Manual 5 Speed, Y4M HD, 1ST 3.539, 5th 0.781
MX2	Transmission - Manual 5 Speed, Y4M HD, 1ST 3.539, 5th 0.756
N33	Steering Column - Tilt Type
N40	Steering - Power, Non-Variable Ratio
N45	Steering Wheel - 3 Spokes
N51	Steering - Manual
NE9	Emission System - EEC 09
NQ5	Cap - Transmission Controlled Lever, Cap Console, Polar Silver
NQB	Control - Steering Wheel, Leather Wrapped (GMDAT)
NQT	Emission System - Open Loop, Leaded (GMDAT)
NQU	Emission System - Korean, ULEV
NT3	Emission System - EEC 00
NT4	Emission System - EEC 05
NWU	Tailpipe - Downward Deflecting
Q8E	Jack - Mechanical, with Tools
QI0	Model Conversion - Interior, Trim Level 0
QI1	Model Conversion - Interior, Trim Level 1
QI2	Model Conversion - Interior, Trim Level 2
RHD	Vehicle Drive - Right Hand Drive
SMR	Ornamentation - Lettering "Groove"
SMS	Ornamentation - Lettering "Jazz"
SMT	Ornamentation - Lettering "Pop"
TCY	

	Provisions - Seat, Child
T3U	Lamp - Front Fog
T3X	Lamp System - Daytime Running, Regular Intensity Low Beam
T3Y	Lamp - Front Fog, Projection Type
T44	Alarm - Overspeed Warning, Acoustical
T56	Spoiler - Rear, Roof, Sport
T79	Lamp - Fog, Rear
T89	Lamp - Tail and Stop, Export
T90	Lamp - Signaling and Marker, Export
T94	Headlamps Control - LH Rule of the Road
TB1	Lamp - Tail and Stop, Korea
TB8	Headlamps Control - RH Rule of the Road
TBI	Plant Code - Talegaon, India
TD1	Reflector - Safety Triangle
TDY	Ornamentation - Lettering, "Chevrolet"
TFC	Alarm - Seat Belt Warning, Passenger
TH5	Height Adjustment - Safety Belt, Front Seat
TL6	Grille - Radiator, Black
TN9	Battery - LN1, FLA, 12V, 50AH, 375 ENCCA
TR6	Headlamps Control - Leveling System, Manual
TS6	Lamp - Stop, High Level
TTQ	Spoiler - Rear, Roof, Sport, Enlarged
TUQ	Lighter - Cigarette, without Illumination
TYS	Sales Package - Korea Electric Power
U04	Horn - Single Note
U05	Horn - Dual
U18	Speedometer - Instrument, Kilometer
U25	Lamp - Interior, Rear Compartment, Courtesy
U71	Antenna - Roof, Radio
U74	Antenna - Radio - Delete
U92	Antenna - Roof, Radio, GPS, Phone
UAD	Speaker System - 2, Front, Base
UAL	Audio Control - Data System, Mode
UC1	Speedometer - Instrument, Miles
UCH	Radio - AM/FM Stereo, Seek, CD, ETR, Fader, MP3
UD7	Sensor Indicator - Rear Parking Assist
UDB	Display Instrument - Driver Info Enhanced (Segmented)
UDG	Display Instrument - Trip Odometer (Segmented)
UDZ	Display - Trip Computer
UH0	Indicator - Seat Belt Warning, LH
UH1	Indicator - Seat Belt Warning, RH
UXX	

	Indicator - Seat Belt Warning, Rear Seat
UK3	Control - Steering Wheel, Accessory
UK5	Radio - AM/FM Stereo, Seek/Scan, Automatic Reverse Cassette, ETR
UM7	Radio - AM/FM Stereo, Seek/Scan, Clock, ETR
UQ4	Speaker System - 4, Base
UQ9	Speaker System - (- Delete)
UTJ	Theft Deterrent - Electrical, Unauthorized Entry
UV8	Telephone - Provisions for Mobile
UW6	Speaker System - 6, Custom
UY0	Battery - LN0, FLA, 12V, 40AH, 300 ENCCA
UZM	Radio - AM/FM Stereo, CD-ROM, MP3/WMA, Navigator, RDS, SD Slot, USB, Wireless Interface
V22	Grille - Radiator, Chrome
V48	Coolant - Engine Maximum Protection
V54	Luggage Carrier - Roof, Painted
V87	Vehicle Statement - Gulf States Organization
VA8	Language Label - Spanish
VD8	Provisions - First Aid Kit
VEE	Bumper Front - Body Color, Front and Rear
VH4	Mud Flaps -
VHU	Bumper Front - Sport
VHY	Protector - Body Sheet Metal, High Corrosion Preventive
VIX	Plate - Vehicle Identification - Visual (GMDAT)
VIY	Plate - Vehicle Identification - Asterisk (*) Mark (GMDAT)
VJY	Protector - Body Sheet Metal, Low Corrosion Preventive
VK8	Holder - Eyeglasses
VL4	License Plate Front - Front Mounting Package, EEC
VMA	License Plate Front - Front Mounting Package, Korea
VNU	VIN Format - U.S. Type
VNV	VIN Format - Korea Type
VNW	VIN Format - EU (ISO) Type
VXP	Panel Center - Instrument, V DK Pewter, Acrylic Paint
VXQ	Panel Center - Instrument, Dark Argent, Metallic Paint
VXR	Panel Center - Instrument, Cyclone, Aqua Graphic Film
W2V	Ornamentation - Lettering, VAR - Delete
WAM	Ornamentation - Name Plate "Matiz"
WAS	Ornamentation - Name Plate "Spark"
WCM	Ornamentation - Lettering "LT"
WF7	Ornamentation - Name Plate "Barina Spark"
WG3	Ornamentation - Name Plate "Spark 300"
WU5	Switch - I/P LP Dimmer

XA6	Label - EEC Compliance
XL4	Chassis - Protection Kit, Engine Compartment
XX7	Radio - Provisions, Installation, VAR 3
Y9Y	Ornamentation - Decal "Chevrolet"
ZY0	Warranty - 50, 000 km, 2 N.mears
ZY9	Warranty - 100, 000 km, 3 N.mears

FASTENERS

Metric Fasteners

This vehicle provides fastener dimensions using the metric system. Most metric fasteners are approximate in diameter to equivalent English fasteners. Make replacements using fasteners of the same nominal diameter, thread pitch, and strength.

A number marking identifies the OE metric fasteners except cross-recess head screws. The number also indicates the strength of the fastener material. A Posidrive® or Type 1A cross-recess identifies a metric cross-recess screw. For best results, use a Type 1A cross-recess screwdriver, or equivalent, in Posidrive® recess head screws.

GM Engineering Standards and North American Industries have adopted a portion of the ISO-defined standard metric fastener sizes. The purpose was to reduce the number of fastener sizes used while retaining the best thread qualities in each thread size. For example, the metric M6.0 X 1 screw, with nearly the same diameter and 25.4 threads per inch replaced the English 1/4-20 and 1/4-28 screws. The thread pitch is midway between the English coarse and fine thread pitches.

Fastener Strength Identification

Fig. 9: Identifying Fastener Strength Marks
 Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
1	English Bolt, Grade 2 (Strength Class)
2	English Bolt, Grade 5 (Strength Class)
3	English Bolt, Grade 7 (Strength Class)
4	English Bolt, Grade 8 (Strength Class)
5	Metric Nut, Strength Class 9
6	Metric Bolts, Strength Class Increases as Numbers Increase

The most commonly used metric fastener strength property classes are 9.8 and 10.9. The class identification is embossed on the head of each bolt. The English, inch strength classes range from grade 2 to grade 8. Radial lines are embossed on the head of each bolt in order to identify the strength class. The number of lines on the head of the bolt is 2 lines less than the actual grade. For example, a grade 8 bolt will have 6 radial lines on the bolt head. Some metric nuts are marked with a single digit strength identification number on the nut face.

The correct fasteners are available through GM SPO. Many metric fasteners available in the aftermarket parts channels are designed to metric standards of countries other than the United States, and may exhibit the following:

- Lower strength
- No numbered head marking system
- Wrong thread pitch

The metric fasteners on GM products are designed to new, international standards. The following are the common sizes and pitches, except for special applications:

- M6.0 X 1
- M8 X 1.25
- M10 X 1.5
- M12 X 1.75
- M14 X 2.00
- M16 X 2.00

Prevailing Torque Fasteners

Prevailing torque fasteners create a thread interface between the fastener and the fastener counterpart in order to prevent the fastener from loosening.

All Metal Prevailing Torque Fasteners

These fasteners accomplish the thread interface by a designed distortion or deformation in the fastener.

Nylon Interface Prevailing Torque Fasteners

These fasteners accomplish the thread interface by the presence of a nylon material on the fastener threads.

Adhesive Coated Fasteners

These fasteners accomplish the thread interface by the presence of a thread-locking compound on the fastener threads. Refer to the appropriate repair procedure in order to determine if the fastener may be reused and the applicable thread-locking compound to apply to the fastener.

1

2

3

4

5

6

7

8

9

Fig. 10: Identifying Adhesive Coated Fasteners
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
1	Prevailing Torque Nut, Center Lock Type
2	Prevailing Torque Nut, Top Lock Type
3	Prevailing Torque Nut, Nylon Patch Type
4	Prevailing Torque Nut, Nylon Washer Insert Type
5	Prevailing Torque Nut, Nylon Insert Type
6	Prevailing Torque Bolt, Dry Adhesive Coating Type
7	Prevailing Torque Bolt, Thread Profile Deformed Type
8	Prevailing Torque Bolt, Nylon Strip Type
9	Prevailing Torque Bolt, Out-of-Round Thread Area Type

A prevailing torque fastener may be reused ONLY if:

- The fastener and the fastener counterpart are clean and not damaged
- There is no rust on the fastener
- The fastener develops the specified minimum torque against its counterpart prior to the fastener seating

THREAD INSERTS

General Purpose Thread Repair Kits.

These kits are available commercially.

Repair Procedure

Fig. 11: Drilling & Tapping Damaged Threads
Courtesy of GENERAL MOTORS COMPANY

WARNING: Refer to Safety Glasses Warning .

NOTE: Refer to the thread repair kit manufacturer instructions regarding the size of the drill and tap to use.

Avoid any buildup of chips. Back out the tap every few turns and remove the chips.

1. Determine the size, the pitch, and the depth of the damaged thread. If necessary, adjust the stop collars on the cutting tool and tap to the required depth.
2. Drill out the damaged threads. Clean out any chips.
3. Lubricate the tap with light engine oil. Tap the hole. Clean the threads.

Fig. 12: View Of Thread Insert

Courtesy of GENERAL MOTORS COMPANY

4. Thread the thread insert onto the mandrel of the installer. Engage the tang of the insert onto the end of the mandrel.

NOTE: **The insert should be flush to one turn below the surface.**

5. Lubricate the insert with light engine oil, except when installing in aluminum and install the insert.
6. If the tang of the insert does not break off when backing out the installer, break the tang off with a drift.

DOOR LOCK AND IGNITION LOCK FOLDING AND NON-FOLDING KEY CUTTING

High Security keys are available from the service parts system.

Obtain the key code from the security card or from the GM Dealer World, Parts, Key Code Look Up system.

If you have the key code and access to a Triax-E., BD Laser or other code key cutting machine from the GM Dealer Equipment Catalog, you may cut a new key.

If you have the original key and access to a Matrix S, BD Laser or other key duplicating machine, you may duplicate the key.

If you do not have a high security key cutting machine, order the side cut key from the service parts system. Include the key code in the NOTE field. Indicate the timing and the method of the shipment.

Inspect the new key operation in the lock cylinder. Ensure the new key operates effectively.

KEY AND LOCK CYLINDER CODING

Ignition Lock Cylinder

Fig. 13: Ignition Lock Cylinder
Courtesy of GENERAL MOTORS COMPANY

1. Tumbler spring (2) and tumbler (3) to be assembled into cylinder (1)-In this case start with the tumbler near the cylinder head and work through until the last tumbler at the cylinder ground. Use the key as tool by pushing it in step by step to hold the already assembled tumblers in place.
2. Slide piece (4) to be assembled into the pocket in cylinder (1).
3. Apply grease on the cylinder diameter.
4. Assemble the rotor case (5) and sub-assembly.
5. Remove the key.

6. Install the C-ring (6) to the bottom of the cylinder.

Front Side Door Lock Cylinder

Fig. 14: Front Side Door Lock Cylinder
Courtesy of GENERAL MOTORS COMPANY

1. Tumbler spring (2) and tumbler (3) to be assembled into cylinder (1)-In this case start with the tumbler near the cylinder head and work through until the last tumbler at the cylinder ground. Use the key as tool by pushing it in step by step to hold the already assembled tumblers in place.
2. Apply grease on the cylinder diameter.
3. Assemble the rotor case (5) and sub-assembly.
4. Remove the key.
5. Install the return spring (5) and lever (6).
6. Install the E-ring (6) to the bottom of the cylinder.
7. Install and stake the rotor case cover (8) onto the head of the rotor case (5) by crimping the cover material in 2 places into the pockets around the head of the rotor case.

Liftgate Lock Cylinder

Fig. 15: Liftgate Lock Cylinder

Courtesy of GENERAL MOTORS COMPANY

1. Tumbler spring (2) and tumbler (3) to be assembled into cylinder (1)-In this case start with the tumbler near the cylinder head and work through until the last tumbler at the cylinder ground. Use the key as tool by pushing it in step by step to hold the already assembled tumblers in place.
2. Apply grease on the cylinder diameter.
3. Assemble the rotor case (5) and sub-assembly.
4. Remove the key.
5. Install the return spring (5) and lever (6).
6. Install the E-ring (6) to the bottom of the cylinder.
7. Install and stake the rotor case cover (8) onto the head of the rotor case (5) by crimping the cover material in 2 places into the pockets around the head of the rotor case.

LIFTING AND JACKING THE VEHICLE

NOTE: The use of a **LOW PROFILE LIFT ARMS SYSTEM** may be required to avoid unwanted contact with the vehicle body and structure depending on lifting equipment used. Refer to the manufacturer recommendation for their applications of low profile lift arms system for their lifting equipment.

Fig. 16: Vehicle Lifting Points

Courtesy of GENERAL MOTORS COMPANY

WARNING: To avoid any vehicle damage, serious personal injury or death when major components are removed from the vehicle and the vehicle is supported by a hoist, support the vehicle with jack stands at the opposite end from which the components are being removed and strap the vehicle to the hoist.

WARNING: To avoid any vehicle damage, serious personal injury or death, always use the jackstands to support the vehicle when lifting the vehicle with a jack.

CAUTION: Perform the following steps before beginning any vehicle lifting or jacking procedure:

- Remove or secure all of the vehicle contents in order to avoid any shifting or any movement that may occur during the vehicle lifting or jacking procedure.
- The lifting equipment or the jacking equipment weight rating must meet or exceed the weight of the vehicle and any vehicle contents.
- The lifting equipment or the jacking equipment must meet the operational standards of the lifting equipment or jacking equipment manufacturer.

- Perform the vehicle lifting or jacking procedure on a clean, hard, dry, level surface.
- Perform the vehicle lifting or jacking procedure only at the identified lift points. DO NOT allow the lifting equipment or jacking equipment to contact any other vehicle components.

Failure to perform the previous steps could result in damage to the lifting equipment or the jacking equipment, the vehicle, and/or the vehicle contents.

Vehicle Lifting- Frame Contact Lift

Front Lift Pads

When lifting the vehicle with a frame-contact lift, place the front lift pads on the rocker outer panel weld flange, as shown.

Rear Lift Pads

When lifting the vehicle with a frame-contact lift, place the rear lift pads on the rocker outer panel weld flange, as shown.

Vehicle Jacking

CAUTION: When you are jacking the vehicle at the front locations, be certain that the jack or the jack lift pad does not contact the front fascia, front fascia air dam, or the front fenders. If such contact occurs, vehicle damage may result. When jacking at selected front locations additional clearance may be required for the jacking points.

NOTE: When you are lifting a vehicle with a service jack, block the wheels at the opposite end from which you are lifting. Use jack stands to provide additional support.

When using a service jack under the front of the vehicle use one of the following locations:

Front of Vehicle

Place the service jack pad in the same location as shown for the front lift pads.

Rear of Vehicle

NOTE: Place jackstands **ONLY** under strong and stable vehicle structures.

Place the service jack pad in the same location as shown for the rear lift pads.

HVAC

Heating, Ventilation, and Air Conditioning - Spark

• Refrigerant Charge	430 g	15 oz

DIAGNOSTIC INFORMATION AND PROCEDURES

LEAK TESTING

Special Tools

- **BO-42220** Universal 12V Leak Detection Lamp
- **GE-39400-A** Halogen Leak Detector
- **GE-41447** R-134A A/C Tracer Dye-Box of 24
- **GE-43872** Fluorescent Dye Cleaner
- **GE-46297** A/C Dye Injector Kit
- **GE-46297-12** Replacement Dye Cartridges

For equivalent regional tools, refer to **Special Tools**.

Refrigerant Leak Testing

NOTE: These vehicles are not now manufactured with fluorescent dye installed directly into the air conditioning (A/C) system. Therefore, if refrigerant leak testing is

required, add florescent dye into the air conditioning (A/C) system.

The fluorescent dye mixes and flows with the polyalkylene glycol (PAG) oil throughout the refrigerant system.

Verifying some passive leaks may require using the **GE-39400-A** detector, even though the A/C system contains fluorescent dye.

Fluorescent Leak Detector

Fluorescent dye will assist in locating any leaks in the A/C system.

NOTE: PAG oil is water soluble.

- Condensation on the evaporator core or the refrigerant lines may wash the PAG oil and fluorescent dye away from the actual leak. Condensation may also carry dye through the HVAC module drain.
- Leaks in the A/C system will be indicated in a light green or yellow color when using the leak detection lamp.

Use the leak detection lamp in the following areas:

- All fittings or connections that use seal washers or O-rings
- All of the A/C components
- The A/C compressor shaft seal
- The A/C hoses and pressure switches
- The HVAC module drain tube, if the evaporator core is suspected of leaking
- The service port sealing caps
- The sealing cap is the primary seal for the service ports.
- Follow the instructions supplied with the **BO-42220** lamp.
- To prevent false diagnosis in the future, thoroughly clean the residual dye from any area where leaks were found. Use a rag and the approved **GE-43872** cleaner.

Fluorescent Dye Injection

NOTE: Use only fluorescent dye approved by General Motors.

NOTE: Do NOT overcharge the A/C system with dye.

- **GE-41447** dye can be poured directly into a removed A/C component.
- **GE-46297-12** dye cartridge is injected into the low side port using **GE-46297** injector kit.
- Not all of the fluorescent dyes are compatible with PAG oil. Some types of dye decrease the oil viscosity or may chemically react with the oil.
- R-134A leak detection dye requires time to work. Depending upon the leak rate, a leak may not become visible for between 15 minutes and 7 days.

- To prevent false diagnosis, thoroughly clean any residual dye from the service port with a rag and the approved fluorescent dye cleaner **GE-43872** dye cleaner.

Halogen Leak Detector

WARNING: Do not operate the detector in a combustible atmosphere since its sensor operates at high temperatures or personal injury and/or damage to the equipment may result.

Ensure that the vehicle has at least 0.45 kg (1 lb) of refrigerant in the A/C refrigeration system in order to perform a leak test. Refer to **Refrigerant Recovery and Recharging** for recharging the A/C system.

NOTE: Halogen leak detectors are sensitive to the following items:

- Windshield washing solutions
- Many solvents and cleaners
- Some adhesives used in the vehicle

Clean and dry all surfaces in order to prevent a false warning. Liquids will damage the detector.

NOTE: Follow a continuous path in order to ensure that you will not miss any possible leaks. Test all areas of the system for leaks.

Follow the instructions supplied with the **GE-39400-A** detector.

AIR CONDITIONING (A/C) SYSTEM PERFORMANCE TEST

This test measures the operating efficiency of the A/C system under the following conditions:

- The current ambient air temperature
- The current relative humidity
- The high side pressure of the A/C system
- The low side pressure of the A/C system
- The temperature of the air being discharged into the passenger compartment

Test Description

The numbers below refer to the step numbers on the diagnostic table.

1

This step determines if the A/C system has at least the minimum refrigerant charge required to operate the system without damage.

2

This step measures the performance of the A/C system.

3

This step is to allow for vehicle variations as well as high ambient temperatures.

Air Conditioning (A/C) System Performance Test

Step	Action	Values	Yes	No
NOTE: • The ambient air temperature must be at least 16°C (60°F). • Do not induce additional air flow across the front of the vehicle during the test. • If you were sent here from a DTC diagnostic table, clear the DTC upon completion of this test.				
1	1. Park the vehicle inside or in the shade. 2. Open the windows in order to ventilate the interior of the vehicle. 3. If the A/C system was operating, allow the A/C system to equalize for about 2 minutes. 4. Turn OFF the ignition. 5. Install the J-43600 ACR 2000 Air Conditioning Service Center or GE-48800 CoolTech A/C Recharge Machine. 6. Record the ambient air temperature and humidity. 7. Record the low and high side STATIC pressure readings. Are both the low side and high side pressures within the specified value?	More than 16°C (60°F) - 345 kPa (50 psi) More than 24°C (75°F) - 483 kPa (70 psi) More than 33°C (90°F) - 690 kPa (100 psi)	Go to Step 2	Go to <u>Leak Testing</u>
	NOTE: Record the relative humidity and the ambient air temperature at the time of the test. 1. Close the vehicle doors and windows. 2. Open the drivers door window 12.7-15.2 cm (5-6 in). 3. Select the following HVAC control settings: • The A/C is ON. • The coldest temperature setting			

2	• The maximum blower speed • Recirculation mode • The instrument panel (I/P) outlet mode • All I/P outlets are OPEN. 4. Install thermometers in the left and right center panel air outlets. 5. Apply the parking brake. 6. Place the transaxle/transmission in one of the following positions: • PARK (Automatic) • NEUTRAL (Manual) 7. Start the engine and warm to operating temperature. 8. Operate the A/C system for 5 minutes. 9. Inspect A/C components for the following conditions: • Abnormal frost areas • Unusual noises 10. Record the following information: • The panel outlet air temperatures • The low-side pressure • The high-side pressure 11. Compare the low and high side pressures and the panel output temperatures to the A/C Performance Table below. Does all the data recorded fall within the specified ranges of the A/C Performance Table below?	-	Go to Step 5	Go to Step 3
3	If the pressures and temperatures recorded do not fall within the specified ranges: 1. Continue to operate the A/C system for an additional 5 minutes. 2. Record the pressures and temperatures again. 3. Compare the low and high side pressures and the panel output temperature to the A/C Performance Table below.	-		

	Does all the data recorded fall within the specified ranges of the A/C Performance Table below?		Go to Step 5	Go to Step 4
4	Perform the necessary repairs. Refer to <u>A/C Diagnostics Chart</u> . Is the action complete?	-	Go to Step 5	-
5	Operate the system in order to verify the test results. Did you find the same results?	-	System OK	Go to <u>Symptoms - HVAC Systems - Manual</u>

A/C Performance Table

Ambient Temperature	Relative Humidity	Low Side Service Port Pressure	High Side Service Port Pressure	Maximum Left Center Discharge Air Temperature
13-18°C (55-65°F)	0-100%	206-282 kPa (30-41 psi)	1350-1660 kPa (196-241 psi)	17°C (61°F)
19-24°C (66-75°F)	Below 40%	206-296 kPa (30-43 psi)	1398-1708 kPa (203-248 psi)	14°C (57°F)
	Above 40%	227-316 kPa (35-46 psi)	1481-1832 kPa (215-266 psi)	18°C (63°F)
25-29°C (76-85°F)	Below 35%	241-316 kPa (36-47 psi)	1550-1818 kPa (225-264 psi)	15°C (59°F)
	35-50%	248-323 kPa (36-47 psi)	1619-1867 kPa (235-271 psi)	17°C (61°F)
	Above 50%	261-337 kPa (38-49 psi)	1660-1977 kPa (241-287 psi)	18°C (64°F)
30-35°C (86-95°F)	Below 30%	268-337 kPa (39-49 psi)	1667-1949 kPa (242-283 psi)	18°C (63°F)
	30-50%	275-351 kPa (40-51 psi)	1772-2032 kPa (250-295 psi)	19°C (64°F)
	Above 50%	282-358 kPa (41-52 psi)	1791-2149 kPa (260-312 psi)	19°C (66°F)
36-41°C (96-105°F)	Below 20%	296-365 kPa (43-53 psi)	1791-2053 kPa (260-298 psi)	19°C (66°F)
	20-40%	296-372 kPa (43-54 psi)	1832-2412 kPa (266-311 psi)	19°C (66°F)
	Above 40%	303-378 kPa (44-55 psi)	1908-2232 kPa (277-324 psi)	20°C (68°F)
42-46°C (106-115°F)	Below 20%	323-392 kPa (47-57 psi)	1922-3156 kPa (279-313 psi)	22°C (70°F)
	Above 20%	330-392 kPa (48-57 psi)	1970-2256 kPa (286-329 psi)	22°C (70°F)
47-49°C (116-120°F)	Below 30%	351-420 kPa (51-61 psi)	1832-2060 kPa (266-299 psi)	23°C (73°F)

A/C DIAGNOSTICS CHART

A/C Diagnostics Chart

Low Side Gauge Reading	High Side Gauge Reading	Potential Causes
Low	Low	Low Refrigerant Charge
		Restriction between Compressor and High Side port
	Low/Normal	Evaporator Freezing
	High	Restriction between the Low Side and High Side ports or Restricted TXV/Orifice Tube
		Compressor Stuck at Maximum Displacement
High	Low	Compressor has Low Displacement or Internal Malfunction
		Malfunctioning Cooling Fans
	High	Refrigerant Overcharge
		Restriction between the Low Side Port and Compressor Inlet
		Restricted Condenser Air Flow
		Expansion Device Stuck Open
		Air in A/C System
Normal/High	Normal/High	Refrigerant Contamination
		PAG or POE Oil Overcharge

NOISE DIAGNOSIS - BLOWER MOTOR

Noise Diagnosis - Blower Motor

Step	Action	Yes	No
DEFINITION: Noise originating from the blower motor.			
1	Were you sent here from Symptoms or another diagnostic table?	Go to Step 2	Go to <u>Symptoms - HVAC Systems - Manual</u>
2	Inspect the air inlet grille for debris. Is debris present?	Go to Step 8	Go to Step 3
3	1. Sit inside the vehicle. 2. Close the vehicle doors and windows. 3. Turn ON the ignition, with the engine OFF. 4. Cycle the blower motor through all of the speeds and modes in order to determine where and when the noise occurs.		
	Is a noise evident during the blower operation?	Go to Step 4	Go to Step 11
	Inspect for excessive vibration at each blower motor		

4	speed by feeling the blower case. Is excess vibration present?	Go to Step 6	Go to Step 5
5	Listen to the blower motor at each speed. Is the blower motor making a squeaking or chirping noise?	Go to Step 9	Go to Step 11
6	1. Remove the blower motor. Refer to <u>Blower Motor Replacement</u>. 2. Inspect the blower motor impeller for deposits of foreign material. 3. Inspect the blower motor for deposits of foreign material. Did you find any foreign material on the blower motor or blower motor impeller?	Go to Step 8	Go to Step 7
7	Inspect the blower motor for the following conditions: • Cracked blades • A loose impeller retainer • Improper impeller alignment Did you find any of these conditions?	Go to Step 9	Go to Step 10
8	Remove the foreign material. Is the action complete?	Go to Step 10	-
9	Replace the blower motor. Refer to <u>Blower Motor Replacement</u> . Is the repair complete?	Go to Step 11	-
10	Install the blower motor. Refer to <u>Blower Motor Replacement</u> . Is the action complete?	Go to Step 11	-
11	Operate the system in order to verify the repair. Did you find and correct the condition?	System OK	Go to Step 2

AIR CONDITIONING COMPRESSOR OIL DIAGNOSIS

Air Conditioning Compressor Oil Diagnosis

Condition	Corrective Action
NOTE: To avoid repeat compressor failure, always inspect the condition of the refrigerant oil and take the appropriate corrective action before installing the replacement compressor.	
Clean oil no debris present	No corrective action necessary.
	• Replace the desiccant or component containing the desiccant.

Clean oil with debris present	• Replace the desiccant filter if applicable. • Remove and inspect the high pressure side filter (if applicable). • Remove, inspect, clean, or replace the orifice tube. • If the system has a front orifice tube and is equipped with a filter in the rear auxiliary line, remove, inspect, clean, or replace the filter.
Dark brown/black and/or pungent/unusual odor with no debris present	• Replace the desiccant or component containing the desiccant. • Replace the desiccant filter if applicable. • Flush the refrigerant system.
Dark brown/black and/or pungent/unusual odor with debris present	• Replace the desiccant or component containing the desiccant. • Replace the desiccant filter if applicable. • Flush the refrigerant system. • Remove and inspect the high pressure side filter if applicable. • Remove, inspect, clean, or replace the orifice tube. • If the system has a front orifice tube and is equipped with a filter in the rear auxiliary line, remove, inspect, clean or replace the filter.
Oil overcharge	Flush the refrigerant system.
Refrigerant contamination	Flush the refrigerant system.
Hybrid polyolester refrigerant oil (POE) contamination	• Flush the refrigerant system. • Replace the desiccant or component containing the desiccant. • Replace the desiccant filter if applicable.

NOISE DIAGNOSIS - AIR CONDITIONING (A/C) SYSTEM

Noise Diagnosis - Air Conditioning (A/C) System

Step	Action	Yes	No
DEFINITION: Noise originating from the A/C compressor, drive belt, or the A/C lines.			
1	Were you sent here from Symptoms or another diagnostic table?	Go to Step 2	Go to <u>Symptoms - HVAC Systems - Manual</u>
	1. A/C system noises can be generally categorized into 3 areas: • Screeching, squealing, chirping noises		

2	• Moaning noises • Vibration/rattle noises 2. Start the engine. 3. Ensure that the A/C is ON. Is a screeching, squealing noise heard when the A/C is engaged?	Go to Step 3	Go to Step 9
3	With the engine OFF, inspect the drive belt for excessive wear. Refer to <u>Drive Belt Falls Off and Excessive Wear Diagnosis</u> . Is the drive belt excessively worn?	Go to Step 18	Go to Step 4
4	Inspect the drive belt tension. Is the drive belt tension correct?	Go to Step 5	Go to Step 18
5	Inspect the drive belt for excessive oil coverage. Is the drive belt covered with oil?	Go to Step 17	Go to Step 6
6	1. Start the engine. 2. Ensure that the A/C is ON. 3. Inspect the compressor and the clutch. Is the A/C compressor locked up?	Go to Step 23	Go to Step 7
7	Is the A/C compressor clutch slipping?	Go to Step 22	Go to Step 8
8	WARNING: Refer to <u>Moving Parts and Hot Surfaces Warning</u> . Using a stethoscope, listen to the A/C compressor for any abnormal noises. Is the compressor causing an abnormal noise?	Go to Step 15	Go to Step 10
9	Does a moaning noise exist when the A/C clutch is engaged?	Go to Step 10	Go to Step 12
10	Listen to the A/C compressor components and mounting for noise concerns using a stethoscope. Are any of these components loose, damaged, or excessively worn?	Go to Step 19	Go to Step 11
11	1. Idle the engine. 2. Engage the A/C compressor clutch. 3. Using a stethoscope, move around the entire refrigerant plumbing system, listening for any abnormal noises caused by a component of the A/C system touching another component. Are any of the A/C components grounding out and causing a vibration noise?	Go to Step 21	Go to Step 13
	Does a vibration or rattle noise exist when the A/C		

12	clutch is engaged?	Go to Step 13	Go to Step 14
13	Does the noise stop when the A/C clutch is disengaged?	Go to Step 15	Go to Step 24
14	1. Idle the engine in PARK with the A/C compressor clutch engaged. 2. Using a stethoscope, move around the entire A/C system testing for any abnormal noises caused by a component. Do any of the A/C components cause an abnormal noise?	Go to Step 20	Go to Step 24
15	Verify that the A/C system is properly charged. Refer to <u>Refrigerant System Specifications (1.2L LL0, 1.0L LFM)</u>. Is the A/C system properly charged?	Go to Step 25	Go to Step 16
16	Recharge the A/C system to specification. Refer to <u>Refrigerant Recovery and Recharging</u>. Is the abnormal compressor noise still present?	Go to Step 23	Go to Step 25
17	Repair the oil leak. Refer to <u>Oil Leak Diagnosis</u> . Is the repair complete?	Go to Step 18	-
18	Replace the drive belt. Refer to <u>Air Conditioning Compressor Belt Replacement</u> . Is the replacement complete?	Go to Step 25	-
19	Repair or replace the A/C compressor mounting component. Is the repair complete?	Go to Step 25	-
20	Repair or replace the component which is causing the moaning concern as needed. Is the repair complete?	Go to Step 25	-
21	Correctly route or insulate the A/C component. Is the repair complete?	Go to Step 25	-
22	Replace the A/C compressor clutch. Refer to <u>Air Conditioning Clutch Replacement (1.2L LL0, 1.0L LFM)</u>. Is the repair complete?	Go to Step 25	-
23	Replace the A/C compressor. Refer to <u>Air Conditioning Compressor Replacement (1.2L LL0, 1.0L LFM)</u>. Is the repair complete?	Go to Step 25	-
24	The concern may be caused by an engine related component. Refer to <u>Vibration Analysis - Engine</u> . Did you find and correct the condition?	Go to Step 25	-
25	Operate the system in order to verify the repair. Did you find and correct the condition?	System OK	Go to Step 2

NOISE DIAGNOSIS - HVAC MODULE

Noise Diagnosis - HVAC Module

Step	Action	Yes	No
DEFINITION: Noise originating from the HVAC module.			
1	Were you sent here from Symptoms or another diagnostic table?	Go to Step 2	Go to Symptoms - HVAC Systems - Manual
2	1. Start the engine. 2. Cycle through all of the following: • Blower motor speeds • HVAC modes • Temperature control settings 3. Determine the location of noise: • Recirculation door • Temperature door • Mode valve Is noise evident when selecting recirculation?	Go to Step 6	Go to Step 3
3	Is noise evident when selecting temperature?	Go to Step 6	Go to Step 4
4	Is noise evident when selecting mode ?	Go to Step 5	Go to Step 2
5	1. Remove the HVAC module. Refer to <u>Air Conditioning (A/C) Evaporator and Blower Module Assembly Replacement.</u> 2. Inspect the mode valve for dust, dirt or debris. Is dust, dirt or debris present?	Go to Step 11	Go to Step 12
6	Remove the HVAC module. Refer to <u>Air Conditioning (A/C) Evaporator and Blower Module Assembly Replacement.</u> Is action complete?	Go to Step 7	-
7	1. Inspect the air flow door for proper operation. 2. Inspect the ducts for obstructions or foreign materials. Were any of these conditions found?	Go to Step 10	Go to Step 8
8	Inspect air flow door for warping or cracking. Is air flow door in normal condition?	Go to Step 13	Go to Step 9
9	Replace air flow door. Is repair complete?	Go to Step 13	-
10	Remove any obstructions or foreign material found. Is action complete?	Go to Step 13	-
11	Vacuum and remove dust, dirt and debris. Is action complete?	Go to Step 14	-

12	Replace the upper evaporator case. Refer to <u>Air Conditioning Evaporator Core Replacement</u> . Is action complete?	Go to Step 14	-
13	Install the HVAC Module. Refer to <u>Air Conditioning (A/C) Evaporator and Blower Module Assembly Replacement</u> . Is action complete?	Go to Step 14	-
14	Operate the system to verify the repair. Did you find and correct the condition?	System OK	Go to Step 2

REPAIR INSTRUCTIONS

REFRIGERANT RECOVERY AND RECHARGING

Special Tools

GE-45037 A/C Oil Injector

For equivalent regional tools, refer to **Special Tools**.

WARNING: To prevent personal injury, avoid breathing A/C Refrigerant and lubricant vapor or mist. Work in a well ventilated area. To remove refrigerant from the A/C System, use service equipment designed for recovery that is certified to meet the requirements of the appropriate SAE Standards. If an accidental system discharge occurs, ventilate the work area before continuing service. Additional health and safety information may be obtained from the refrigerant, refrigerant recovery, and lubricant manufacturers.

WARNING: For personal protection, goggles and lint-free gloves should be worn and a clean cloth wrapped around fittings, valves, and connections when doing work that includes opening the refrigerant system. If refrigerant comes in contact with any part of the body severe frostbite and personal injury can result. The exposed area should be flushed immediately with cold water and prompt medical help should be obtained.

CAUTION: R-134a is the only approved refrigerant for use in this vehicle. The use of any other refrigerant may result in poor system performance or component failure.

CAUTION: To avoid system damage use only R-134a dedicated tools when servicing the A/C system.

CAUTION: Use only Polyalkylene Glycol Synthetic Refrigerant Oil (PAG) for internal circulation through the R-134a A/C system and only 525 viscosity mineral

oil on fitting threads and O-rings. If lubricants other than those specified are used, compressor failure and/or fitting seizure may result.

CAUTION: R-12 refrigerant and R-134a refrigerant must never be mixed, even in the smallest of amounts, as they are incompatible with each other. If the refrigerants are mixed, compressor failure is likely to occur. Refer to the manufacturer instructions included with the service equipment before servicing.

The air conditioning filling device service center is a complete air conditioning service center for R-134a. The ACR 2000 recovers, recycles, evacuates and recharges A/C refrigerant quickly, accurately and automatically. The unit has a display screen that contains the function controls and displays prompts that will lead the technician through the recover, recycle, evacuate and recharge operations. R-134a is recovered into and charged out of an internal storage vessel. The ACR 2000 automatically replenishes this vessel from an external source tank in order to maintain a constant 5.45-6.82 kg (12-15 lb) of A/C refrigerant.

The ACR 2000 has a built in A/C refrigerant identifier that will test for contamination, prior to recovery and will notify the technician if there are foreign gases present in the A/C system. If foreign gases are present, the ACR 2000 will not recover the refrigerant from the A/C system.

The ACR 2000 also features automatic air purge, single pass recycling and an automatic oil drain.

Refer to the air conditioning filling device service center manual for operation and setup instruction. Always recharge the A/C system with the proper amount of R-134a. Refer to **Refrigerant System Specifications (1.2L LL0, 1.0L LFM)** for the correct amount.

A/C Refrigerant System Oil Charge Replenishing

If oil was removed from the A/C system during the recovery process or due to component replacement, the oil must be replenished. Oil can be injected into a charged system using **GE-45037** injector. For the proper quantities of oil to add to the A/C refrigerant system, refer to **Refrigerant System Specifications (1.2L LL0, 1.0L LFM)**.

FLUSHING

Special Tools

- **J 41447** Leak Detection Dye
- **J 42220** Universal 12V Leak Detection Lamp
- **J 43600** ACR 2000 Refrigerant Station
- **J 45268** Flush Adapter Kit
- **J 45037** A/C Oil Injector

NOTE: Flushing is not intended to remove metal from the A/C system.

Flushing is intended to remove the following:

- Contaminated PAG oil
- Desiccant, following a desiccant bag failure
- Overcharge of PAG oil
- Refrigerant contamination

NOTE: Warmer engine or ambient temperature decreases the refrigerant recovery time during the A/C flush procedure.

1. Recover the refrigerant. Refer to **Refrigerant Recovery and Recharging**.
2. Remove the thermal expansion valve (TXV). Refer to **Air Conditioning Evaporator Thermal Expansion Valve Replacement**.
3. Install the stud for the **GE-45268** Flush Adapter Kit onto the J 45268-115.
4. Install the J 45268-115 in place of the TXV.

CAUTION: Refer to **Fastener Caution** .

5. Install the TXV mounting bolts and tighten to 3.5 (31 lb in).
6. Connect the evaporator line to the J 45268-115.
7. Install the TXV block fitting nut and tighten to 20 (15 lb ft).
8. Remove the A/C compressor. Refer to **Air Conditioning Compressor Replacement (1.2L LL0, 1.0L LFM)**.
9. Install J 45268-4 to the A/C compressor suction hose.
10. Install J 45268-5 to the A/C compressor discharge hose.

Fig. 1: View Of A/C Filter & Check Valve
Courtesy of GENERAL MOTORS COMPANY

NOTE: The filter inside the J 45268-1 is serviceable. Remove and discard the check valve from the filter.

11. Forward flow refrigerant flushing is recommended for contaminated refrigerant or PAG oil.

Perform the following procedure:

1. Service the filter with ACDelco P/N GF 470, before each flush.

Connect the J-45268-1 flush filter to the suction port of the J-45268-4 flush adapter.

2. Connect the blue hose from the **J-43600** air conditioning service center to the J-45268-1 flush filter adapter.
3. Connect the red hose from the **J-43600** air conditioning service center to the J-45268-5 flush adapter.

12. Reverse flow refrigerant flushing is recommended for desiccant bag failure. Perform the following procedure and replace the accumulator when the flush procedure is complete.

NOTE: **The filter inside the J 45268-1 is serviceable. Remove and discard the check valve from the filter.**

1. Service the filter with AC P/N GF 470, before each flush. Connect the J-45268-1 flush filter to the discharge port of the J-45268-5 flush adapter.
2. Connect the blue hose from the **J-43600** air conditioning service center to the J 45268-1 flush filter adapter.
3. Connect the red hose from the **J-43600** air conditioning service center to the suction port of the J-45268-4 flush adapter.

NOTE: **Close the valve on the external refrigerant tank, before starting the flush process.**

13. Flush the A/C system. Follow the instructions supplied with the **J-43600** air conditioning service center.
14. Disconnect the red hose on the **J-43600** ACR 2000 air conditioning service center from the J 45268-5.
15. Disconnect the blue hose on the **J-43600** ACR 2000 air conditioning service center from the J 45268-1.
16. Remove J 45268-1 from the J 45268-4.
17. Remove the J 45268-5 from the A/C compressor discharge hose.
18. Remove the J 45268-4 from the A/C compressor suction hose.

NOTE: **Flushing will remove all the PAG oil from the A/C system.**

The A/C system must be replenished with the correct amount of PAG oil.

19. If you will reinstall the removed A/C compressor, perform the following procedure:
 1. Remove the A/C compressor drain plug.
 2. Drain the PAG oil from the A/C compressor. Rotate the compressor input shaft to assist in draining the PAG oil from the compressor.
 3. Install the A/C compressor drain plug and tighten to 16 (12 lb ft).
 4. Add the total system capacity of PAG oil to the A/C compressor. Refer to **Refrigerant System Specifications (1.2L LL0, 1.0L LFM)**
20. If you will replace the A/C compressor after flushing the system, perform the following procedure:
 1. Determine if the new service compressor is shipped with PAG oil. Refer to **Refrigerant System Specifications (1.2L LL0, 1.0L LFM)**.
 2. If the service compressor is shipped with PAG oil, DO NOT drain the new PAG oil from the compressor.
 3. Deduct the amount of PAG oil shipped with the service compressor from the amount of PAG oil listed in the capacities table. Refer to **Refrigerant System Specifications (1.2L LL0, 1.0L LFM)**.
 4. Add the calculated amount to the compressor, as needed.

NOTE: Flushing will remove the fluorescent leak detection dye from the A/C system.

21. Add one bottle of **J 41447** Leak Detection Dye directly to the A/C compressor.
22. Install the A/C compressor. Refer to **Air Conditioning Compressor Replacement (1.2L LL0, 1.0L LFM)**.
23. Remove J 45268-115.
24. Inspect the TXV for debris. Clean or replace as needed.
25. Install the TXV. Refer to **Air Conditioning Evaporator Thermal Expansion Valve Replacement**.
26. Evacuate and recharge the A/C system. Refer to **Refrigerant System Specifications (1.2L LL0, 1.0L LFM)**.
27. Leak test the fittings using **J42220** Universal 12V Leak Detection Lamp.

After Flushing Is Complete

NOTE: Flushing will remove all the A/C system lubricant and leak detection dye from the A/C system.

After a compressor failure, it is extremely important to eliminate and/or contain the debris that may cause repeat repairs. The debris generated from a compressor failure will be discharged into the compressor suction line, discharge line, condenser and liquid line. A suction screen filter should be installed whenever possible, after a compressor failure, to protect the expansion device (orifice tube or TXV) in both the front and rear systems from debris.

1. Remove the suction hose from the A/C compressor. Refer to **Air Conditioning Compressor and Condenser Hose Replacement (1.2L LL0, 1.0L LFM)**.
2. Install the suction screen filter kit (P/N 95369523) to the suction port of A/C compressor.
3. Install the suction hose and suction screen filter mounting bolt and tighten the bolts to 22 (16 lb ft).
4. Install the proper amount of PAG oil, into the A/C system using the **J 45037** Oil Injector. Refer to **Refrigerant System Specifications (1.2L LL0, 1.0L LFM)**.
5. Evacuate and recharge the A/C system. Refer to **Refrigerant System Specifications (1.2L LL0, 1.0L LFM)**.
6. Verify proper A/C system operation.
7. Leak test all connections using the **J 44220** Universal 12V Leak Detection Lamp or equivalents. Remember that the A/C system must operate for several minutes before leak dye will show a leak if one is present.

AIR CONDITIONING COMPRESSOR OIL BALANCING (1.2L LL0, 1.0L LFM)

Draining Procedure

Fig. 2: Draining Refrigerant Oil From Air Conditioning Compressor
Courtesy of GENERAL MOTORS COMPANY

NOTE: **Drain and measure as much of the refrigerant oil as possible from the removed compressor.**

1. Drain the oil from both the suction and discharge ports of the removed compressor into a clean, graduated container. Rotate the compressor shaft to assist in draining the compressor.
2. Measure and record the amount of oil drained from the removed compressor. This measurement will be used during installation of the replacement compressor.
3. Inspect the oil drained from removed compressor. Refer to **Air Conditioning Compressor Oil Diagnosis**.
4. Properly discard the used refrigerant oil.

Balancing Procedure

Fig. 3: Draining Refrigerant Oil From Air Conditioning Compressor
Courtesy of GENERAL MOTORS COMPANY

NOTE: **The refrigerant oil in the A/C system must be balanced during compressor replacement.**

1. Before installing the compressor, the refrigerant oil will have to be fully drained:
2. Add back the same quantity of polyalkylene glycol (PAG) oil as drained from the removed compressor.

Refer to the amount of refrigerant oil recorded during the compressor removal.

AIR CONDITIONING COMPRESSOR REPLACEMENT (1.2L LL0, 1.0L LFM)

Fig. 4: Air Conditioning Compressor
Courtesy of GENERAL MOTORS COMPANY

Air Conditioning Compressor Replacement (1.2L LL0, 1.0L LFM)

Callout	Component Name
Preliminary Procedures 1. Recover the refrigerant. Refer to <u>Refrigerant Recovery and Recharging</u>. 2. Remove the air conditioning compressor belt. Refer to <u>Air Conditioning Compressor Belt Replacement</u>. 3. Raise and support the vehicle. Refer to <u>Lifting and Jacking the Vehicle</u>. 4. Remove the front bumper fascia opening lower cover. Refer to <u>Front Bumper Fascia Opening Lower Cover Replacement</u>. 5. Disconnect the A/C compressor electrical connector. 6. Remove the compressor hose assembly from the compressor. Refer to <u>Air Conditioning Compressor and Condenser Hose Replacement (1.2L LL0, 1.0L LFM)</u>, and <u>Air Conditioning Evaporator Hose Assembly Replacement (1.2L LL0, 1.0L LFM)</u>.	
1	Air Conditioning Compressor Bolt (Qty: 4) CAUTION: Refer to <u>Fastener Caution</u> . Tighten 22 (16 lb ft)

2	Engine Wiring Harness Bracket
3	Air Conditioning Compressor Assembly Procedure 1. Use a low viscosity, poly-alkylene glycol (PAG) oil. Use of the incorrect oil can result in compressor failure. 2. When replacing the A/C compressor, balance the compressor oil. Refer to <u>Air Conditioning Compressor Oil Balancing (1.2L LL0, 1.0L LFM)</u> . 3. Using GE 39400-A leak detector test A/C compressor fittings. Special Tools GE 39400-A Electronic Halogen Leak Detector For equivalent regional tools, refer to <u>Special Tools</u> .

AIR CONDITIONING CLUTCH REPLACEMENT (1.2L LL0, 1.0L LFM)

Special Tools

- **GE-39400-A** Halogen Leak Detector
- **GE-48965** Clutch Plate Holder

For equivalent regional tools, refer to **Special Tools**.

Removal Procedure

1. Remove the compressor. Refer to **Air Conditioning Compressor Replacement (1.2L LL0, 1.0L LFM)**.

Fig. 5: Identifying GE-48965 Clutch Plate Holder
Courtesy of GENERAL MOTORS COMPANY

2. Use the **GE-48965** clutch plate holder (1) to hold the compressor clutch plate from turning.
3. Remove the compressor clutch plate nut from the compressor.

Fig. 6: Compressor Clutch Plate

Courtesy of GENERAL MOTORS COMPANY

4. Remove the compressor clutch plate (1).
5. Remove the compressor air gap shim (2).
6. Remove the compressor pulley snap ring (3) using a ring pryer.

Fig. 7: Compressor Pulley And Compressor Clutch Coil
Courtesy of GENERAL MOTORS COMPANY

7. Remove the compressor pulley (1) from the compressor.
8. Remove the compressor pulley snap ring (2) using a ring pryer.
9. Remove the compressor clutch coil (3) from the compressor.

Installation Procedure

Fig. 8: Compressor Pulley And Compressor Clutch Coil
Courtesy of GENERAL MOTORS COMPANY

1. Install the compressor clutch coil (3) to the compressor.
2. Install the compressor pulley snap ring (2) using a ring pryer.
3. Install the compressor pulley (1) to the compressor.

Fig. 9: Compressor Clutch Plate

Courtesy of GENERAL MOTORS COMPANY

4. Install the compressor pulley snap ring (3) using a ring pryer.
5. Install the compressor air gap shim (2).
6. Install the compressor clutch plate (1).

Fig. 10: Measuring Air Gap Between Pulley And Drive Plate
Courtesy of GENERAL MOTORS COMPANY

7. Measure the air gap between the pulley and the drive plate. Adjust the shims to achieve 0.25-0.45 mm (0.0098-0.0177 in) air gap.

Fig. 11: Identifying GE-48965 Clutch Plate Holder
Courtesy of GENERAL MOTORS COMPANY

8. Use the **GE-48965** clutch plate holder (1) to hold the compressor clutch plate from turning.

CAUTION: Refer to Fastener Caution .

9. Install the compressor clutch plate bolt and tighten to 16 (12 lb ft).
10. Install the compressor. Refer to **Air Conditioning Compressor Replacement (1.2L LL0, 1.0L LFM)**.
11. Leak test the fittings using the **GE-39400-A** halogen leak detector.

AIR CONDITIONING COMPRESSOR BRACKET REPLACEMENT

Fig. 12: Air Conditioning Compressor Bracket
Courtesy of GENERAL MOTORS COMPANY

Air Conditioning Compressor Bracket Replacement

Callout	Component Name
Preliminary Procedures Remove the air conditioning compressor. Refer to <u>Air Conditioning Compressor Replacement (1.2L LL0, 1.0L LFM)</u> .	
1	Air Conditioning Compressor Bracket Bolt (Qty: 4) CAUTION: Refer to <u>Fastener Caution</u> . Tighten 22 N.m (16 lb ft)
2	Air Conditioning Compressor Bracket

AIR CONDITIONING SYSTEM SEAL REPLACEMENT

Removal Procedure

1. Disassemble the A/C refrigerant components. Refer to the appropriate repair procedure.

NOTE: Cap or tape the open A/C refrigerant components immediately to prevent

system contamination.

2. Cap or tape the A/C refrigerant components.

Fig. 13: Sealing Washer

Courtesy of GENERAL MOTORS COMPANY

3. Remove the sealing washer (1) from the A/C refrigerant component.
4. Inspect the seal washer for signs of damage to help determine the root cause of the failure.
5. Inspect the A/C refrigerant components for damage or burrs. Repair if necessary.

NOTE: DO NOT reuse sealing washer.

6. DISCARD the sealing washer.

Installation Procedure

NOTE: Flat washer type seals do not require lubrication.

1. Inspect the new sealing washer for any signs of cracks, cuts, or damage.

Do not use a damaged sealing washer.

2. Remove the cap or tape from the A/C refrigerant components.

Fig. 14: Identifying Proper Seating Of A/C Refrigerant O-Ring
Courtesy of GENERAL MOTORS COMPANY

3. Using a lint-free clean, dry cloth, clean the sealing surfaces of the A/C refrigerant components.
4. Carefully install the NEW sealing washer (1) onto the A/C refrigerant component.

The sealing washer (1) must completely bottom against the surface of the fitting.

NOTE: After tightening the A/C components, there should be a slight sealing gap of approximately 1.2 mm (3/64 in) between the A/C line and the A/C component.

5. Assemble the remaining A/C refrigerant components. Refer to the appropriate repair procedure.

AIR CONDITIONING O-RING SEAL REPLACEMENT

Removal Procedure

1. Disassemble the A/C refrigerant components. Refer to the appropriate repair procedure.
2. Remove the O-ring seal from the A/C refrigerant component.
3. Inspect the O-ring seal for signs of damage to help determine the root cause of the failure.
4. Inspect the A/C components for damage or burrs. Repair if necessary.

NOTE: Cap or tape the open A/C refrigerant components immediately to prevent system contamination.

5. Cap or tape the A/C refrigerant components.
6. Discard the O-ring seal.

Installation Procedure

1. Inspect the new O-ring seal for any sign of cracks, cuts, or damage. Replace if necessary.
2. Remove the cap or tape from the A/C refrigerant components.
3. Using a lint-free clean, dry cloth, carefully clean the sealing surfaces of the A/C refrigerant components.

NOTE: DO NOT allow any of the mineral base 525 viscosity refrigerant oil on the new O-ring seal to enter the refrigerant system.

4. Lightly coat the new O-ring seal with mineral base 525 viscosity refrigerant oil.

NOTE: DO NOT reuse O-ring seals.

5. Carefully slide the new O-ring seal onto the A/C refrigerant component.

Fig. 15: O-ring

Courtesy of GENERAL MOTORS COMPANY

6. The O-ring seal (1) must be fully seated.
7. Assemble the A/C components.

AIR CONDITIONING COMPRESSOR AND CONDENSER HOSE REPLACEMENT (1.2L LL0, 1.0L LFM)

Fig. 16: Air Conditioning Compressor and Condenser Hose
 Courtesy of GENERAL MOTORS COMPANY

Air Conditioning Compressor and Condenser Hose Replacement (1.2L LL0, 1.0L LFM)

Callout	Component Name
Preliminary Procedures 1. Recover the refrigerant. Refer to <u>Refrigerant Recovery and Recharging</u>. 2. Remove the front bumper fascia opening lower cover. Refer to <u>Front Bumper Fascia Opening Lower Cover Replacement</u>. 3. Disconnect the A/C refrigerant pressure sensor electrical connector.	
1	Air Conditioning Compressor and Condenser Hose Nut to Air Conditioning Condenser CAUTION: Refer to <u>Fastener Caution</u> . Tighten 22 (16 lb ft)
2	Air Conditioning Compressor and Condenser Hose Bolt to Air Conditioning Compressor Tighten 22 (16 lb ft)
3	Air Conditioning Compressor and Condenser Hose

AIR CONDITIONING EVAPORATOR HOSE ASSEMBLY REPLACEMENT (1.2L LL0, 1.0L LFM)

Fig. 17: Air Conditioning Evaporator Hose Assembly
 Courtesy of GENERAL MOTORS COMPANY

Air Conditioning Evaporator Hose Assembly Replacement (1.2L LL0, 1.0L LFM)

Callout	Component Name
Preliminary Procedures 1. Recover the refrigerant. Refer to <u>Refrigerant Recovery and Recharging</u>. 2. Remove the air cleaner assembly. Refer to <u>Air Cleaner Assembly Replacement</u>. 3. Remove the front bumper fascia opening lower cover. Refer to <u>Front Bumper Fascia Opening Lower Cover Replacement</u>. 4. Remove the plenum lower panel. Refer to <u>Plenum Lower Panel Replacement</u>. 5. Put aside the radiator surge tank after removing the screws. Refer to <u>Radiator Surge Tank Replacement (LL0)</u>, <u>Radiator Surge Tank Replacement (LFM)</u>. 6. Disconnect the left rear (LR) and right rear (RR) brake pipes from the brake pressure modulator valve (BPMV). Refer to <u>Brake Pressure Modulator Valve Replacement</u>. 7. Disconnect the A/C refrigerant pressure sensor electrical connector.	
1	Air Conditioning Evaporator Hose Assembly Nut to Air Conditioning Evaporator Thermal Expansion Valve (Qty: 1) CAUTION: Refer to <u>Fastener Caution</u> .

	Tighten 22 (16 lb ft)
2	Air Conditioning Evaporator Hose Assembly Nut to Air Conditioning Condenser (Qty: 1) Tighten 22 (16 lb ft)
3	Air Conditioning Evaporator Hose Assembly Bolt to Air Conditioning Compressor (Qty: 1) Tighten 22 (16 lb ft)
4	Air Conditioning Evaporator Hose Assembly Mounting Bracket Nut (Qty: 2) Tighten 10 (89 lb in)
5	Air Conditioning Evaporator Hose Assembly

AIR CONDITIONING (AC) REFRIGERANT FILTER REPLACEMENT

Special Tools

GE 39400-A Halogen Leak Detector

For equivalent regional tools, refer to **Special Tools**.

Removal Procedure

1. Recover the refrigerant. Refer to **Refrigerant Recovery and Recharging**.
2. Remove the front bumper fascia opening lower cover. Refer to **Front Bumper Fascia Opening Lower Cover Replacement**.

Fig. 18: AC Refrigerant Filter Components
Courtesy of GENERAL MOTORS COMPANY

NOTE: Cap all A/C components immediately to prevent system contamination.

3. Remove the air conditioning receiver and dehydrator plug (4).
4. Remove and discard the sealing washers (3).
5. Remove the refrigerant filter (2) from the condenser (1).

Installation Procedure

1. Uncap A/C components.
2. Install new sealing washers (3). Refer to **Air Conditioning O-Ring Seal Replacement.**

Fig. 19: AC Refrigerant Filter Components
Courtesy of GENERAL MOTORS COMPANY

3. Install the refrigerant filter (2) into the air conditioning condenser (1).
4. Install the air conditioning receiver and dehydrator plug (4).
5. Install the front bumper fascia opening lower cover. Refer to **Front Bumper Fascia Opening Lower Cover Replacement** .
6. Evacuate and charge the refrigerant system. Refer to **Refrigerant Recovery and Recharging**.
7. Leak test the fittings using the **GE 39400-A** detector.

AIR CONDITIONING REFRIGERANT SERVICE VALVE CORE REPLACEMENT

Special Tools

- **GE-39400-A** Halogen Leak Detector
- **GE-46246** Valve Core Removal Tool

For equivalent regional tools, refer to **Special Tools**.

Removal Procedure

1. Recover the refrigerant. Refer to **Refrigerant Recovery and Recharging**.

Fig. 20: Service Port Valve Core

Courtesy of GENERAL MOTORS COMPANY

2. Remove the service port valve core (1) using the **GE-46246** remover.

Installation Procedure

Fig. 21: Service Port Valve Core
Courtesy of GENERAL MOTORS COMPANY

CAUTION: Refer to Fastener Caution .

1. Install the service port valve core (1) using the **GE-46246** remover and tighten to 0.4 N.m (4 lb in).
2. Evacuate and charge the refrigerant system. Refer to Refrigerant Recovery and Recharging.
3. Leak test the fittings using the **GE-39400-A** detector.

AIR CONDITIONING EVAPORATOR THERMAL EXPANSION VALVE REPLACEMENT

Special Tools

GE-39400-A Halogen Leak Detector

For equivalent regional tools, refer to Special Tools.

Removal Procedure

1. Recover the refrigerant. Refer to Refrigerant Recovery and Recharging.

2. Remove the radiator surge tank screws. Refer to **Radiator Surge Tank Replacement (LL0) , Radiator Surge Tank Replacement (LFM) .**
3. Remove the A/C evaporator hose assembly mounting bracket nut from the wheelhouse panel side. Refer to **Air Conditioning Evaporator Hose Assembly Replacement (1.2L LL0, 1.0L LFM).**

Fig. 22: A/C Evaporator Hose And A/C Evaporator TXV
Courtesy of GENERAL MOTORS COMPANY

4. Disconnect the A/C evaporator hose (1) from A/C evaporator TXV. Refer to **Air Conditioning Evaporator Hose Assembly Replacement (1.2L LL0, 1.0L LFM).**
5. Remove the 2 A/C TXV bolts (2).
6. Remove the TXV (3).

Installation Procedure

Fig. 23: A/C Evaporator Hose And A/C Evaporator TXV
 Courtesy of GENERAL MOTORS COMPANY

CAUTION: Refer to Fastener Caution .

NOTE: Use NEW O-ring seals. Refer to Air Conditioning O-Ring Seal Replacement.

1. Install A/C TXV (3) and the 2 A/C TXV bolts (2) and tighten to 3.5 N.m (31 lb in).
2. Connect the air conditioning evaporator hose (1) to A/C evaporator TXV (3). Refer to Air Conditioning Evaporator Hose Assembly Replacement (1.2L LL0, 1.0L LFM).
3. Install the A/C evaporator hose assembly mounting bracket nut from the wheelhouse panel side. Refer to Air Conditioning Evaporator Hose Assembly Replacement (1.2L LL0, 1.0L LFM).
4. Install the radiator surge tank screws. Refer to Radiator Surge Tank Replacement (LL0) , Radiator Surge Tank Replacement (LFM) .
5. Evacuate and charge the refrigerant system. Refer to Refrigerant Recovery and Recharging.
6. Leak test the fittings using the GE-39400-A detector.

AIR CONDITIONING (A/C) REFRIGERANT PRESSURE SENSOR REPLACEMENT (1.2L LL0, 1.0L LFM)

Fig. 24: Air Conditioning (A/C) Refrigerant Pressure Sensor
 Courtesy of GENERAL MOTORS COMPANY

Air Conditioning (A/C) Refrigerant Pressure Sensor Replacement (1.2L LL0, 1.0L LFM)

Callout	Component Name
Preliminary Procedure Remove the front bumper fascia opening lower cover. Refer to <u>Front Bumper Fascia Opening Lower Cover Replacement</u> .	
1	Air Conditioning Refrigerant Pressure Sensor CAUTION: Refer to <u>Fastener Caution</u> . Procedure 1. Disconnect the air conditioning refrigerant pressure sensor connector. 2. Remove and discard the O-ring and replace with NEW. Refer to <u>Air Conditioning O-Ring Seal Replacement</u> . Tighten 8 (71 lb in)

AIR CONDITIONING CONDENSER REPLACEMENT (GASOLINE ENGINE)

Removal Procedure

1. Recover the refrigerant. Refer to Refrigerant Recovery and Recharging.
2. Remove the front bumper fascia. Refer to Front Bumper Fascia Replacement.

Fig. 25: Identifying Side Opening Cover Retainers
Courtesy of GENERAL MOTORS COMPANY

3. Remove the 3 right side opening cover retainer (1) and right side opening cover (2).
4. Remove the 4 left side opening cover retainer (3) and left side opening cover (4).

Fig. 26: Identifying Upper Opening Cover Retainers
Courtesy of GENERAL MOTORS COMPANY

5. Remove the 4 upper opening cover retainer (1) and upper opening cover (2).

Fig. 27: Locating Air Conditioning Hose Fasteners
Courtesy of GENERAL MOTORS COMPANY

6. Remove air conditioning compressor and condenser hose nut (1).
7. Remove air conditioning evaporator hose assembly nut (2).
8. Remove air conditioning hoses (3) from the air conditioning condenser.

Fig. 28: Identifying Air Conditioning Condenser & Radiator
Courtesy of GENERAL MOTORS COMPANY

9. Unclip air conditioning condenser (1) from the radiator (2).

Installation Procedure

Fig. 29: Identifying Air Conditioning Condenser & Radiator
Courtesy of GENERAL MOTORS COMPANY

1. Clip the air conditioning condenser (1) to the radiator (2).

Fig. 30: Locating Air Conditioning Hose Fasteners
Courtesy of GENERAL MOTORS COMPANY

2. Install air conditioning hoses (3) to the air conditioning condenser.

CAUTION: Refer to Fastener Caution .

3. Install air conditioning evaporator hose assembly nut (2) and tighten to 22 (16 lb in).
4. Install air conditioning compressor and condenser nut (1) and tighten to 22 (16 lb in).

Fig. 31: Identifying Upper Opening Cover Retainers
Courtesy of GENERAL MOTORS COMPANY

5. Install the upper opening cover (2) and 4 upper opening cover retainer (1).

Fig. 32: Identifying Side Opening Cover Retainers
Courtesy of GENERAL MOTORS COMPANY

6. Install the left side opening cover (4) and 4 left side opening cover retainer (3).
7. Install the right side opening cover (2) and 3 right side opening cover retainer (1).
8. Install the front bumper fascia. Refer to **Front Bumper Fascia Replacement** .
9. Charge the refrigerant system. Refer to **Refrigerant Recovery and Recharging**.

CONDENSER OUTLET TUBE REPLACEMENT

Removal Procedure

1. Recover the refrigerant. Refer to **Refrigerant Recovery and Recharging**.
2. Remove the charge air cooler inlet duct. Refer to .

Fig. 33: Air Conditioning Condenser And Evaporator Hose Fitting Nut
Courtesy of GENERAL MOTORS COMPANY

3. Remove the air conditioning condenser and evaporator hose fitting nut (3) from the air conditioning evaporator hose (1).
4. Loosen the air conditioning compressor hose (2) and the condenser outlet tube (4).

Fig. 34: Condenser Outlet Tube Nut
Courtesy of GENERAL MOTORS COMPANY

5. Remove the condenser outlet tube nut (3) from the air conditioning condenser (2).
6. Remove the condenser outlet tube (1).

Installation Procedure

1. Install NEW system seals to the air conditioning condenser outlet tube and the air conditioning condenser and the evaporator hose. Refer to **Air Conditioning System Seal Replacement**.

Fig. 35: Condenser Outlet Tube Nut
Courtesy of GENERAL MOTORS COMPANY

2. Install the condenser outlet tube (1).

CAUTION: Refer to Fastener Caution .

3. Install the condenser outlet tube nut (3) to the air conditioning condenser (2) and tighten to 9 N.m (80 lb in).

Fig. 36: Air Conditioning Condenser And Evaporator Hose Fitting Nut
Courtesy of GENERAL MOTORS COMPANY

4. Install the condenser outlet tube (4) to the air conditioning compressor hose (2).
5. Install the condenser outlet tube and the air conditioning compressor hose assembly to the air conditioning evaporator hose (1).
6. Install the air conditioning condenser and evaporator hose fitting nut (3) to the air conditioning evaporator hose (1) and tighten to 22 N.m (16 lb ft)..
7. Install the charge air cooler inlet duct. Refer to .
8. Evacuate and charge the refrigerant system. Refer to **Refrigerant Recovery and Recharging**.

AIR CONDITIONING (A/C) EVAPORATOR AND BLOWER MODULE ASSEMBLY REPLACEMENT

Removal Procedure

1. Drain the cooling system. Refer to **Cooling System Draining and Filling** .
2. Recover the refrigerant. Refer to **Refrigerant Recovery and Recharging**.
3. Disconnect the heater hoses from the heater core. Refer to **Heater Inlet Hose Replacement (1.0L LMT, 1.19L LC5, and 1.2L LMU)**, and **Heater Outlet Hose Replacement (1.0L LMT, 1.19L LC5, and 1.2L LMU)**.

4. Remove the instrument panel (I/P) tie bar. Refer to **Instrument Panel Tie Bar Replacement** .

Fig. 37: A/C Evaporator Hose Assembly Nut
Courtesy of GENERAL MOTORS COMPANY

5. Remove the A/C evaporator hose assembly nut (1).
6. Disconnect the A/C evaporator hose assembly (2) from the thermal expansion valve.

Fig. 38: HVAC Module Assembly And Dash Panel Bolts
Courtesy of GENERAL MOTORS COMPANY

7. Remove the HVAC module assembly to dash panel bolts (1).

Fig. 39: HVAC Module Assembly
Courtesy of GENERAL MOTORS COMPANY

8. Remove the HVAC module assembly (1).

Installation Procedure

Fig. 40: HVAC Module Assembly
Courtesy of GENERAL MOTORS COMPANY

1. Install the HVAC module assembly (1).

Fig. 41: HVAC Module Assembly And Dash Panel Bolts
Courtesy of GENERAL MOTORS COMPANY

CAUTION: Refer to Fastener Caution .

2. Install the HVAC module assembly to dash panel bolts (1) and tighten to 6 N.m (53 lb in).

Fig. 42: A/C Evaporator Hose Assembly Nut
Courtesy of GENERAL MOTORS COMPANY

3. Connect the A/C evaporator hose assembly (2) to the thermal expansion valve.
4. Install the A/C evaporator hose assembly nut (1) and tighten to 20 N.m (15 lb ft).
5. Install the I/P tie bar. Refer to **Instrument Panel Tie Bar Replacement** .
6. Connect the heater hoses to the heater core. Refer to **Heater Inlet Hose Replacement (1.0L LMT, 1.19L LC5, and 1.2L LMU)**, and **Heater Outlet Hose Replacement (1.0L LMT, 1.19L LC5, and 1.2L LMU)**.
7. Evacuate and charge the refrigerant system. Refer to **Refrigerant Recovery and Recharging**.
8. Fill the cooling system. Refer to **Cooling System Draining and Filling** .

AIR CONDITIONING EVAPORATOR CORE REPLACEMENT

Removal Procedure

1. Recover the refrigerant. Refer to **Refrigerant Recovery and Recharging**.
2. Remove the air conditioning (A/C) evaporator and blower module assembly. Refer to **Air Conditioning (A/C) Evaporator and Blower Module Assembly Replacement**.

Fig. 43: A/C Module Wiring Harness
Courtesy of GENERAL MOTORS COMPANY

3. Disconnect the electrical connectors.
4. Remove the A/C module wiring harness (1).
5. Remove the floor air outlet ducts. Refer to **Floor Air Outlet Duct Replacement - Left Side (Left Hand Drive)**, and **Floor Air Outlet Duct Replacement - Right Side**.
6. Remove the heater core. Refer to **Heater Core Replacement**.

Fig. 44: A/C Evaporator Tube Seal
Courtesy of GENERAL MOTORS COMPANY

7. Remove the A/C evaporator tube seal (1).

Fig. 45: Heater And A/C Evaporator Case Screws
Courtesy of GENERAL MOTORS COMPANY

8. Remove the heater and A/C evaporator case screws (1).
9. Remove the heater and A/C evaporator case (2) from A/C evaporator and blower module assembly (3).

Fig. 46: Evaporator Rear Cover And Screws
Courtesy of GENERAL MOTORS COMPANY

10. Remove the evaporator rear cover screws (1).
11. Remove the evaporator rear cover (2) from A/C evaporator and blower module assembly.
12. Remove the A/C evaporator core (3).

Installation Procedure

Fig. 47: Evaporator Rear Cover And Screws
Courtesy of GENERAL MOTORS COMPANY

1. Install the A/C evaporator core (3).
2. Install the evaporator rear cover (2) to A/C evaporator and blower module assembly.

CAUTION: Refer to Fastener Caution .

3. Install the evaporator rear cover screws (1) and tighten to 1.2 (11 lb in).

Fig. 48: Heater And A/C Evaporator Case Screws
Courtesy of GENERAL MOTORS COMPANY

4. Install the heater and A/C evaporator case (2) to A/C evaporator and blower module assembly (3).
5. Install the heater and A/C evaporator case screws (1) and tighten to 1.2 (11 lb in).

Fig. 49: A/C Evaporator Tube Seal
Courtesy of GENERAL MOTORS COMPANY

6. Install the A/C evaporator tube seal (1).
7. Install the heater core. Refer to **Heater Core Replacement**.
8. Install the floor air outlet ducts. Refer to **Floor Air Outlet Duct Replacement - Left Side (Left Hand Drive)**, and **Floor Air Outlet Duct Replacement - Right Side**.

Fig. 50: A/C Module Wiring Harness
Courtesy of GENERAL MOTORS COMPANY

9. Install the A/C module wiring harness (1).
10. Connect the electrical connectors.
11. Install the A/C evaporator and blower module assembly. Refer to **Air Conditioning (A/C) Evaporator and Blower Module Assembly Replacement**.
12. Evacuate and charge the refrigerant system. Refer to **Refrigerant Recovery and Recharging**.

HEATER INLET HOSE REPLACEMENT (1.0L LMT, 1.19L LC5, AND 1.2L LMU)

Fig. 51: Heater Inlet Hose

Courtesy of GENERAL MOTORS COMPANY

Heater Inlet Hose Replacement (1.0L LMT, 1.19L LC5, and 1.2L LMU)

Callout	Component Name
Preliminary Procedure	
Drain the cooling system. Refer to <u>Cooling System Draining and Filling</u> .	
1	Heater Inlet Clamp (Qty: 2)
2	Heater Inlet Hose

HEATER OUTLET HOSE REPLACEMENT (1.0L LMT, 1.19L LC5, AND 1.2L LMU)

Fig. 52: Heater Outlet Hose

Courtesy of GENERAL MOTORS COMPANY

Heater Outlet Hose Replacement (1.0L LMT, 1.19L LC5, and 1.2L LMU)

Callout	Component Name
Preliminary Procedures	
1. Drain the cooling system. Refer to <u>Cooling System Draining and Filling</u> .	
2. Remove the air cleaner assembly. Refer to <u>Air Cleaner Assembly Replacement</u> .	
1	Heater Outlet Clamp (Qty: 2)
2	Heater Outlet Hose

PASSENGER COMPARTMENT AIR FILTER REPLACEMENT (LEFT HAND DRIVE)

Removal Procedure

1. Remove the instrument panel (I/P) compartment. Refer to Instrument Panel Compartment Replacement .

Fig. 53: Passenger Compartment Air Filter Housing Cover
Courtesy of GENERAL MOTORS COMPANY

2. Remove the passenger compartment air filter housing cover (1).
3. Remove the passenger compartment air filter (2).

Installation Procedure

Fig. 54: Passenger Compartment Air Filter Housing Cover
Courtesy of GENERAL MOTORS COMPANY

1. Install the passenger compartment air filter (2).
2. Install the passenger compartment air filter housing cover (1).
3. Install the I/P compartment. Refer to **Instrument Panel Compartment Replacement** .

BLOWER MOTOR RESISTOR REPLACEMENT (LEFT HAND DRIVE)

Fig. 55: Blower Motor Resistor
 Courtesy of GENERAL MOTORS COMPANY

Blower Motor Resistor Replacement (Left Hand Drive)

Callout	Component Name
Preliminary Procedure Disconnect the battery negative cable. Refer to <u>Battery Negative Cable Disconnection and Connection</u> .	
1	Blower Motor Resistor Electrical Connector
2	Blower Motor Resistor Screw (Qty: 2) CAUTION: Refer to <u>Fastener Caution</u> . Tighten 1.2 N.m (11 lb in)
3	Blower Motor Resistor

BLOWER MOTOR REPLACEMENT

Fig. 56: Blower Motor

Courtesy of GENERAL MOTORS COMPANY

Blower Motor Replacement

Callout	Component Name
Preliminary Procedures 1. Disconnect the battery negative cable. Refer to <u>Battery Negative Cable Disconnection and Connection</u> . 2. Remove the inflatable restraint instrument panel lower module. Refer to <u>Instrument Panel Lower Airbag Replacement - Passenger Side</u> . 3. Disconnect the electrical connector.	
1	Blower Motor Screw (Qty: 3) CAUTION: Refer to <u>Fastener Caution</u> . Tighten 1.2 (11 lb in)
2	Blower Motor Procedure Disconnect the blower motor tube.

INSTRUMENT PANEL OUTER AIR OUTLET REPLACEMENT - LEFT SIDE

Fig. 57: Instrument Panel Outer Air Outlet
Courtesy of GENERAL MOTORS COMPANY

Instrument Panel Outer Air Outlet Replacement - Left Side

Callout	Component Name
1	Inner Air Outlet Nozzle TIP: Carefully use a flat-bladed screwdriver to remove the inner air outlet nozzle.
2	Air Outlet Cover
3	Outer Air Outlet Nozzle
4	Air Outlet Nozzle Housing TIP: Release the portion shown as the arrow with a flat-bladed screwdriver to remove the nozzle housing.

INSTRUMENT PANEL CENTER AIR OUTLET REPLACEMENT

Fig. 58: Instrument Panel Center Air Outlet
 Courtesy of GENERAL MOTORS COMPANY

Instrument Panel Center Air Outlet Replacement

Callout	Component Name
Preliminary Procedure Remove the instrument panel center molding. Refer to <u>Instrument Panel Center Molding Replacement</u> .	
1	Instrument Panel Center Air Outlet

INSTRUMENT PANEL OUTER AIR OUTLET REPLACEMENT - RIGHT SIDE

Fig. 59: Instrument Panel Outer Air Outlet
 Courtesy of GENERAL MOTORS COMPANY

Instrument Panel Outer Air Outlet Replacement - Right Side

Callout	Component Name
1	Inner Air Outlet Nozzle TIP: Carefully use a flat-bladed screwdriver to remove the inner air outlet nozzle.
2	Air Outlet Cover
3	Outer Air Outlet Nozzle
4	Air Outlet Nozzle Housing TIP: Release the portion shown as the arrow with a flat-bladed screwdriver to remove the nozzle housing.

INSTRUMENT PANEL OUTER AIR OUTLET DUCT REPLACEMENT

Fig. 60: Instrument Panel Outer Air Outlet Duct
 Courtesy of GENERAL MOTORS COMPANY

Instrument Panel Outer Air Outlet Duct Replacement

Callout	Component Name
Preliminary Procedure	
Remove the instrument panel (I/P) assembly. Refer to <u>Instrument Panel Assembly Replacement</u> .	
1	I/P Outer Air Outlet Duct Screw (Qty: 5) CAUTION: Refer to <u>Fastener Caution</u> . Tighten 1.3 N.m (12 lb in)
2	I/P Outer Air Outlet Duct

WINDSHIELD DEFROSTER NOZZLE REPLACEMENT

Fig. 61: Windshield Defroster Nozzle
 Courtesy of GENERAL MOTORS COMPANY

Windshield Defroster Nozzle Replacement

Callout	Component Name
Preliminary Procedure	
Remove the instrument panel (I/P) assembly. Refer to <u>Instrument Panel Assembly Replacement</u> .	
1	Windshield Defroster Nozzle Screw (Qty: 6) CAUTION: Refer to <u>Fastener Caution</u> . Tighten 1.3 N.m (12 lb in)
2	Windshield Defroster Nozzle

FLOOR AIR OUTLET DUCT REPLACEMENT - LEFT SIDE (LEFT HAND DRIVE)

Fig. 62: Floor Air Outlet Duct - Left Side (Left Hand Drive)
 Courtesy of GENERAL MOTORS COMPANY

Floor Air Outlet Duct Replacement - Left Side (Left Hand Drive)

Callout	Component Name
Preliminary Procedure 1. Remove the steering column opening filler. Refer to <u>Steering Column Opening Filler Replacement</u> . 2. Remove the radio. Refer to <u>Radio Replacement</u> .	
1	Left Floor Air Outlet Duct Screw (Qty: 1) CAUTION: Refer to <u>Fastener Caution</u> . Tighten 1.2 N.m (11 lb in)
2	Floor Air Outlet Duct - Left

FLOOR AIR OUTLET DUCT REPLACEMENT - RIGHT SIDE

Fig. 63: Floor Air Outlet Duct - Right Side
 Courtesy of GENERAL MOTORS COMPANY

Floor Air Outlet Duct Replacement - Right Side

Callout	Component Name
Preliminary Procedure Remove the inflatable restraint instrument panel lower module. Refer to <u>Instrument Panel Lower Airbag Replacement - Passenger Side</u> .	
1	Right Floor Air Outlet Duct Bolt (Qty: 2) CAUTION: Refer to <u>Fastener Caution</u> . Tighten 1.2 (11 lb in)
2	Floor Air Outlet Duct - Right

HEATER CORE REPLACEMENT

Removal Procedure

1. Remove the air conditioning (A/C) evaporator and blower module assembly. Refer to **Air Conditioning (A/C) Evaporator and Blower Module Assembly Replacement**.

Fig. 64: Heater Core Pipe Side Cover
Courtesy of GENERAL MOTORS COMPANY

2. Disconnect the evaporator air temperature sensor connector from the heater core pipe side cover.
3. Remove the heater core pipe side cover screws (1).
4. Remove the heater core pipe side cover (2).

Fig. 65: Heater Core Pipe Tube Seal

Courtesy of GENERAL MOTORS COMPANY

5. Remove the heater core pipe tube seal (1).
6. Remove the heater core pipe under cover screw (2).
7. Remove the heater core pipe under cover (3).

Fig. 66: Heater Core Cover Screws
Courtesy of GENERAL MOTORS COMPANY

8. Remove the heater core cover screws (1).
9. Remove the heater core cover (2).

Fig. 67: Heater Core

Courtesy of GENERAL MOTORS COMPANY

10. Remove the heater core (1) from the air conditioning evaporator and blower module assembly.

Installation Procedure

Fig. 68: Heater Core

Courtesy of GENERAL MOTORS COMPANY

1. Install the heater core (1) to the air conditioning evaporator and blower module assembly.

Fig. 69: Heater Core Cover Screws
Courtesy of GENERAL MOTORS COMPANY

2. Install the heater core cover (2).

CAUTION: Refer to Fastener Caution .

3. Install the heater core cover screws (1) and tighten to 1.2 (11 lb in).

Fig. 70: Heater Core Pipe Tube Seal
Courtesy of GENERAL MOTORS COMPANY

4. Install the heater core pipe under cover (3).
5. Install the heater core pipe under cover screw (2) and tighten to 1.2 (11 lb in).
6. Install the heater core pipe tube seal (1).

Fig. 71: Heater Core Pipe Side Cover
Courtesy of GENERAL MOTORS COMPANY

7. Install the heater core pipe side cover (2).
8. Install the heater core pipe side cover screws (1) and tighten to 1.2 (11 lb in).
9. Connect the evaporator air temperature sensor connector to the heater core pipe side cover.
10. Install the air conditioning evaporator and blower module assembly. Refer to **Air Conditioning (A/C) Evaporator and Blower Module Assembly Replacement**.

DESCRIPTION AND OPERATION

HEATING AND AIR CONDITIONING SYSTEM DESCRIPTION AND OPERATION

Engine Coolant

Engine coolant is the key element of the heating system. The thermostat controls engine operating coolant temperature. The thermostat also creates a restriction for the cooling system that promotes a positive coolant flow and helps prevent cavitation. Coolant enters the heater core through the inlet heater hose, in a pressurized state.

The heater core is located inside the HVAC module. The heat of the coolant flowing through the heater core is absorbed by the ambient air drawn through the HVAC module. Heated air is distributed to the passenger

compartment, through the HVAC module, for passenger comfort.

The amount of heat delivered to the passenger compartment is controlled by opening or closing the HVAC module air temperature door. The coolant exits the heater core through the return heater hose and recirculated back through the engine cooling system.

A/C Cycle

Refrigerant is the key element in an air conditioning system. R-134a is presently the only EPA approved refrigerant for automotive use. R-134a is an very low temperature gas that can transfer the undesirable heat and moisture from the passenger compartment to the outside air.

The A/C compressor is belt driven and operates when the magnetic clutch is engaged. The compressor builds pressure on the vapor refrigerant. Compressing the refrigerant also adds heat to the refrigerant. The refrigerant is discharged from the compressor, through the discharge hose, and forced to flow to the condenser and then through the balance of the A/C system. The A/C system is mechanically protected with the use of a high pressure relief valve. If the high pressure switch were to fail or if the refrigerant system becomes restricted and refrigerant pressure continued to rise, the high pressure relief will pop open and release refrigerant from the system.

Compressed refrigerant enters the condenser in a high temperature, high pressure vapor state. As the refrigerant flows through the condenser, the heat of the refrigerant is transferred to the ambient air passing through the condenser. Cooling the refrigerant causes the refrigerant to condense and change from a vapor to a liquid state.

The condenser is located in front of the radiator for maximum heat transfer. The condenser is made of aluminum and aluminum cooling fins, which allows rapid heat transfer for the refrigerant. The semi-cooled liquid refrigerant exits the condenser and flows through the liquid line, to the thermal expansion valve.

The thermal expansion valve is located in the liquid line between the condenser and the evaporator. The thermal expansion valve is the dividing point for the high and the low pressure sides of the A/C system. As the refrigerant passes through the thermal expansion valve, the pressure of the refrigerant is lowered. Due to the pressure differential of the liquid refrigerant, the refrigerant will begin to vaporize at the thermal expansion valve. The thermal expansion valve also meters the amount of liquid refrigerant that can flow into the evaporator.

Refrigerant exiting the thermal expansion valve flows into the evaporator core in a low pressure, liquid state. Ambient air is drawn through the HVAC module and passes through the evaporator core. Warm and moist air will cause the liquid refrigerant boil inside of the evaporator core. The boiling refrigerant absorbs heat from the ambient air and draws moisture onto the evaporator. The refrigerant exits the evaporator back through the thermal expansion valve and into the suction line and back to the compressor, in a vapor state completing the A/C cycle of heat removal. At the compressor, the refrigerant is compressed again and the cycle of heat removal is repeated.

The conditioned air is distributed through the HVAC module for passenger comfort. The heat and moisture removed from the passenger compartment will also change form, or condense, and is discharged from the HVAC module as water under the vehicle.

DIAGNOSTIC INFORMATION AND PROCEDURES

DIAGNOSTIC CODE INDEX

DIAGNOSTIC CODE INDEX

DTC	Description
<u>DTC B2750</u>	DTC B2750 Horn Relay Secondary Circuit

DTC B2750: HORN RELAY

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

DTC Descriptors

DTC B2750

Horn Relay Secondary Circuit

For symptom byte information refer to: **Symptom Byte List**

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Control	B2750 02	B2750 04	B2750 01	-

Circuit/System Description

The Body Control Module provides a ground for the Horn printed circuit board relay within the underhood fuse block. The underhood fuse block will then provide B+ voltage to the horn control circuit, sounding the horn.

Conditions for Running the DTC

When the horn output is actively being requested by the Body Control Module.

Conditions for Setting the DTC

B2750 01

The Body Control Module detects a short to voltage in the horn relay control circuit.

B2750 02

The Body Control Module detects a short to ground in the horn relay control circuit.

B2750 04

The Body Control Module detects an open/high resistance in the horn relay control circuit.

Action Taken When the DTC Sets

The Body Control Module will command the horn when requested but the horn will be inoperative.

Conditions for Clearing the DTC

- The DTC clears when the fault is no longer detected.
- The current DTC will become history when the request for the output is removed.
- The history DTC will clear after 50 consecutive fault-free ignition cycles have occurred.

Description and Operation

Horns System Description and Operation

Electrical Information Reference

- **Circuit Testing**
- **Connector Repairs**
- **Testing for Intermittent Conditions and Poor Connections**
- **Wiring Repairs**

Scan Tool Reference

Control Module References for scan tool information

Circuit/System Verification

1. Ignition ON.
2. Verify the operation of the P12 Horn when commanding the Horn Relay On and Off with a scan tool.
 - **If the P12 Horn is always ON or always OFF**

Refer to Circuit/System Testing.

- **If the P12 Horn turns ON and OFF**

3. All OK.

Circuit/System Testing

1. Ignition OFF, disconnect the X1 harness connector at the X50A Fuse Block-Underhood, ignition ON.
2. Verify the P12 Horn is not activated.
 - **If the P12 Horn is activated**
 1. Ignition OFF, disconnect the harness connector at the P12 Horn, ignition ON.
 2. Test for less than 1 V between the control circuit terminal 2 and ground.
 - If 1 V or greater, repair the short to voltage on the circuit.
 - If less than 1 V, test or replace the P12 Horn.
 - **If the P12 Horn is not activated**
3. Connect a 15A fused jumper wire between the control circuit terminal 9 and B+.
4. Verify the P12 Horn activates.
 - **If the P12 Horn does not activate**
 1. Ignition OFF, remove the jumper wire, disconnect the harness connector at the P12 Horn, ignition ON.
 2. Test for infinite resistance between the control circuit and ground.
 - If less than Infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance
 3. Test for less than 2 ohms in the control circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, test or replace the P12 Horn.
 - **If the P12 Horn activates**
5. Ignition OFF, connect the X1 harness connector at the X50A Fuse Block-Underhood. Disconnect the X5 harness connector at the K9 Body Control Module, ignition ON.
6. Verify the P12 Horn is not activated.
 - **If the P12 Horn is activated**
 1. Ignition OFF, disconnect the X2 harness connector at the X50A Fuse Block-Underhood.
 2. Test for infinite resistance between the control circuit terminal 19 X5 at the K9 Body Control Module and ground.
 - If less than Infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance, test or replace the X50A Fuse Block-Underhood.
 - **If the P12 Horn is not activated**
7. Connect a 3 A fused jumper wire between the control circuit terminal 19 and ground.
8. Verify the P12 Horn activates.
 - **If the P12 Horn does not activate**

1. Ignition OFF, remove the jumper wire, disconnect the X2 harness connector at the X50A Fuse Block-Underhood, ignition ON.
2. Test for less than 1 V between the control circuit terminal 19 X5 at the K9 Body Control Module and ground.
 - If 1 V or greater, repair the short to voltage on the circuit.
 - If less than 1 V
3. Test for less than 2 ohms in the control circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, test or replace the X50A Fuse Block-Underhood.
 - **If the P12 Horn activates**
9. Replace the K9 Body Control Module.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

- **Fuse Block Replacement**
- **Control Module References** for Body Control Module replacement, programming and setup

SYMPTOMS - HORNS

IMPORTANT: The following steps must be completed before using the symptom tables:

1. Perform **Diagnostic System Check - Vehicle** , before using the symptom tables in order to verify that all of the following are true:
 - There are no DTCs set
 - The control modules can communicate via the serial data link
2. Review the system operation in order to familiarize yourself with the system functions. Refer to **Horns System Description and Operation**.

Visual/Physical Inspection

- Inspect for aftermarket devices which could affect the operation of the horn system. Refer to **Checking Aftermarket Accessories** .
- Inspect the easily accessible or visible system components for obvious damage or conditions which could cause the symptom.
- Perform the following if a horn buzzes or has a harsh tone.
 - Inspect for debris in the joint where the horn fastens to the vehicle.
 - Test the torque of the horn mounting hardware. The horn mounting hardware should be tightened to a torque of 10 N.m (7 lb ft).

Intermittent

Faulty electrical connections or wiring may be the cause of intermittent conditions. Refer to **Testing for Intermittent Conditions and Poor Connections** .

Symptom List

Refer to a symptom diagnostic procedure **Horns Malfunction** in order to diagnose the symptom.

HORNS MALFUNCTION

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Horn Switch Signal	1	2	2	-
Horn Relay Control	B2750 02	B2750 04	B2750 01	-
Horn Control	2	2	1	-
Horn Ground	-	2	-	-
1. Horn Always On 2. Horn Inoperative				

Circuit/System Description

The body control module monitors the horn switch signal circuit, when the horn pad is pressed, the BCM detects the drop in the horn switch signal circuit and provides a ground for the horn PCB relay within the underhood fuse block. The underhood fuse block will then provide B+ voltage to the horn control circuit, sounding the horns

Diagnostic Aids

A short to ground in the horn relay control circuit or a short to voltage in the horn control circuit will cause the horns to sound continuously until the horns overheat and become inoperative.

Rotate the steering wheel while pressing the horn pad to identify intermittent and poor connections within the steering column.

If diagnosing a Horn- Poor Tone condition, inspect the following:

- Debris or water in the horn assembly
- Proper horn mounting hardware torque-Refer to **Fastener Tightening Specifications**.
- Debris in the joint where the horns attach to the vehicle

- Debris in direct contact with the horn
- Vehicle components vibrating while the horn is sounding

Scan Tool Reference

Control Module References for scan tool information

Circuit/System Verification

1. Ignition ON.
2. Verify the scan tool Horn Switch parameter changes between Active and Inactive when pressing and releasing the horn pad.
 - **If the parameter does not change**

Refer to Circuit/System Testing - Horn Switch Malfunction.
 - **If the parameter changes**
3. Verify the P12 Horn turns ON and OFF and emit a clear and even tone when commanding the Horn Relay On and Off with a scan tool.
 - **If the P12 Horn does not turn ON and OFF**

Refer to Circuit/System Testing - Horns or Horn Command Malfunction.
 - **If the sound emitted is not clear and even**

Refer to Circuit/System Testing - Horn - Poor Tone.

- If the P12 Horn turns ON and OFF and emit a even and clear tone

4. All OK.

Circuit/System Testing

Horn Switch Malfunction

NOTE: Refer to SIR Service Precautions .

1. Ignition OFF, disconnect the X1 harness connector at the X85 Steering Wheel Air Bag Coil. Ignition ON
2. Verify the scan tool Horn Switch parameter is Inactive.
 - **If not Inactive**
 1. Ignition OFF, disconnect the harness connector at the K9 Body Control Module.
 2. Test for infinite resistance between the signal circuit terminal 1 and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance, replace the K9 Body Control Module.
 - **If Inactive**
3. Install a 3 A fused jumper wire between the signal circuit terminal 1 and ground.
4. Verify the scan tool Horn Switch parameter is Active.
 - **If not Active**
 1. Ignition OFF, remove the 3 A fused jumper wire, disconnect the harness connector at the K9 Body Control Module, ignition ON.
 2. Test for less than 1 V between the signal circuit and ground.
 - If 1 V or greater, repair the short to voltage on the circuit.
 - If less than 1 V
 3. Test for less than 2 ohms in the signal circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, replace the K9 Body Control Module.
 - **If Active**
5. Test or replace the S33 Horn Switch.

Horns or Horn Command Malfunction

1. Ignition OFF and all vehicle systems OFF. Disconnect the harness connector at the P12 Horn. It may take up to 2 minutes for all vehicle systems to power down.
2. Test for less than 1 ohms between the ground circuit terminal 1 and ground.
 - **If 1 ohms or greater**
 1. Ignition OFF.
 2. Test for less than 2 ohms in the ground circuit end to end.

- If 2 ohms or greater, repair the open/high resistance in the circuit.
- If less than 2 ohms, repair the open/high resistance in the ground connection.

- **If less than 1 ohms**

3. Connect a test lamp between the control circuit terminal 2 and ground, Ignition ON.
4. Verify the test lamp does not turn ON and OFF when commanding the Horn Relay On and Off with a scan tool.
 - **If the test lamp turns ON and OFF**

Test or replace the P12 Horn.

- **If the test lamp does not turn ON and OFF**

5. Ignition OFF, connect the harness connector at the P12 Horn. Disconnect the X1 harness connector at the X50A Fuse Block-Underhood, Ignition ON.
6. Verify the P12 Horn is not activated.

- **If the P12 Horn is activated**

1. Ignition OFF, disconnect the harness connector at the P12 Horn, Ignition ON.
2. Test for less than 1 V between the control circuit terminal 2 and ground.
 - If 1 V or greater, repair the short to voltage on the circuit.
 - If less than 1 V, test or replace the P12 Horn.

- **If the P12 Horn is not activated**

7. Connect a 15 A fused jumper wire between the control circuit terminal 9 and B+.
8. Verify the P12 Horn activates.

- **If the P12 Horn does not activate**

1. Ignition OFF, remove the jumper wire, disconnect the harness connector at the P12 Horn, Ignition ON.
2. Test for infinite resistance between the control circuit and ground.
 - If less than Infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance
3. Test for less than 2 ohms in the control circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, test or replace the P12 Horn.

- **If the P12 Horn activates**

9. Ignition OFF, connect the X1 harness connector at the X50A Fuse Block-Underhood. Disconnect the X5 harness connector at the K9 Body Control Module, Ignition ON.
10. Verify the P12 Horn is not activated.
 - **If the P12 Horn is activated**
 1. Ignition OFF, disconnect the X2 harness connector at the X50A Fuse Block-Underhood.
 2. Test for infinite resistance between the K9 Body Control Module control circuit terminal 19 X5 and ground.

- If less than Infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance, replace the X50A Fuse Block-Underhood.
- **If the P12 Horn is not activated**
- 11. Connect a 3 A fused jumper wire between the control circuit terminal 19 and ground.
- 12. Verify the P12 Horn activates.
 - **If the P12 Horn does not activate**
 1. Ignition OFF, remove the jumper wire, disconnect the X2 harness connector at the X50A Fuse Block-Underhood, Ignition ON.
 2. Test for less than 1 V between the K9 Body Control Module control circuit terminal 19 X5 and ground.
 - If 1 V or greater, repair the short to voltage on the circuit.
 - If less than 1 V
 3. Test for less than 2 ohms in the control circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, replace the X50A Fuse Block-Underhood.
 - **If the P12 Horn activates**
- 13. Replace the K9 Body Control Module.

Horn - Poor Tone

1. Ignition OFF and all vehicle systems OFF, disconnect the harness connector at the P12 Horn. It may take up to 2 minutes for all vehicle systems to power down.
2. Test for less than 10 ohms between the ground circuit terminal 1 and ground.
 - **If 10 ohms or greater**
 1. Ignition OFF.
 2. Test for less than 2 ohms in the ground circuit end to end.
 - If 2 ohms or greater, repair the high resistance in the circuit.
 - If less than 2 ohms, repair high resistance in the ground connection.
 - **If less than 10 ohms**
3. Ignition OFF, disconnect the X1 harness connector at the X50A Fuse Block-Underhood.
4. Test for less than 2 ohms between the P12 Horn control circuit terminal 2 and the X50A Fuse Block-Underhood control circuit terminal 9 X1.
 - **If 2 ohms or greater**

Repair the high resistance in the control circuit.
 - **If less than 2 ohms**
5. Test or replace the P12 Horn.

Component Testing

Horn Test

1. Ignition OFF, disconnect the harness connector at the P12 Horn.
2. Install a 15 A fused jumper wire between the control terminal 2 and 12 V. Install a jumper wire between the ground terminal 1 and ground.
3. Verify the P12 Horn turns ON and OFF
 - **If the P12 Horn does not turn ON and OFF**

Replace the P12 Horn.

- **If the P12 Horn turns ON and OFF**
4. All OK

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

- **Fuse Block Replacement**
- **Horn Replacement**
- **Steering Wheel Horn Contact Replacement**
- **Control Module References** for body control module replacement, programming and setup

REPAIR INSTRUCTIONS

HORN REPLACEMENT

Fig. 2: Horn Bolt

Courtesy of GENERAL MOTORS COMPANY

Horn Replacement

Callout	Component Name
Preliminary Procedure 1. Remove the tire and wheel. Refer to <u>Tire and Wheel Removal and Installation</u> . 2. Remove the front wheel house liner. Refer to <u>Front Wheelhouse Liner Replacement</u> . 3. Remove the air cleaner resonator assembly. Refer to <u>Air Cleaner Resonator Replacement</u> .	
1	Horn Bolt (Qty: 1) CAUTION: Refer to <u>Fastener Caution</u> . Tighten 21 N.m (16 lb ft)
2	Horn TIP: Disconnect electrical connectors.

STEERING WHEEL HORN CONTACT REPLACEMENT

Fig. 3: Steering Wheel Horn Contact
 Courtesy of GENERAL MOTORS COMPANY

Steering Wheel Horn Contact Replacement

Callout	Component Name
Preliminary Procedure Remove inflatable restraint steering wheel module. Refer to <u>Airbag Steering Wheel Module Replacement</u> .	
1	Steering Wheel Horn Contact Bolt (Qty: 4) CAUTION: Refer to <u>Fastener Caution</u> . Tighten 5.5 N.m (49 lb in)
2	Steering Wheel Horn Contact TIP: Disconnect the electrical connector.

DESCRIPTION AND OPERATION

HORNS SYSTEM DESCRIPTION AND OPERATION

System Description

The horn system consists of the following components:

- HORN fuse
- Underhood fuse block (contains PCB horn relay)
- Horn switch
- Horn
- Body control module (BCM)

14 Horns Block Diagram

Fig. 4: Horns System Description

DA	Serial Data
DA	Serial Data
HW	Hard-Wired
HW	Hard-Wired
K84	K84 Keyless Entry Control Module
S33	S33 Horn Switch
K73	K73 Telematics Communication Interface Control Module
K9	K9 Body Control Module

X50A	X50A Fuse Block - Underhood
P12	P12 Horn

System Operation

The vehicle horn system is activated under the following conditions:

- When the horn switch is depressed
- The BCM commands the horns ON under any of the following conditions:
 - When the content theft deterrent system detects a vehicle intrusion-For further information refer to **Theft Systems Description and Operation** .
 - When the panic button is depressed on the remote control door lock transmitter-For further information refer to **Keyless Entry System Description and Operation** .
 - When the keyless entry system is used to lock the vehicle, a horn chirp may sound to notify the driver that the vehicle has been locked. The notification feature may be enabled or disabled through personalization. For further information refer to **Keyless Entry System Description and Operation** .

When the OnStar® system is used to sound the horns if equipped-For further information, refer to **OnStar Description and Operation** .

Circuit Operation

Battery positive voltage is applied at all times to the horn relay coil and the horn relay switch. Pressing either of the horn switches applies ground to the horn relay control circuit. The BCM may also apply ground to the horn relay control circuit as described above. When the horn relay control circuit is grounded, the horn relay is energized and battery positive voltage is applied to the horns through the horn control circuit. The horns sound as long as ground is applied to the horn relay control circuit.

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.

- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

DTC Descriptor

DTC B3933 02

Air Conditioning Evaporator Temperature Sensor Circuit Short to Ground

DTC B3933 05

Air Conditioning Evaporator Temperature Sensor Circuit High Voltage/Open

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Signal	B3933 02, 2	B3933 05, 1	B3933 05, 1	-
Low Reference	-	B3933 05, 1	-	-
1. The A/C compressor does not turn ON. 2. The A/C compressor is always ON, does not cycle ON and OFF.				

Circuit/System Description

The temperature sensor is a 2-wire negative temperature coefficient thermistor. The body control module provides a signal circuit and low reference circuit to the sensor. As the air temperature surrounding the sensor increases, the sensor resistance decreases. The sensor signal voltage decreases as the resistance decreases. The sensor operates within a temperature range between -40 to 85°C (-40 to 185°F).

Conditions for Running the DTC

- Ignition ON.
- The HVAC control module is ON.

Conditions for Setting the DTC

The body control module detects the sensor signal voltage is less than 0.1 V or greater than 4.9 V for more than 50 ms.

Action Taken When the DTC Sets

The A/C compressor is disabled if the last test is not passed.

Conditions for Clearing the DTC

The sensor signal is within specified range between 0.1-4.9 V.

Scan Tool Reference

Control Module References for scan tool information

Circuit/System Verification

1. Ignition ON.
2. Verify the scan tool A/C Evaporator Temperature Sensor parameter is within 5°C (9°F) of ambient temperature
 - **If not within 5°C (9°F) of ambient temperature**

Refer to Circuit/System Testing.
 - **If within 5°C (9°F) of ambient temperature**
3. All OK.

Circuit/System Testing

1. Ignition OFF and all vehicle systems OFF, disconnect the harness connector at the B39 A/C Evaporator Temperature Sensor. It may take up to 2 min for all vehicle systems to power down.
2. Test for less than 10 ohms between the low reference circuit terminal B and ground.
 - **If 10 ohms or greater**
 1. Ignition OFF, disconnect the harness connector at the K9 Body Control Module.
 2. Test for less than 2 ohms in the low reference circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.

- If less than 2 ohms, replace the K9 Body Control Module.
 - **If less than 10 ohms**
- 3. Ignition ON.
- 4. Verify the scan tool BCM A/C Evaporator Temperature Sensor parameter is greater than 4.9 V.
 - **If 4.9 V or less**
 1. Ignition OFF, disconnect the harness connector at the K9 Body Control Module.
 2. Test for infinite resistance between the signal circuit terminal A and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance, replace the K9 Body Control Module.
 - **If greater than 4.9 V**
- 5. Install a 3 A fused jumper wire between the signal circuit terminal A and the low reference circuit terminal B.
- 6. Verify the scan tool A/C Evaporator Temperature Sensor is less than 0.1 V.
 - **If 0.1 V or greater**
 1. Ignition OFF, remove the jumper wire and disconnect the harness connector at the K9 Body Control Module, ignition ON.
 2. Test for less than 1 V between the signal circuit and ground.
 - If 1 V or greater, repair the short to voltage on the circuit.
 - If less than 1 V
 3. Ignition OFF.
 4. Test for less than 2 ohms in the signal circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, replace the K9 Body Control Module.
 - **If less than 0.1 V**
- 7. Test or replace the B39 A/C Evaporator Temperature Sensor.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

- **HVAC Component Replacement Reference**
- **Control Module References** for K9 Body Control Module replacement, programming and setup

DTC B393D: AIR CONDITIONING INDICATOR CIRCUIT

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

DTC Descriptor

DTC B393D 02

Air Conditioning Indicator Circuit Short To Ground

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Control	B393D 02	1	2	-
1. A/C Indicator always OFF 2. A/C Indicator always ON				

Circuit/System Description

When the body control module receives a command to activate the air conditioning system, it applies B+ to the A/C indicator control circuit causing the indicator to illuminate.

Conditions for Running the DTC

- Ignition ON
- A/C system ON

Conditions for Setting the DTC

The body control module detects a short to ground on the A/C indicator control circuit.

Action Taken When the DTC Sets

The air conditioning ON indicator will be inoperative

Conditions for Clearing the DTC

- When the fault is no longer present, the DTC will be a history DTC.
- The history DTC will clear after 50 fault-free ignition cycles occurred.

Circuit/System Verification

1. Ignition ON.
2. Verify the air conditioning indicator turns ON and OFF when commanding the BCM A/C Indicator On and Off with a scan tool.
 - **If the air conditioning indicator does not turn ON or OFF**

Refer to Circuit/System Testing

- **If the air conditioning indicator turns ON and OFF**
3. All OK.

Circuit/System Testing

1. Ignition OFF, disconnect the X1 harness connector at the K33 HVAC Control Module, ignition ON.
2. Connect a test lamp between the control circuit terminal 5 and ground.
3. Verify the test lamp turns ON and OFF when commanding the A/C Indicator On and Off with a scan tool.
 - **If the test lamp is always OFF**
 1. Ignition OFF, remove the test lamp and disconnect the X1 harness connector at the K9 Body Control Module.
 2. Test for infinite resistance between the control circuit and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance
 3. Test for less than 2 ohms in the control circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, replace the K9 Body Control Module.
 - **If the test lamp is always ON**
 1. Ignition OFF, remove the test lamp and disconnect the X1 harness connector at the K9 Body

Control Module, ignition ON.

2. Test for less than 1 V between the control circuit and ground.

- If 1 V or greater, repair the short to voltage on the circuit.
- If less than 1 V, replace the K9 Body Control Module.

○ **If the test lamp turns ON and OFF**

4. Replace the K33 HVAC Control Module.

5. Ignition ON.

6. Verify the air conditioning indicator turns ON and OFF when commanding the BCM A/C Indicator On and Off with a scan tool.

○ **If the air conditioning indicator does not turn ON or OFF**

Replace the K9 Body Control Module.

○ **If the air conditioning indicator turns ON and OFF**

7. All OK.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

DTC P0532 OR P0533: AIR CONDITIONING (A/C) REFRIGERANT PRESSURE SENSOR

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of the diagnostic category.

DTC Descriptors

DTC P0532

Air Conditioning (A/C) Refrigerant Pressure Sensor Circuit Low Voltage

DTC P0533

Air Conditioning (A/C) Refrigerant Pressure Sensor Circuit High Voltage

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
---------	-----------------	----------------------	------------------	--------------------

5 V Reference	P0532, P0641	P0532	P0533	-
Signal	P0532	P0532	P0533	-
Low Reference	-	P0533	-	-

Circuit/System Description

The engine control module (ECM) monitors the high side refrigerant pressure through the A/C refrigerant pressure sensor. The ECM supplies a 5 V reference and a low reference to the sensor. Changes in the A/C refrigerant pressure cause the sensor signal to the ECM to vary. When the pressure is high, the signal voltage is high. When the pressure is low, the signal voltage is low. The ECM may use this information to turn the cooling fans on as well as to monitor clutch engagement. The HVAC module will receive the A/C refrigerant pressure information from the ECM via serial data.

Conditions for Running the DTC

- Engine is running.
- Any of the conditions for setting the DTC are met for 15 s.
- Battery voltage is between 11-18 V.

Conditions for Setting the DTC

P0532

The ECM detects that the A/C pressure is less than 1 psi (0.25 V).

P0533

The ECM detects that the A/C pressure is more than 428 psi (4.92 V).

Action Taken When the DTC Sets

- The A/C compressor is disabled.
- The ECM will illuminate the malfunction indicator lamp (MIL).

Conditions for Clearing the DTC

The condition for setting the DTC is no longer present.

Diagnostic Aids

A malfunction within the refrigerant system causing high pressure can cause this DTC to set.

Circuit/System Verification

1. Ignition ON
2. Verify the scan tool ECM A/C High Side Pressure Sensor parameter is between 6.8 kPa (1 psi) and 2950 kPa (428 psi).
 - **If not between 6.8 kPa (1 psi) and 2950 kPa (428 psi)**

Refer to Circuit/System Testing

- **If between 6.8 kPa (1 psi) and 2950 kPa (428 psi)**
3. All OK

Circuit/System Testing

1. Ignition OFF and all vehicle systems OFF, disconnect the harness connector at the B1 A/C Refrigerant Pressure Sensor. It may take up to 2 min for all vehicle systems to power down.
2. Test for less than 10 ohms between the low reference circuit terminal 1 and ground.
 - **If 10 ohms or greater**
 1. Ignition OFF, disconnect the harness connector at the K20 Engine Control Module.
 2. Test for less than 2 ohms in the low reference circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.

- If less than 2 ohms, replace the K20 Engine Control Module.
 - **If less than 10 ohms**
- 3. Ignition ON.
- 4. Test for 4.8-5.2 V between the 5 V reference circuit terminal 2 and ground.
 - **If less than 4.8 V**
 - 1. Ignition OFF, disconnect the harness connector at the K20 Engine Control Module.
 - 2. Test for infinite resistance between the 5 V reference circuit and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance
 - 3. Test for less than 2 ohms in the 5 V reference circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, replace the K20 Engine Control Module.
 - **If greater than 5.2 V**
 - 1. Ignition OFF, disconnect the harness connector at the K20 Engine Control Module, ignition ON.
 - 2. Test for less than 1 V between the 5 V reference circuit and ground.
 - If 1 V or greater, repair the short to voltage on the circuit.
 - If less than 1 V, replace the K20 Engine Control Module.
 - **If between 4.8-5.2 V**
- 5. Verify the scan tool ECM A/C High Side Pressure Sensor parameter is less than .25 V.
 - **If .25 V or greater**
 - 1. Ignition OFF, disconnect the harness connector at the K20 Engine Control Module, ignition ON.
 - 2. Test for less than 1 V between the signal circuit terminal 3 and ground.
 - If 1 V or greater, repair the short to voltage on the circuit.
 - If less than 1 V, replace the K20 Engine Control Module.
 - **If less than .25 V**
- 6. Install a 3 A fused jumper wire between the signal circuit terminal 3 and the 5 V reference circuit terminal 2.
- 7. Verify the scan tool ECM A/C High Side Pressure Sensor parameter is greater than 4.8 V.
 - **If 4.8 V or less**
 - 1. Ignition OFF, remove the jumper wire, disconnect the harness connector at the K20 Engine Control Module.
 - 2. Test for infinite resistance between the signal circuit terminal 3 and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance
 - 3. Test for less than 2 ohms in the signal circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, replace the K20 Engine Control Module.
 - **If greater than 4.8 V**

8. Test or replace the B1 A/C Refrigerant Pressure Sensor.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

Relay Coil Control	P0646	P0645	P0647	-
Relay Switch Control	1	1	1	-
Ground	-	1	-	-
1. A/C Compressor Malfunction				

Circuit/System Description

When the ECM receives an A/C request signal from the body control module via serial data, and system conditions are such that A/C operation is allowed, the ECM will apply ground through the A/C compressor

clutch relay control circuit, energizing the A/C compressor clutch relay. With the relay energized, battery voltage is applied through the control circuit to the A/C compressor clutch assembly, engaging the A/C compressor.

Conditions for Running the DTC

- The ignition voltage is between 11-18 volts.
- The engine speed is greater than 600 RPM.
- An A/C request is made.

Conditions for Setting the DTC

P0645

The ECM detects an open on the A/C compressor clutch relay control circuit.

P0646

The ECM detects a short to ground on the A/C compressor clutch relay control circuit.

P0647

The ECM detects a short to voltage at the A/C compressor clutch relay control circuit.

Action Taken When the DTC Sets

The A/C compressor is inoperative.

Conditions for Clearing the DTC

The condition for setting the DTC is no longer present.

Circuit/System Testing

1. Ignition OFF and all vehicle systems OFF, disconnect the harness connector at the Q2 A/C Compressor Clutch. It may take up to 2 min for all vehicle systems to power down.
2. Test for less than 10 ohms between the Q2 A/C Compressor Clutch ground circuit terminal A and ground.
 - **If 10 ohms or greater**
 1. Ignition OFF.
 2. Test for less than 2 ohms in the ground circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, repair the open/high resistance in the ground connection.
 - **If less than 10 ohms**
3. Connect a test lamp between the control circuit terminal B and ground, ignition ON.
4. Verify the test lamp does not turn ON and OFF when commanding the Q2 A/C Compressor Clutch On and Off with a scan tool.
 - **If the test lamp turns ON and OFF**

Test or replace the Q2 A/C Compressor Clutch.

- **If the test lamp does not turn ON and OFF**
5. Ignition OFF, connect the harness connector at the Q2 A/C Compressor Clutch and disconnect the X3 harness connector at the X50A Fuse Block - Underhood, ignition ON.
 6. Verify the Q2 A/C Compressor Clutch is not activated.
 - **If the Q2 A/C Compressor Clutch is activated**
 1. Ignition OFF, disconnect the harness connector at the Q2 A/C Compressor Clutch, ignition ON.
 2. Test for less than 1 V between the control circuit terminal B and ground.
 - If 1 V or greater, repair the short to voltage on the circuit.
 - If less than 1 V, test or replace the Q2 A/C Compressor Clutch.
 - **If the Q2 A/C Compressor Clutch is not activated**

7. Connect a 10 A fused jumper wire between the control circuit terminal 16 and B+.
8. Verify the Q2 A/C Compressor Clutch activates.
 - **If the Q2 A/C Compressor Clutch does not activate**
 1. Ignition OFF, remove the jumper wire and disconnect the harness connector at the Q2 A/C Compressor Clutch, ignition ON.
 2. Test for infinite resistance between the control circuit and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance
 3. Test for less than 2 ohms in the control circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, test or replace the Q2 A/C Compressor Clutch.
 - **If the Q2 A/C Compressor Clutch activates**
9. Ignition OFF, connect the X3 harness connector at the X50A Fuse Block - Underhood and disconnect the harness connector at the K20 Engine Control Module, ignition ON.
10. Verify the Q2 A/C Compressor Clutch is not activated.
 - **If the Q2 A/C Compressor Clutch is activated**
 1. Ignition OFF, disconnect the X3 harness connector at the X50A Fuse Block - Underhood.
 2. Test for infinite resistance between the X3 X50A Fuse Block - Underhood control circuit terminal 22 and ground.
 - If less than Infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance, test or replace the X50A Fuse Block - Underhood.
 - **If the Q2 A/C Compressor Clutch is not activated**
11. Connect a 3 A fused jumper wire between the K20 Engine Control Module control circuit terminal for the KR29 A/C Compressor Clutch Relay and ground.
12. Verify the Q2 A/C Compressor Clutch activates.
 - **If the Q2 A/C Compressor Clutch does not activate**
 1. Ignition OFF, remove the jumper wire, disconnect the X3 harness connector at the X50A Fuse Block - Underhood, ignition ON.
 2. Test for less than 1 V between the X3 X50A Fuse Block - Underhood control circuit terminal 22 and ground.
 - If 1 V or greater, repair the short to voltage on the circuit.
 - If less than 1 V
 3. Test for less than 2 ohms in the control circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, test or replace the X50A Fuse Block - Underhood.
 - **If the Q2 A/C Compressor Clutch activates**
13. Replace the K20 Engine Control Module.

Component Testing

Compressor Clutch Test

1. Ignition OFF, disconnect the Q2 A/C Compressor Clutch.
2. Test for 3.9 - 4.3 ohms between terminal A and terminal B.

- **If not between 3.9 - 4.3 ohms**

Replace the Q2 A/C Compressor Clutch.

- **If between 3.9 - 4.3 ohms**

3. Test for infinite resistance between terminal A and ground.

- **If less than infinite resistance**

Replace the Q2 A/C Compressor Clutch.

- **If infinite resistance**

4. All OK.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

- **HVAC Component Replacement Reference**
- **Control Module References** for engine control module replacement, programming and setup

SYMPTOMS - HVAC SYSTEMS - MANUAL

NOTE: **The following steps must be completed before using the symptom tables:**

1. Perform the **Diagnostic System Check - Vehicle** before using the HVAC System Malfunction procedure in order to verify that all of the following are true:
 - There are no DTCs set.
 - The control modules can communicate via the serial data link.
2. Review the system operation in order to familiarize yourself with the system functions. Refer to **Manual HVAC Description and Operation**.

Visual/Physical Inspection

- Inspect for aftermarket devices which may affect the operation of the HVAC System. Refer to **Checking Aftermarket Accessories**.
- Inspect the easily accessible or visible system components for obvious damage or conditions which may cause the symptom.
- Verify the A/C compressor turns freely and is not seized.
- Verify that the customer is using the correct key to enable personalization and is not inadvertently activating auxiliary HVAC controls.

- The A/C compressor will not operate in cold outside air temperatures.
- The following conditions may cause window fogging:
 - Wet carpet or mats
 - High humidity
 - Interior water leak
 - Blocked A/C evaporator drain tube
 - Maximum passenger capacity
 - Blocked body pressure relief valves
- Inspect the air distribution system for causes of reduced air flow:
 - Obstructed or dirty passenger compartment air filter, if equipped
 - Blocked or damaged air inlet or outlet vents

Intermittent

Faulty electrical connections or wiring may be the cause of intermittent conditions. Refer to **Testing for Intermittent Conditions and Poor Connections** .

Symptom List

Refer to **HVAC System Malfunction** in order to diagnose the symptom:

HVAC SYSTEM MALFUNCTION

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

Diagnostic Aids

Check the following mechanical fault sources:

- Air distribution box
- Air distribution hoses/air distribution ducts
- Mode and temperature door cables

The scan tool BCM A/C Evaporator Temperature Sensor parameter displays voltage values. In order to correlate the voltage values to temperature values, use the table below:

A/C Evaporator Temperature Sensor Voltage	A/C Evaporator Temperature Sensor Temperature
5 V	73°C (-100°F) or less

4.5 V	-62°C (-80°F)
4 V	-51°C (-60°F)
3.5 V	-40°C (-40°F)
3 V	-29°C (-20°F)
2.5 V	-18°C (0°F)
2 V	-7°C (20°F)
1.5 V	4°C (40°F)
1 V	16°C (60°F)
0.5 V	27°C (80°F)
0 V	38°C (100°F) or greater

Special Tools

J43600 ACR Air Conditioning Service Center

Circuit/System Verification

NOTE: Check for bulletins before proceeding.

1. Ignition ON.

2. Verify the A/C compressor and the recirculation door are not both inoperative.
 - **If the A/C compressor and the recirculation door are both inoperative**

Refer to System/Circuit Testing.

- **If the A/C compressor and the recirculation door are not both inoperative**
3. Verify the blower motor operates properly with the blower motor switch in each speed position.
 - **If the blower motor does not operate properly in each speed position**

Refer to **Blower Motor Malfunction**.

- **If the blower motor operates properly in each speed position**
4. Verify the air inlet door works properly when commanded.
 - **If the air inlet door does not work properly**

Refer to **Air Recirculation Malfunction**.

- **If the air inlet door does work properly**
5. Install the **J43600** ACR Air Conditioning Service Center, ignition ON.
 6. Verify the high side pressure reading on the Air Conditioning Service Center is within 10% of the scan tool BCM A/C High Side Pressure Sensor parameter.
 - **If the reading is not within 10%**

Refer to **DTC P0532 or P0533**.

- **If the reading is within 10%**
7. Verify the scan tool A/C High Side Pressure Sensor parameter is between 269-2929 kPa (39-425 PSI).
 - **If the reading is not between 269-2929 kPa (39-425 PSI)**

Refer to **Air Conditioning (A/C) System Performance Test** .

- **If the reading is between 269-2929 kPa (39-425 PSI)**
8. Verify the scan tool BCM A/C Evaporator Temperature Sensor parameter listed is within 10% of ambient temperature.
 - **If not within 10% of ambient temperature**

Refer to **DTC B3933**.

- **If within 10% of ambient temperature**
9. Engine ON, A/C system ON
 10. Verify cool air flows from the ducts with the temperature control in the coldest position.
 - **If the air is not cool**
 1. Verify the Q2 A/C Compressor Clutch is engaged.

- If the Q2 A/C Compressor Clutch is not engaged, refer to **Air Conditioning Compressor Malfunction**.
 - If the Q2 A/C Compressor Clutch is engaged, refer to **Air Conditioning (A/C) System Performance Test**.
 - **If the air is cool**
11. Verify the A/C indicator turns ON and OFF when the A/C switch is depressed.
- **If the A/C indicator does not turn ON and OFF**
- Refer to **DTC B393D**.
- **If the A/C indicator turns ON and OFF**
12. Verify warm air flows from the ducts with the temperature control in the warmest position.
- **If the air is not warm**
- Refer to **Symptoms - Engine Cooling**.
- **If the air is warm**
13. All OK.

Circuit/System Testing

1. Ignition OFF and all vehicle systems OFF, disconnect the X1 harness connector at the K33 HVAC Control Module. It may take up to 2 min for all vehicle systems to power down.
2. Test for less than 10 ohms between the ground circuit terminal 7 and ground.
 - **If 10 ohms or greater**
 1. Test for less than 2 ohms in the ground circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, repair the open/high resistance in the ground connection.
 - **If less than 10 ohms**
3. Verify a test lamp illuminates between the B+ circuit terminal 1 and ground.
 - **If the test lamp does not illuminate and the circuit fuse is good**
 1. Ignition OFF, remove the test lamp.
 2. Test for less than 2 ohms in the B+ circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, verify the fuse is not open and there is voltage at the fuse.
 - **If the test lamp does not illuminate and the circuit fuse is open**
 1. Ignition OFF, remove the test lamp.
 2. Test for infinite resistance between the B+ circuit and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance, replace the K33 HVAC Control Module.
 - **If the test lamp illuminates**

4. Verify a test lamp illuminates between the ignition circuit terminal 9 and ground.
 - **If the test lamp does not illuminate and the circuit fuse is good**
 1. Ignition OFF, remove the test lamp.
 2. Test for less than 2 ohms in the ignition circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, verify the fuse is not open and there is voltage at the fuse.
 - **If the test lamp does not illuminate and the circuit fuse is open**
 1. Ignition OFF, remove the test lamp.
 2. Test for infinite resistance between the ignition circuit and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance, replace the K33 HVAC Control Module.
 - **If the test lamp illuminates**
5. Replace the K33 HVAC Control Module.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

- **HVAC Component Replacement Reference**
- **Control Module References** for HVAC control module replacement, programming and setup

AIR CONDITIONING COMPRESSOR MALFUNCTION

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Air Conditioning Request Signal	2	1	-	-
Defrost Control Signal	2	3	-	-
Blower Feedback	2	1	-	-
1. A/C compressor clutch will not engage except in defrost 2. A/C compressor clutch engaged at all times 3. A/C inoperative during defrost mode only.				

Circuit/System Description

When the A/C switch is pressed or defrost mode is selected with the blower on, and system conditions are such

that A/C operation is allowed, the ECM will apply ground through the A/C compressor clutch relay control circuit, energizing the A/C compressor clutch relay. With the relay energized, battery voltage is applied through the control circuit to the A/C compressor clutch assembly, engaging the A/C compressor.

Diagnostic Aids

In order for the A/C compressor clutch to engage, several conditions are required as follows:

- Defrost mode is selected or the A/C switch is depressed.
- Battery voltage is between 9-18 V.
- Engine coolant temperature is less than 124°C (255°F).
- Engine speed is greater than 600 RPM.
- Engine speed is less than 5 500 RPM.
- A/C high side pressure is between 269-2 929 kPa (39-425 PSI).
- Throttle position is less than 100%.
- Evaporator temperature is greater than 3°C (38°F).
- ECM does not detect excessive torque load.
- ECM does not detect insufficient idle quality.
- The ambient temperature is above 1°C (34°F).
- Blower motor must be in any other position than off.
- A/C switch is depressed.

Circuit/System Verification

NOTE: Refer to **HVAC System Malfunction** before performing this procedure.

1. Ignition ON.
2. Verify the scan tool ECM A/C Request Signal parameter changes from No to Yes under both of the following conditions listed below:
 - Defrost mode selected with blower ON, A/C switch OFF
 - A/C switch depressed with blower ON, temperature controls at their coolest setting, and mode controls in any position other than defrost mode
 - **If YES under only one of the conditions above**

Refer to Circuit/System Testing - A/C Request Circuit Test.

- **If YES under neither of the conditions above**

Refer to Circuit/System Testing - Blower Feedback Test.

- **If YES under both of the conditions above**

Refer to **DTC P0645, P0646, or P0647**.

Circuit/System Testing

NOTE: You must perform the Circuit/System Verification before proceeding with Circuit/System Testing.

A/C Request Circuit Test

1. Ignition OFF, disconnect the X1 harness connector at the K33 HVAC Control Module, ignition ON.
2. Verify a test lamp illuminates between ground and the signal circuit terminals listed below:
 - Terminal 4
 - Terminal 8
 - **If the test lamp does not illuminate for both terminals**
1. Ignition OFF, remove the test lamp, disconnect the X1 harness connector at the K9 Body Control Module.
2. Test for infinite resistance between ground and the K9 Body Control Module connector X1 signal circuit terminals listed below:
 - Terminal 10
 - Terminal 12
 - If less than infinite resistance, repair the short to ground on the circuit.

- If infinite resistance

3. Test for less than 2 ohms in the signal circuits end to end.

- If 2 ohms or greater, repair the open/high resistance in the circuit.
- If less than 2 ohms, replace the K9 Body Control Module.

- **If the test lamp does illuminate for both terminals**

3. Position the blower switch to HI

4. Install a 3 A fused jumper wire between the signal circuit terminal 4 and ground.

5. Verify the scan tool ECM A/C Request Signal parameter is Yes.

- **If the parameter is not Yes**

Replace the K9 Body Control Module.

- **If the parameter is Yes**

6. Remove the jumper wire and install a 3 A fused jumper wire between the signal circuit terminal 8 and ground.

7. Verify the scan tool ECM A/C Request Signal parameter is Yes.

- **If the parameter is not Yes**

Replace the K9 Body Control Module.

- **If the parameter is Yes**

8. Replace the K33 HVAC Control Module

Blower Feedback Test

1. Ignition OFF, disconnect the harness connector at the S94 Blower Motor Switch, ignition ON.

2. Test for 11 V or greater between signal circuit terminal 5 and ground.

- **If less than 11 V**

1. Disconnect the X2 harness connector at the K9 Body Control Module.

2. Test for infinite resistance between the S94 Blower Motor Switch signal circuit terminal 5 and ground.

- If less than infinite resistance, repair the short to ground on the circuit.
- If infinite resistance

3. Test for less than 2 ohms in the signal circuit end to end.

- If 2 ohms or greater, repair the open/high resistance in the circuit.
- If less than 2 ohms, replace the K9 Body Control Module.

- **If 11 V or greater**

3. Install a 3 A fused jumper wire between the signal circuit terminal 5 and ground.

4. Depress the A/C switch.

5. Verify the scan tool ECM A/C Request Signal parameter is Yes.

- **If the parameter is not Yes**

Replace the K9 Body Control Module.

- **If the parameter is Yes**

6. Replace the K33 HVAC Control Module

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

- **Control Module References** for K33 HVAC Control Module and K9 Body Control Module replacement, programming and setup

BLOWER MOTOR MALFUNCTION

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Blower Motor Ignition Voltage	2	2	-	-
Blower Motor Control	1	2	-	-
Speed 4 Control	1	3	-	-
Speed 3 Control	1	3	-	-
Speed 2 Control	1	3	-	-
Speed 1 Control	1	3	-	-
Switch Ground	-	2	-	-
1. Unwanted Blower Operation 2. Blower Inoperative 3. Blower Speed Inoperative				

Circuit/System Description

The blower motor switch applies ground to the blower motor control circuit that corresponds to the selected blower speed. The resistors and the blower motor are in a series circuit. The following list represents the number of resistors in series with the blower motor per particular speed request:

- Low speed, 3 resistors

- Medium 1 speed, 2 resistors
- Medium 2 speed, 1 resistors

When blower switch is in the Hi speed position, ground is applied directly to the blower motor through the blower switch.

Circuit/System Verification

1. Ignition ON.
2. Verify the blower motor operates in all speed positions.
 - **If the blower motor does not operate in any speed position**
 Refer to Circuit/System Testing - Blower Motor Circuit Test.
 - **If the blower motor operates in one or more, but not all speed positions**
 Refer to Circuit/System Testing - Blower Motor Switch Circuit Test.
 - **If the blower motor is always ON**
 Refer to Circuit/System Testing - Blower Motor Always ON Circuit Test.

- **If the blower motor operates correctly in all speed positions**
- 3. All OK.

Circuit/System Testing

Blower Motor Circuit Test

1. Ignition OFF, disconnect the harness connector at the R3 Blower Motor Resistor.
2. Place the blower motor switch in the high speed position.
3. Test for less than 10 ohms between the control circuit terminal D and ground.
 - **If 10 ohms or greater**
 1. Ignition OFF, disconnect the X2 harness connector at the K33 HVAC Control Module.
 2. Test for less than 2 ohms between the ground circuit terminal 3 and ground.
 - If less than 2 ohms, replace the K33 HVAC Control Module.
 - If greater than 2 ohms
 3. Test for less than 2 ohms in the ground circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, repair the open/high resistance in the ground connection.
 - **If less than 10 ohms**
4. Ignition OFF, connect the harness connector at the R3 Blower Motor Resistor and disconnect the harness connector at the M8 Blower Motor.
5. Test for less than 10 ohms between the control circuit terminal 2 and ground.
 - **If 10 ohms or greater**
 1. Ignition OFF, disconnect the harness connector at the R3 Blower Motor Resistor.
 2. Test for less than 2 ohms in the control circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, test or replace the R3 Blower Motor Resistor.
 - **If less than 10 ohms**
6. Ignition ON.
7. Verify a test lamp illuminates between the ignition circuit terminal 1 and ground.
 - **If the test lamp does not illuminate and the circuit fuse is good**
 1. Remove the test lamp, ignition OFF.
 2. Test for less than 2 ohms in the ignition circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, verify the fuse is OK and there is voltage at the fuse.
 - **If the test lamp does not illuminate and the circuit fuse is open**
 1. Remove the test lamp, ignition OFF.
 2. Test for infinite resistance between the ignition circuit and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.

- If infinite resistance, test or replace the M8 Blower Motor.
 - **If the test lamp illuminates**
8. Test or replace the M8 Blower Motor.

Blower Motor Switch Circuit Test

1. Ignition OFF, disconnect the harness connector at the R3 Blower Motor Resistor.
2. Test for less than 10 ohms between each control circuit terminal listed below and ground with the blower switch in the appropriate position.
 - Blower speed 1 terminal E
 - Blower speed 2 terminal A
 - Blower speed 3 terminal B
 - Blower speed 4 terminal D
 - **If 10 ohms or greater**
 1. Ignition OFF, disconnect the X2 harness connector at the K33 HVAC Control Module.
 2. Test for less than 2 ohms in the control circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, replace the K33 HVAC Control Module.
 - **If less than 10 ohms**
3. Test or replace the R3 Blower Motor Resistor.

Blower Motor Always ON Circuit Test

1. Ignition OFF, disconnect the harness connector at the R3 Blower Motor Resistor.
2. Place the blower motor switch in the OFF position.
3. Test for infinite resistance between each control circuit terminal listed below and ground:
 - Blower speed 1 terminal E
 - Blower speed 2 terminal A
 - Blower speed 3 terminal B
 - Blower speed 4 terminal D
 - **If less than infinite resistance**
 1. Disconnect the X2 harness connector at the K33 HVAC Control Module.
 2. Test for infinite resistance between the control circuit and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance, replace the K33 HVAC Control Module.
 - **If infinite resistance**
4. Ignition OFF, disconnect the harness connector at the M8 blower motor.
5. Test for infinite resistance between the control circuit terminal 2 and ground.
 - **If less than infinite resistance**

Repair the short to ground on the circuit

- **If infinite resistance**

6. All OK

Component Testing

Blower Switch

1. Ignition OFF, disconnect the X2 harness connector at the K33 HVAC Control Module.
2. Test for infinite resistance between the ground terminal 3 and each control terminal with the blower switch in the OFF position.

- **If less than infinite resistance**

Replace the K33 HVAC Control Module.

- **If infinite resistance**

3. Test for less than 2 ohms between the ground terminal 3 and each control terminal with the switch in the appropriate position.

- **If 2 ohms or greater**

Replace the K33 HVAC Control Module.

- **If less than 2 ohms**

4. All OK.

Blower Motor Resistor

1. Ignition OFF, disconnect the harness connector at the R3 Blower Motor Resistor.
2. Test for 2.7-3.3 ohms between terminal C and terminal E.

- **If not between 2.7-3.3 ohms**

Replace the R3 Blower Motor Resistor.

- **If between 2.7-3.3 ohms**

3. Test for 1.62-1.98 ohms between terminal C and terminal A.

- **If not between 1.62-1.98 ohms**

Replace the R3 Blower Motor Resistor.

- **If between 1.62-1.98 ohms**

4. Test for 0.72-0.88 ohms between terminal C and terminal B.

- **If not between 0.72-0.88 ohms**

Replace the R3 Blower Motor Resistor.

- **If between 0.72-0.88 ohms**

5. Test for 0.36-0.44 ohms between terminal C and terminal D.

- **If not between 0.36-0.44 ohms**

Replace the R3 Blower Motor Resistor.

- **If between 0.36-0.44 ohms**

6. All OK.

Repair Instructions

AIR RECIRCULATION MALFUNCTION

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Control - Terminal A	1	1	1	-
Control - Terminal B	1	1	1	-
1. Air inlet door is inoperative.				

Circuit/System Description

The air inlet actuator is a 2-wire bi-directional electric motor. There are two control circuits that enable the actuator to operate. The control circuits use either a 0 or 12-volt value to coordinate the actuator movement. When the actuator is at rest, both control circuits have a value of approximately 12 V. In order to move the actuator, the HVAC control module grounds one of the control circuits while providing the other with 12 V. The HVAC control module reverses the polarity of the control circuits to move the actuator in the opposite direction.

Circuit/System Verification

1. Ignition ON.
2. Verify the M4 Air Inlet Door Actuator moves between the RECIRCULATE and FRESH AIR position within 20 s when pressing the recirculation switch.
 - **If the M4 Air Inlet Door Actuator does not move between the RECIRCULATE and FRESH AIR position**

Refer to Circuit/System Testing.
 - **If the M4 Air Inlet Door Actuator moves between the RECIRCULATE and FRESH AIR position**
3. All OK.

Circuit/System Testing

1. Ignition OFF and all vehicle systems OFF, disconnect the X1 harness connector at the K33 HVAC Control Module. It may take up to 2 min for all vehicle systems to power down.
2. Test for less than 10 ohms between the ground circuit terminal 7 and ground.
 - **If 10 ohms or greater**
 1. Ignition OFF.
 2. Test for less than 2 ohms in the ground circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.

- If less than 2 ohms, repair the open/high resistance in the ground connection.
 - **If less than 10 ohms**
- 3. Ignition ON.
- 4. Verify a test lamp illuminates between the ignition circuit terminal 9 and ground.
 - **If the test lamp does not illuminate and the circuit fuse is good**
 1. Ignition OFF, remove the test lamp..
 2. Test for less than 2 ohms in the ignition circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, verify the fuse is not open and there is voltage at the fuse.
 - **If the test lamp does not illuminate and the circuit fuse is open**
 1. Ignition OFF, remove the test lamp.
 2. Test for infinite resistance between the ignition circuit and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance, replace the K33 HVAC Control Module.
 - **If the test lamp illuminates**
- 5. Ignition OFF, connect the harness connector at the K33 HVAC Control Module and disconnect the harness connector at the M4 Air Inlet Door Actuator.
- 6. Connect a test lamp between control circuit terminal A and control circuit terminal B, ignition ON.
- 7. Verify the test lamp illuminates for approximately 20 s when commanding the RECIRCULATE and FRESH AIR positions using the recirculate switch.
 - **If the test lamp does not illuminate during either of the commands**
 1. Ignition OFF, remove the test lamp and disconnect the X1 harness connector at the K33 HVAC Control Module, ignition ON.
 2. Test for less than 2 ohms in each control circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms
 3. Test for infinite resistance between each control circuit and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance, replace the K33 HVAC Control Module.
 - **If the test lamp illuminates during each of the commands**
- 8. Test or replace the M4 Air Inlet Door Actuator.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

REPAIR INSTRUCTIONS

HEATER AND AIR CONDITIONING CONTROL REPLACEMENT (LEFT HAND DRIVE)

Removal Procedure

WARNING: Refer to Battery Disconnect Warning .

1. Disconnect the negative battery cable. Refer to Battery Negative Cable Disconnection and Connection .
2. Remove the instrument panel (I/P) compartment. Refer to Instrument Panel Compartment Replacement .
3. Remove the radio. Radio Replacement .

Fig. 4: Heater And Air Conditioning (A/C) Control Screws
Courtesy of GENERAL MOTORS COMPANY

4. Remove the heater and air conditioning (A/C) control screws (1).

Fig. 5: Heater And A/C Control

Courtesy of GENERAL MOTORS COMPANY

5. Remove the heater and A/C control (4) by pulling it out to provide clearance for the removal of the cables.

NOTE: **Note the location of the cables to facilitate their reinstallation.**

6. Disconnect the temperature control cable (1), mode control cable (2) and air inlet control cable (3).
7. Disconnect the electrical connectors.

Installation Procedure

Fig. 6: Heater And A/C Control

Courtesy of GENERAL MOTORS COMPANY

1. Connect the electrical connectors.
2. Connect the temperature control cable (1), mode control cable (2) and air inlet control cable (3).
3. Install the heater and A/C control (4) by gently inserting the heater and A/C control into the proper position on the I/P.

Fig. 7: Heater And Air Conditioning (A/C) Control Screws
Courtesy of GENERAL MOTORS COMPANY

CAUTION: Refer to Fastener Caution .

4. Install the heater and A/C control screws (1) and tighten to 2.5 N.m (23 lb in).
5. Install the radio. Refer to Radio Replacement .
6. Install the I/P compartment. Refer to Instrument Panel Compartment Replacement .
7. Connect the negative battery cable. Refer to Battery Negative Cable Disconnection and Connection .

HEATER AND AIR CONDITIONING CONTROL REPLACEMENT (RIGHT HAND DRIVE)

Removal Procedure

WARNING: Refer to Battery Disconnect Warning .

1. Disconnect the negative battery cable. Refer to Battery Negative Cable Disconnection and Connection .

2. Remove the instrument panel (I/P) compartment. Refer to **Instrument Panel Compartment Replacement** .
3. Remove the radio. **Radio Replacement** .

Fig. 8: Heater And Air Conditioning (A/C) Control Screws
Courtesy of GENERAL MOTORS COMPANY

4. Remove the heater and air conditioning (A/C) control screws (1).

Fig. 9: Heater And A/C Control

Courtesy of GENERAL MOTORS COMPANY

5. Remove the heater and A/C control (4) by pulling it out to provide clearance for the removal of the cables.

NOTE: **Note the location of the cables to facilitate their reinstallation.**

6. Disconnect the temperature control cable (1), mode control cable (2) and air inlet control cable (3).
7. Disconnect the electrical connectors.

Installation Procedure

Fig. 10: Heater And A/C Control

Courtesy of GENERAL MOTORS COMPANY

1. Connect the electrical connectors.
2. Connect the temperature control cable (1), mode control cable (2) and air inlet control cable (3) to the heater and A/C control (4).
3. Install the heater and air conditioning control (4) by gently inserting the heater and air conditioning control into the proper position on the instrument panel.

Fig. 11: Heater And Air Conditioning (A/C) Control Screws
Courtesy of GENERAL MOTORS COMPANY

CAUTION: Refer to Fastener Caution .

4. Install the heater and A/C control screws (1) and tighten to 2.5 N.m (23 lb in).
5. Install the radio. Refer to Radio Replacement .
6. Install the I/P compartment. Refer to Instrument Panel Compartment Replacement .
7. Connect the negative battery cable. Refer to Battery Negative Cable Disconnection and Connection .

MODE VALVE LINK REPLACEMENT

Removal Procedure

1. Remove the left side floor air outlet duct. Refer to Floor Air Outlet Duct Replacement - Left Side (Left Hand Drive) .
2. Disconnect the stop lamp switch connector.

Fig. 12: Mode Valve Link And Locking Tap
Courtesy of GENERAL MOTORS COMPANY

3. Remove the mode valve link (2) pressing the locking tap (1) of module.

Installation Procedure

Fig. 13: Mode Valve Link

Courtesy of GENERAL MOTORS COMPANY

1. Install the mode valve link (1).
2. Connect the stop lamp switch connector.
3. Install the left side floor air outlet duct. Refer to **Floor Air Outlet Duct Replacement - Left Side (Left Hand Drive)** .

TEMPERATURE VALVE LINK REPLACEMENT

Removal Procedure

1. Remove the left floor air outlet duct. Refer to **Floor Air Outlet Duct Replacement - Left Side (Left Hand Drive)** .

Fig. 14: Temperature Control Cable
Courtesy of GENERAL MOTORS COMPANY

2. Disconnect the temperature control cable (1) from the air conditioning (A/C) evaporator and blower module assembly.
3. Remove the temperature cable link (3) releasing the locking tap (2) of module.

Fig. 15: Temperature Valve Link
Courtesy of GENERAL MOTORS COMPANY

4. Remove the temperature valve link (2) releasing the locking tap (1) of valve link.

Installation Procedure

Fig. 16: Temperature Valve Link
Courtesy of GENERAL MOTORS COMPANY

1. Install the temperature valve link.

Fig. 17: Temperature Cable Link
Courtesy of GENERAL MOTORS COMPANY

2. Install the temperature cable link (1).
3. Connect the temperature control cable (2) to the A/C evaporator and blower module assembly.
4. Install the left floor air outlet duct. Refer to **Floor Air Outlet Duct Replacement - Left Side (Left Hand Drive)** .

AIR INLET VALVE LINK REPLACEMENT (LEFT HAND DRIVE)

Fig. 18: Air Inlet Valve Link (Left Hand Drive)

Courtesy of GENERAL MOTORS COMPANY

Air Inlet Valve Link Replacement (Left Hand Drive)

Callout	Component Name
Preliminary Procedure 1. Remove the right side floor air outlet duct. Refer to <u>Floor Air Outlet Duct Replacement - Right Side</u> . 2. Disconnect the air inlet control cable from the air conditioning (A/C) evaporator and blower module assembly. Refer to <u>Air Conditioning Evaporator Hose Assembly Replacement (1.2L LL0, 1.0L LFM)</u> .	
1	Air Inlet Valve Link Screw (Qty: 1) CAUTION: Refer to <u>Fastener Caution</u> . Tighten 1.2 N.m (11 lb in)
2	Air Inlet Valve Link

AIR INLET VALVE LINK REPLACEMENT (RIGHT HAND DRIVE)

Fig. 19: Air Inlet Valve Link (Right Hand Drive)
 Courtesy of GENERAL MOTORS COMPANY

Air Inlet Valve Link Replacement (Right Hand Drive)

Callout	Component Name
Preliminary Procedure 1. Remove the left side floor air outlet duct. Refer to <u>Floor Air Outlet Duct Replacement - Left Side (Left Hand Drive)</u> . 2. Disconnect the air inlet control cable from the air conditioning (A/C) evaporator and blower module assembly. Refer to <u>Air Conditioning Evaporator Hose Assembly Replacement (1.2L LL0, 1.0L LFM)</u> .	
1	Air Inlet Valve Link Screw (Qty: 1) CAUTION: Refer to <u>Fastener Caution</u> . Tighten 1.2 N.m (11 lb in)
2	Air Inlet Valve Link

TEMPERATURE CONTROL CABLE REPLACEMENT

Fig. 20: Temperature Control Cable
 Courtesy of GENERAL MOTORS COMPANY

Temperature Control Cable Replacement

Callout	Component Name
Preliminary Procedure Disconnect the temperature control cable from the heater and air conditioning (A/C) control. Refer to <u>Heater and Air Conditioning Control Replacement (Left Hand Drive)</u> , <u>Heater and Air Conditioning Control Replacement (Right Hand Drive)</u> .	
1	Temperature Control Cable Procedure 1. Disconnect the cable eyelet from the temperature valve link. 2. Disconnect the temperature control cable from the temperature control cable retainer.

MODE CONTROL CABLE REPLACEMENT

Fig. 21: Mode Control Cable
 Courtesy of GENERAL MOTORS COMPANY

Mode Control Cable Replacement

Callout	Component Name
Preliminary Procedure Disconnect the mode control cable from the heater and air conditioning (A/C) control. Refer to Heater and Air Conditioning Control Replacement (Left Hand Drive) , Heater and Air Conditioning Control Replacement (Right Hand Drive) .	
1	Mode Control Cable Procedure 1. Disconnect the cable eyelet from the mode valve link. 2. Disconnect the mode control cable from the mode control cable retainer.

INSIDE AIR RECIRCULATING CONTROL CABLE REPLACEMENT (LEFT HAND DRIVE)

Fig. 22: Inside Air Recirculating Control Cable (Left Hand Drive)
 Courtesy of GENERAL MOTORS COMPANY

Inside Air Recirculating Control Cable Replacement (Left Hand Drive)

Callout	Component Name
Preliminary Procedure 1. Remove the right side floor air outlet duct. Refer to <u>Floor Air Outlet Duct Replacement - Right Side</u> . 2. Disconnect the air inlet control cable from the heater and air conditioning (A/C) control. Refer to <u>Mode Control Cable Replacement</u>.	
1	Air Inlet Control Cable Procedure 1. Disconnect the cable eyelet from the air inlet valve link. 2. Disconnect the air inlet control cable from the air inlet control cable retainer.

INSIDE AIR RECIRCULATING CONTROL CABLE REPLACEMENT (RIGHT HAND DRIVE)

Fig. 23: Inside Air Recirculating Control Cable (Right Hand Drive)
 Courtesy of GENERAL MOTORS COMPANY

Inside Air Recirculating Control Cable Replacement (Right Hand Drive)

Callout	Component Name
Preliminary Procedures	
1. Remove the left side floor air outlet duct. Refer to <u>Floor Air Outlet Duct Replacement - Left Side (Left Hand Drive)</u> . 2. Disconnect the air inlet control cable from the heater and air conditioning (A/C) control. Refer to <u>Heater and Air Conditioning Control Replacement (Left Hand Drive)</u>, <u>Heater and Air Conditioning Control Replacement (Right Hand Drive)</u>.	
1	Air Inlet Control Cable Procedure 1. Disconnect the cable eyelet from the air inlet valve link. 2. Disconnect the air inlet control cable from the air inlet control cable retainer.

AIR INLET VALVE ACTUATOR REPLACEMENT

Fig. 24: Air Inlet Valve Actuator
 Courtesy of GENERAL MOTORS COMPANY

Air Inlet Valve Actuator Replacement

Callout	Component Name
Preliminary Procedures	
1. Disconnect the battery negative cable. Refer to <u>Battery Negative Cable Disconnection and Connection</u> . 2. Remove the instrument panel assembly. Refer to <u>Instrument Panel Assembly Replacement</u> .	
1	Air Inlet Valve Actuator Bolt (Qty: 3) CAUTION: Refer to <u>Fastener Caution</u> . Tighten 1.2 (11 lb in)
2	Air Inlet Valve Actuator Procedure Disconnect the electrical connector.

EVAPORATOR AIR TEMPERATURE SENSOR REPLACEMENT

Fig. 25: Evaporator Air Temperature Sensor
 Courtesy of GENERAL MOTORS COMPANY

Evaporator Air Temperature Sensor Replacement

Callout	Component Name
1	Heater Core Pipe Side Cover Screw (Qty: 3) CAUTION: Refer to <u>Fastener Caution</u> .
2	Heater Core Pipe Side Cover
3	Evaporator Air Temperature Sensor Procedure 1. Disconnect the electrical connector. 2. Rotate the inside air temperature sensor to remove.

DESCRIPTION AND OPERATION

MANUAL HVAC DESCRIPTION AND OPERATION

The air temperature and the air delivery description and operation are divided into five areas:

- HVAC Control Components
- Air Speed

- Air Delivery
- Heating and A/C Operation
- Recirculation Operation

HVAC Control Components

HVAC Control Assembly

The HVAC control assembly interfaces between the operator and the HVAC system to maintain air temperature and distribution settings. The air temperature and mode doors are controlled by cables. The recirculation actuator is electrically controlled.

There are two different HVAC control assemblies. The first type uses serial data to communicate system messages and requests to other module. The other uses discrete hard-wired signals to communicate commands. The hard-wired HVAC control assembly cannot communicate via serial data.

HVAC control module programming can not be performed on the hard-wired HVAC control assembly.

The HVAC control module supports the following features:

Feature	Availability
Afterblow	NO
Purge	NO
Personalization	NO
Actuator Calibration	NO

Evaporator Temperature Sensor

The evaporator temperature sensor is a two-wire negative temperature co-efficient thermistor. The sensor operates within a temperature range of -40 to +85°C (-40 to +185°F). The sensor is installed at the evaporator and measures its temperature. If the temperature drops under 1°C (34°F), the compressor will be switched off in order to prevent a frozen evaporator.

A/C Refrigerant Pressure Sensor

The engine control module (ECM) monitors the high side refrigerant pressure through the A/C refrigerant pressure sensor. The ECM supplies a 5V reference and a low reference to the sensor. Changes in the A/C refrigerant pressure cause the sensor signal to the ECM to vary. When the pressure is high, the signal voltage is high. When the pressure is low, the signal voltage is low. When pressure is high, the ECM commands the cooling fans on. When pressure is too high or too low, the ECM will inhibit activation of the A/C compressor.

A/C Compressor

The A/C compressor is belt driven and operates when the magnetic clutch is engaged. When the A/C switch is pressed, an A/C request message to the ECM. If the ECM determines that conditions are acceptable for A/C operation, it will ground the A/C compressor clutch relay control circuit, which activate the A/C compressor

clutch relay. With the relay contacts closed, battery voltage is supplied to the A/C compressor clutch. The A/C compressor clutch will engage and the compressor will operate.

Air Speed

The HVAC control assembly applies a ground to the blower motor control circuit that corresponds to the selected blower speed. The resistors and the blower motor are in a series circuit. The following list represents the number of resistors in series with the blower motor per particular speed request:

- Low speed, 3 resistors
- Medium 1 speed, 2 resistors
- Medium 2 speed, 1 resistors

When blower switch is in the Hi speed position, ground is applied directly to the blower motor through the blower switch.

Air Delivery

The HVAC control assembly controls the distribution of air by the use of recirculation actuator and the mechanically controlled mode door. The modes that may be selected are:

- Defrost - Air flow is directed at the windshield
- Defog - Air flow is split between the windshield and floor
- Vent - Air flow is directed to the vents located in the instrument panel
- Bi-Level - Air flow is split between the instrument panel vents and the floor vents
- Floor - Air flow is directed to the floor

The desired air distribution mode can be selected with the air distribution knob at the HVAC control assembly. Depending on the position of the flap, air is distributed through various ducts leading to the outlets in the instrument panel. When the defrost position is selected, the HVAC control assembly will command the recirculation actuator to outside air, reducing window fogging.

Heating and A/C Operation

The purpose of the heating and A/C system is to provide heated and cooled air to the interior of the vehicle. The A/C system will also remove humidity from the interior and reduce windshield fogging. Regardless of the temperature setting, the following can affect the rate that the HVAC system can achieve the desired temperature:

- Recirculation actuator setting
- Difference between inside and desired temperature
- Blower motor speed setting
- Mode setting

When the A/C switch is pressed, an A/C request message to the ECM. If the ECM determines that conditions

are acceptable for A/C operation, it will ground the A/C compressor clutch relay control circuit, which activate the A/C compressor clutch relay. With the relay contacts closed, battery voltage is supplied to the A/C compressor clutch. The A/C compressor clutch will engage and the compressor will operate.

The following conditions must be met in order to activate the A/C compressor:

- Battery voltage is between 9-18 V
- Engine coolant temperature is less than 120°C (248 °F)
- Engine speed is greater than 600 RPM
- Engine speed is less than 6200 RPM
- A/C high side pressure is between 220-3100 kPa (32-450 PSI)
- Throttle position is less than 95%
- Evaporator temperature is greater than 3°C (38°F)
- ECM does not detect an excessive torque load
- ECM does not detect insufficient idle quality
- Outside air temperature is greater than 3°C (38°F)
- Blower motor ON

The temperature door controls the temperature of the air entering the passenger compartment. Air entering the passenger compartment passes through the heater core and/or the evaporator core. The position of the temperature door determines how much air passes through the heater or evaporator core. As the temperature control is moved to a hotter setting, the temperature door will direct more air through the heater core. As the temperature control is moved to a cooler setting, more air will be passed through the evaporator core.

Recirculation Operation

Recirculation Actuator

The recirculation actuator is a two-wire bi-directional electric motor. There are two control circuits that allow actuator operation. The control circuits use either a 0 or 12-volt value to coordinate the actuator movement. When the actuator is at rest, both control circuits have a value of 0 volts. To move the actuator, the HVAC control module grounds one of the control circuits while providing the other with 12 volts. The HVAC control module reverses the polarity of the control circuits to move the actuator in the opposite direction.

DIAGNOSTIC INFORMATION AND PROCEDURES

DIAGNOSTIC CODE INDEX

DIAGNOSTIC CODE INDEX

DTC	Description
-----	-------------

DTC C0267

DTC C0267 Low Brake Fluid Indicated

DTC C0267: LOW BRAKE FLUID**Diagnostic Instructions**

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

DTC Descriptor**DTC C0267**

Low Brake Fluid Indicated

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Signal	C0267 00	C0267 00	-	-
Ground	-	C0267 00	-	-

Circuit/System Description

The brake fluid level switch monitors the level of the brake fluid in the brake fluid reservoir. When the electronic brake control module sees the brake fluid level switch input open, the DTC is set.

Conditions for Running the DTC

Ignition ON.

Conditions for Setting the DTC

Low brake fluid level is detected for 5 s.

Conditions for Clearing the DTC

The condition for setting the DTC is no longer present.

Description and Operation

Brake Warning System Description and Operation

Electrical Information Reference

- **Circuit Testing**
- **Connector Repairs**
- **Testing for Intermittent Conditions and Poor Connections**
- **Wiring Repairs**

Scan Tool Reference

Control Module References for scan tool information

Circuit/System Verification

1. Verify that the brake fluid has the proper level. The fluid level should be above minimum level.
 - **If low**

Refer to **Brake Fluid Loss**.

- **If above minimum level**
2. Ignition ON.
3. Verify the scan tool Brake Fluid Level Sensor parameter. The reading should be Ok.
 - **If the parameter is Low**

Refer to Circuit/System Testing.

- **If the parameter is Ok**
4. All OK.

Circuit/System Testing

1. Ignition OFF, disconnect the harness connector at the B20 Brake Fluid Level Switch.
2. Test for less than 10 ohms between the ground circuit terminal 2 and ground.
 - **If 10 ohms or greater**
 1. Ignition OFF.
 2. Test for less than 2 ohms in the ground circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, repair the open/high resistance in the ground connection.
 - **If less than 10 ohms**

3. Ignition ON.
4. Verify the scan tool Brake Fluid Level Sensor parameter is Low.
 - **If the parameter is not Low**
 1. Ignition OFF, disconnect the harness connector at the K17 Electronic Brake Control Module.
 2. Test for infinite resistance between the signal circuit and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance, replace the K17 Electronic Brake Control Module.
 - **If the parameter is Low**
5. Install a 3 A fused jumper wire between the signal circuit terminal 1 and ground.
6. Verify the scan tool Brake Fluid Level Sensor parameter is Ok.
 - **If the parameter is not Ok**
 1. Ignition OFF, disconnect the harness connector at the K17 Electronic Brake Control Module, ignition ON.
 2. Test for less than 1 V between the signal circuit and ground.
 - If 1 V or greater, repair the short to voltage on the circuit.
 - If less than 1 V.
 3. Test for less than 2 ohms in the signal circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, replace the K17 Electronic Brake Control Module.
 - **If the parameter is Ok**
7. Test or replace the B20 Brake Fluid Level Switch.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

- **Brake Fluid Level Indicator Switch Replacement**
- **Control Module References** for Electronic Brake Control Module replacement, programming and setup.

SYMPTOMS - HYDRAULIC BRAKES

NOTE: The following steps must be completed before using the symptom tables.

1. Perform the **Brake System Vehicle Road Test** before using the hydraulic brake symptom tables in order to duplicate the customers concern.
2. Review the system operation in order to familiarize yourself with the system functions. Refer to the following:
 - **Brake Warning System Description and Operation**
 - **Hydraulic Brake System Description and Operation**
 - **Brake Booster Vacuum Assist Description and Operation**

- **ABS Description and Operation (With FX3)** , **ABS Description and Operation (Without FX3)**

Visual/Physical Inspection

- Inspect for aftermarket devices which could affect the operation of the hydraulic brake system. Refer to **Checking Aftermarket Accessories** .
- Inspect the easily accessible or visible system components, for obvious damage or conditions, which could cause the symptom.

Intermittent

Faulty electrical connections or wiring may be the cause of intermittent conditions. Refer to **Testing for Intermittent Conditions and Poor Connections** .

Symptom List

Refer to a symptom diagnostic procedure from the following list in order to diagnose the symptom:

- **Brake Booster Pump Motor Malfunction**
- **Brake Warning Indicator Malfunction**

BRAKE BOOSTER PUMP MOTOR MALFUNCTION

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage
Brake Booster Pump Relay B+	1	1	-
Brake Booster Pump Motor B+	1	1	2
Brake Booster Vacuum Switch Ignition	1	1	-
Brake Booster Pump Relay Coil Control	1	1	2
Brake Booster Pump Motor Ground	-	1	-
Brake Booster Pump Relay Ground	-	1	-
1. Brake Booster Pump Always Off 2. Brake Booster Pump Always On			

Circuit/System Description

The brake booster vacuum switch monitors the amount of vacuum available to the power brake booster. When

the vacuum within the system drops, the switch within the brake booster vacuum sensor closes allowing voltage to be supplied to the brake booster pump relay.

Circuit/System Testing

Brake Booster Pump Motor Inoperative

1. Ignition OFF and all vehicle systems OFF, disconnect the KR14 Brake Booster Pump Motor Relay. It may take up to 2 minutes for all vehicle systems to power down.
2. Test for less than 10 ohms between the ground circuit terminal 86 and ground.
 - **If 10 ohms or greater**
 1. Test for less than 2 ohms in the ground circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, repair the open/high resistance in the ground connection.
 - **If less than 10 ohms**
3. Ignition ON.
4. Verify that a test lamp illuminates between the B+ circuit terminal 30 and ground.
 - **If the test lamp does not illuminate and the circuit fuse is good**
 1. Ignition OFF.
 2. Test for less than 2 ohms in the B+ circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, verify the fuse is not open and there is voltage at the fuse.

- **If the test lamp does not illuminate and the circuit fuse is open**
- 1. Ignition OFF.
- 2. Test for infinite resistance between the B+ circuit and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance, disconnect the M9 brake booster pump motor.
- 1. Test for infinite resistance between the Brake Booster Pump Motor control circuit and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance, replace the brake booster pump motor.
- **If the test lamp illuminates**
- 5. Connect a 40 A fused jumper wire between the B+ circuit terminal 30 and the control circuit terminal 87.
- 6. Verify the M9 Brake Booster Pump Motor is activated.
 - **If the M9 Brake Booster Pump Motor does not activate**
 - 1. Ignition OFF, disconnect the harness connector at the M9 Brake Booster Pump Motor.
 - 2. Test for less than 2 ohms in the control circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms.
 - 3. Test for less than 10 ohms between the ground circuit terminal 2 and ground.
 - If 10 ohms or greater, repair the open/high resistance in the ground circuit.
 - If less than 10 ohms, replace the M9 Brake Booster Pump Motor.
 - **If the M9 Brake Booster Pump Motor activates**
- 7. Ignition OFF, disconnect the B19C Brake Booster Vacuum Switch, ignition ON.
- 8. Verify that a test lamp illuminates between the ignition circuit terminal 1 and ground.
 - **If the test lamp does not illuminate and the circuit fuse is good**
 - 1. Ignition OFF.
 - 2. Test for less than 2 ohms in the ignition circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, verify the fuse is not open and there is voltage at the fuse.
 - **If the test lamp does not illuminate and the circuit fuse is open**
 - 1. Ignition OFF.
 - 2. Test for infinite resistance between the ignition circuit and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance, repair the short to ground on the relay control circuit.
 - **If the test lamp illuminates**
- 9. Verify that a test lamp does not illuminate between the control circuit terminal 2 and ground.
 - **If the test lamp illuminates**

Repair the short to voltage on the circuit.

- **If the test lamp does not illuminate**
- 10. Reconnect the KR14 Brake Booster Pump Motor Relay, connect a 10 A fused jumper wire between the ignition circuit terminal 1 and the control circuit terminal 2 at the harness connector of the B19C Brake Booster Vacuum Switch.
- 11. Verify the M9 Brake Booster Pump Motor is activated.
 - **If the M9 Brake Booster Pump Motor does not activate**
 1. Ignition OFF, disconnect the KR14 Brake Booster Pump Motor Relay.
 2. Test for less than 2 ohms in the control circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, replace the KR14 Brake Booster Pump Motor Relay.
 - **If the M9 Brake Booster Pump Motor activates**
- 12. Test or replace the B19C Brake Booster Vacuum Switch.

Brake Booster Pump Motor Always On

1. Ignition OFF and all vehicle systems OFF, disconnect the M9 Brake Booster Pump Motor. It may take up to 2 minutes for all vehicle systems to power down.
2. Verify that a test lamp does not illuminate between the Brake Booster Pump Motor control circuit terminal 1 and ground.
 - **If the test lamp illuminates**

Repair the short to voltage on the circuit.
 - **If the test lamp does not illuminate**
3. Disconnect the B19C Brake Booster Vacuum Switch.
4. Verify that a test lamp does not illuminate between the relay control circuit terminal 2 and ground.
 - If the test lamp illuminates, repair the short to voltage on the circuit.
 - If the test lamp does not illuminates, replace the relay.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

- **Power Brake Booster Vacuum Sensor Replacement**
- **Power Brake Booster Pump Replacement (Automatic Transmission), Power Brake Booster Pump Replacement (Manual Transmission), Power Brake Booster Pump Replacement (CVT)**

BRAKE WARNING INDICATOR MALFUNCTION

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.

- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Signal	C0267 00	1	1	-
Ground	-	1	-	-
1. Brake Warning Indicator Malfunction				

Circuit/System Description

The instrument cluster turns ON the brake warning indicator for 5 s after ignition ON. The body control module monitors the parking brake switch and will request the instrument cluster via serial data to turn the brake warning indicator ON when the parking brake is applied. The electronic brake control module monitors the brake fluid level in the brake fluid reservoir. When the fluid within the brake fluid reservoir is below the minimum level, contacts within the brake fluid level switch closes causing the voltage within the signal circuit to drop. The electronic brake control module will detect the voltage drop and will send a serial data message to the instrument cluster commanding the brake warning indicator to illuminate.

Circuit/System Verification

1. Verify that the brake fluid has the proper level. The fluid level should be above minimum level.
 - **If low**

Refer to **Brake Fluid Loss**.

- **If above minimum level**
2. Ignition ON.
 3. Verify the scan tool Brake Fluid Level Sensor parameter. The reading should be Ok.
 - **If the parameter is Low**

Refer to Brake Fluid Level Switch Malfunction.

- **If the parameter is Ok**
4. Verify the brake warning indicator turns ON and OFF, when commanding the instrument cluster All Indicators ON and OFF with a scan tool.
 - **If the brake warning indicator does not turn ON and OFF**

Replace the P16 Instrument Cluster.

- **If the brake warning indicator turns ON and OFF**
5. Verify the scan tool Park Brake Switch parameter changes between Applied and Released while applying and releasing the parking brake.
 - **If the parameter does not change between Applied and inactive**

Refer to Park Brake Switch Malfunction.

- **If the parameter changes between Applied and Released**
6. Apply the parking brake.
 7. Verify the brake warning indicator turns ON.
 - **If the brake warning indicator does not turn ON**

Replace the K9 Body Control Module.

- **If the brake warning indicator turns ON**
8. Release the parking brake.
 9. Verify the brake warning indicator turns OFF.
 - **If the brake warning indicator does not turn OFF**

Refer to Brake Fluid Level Switch Malfunction.

- **If the brake warning indicator turns OFF**
10. All OK.

Circuit/System Testing

NOTE: **Circuit/System Verification must be performed before Circuit/System Testing.**

Park Brake Switch Malfunction

1. Ignition OFF, disconnect the harness connector at the B80 Park Brake Switch.
2. Inspect the B80 Park Brake Switch for physical damage and correct installation.
 - **If physical damage or incorrect installation is found**

Replace the B80 Park Brake Switch.
 - **If physical damage or incorrect installation is not found**
3. Ignition ON.
4. Verify the scan tool Park Brake Switch parameter is Released.
 - **If the parameter is not Released**
 1. Ignition OFF, disconnect the harness connector X7 at the K9 Body Control Module.
 2. Test for infinite resistance between the signal circuit and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance, replace the K9 Body Control Module.
 - **If the parameter Released**
5. Install a 3 A fused jumper wire between the signal circuit terminal A and ground.
6. Verify the scan tool Park Brake Switch parameter is Applied.
 - **If the parameter is not Applied**
 1. Ignition OFF, disconnect the harness connector X7 at the K9 Body Control Module, ignition ON.
 2. Test for less than 1 V between the signal circuit and ground.
 - If 1 V or greater, repair the short to voltage on the circuit.
 - If less than 1 V.
 3. Test for less than 2 ohms in the signal circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, replace the K9 Body Control Module.
 - **If the parameter is Applied**
7. Test or replace the B80 Park Brake Switch.

Brake Fluid Level Switch Malfunction

1. Ignition OFF, disconnect the harness connector at the B20 Brake Fluid Level Switch.
2. Test for less than 10 ohms between the ground circuit terminal 2 and ground.
 - **If 10 ohms or greater**
 1. Ignition OFF.

2. Test for less than 2 ohms in the ground circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, repair the open/high resistance in the ground connection.
 - **If less than 10 ohms**
3. Ignition ON.
4. Verify the scan tool Brake Fluid Level Sensor parameter is Low.
 - **If the parameter is not Low**
 1. Ignition OFF, disconnect the harness connector at the K17 Electronic Brake Control Module.
 2. Test for infinite resistance between the signal circuit and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance, replace the K17 Electronic Brake Control Module.
 - **If the parameter is Low**
5. Install a 3 A fused jumper wire between the signal circuit terminal 1 and ground.
6. Verify the scan tool Brake Fluid Level Sensor parameter is Ok.
 - **If the parameter is not Ok**
 1. Ignition OFF, disconnect the harness connector at the K17 Electronic Brake Control Module, ignition ON.
 2. Test for less than 1 V between the signal circuit and ground.
 - If 1 V or greater, repair the short to voltage on the circuit.
 - If less than 1 V.
 3. Test for less than 2 ohms in the signal circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, replace the K17 Electronic Brake Control Module.
 - **If the parameter is Ok**
7. Test or replace the B20 Brake Fluid Level Switch.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

- **Brake Fluid Level Indicator Switch Replacement**
- **Parking Brake Indicator Switch Replacement**
- **Control Module References** for control module replacement, programming and setup.

BRAKE PULSATION

Brake Pulsation

Step	Action	Yes	No
DEFINITION: Fluctuation or pulsation is felt through the brake pedal, steering wheel, seat, floor, and/or in the vehicle ONLY when braking.			

1	Were you sent here from the Hydraulic Brake Symptom table?	Go to Step 2	Go to <u>Symptoms - Hydraulic Brakes</u>
2	1. Inspect the disc brake system for the following conditions: • Excessive thickness variation of rotor friction surfaces • Excessive assembled lateral runout (LRO) of rotor friction surfaces • Hard spots, heat checks, blueing discoloration of rotor friction surfaces; possibly due to brake drag • Excessive corrosion of rotor friction surfaces; including red, gray or black oxidation • Loose, damaged or missing caliper or lining hardware • Bent of damaged caliper or mounting component • Excessive LRO of wheel hub/axle flange; due to damage and/or loose or excessively worn bearings 2. Adjust, repair or replace components as necessary. Refer to <u>Disc Brake System Diagnosis</u>.		
	Did you find and correct a condition?	Go to Step 4	Go to Step 3
3	1. Inspect the drum brake system for the following conditions: • Out of round or damaged drum • Excessive radial runout of drum friction surface • Hard spots, heat checks, blueing discoloration of drum friction surface; possibly due to brake drag • Bent of damaged drum • Excessive radial runout of wheel hub/axle flange; due to damage and/or loose or excessively worn bearings 2. Adjust, repair or replace components as necessary. Refer to <u>Drum Brake System Diagnosis</u>.		
	Did you find and correct a condition?	Go to Step 4	Go to <u>Symptoms - Hydraulic Brakes</u>

4	1. Install or connect components that were removed or disconnected during diagnosis. 2. Road test the vehicle in order to confirm proper operation. Refer to <u>Brake System Vehicle Road Test</u>.		
	Is the condition still present?	Go to Step 2	System OK

BRAKE SYSTEM NOISE

Brake System Noise

Step	Action	Yes	No
DEFINITION: Vehicle exhibits abnormal noise when braking; vehicle may exhibit abnormal noise during motion just after brake pedal release.			
1	Were you sent here from the Hydraulic Brake Symptom table?	Go to Step 2	Go to <u>Symptoms - Hydraulic Brakes</u>
2	1. Inspect the disc brake system for the following conditions: • Lining wear indicator contact with rotor • Debris trapped between rotor and splash shield or backing plate; and/or debris trapped between rotor and linings • Contaminated linings • Aftermarket linings • Glazed linings • Distorted, cracked or damaged linings • Excessively worn linings • Damaged or excessively worn caliper hardware and/or lining hardware • Incorrectly installed, loose or missing caliper hardware and/or lining hardware • Lack of lubrication or excessive corrosion on metal to metal contact surfaces • Bent or damaged splash shield or backing plate • Hard spots, heat checks, blueing discoloration of rotor friction surfaces • Glazed rotor friction surfaces • Bent or damaged caliper or mounting component 2. Adjust, repair or replace components as necessary. Refer to <u>Disc Brake System Diagnosis</u>.		

	Did you find and correct a condition?	Go to Step 10	Go to Step 3
3	1. Inspect the drum brake system for the following conditions: • Glazed linings • Contaminated linings • Aftermarket linings • Distorted, damaged or excessively worn linings • Improper adjustment • Weak or damaged return spring or springs • Weak or damaged hold down spring or springs • Cracked, scored, excessively worn or damaged drum • Out of round or damaged drum • Hard spots, heat checks, blueing discoloration of drum friction surface • Threaded or spiral grooves in drum friction surface • Distorted or damaged backing plate • Lack of lubrication on backing plate • Excessive dust or foreign matter in drum 2. Adjust, repair or replace components as necessary. Refer to <u>Drum Brake System Diagnosis</u>.		
	Did you find and correct a condition?	Go to Step 10	Go to Step 4
4	1. Inspect the brake assist system for the following conditions: • Lack of lubrication or excessively worn pushrod or pedal pivots or pivot bushings • Bent or damaged pedal pushrod, pedal and pedal bracket • Damaged or improperly operating vacuum booster and/or check valve, if equipped • Low power steering fluid level, if equipped with hydraulic boost • Improperly tensioned, excessively worn or damaged power steering belt, if equipped with hydraulic boost • Restricted return hose from hydraulic booster, if equipped • Improperly operating hydraulic booster, if equipped		

	• Improperly functioning power steering system, if equipped with a hydraulic booster assembly • Contaminated power steering fluid, if equipped with hydraulic boost 2. Adjust, repair or replace components as necessary. Refer to <u>Brake Assist System Diagnosis</u>.		
	Did you find and correct a condition?	Go to Step 10	Go to Step 5
5	1. Inspect the hydraulic brake system for the following conditions. • Improper operation of wheel cylinder pistons, if equipped • Improper operation of caliper pistons • Contaminated brake fluid 2. Adjust, repair or replace components as necessary. Refer to <u>Hydraulic Brake System Diagnosis</u>.		
	Did you find and correct a condition?	Go to Step 10	Go to Step 6
6	Is the vehicle equipped with a drum-in-rotor type of park brake system?	Go to Step 7	Go to Step 9
7	Ensure the park brake shoes are not adjusted too tightly, possibly causing a noise under certain conditions. Are the park brake shoes adjusted too tightly?	Go to Step 8	Go to Step 9
8	1. Clean and inspect the park brake shoes for excessive wear and/or damage. 2. Inspect the drum portion of the rotors for excessive wear, blueing discoloration, heat spots and excessive radial runout. 3. If any of these conditions are present, replace the affected components. 4. Adjust the park brake system.		
	Did you find and correct a condition?	Go to Step 10	Go to Step 9
9	Inspect the park brake system for proper operation. Refer to <u>Park Brake System Diagnosis</u>. Did you find and correct a condition?	Go to Step 10	Go to <u>Symptoms - Hydraulic Brakes</u>
10	1. Install or connect components that were removed or disconnected during diagnosis. 2. Road test the vehicle in order to confirm proper operation. Refer to <u>Brake System Vehicle Road Test</u>.		
	Is the condition still present?	Go to Step 2	System OK

BRAKING ACTION UNEVEN - PULLS TO ONE SIDE

Test Description

The number below refer to the step number on the diagnostic table:

5

Suspension components that are not operating properly may cause a disturbance to the vehicle during application of the brake system.

6

Steering components that are not operating correctly may cause a disturbance to the vehicle during application of the brake system.

Braking Action Uneven - Pulls to One Side

Step	Action	Yes	No
DEFINITION: Vehicle pulls to one side only when braking.			
1	Were you sent here from the Hydraulic Brake Symptom table?	Go to Step 2	Go to <u>Symptoms - Hydraulic Brakes</u>
2	- Inspect the hydraulic brake system for the following conditions: - Kinked, pinched or damaged brake pipe or flexible brake hose - Sticking or improperly operating caliper piston - Sticking or improperly operating wheel cylinder pistons - Brake fluid leak - Adjust, repair or replace components as necessary. Refer to <u>Hydraulic Brake System Diagnosis</u>. Did you find and correct a condition?	Go to Step 7	Go to Step 3
	- Inspect the disc brake system for the following conditions: - Contaminated linings - Glazed linings - Distorted, cracked or damaged linings on one side - Loose, damaged or missing caliper hardware and/or lining hardware - Incorrect linings on one side		

3	• Hard spots, heat checks, blueing discoloration of rotor friction surfaces; possibly due to brake drag • Glazed rotor friction surfaces • Bent or damaged caliper or mounting component 2. Adjust, repair or replace components as necessary. Refer to <u>Disc Brake System Diagnosis</u>. Did you find and correct a condition?	Go to Step 7	Go to Step 4
4	1. Inspect the drum brake system for the following conditions: • Improper adjustment or improper adjuster operation • Weak or damaged return spring or springs • Glazed linings • Contaminated linings • Distorted or damaged linings • Incorrect linings on one side • Excessively worn or damaged drum on one side 2. Adjust, repair or replace components as necessary. Refer to <u>Drum Brake System Diagnosis</u>. Did you find and correct a condition?	Go to Step 7	Go to Step 5
5	1. Inspect the suspension system for the following conditions: • Incorrect tire pressure • Loose suspension component connections • Excessively worn or damaged suspension components 2. Adjust, repair or replace components as necessary. Refer to <u>Symptoms - Suspension General Diagnosis</u>. Did you find and correct a condition?	Go to Step 7	Go to Step 6
	1. Inspect the steering system for the following conditions:		

6	- Loose steering component connections - Excessively worn or damaged steering components 2. Adjust, repair or replace components as necessary. Refer to <u>Symptoms - Power Steering System (Electric Power Steering)</u> .		
	Did you find and correct a condition?	Go to Step 7	Go to <u>Symptoms - Hydraulic Brakes</u>
7	1. Install or connect components that were removed or disconnected during diagnosis. 2. Road test the vehicle in order to confirm proper operation. Refer to <u>Brake System Vehicle Road Test</u>.		
	Is the condition still present?	Go to Step 2	System OK

BRAKING ACTION UNEVEN - FRONT TO REAR

Test Description

The number below refers to the step number on the diagnostic table:

5

Suspension components that are not operating properly may cause a disturbance to the vehicle during application of the brake system.

Braking Action Uneven - Front to Rear

Step	Action	Yes	No
DEFINITION: Braking action or stopping force sensitive or grabbing and/or more pronounced at the front or at the rear axle. Sensitive or grabbing brakes: Excessive brake jump-in force relative to brake pedal input.			
1	Were you sent here from the Hydraulic Brake Symptom table?	Go to Step 2	Go to <u>Symptoms - Hydraulic Brakes</u>
2	1. Inspect the hydraulic brake system for the following conditions: - Improper operation of wheel cylinder pistons, if equipped - Improper operation of caliper pistons - Kinked, pinched or damaged brake pipe or flexible brake hose - Brake fluid leak - Improperly functioning proportioning valve, if equipped		

	• Improper operation of dynamic rear proportioning (DRP) system, if equipped 2. Adjust, repair or replace components as necessary. Refer to <u>Hydraulic Brake System Diagnosis</u>.		
	Did you find and correct a condition?	Go to Step 7	Go to Step 3
3	1. Inspect the disc brake system for the following conditions: • Contaminated linings • Glazed linings • Distorted, cracked or damaged linings • Excessively worn linings • Aftermarket linings • Damaged or excessively worn caliper hardware and/or lining hardware • Hard spots, heat checks, blueing discoloration of rotor friction surfaces • Glazed rotor friction surfaces 2. Adjust, repair or replace components as necessary. Refer to <u>Disc Brake System Diagnosis</u>.		
	Did you find and correct a condition?	Go to Step 7	Go to Step 4
4	1. Inspect the drum brake system for the following conditions. • Contaminated linings • Improper adjustment • Excessively worn or damaged linings • Weak or damaged return spring or springs • Excessively worn or damaged drums • Hard spots, heat checks, blueing discoloration of drum friction surface • Distorted or damaged backing plate 2. Adjust, repair or replace components as necessary. Refer to <u>Drum Brake System Diagnosis</u>.		
	Did you find and correct a condition?	Go to Step 7	Go to Step 5
	1. Inspect the suspension system for the following conditions:		

5	- Loose suspension component connections - Excessively worn or damaged suspension components 2. Adjust, repair or replace components as necessary. Refer to <u>Symptoms - Suspension General Diagnosis</u>.		
	Did you find and correct a condition?	Go to Step 7	Go to Step 6
6	1. Inspect the brake assist system for the following conditions: - Binding, bent or damaged pedal pushrod, pedal and pedal bracket - Damaged or improperly operating vacuum booster, if equipped - Damaged or improperly operating hydraulic booster, if equipped 2. Adjust, repair or replace components as necessary. Refer to <u>Brake Assist System Diagnosis</u>.		
	Did you find and correct a condition?	Go to Step 7	Go to <u>Symptoms - Hydraulic Brakes</u>
7	1. Install or connect components that were removed or disconnected during diagnosis. 2. Road test the vehicle in order to confirm proper operation. Refer to <u>Brake System Vehicle Road Test</u>.		
	Is the condition still present?	Go to Step 2	System OK

BRAKE PEDAL EXCESSIVE TRAVEL

Brake Pedal Excessive Travel

Step	Action	Yes	No
DEFINITION: Brake pedal travels further than expected to obtain firm pedal and/or firm pedal cannot be obtained, pedal fades away and pedal is spongy.			
1	Were you sent here from the Hydraulic Brake Symptom table?	Go to Step 2	Go to <u>Symptoms - Hydraulic Brakes</u>
	Inspect the travel and feel of brake pedal applies. Perform the following: 1. Apply the brake pedal several times to fully deplete the power reserve.		

2	2. With power reserve depleted, apply the brake pedal with light, steady pressure and hold for 15 seconds. Observe pedal travel and feel. 3. Apply the brake pedal with light, steady pressure, then without pumping the pedal, reduce pressure and reapply pressure several times. Observe pedal travel and feel for each apply. 4. Apply the brake pedal slowly, then release and apply the pedal quickly. Observe pedal travel and feel for each apply. Did you complete the brake pedal travel and feel inspections?	Go to Step 3	-
3	1. Inspect the hydraulic brake system for the conditions listed, based on the following symptoms observed during the pedal travel and feel inspections. • Pedal feel was spongy. ○ Air in hydraulic system ○ External brake fluid leaks ○ Soft, weak or damaged hydraulic hoses; expanding under pressure • Pedal fell away and/or traveled to or almost to floor. ○ External brake fluid leaks ○ Poor brake fluid quality; low boiling point ○ Internal brake fluid leaks; improperly functioning master cylinder • Pedal was somewhat firm then dropped slightly and pedal rose with successive applies and pedal travel was different between slow and quick applies. ○ Internal brake fluid leaks; improperly functioning master cylinder ○ Poor brake fluid quality; low boiling point ○ Binding wheel cylinder pistons, if equipped • Pedal returned to rest slowly after any of the applies. ○ Internally damaged flexible brake hoses; hindering fluid return		

	○ Binding caliper pistons ○ Binding wheel cylinder pistons, if equipped ○ Internal brake fluid leaks; improperly functioning master cylinder 2. Repair or replace components as necessary. Refer to <u>Hydraulic Brake System Diagnosis</u>. 3. Re-inspect brake pedal apply travel and feel.		
	Did you find and correct a condition?	Go to Step 9	Go to Step 4
4	1. Inspect the drum brake system, if equipped, for the following conditions: ● Improper adjustment or improper adjuster operation ● Glazed or excessively worn linings ● Cracked, distorted or damaged linings ● Cracked, excessively worn, distorted or damaged drums ● Bell-mouth or barrel-shaped drum friction surface ● Hard spots, heat checks, blueing discoloration of drum friction surface 2. Adjust, repair or replace components as necessary. Refer to <u>Drum Brake System Diagnosis</u>. 3. Re-inspect brake pedal apply travel and feel.		
	Did you find and correct a condition?	Go to Step 9	Go to Step 5
5	1. Inspect the disc brake system for the following conditions: ● Cracked, excessively worn or damaged linings ● Cracked, excessively worn or damaged rotors ● Improperly operating, binding or damaged caliper hardware and/or lining hardware ● Loose or missing caliper hardware and/or lining hardware ● Excessive assembled lateral runout (LRO) of rotor friction surfaces ● Bent or damaged caliper or mounting component 2. Adjust, repair or replace components as necessary. Refer to <u>Disc Brake System Diagnosis</u>.		

	3. Re-inspect brake pedal apply travel and feel. Did you find and correct a condition?	Go to Step 9	Go to Step 6
6	Inspect for proper brake pedal travel. Refer to <u>Brake Pedal Travel Measurement and Inspection.</u> Is the brake pedal travel distance within the acceptable limits?	Go to Step 8	Go to Step 7
7	1. Inspect for worn, missing, misaligned, bent or damaged brake pedal system components. - For the brake pedal pushrod component inspection, refer to <u>Brake Pedal Pushrod Inspection.</u> - Inspect the brake pedal bushings for binding, excessive wear and/or damage and inspect the brake pedal for a misaligned, bent, and/or damaged condition. 2. Replace the brake pedal system components that are worn, missing, misaligned, bent or damaged. Did you find and replace any worn, missing, misaligned, bent or damaged brake pedal system components?	Go to Step 9	Go to Step 8
8	1. Inspect the brake assist system for the following conditions: - Vacuum leaks and/or improperly operating check valve, if equipped with vacuum assist - Power steering fluid leaks, if equipped with hydraulic power assist - Damaged or improperly operating brake booster assembly 2. Adjust, repair or replace components as necessary. Refer to <u>Brake Assist System Diagnosis.</u> Did you find and correct a condition?	Go to Step 9	Go to <u>Symptoms - Hydraulic Brakes</u>
9	1. Install or connect components that were removed or disconnected during diagnosis. 2. Road test the vehicle in order to confirm proper operation. Refer to <u>Brake System Vehicle Road Test.</u> Is the condition still present?	Go to Step 2	System OK

BRAKE PEDAL EXCESSIVE EFFORT

Brake Pedal Excessive Effort

Step	Action	Yes	No
DEFINITION: Brake pedal requires an increased amount of input from the driver to obtain good braking action and/or stopping distance is increased.			
1	Were you sent here from the Hydraulic Brake Symptom table?	Go to Step 2	Go to <u>Symptoms - Hydraulic Brakes</u>
2	- Inspect the brake assist system for the following conditions: - Vacuum leaks, if equipped with vacuum power assist - Power steering fluid leaks, if equipped with hydraulic power assist - Lack of lubrication, binding or excessively worn pushrod or pedal pivots or pivot bushings - Bent or damaged pedal pushrod, pedal and pedal bracket - Damaged or improperly operating brake booster assembly - Adjust, repair or replace components as necessary. Refer to <u>Brake Assist System Diagnosis</u>.		
	Did you find and correct a condition?	Go to Step 6	Go to Step 3
3	- Inspect the hydraulic brake system for the following conditions: - Binding caliper pistons - Binding wheel cylinder pistons, if equipped - Internally damaged flexible brake hoses; hindering fluid flow - External brake fluid leaks - Kinked or damaged flexible brake hoses and/or pipes - Internal brake fluid leaks; improperly operating master cylinder - Poor brake fluid quality; low boiling point - Adjust, repair or replace components as necessary. Refer to <u>Hydraulic Brake System Diagnosis</u>.		
	Did you find and correct a condition?	Go to Step 6	Go to Step 4
	Inspect the disc brake system for the following conditions:		

4	• Excessively worn linings • Glazed linings • Cracked, distorted or damaged linings • Contaminated linings • Binding, damaged or excessively worn caliper hardware and/or lining hardware • Lack of lubrication or excessive corrosion on metal to metal contact surfaces • Excessively worn or corroded rotor friction surfaces • Glazed rotor friction surfaces • Hard spots, heat checks, blueing discoloration of rotor friction surfaces 2. Adjust, repair or replace components as necessary. Refer to <u>Disc Brake System Diagnosis</u>.		
	Did you find and correct a condition?	Go to Step 6	Go to Step 5
5	1. Inspect the drum brake system, if equipped, for the following conditions: • Excessively worn linings • Improper adjustment or improper adjuster operation • Glazed linings • Cracked, distorted or damaged linings • Contaminated linings • Out of round or damaged drum • Bell-mouth or barrel-shaped drum friction surface • Hard spots, heat checks, blueing discoloration of drum friction surface • Lack of lubrication on backing plate • Excessive dust or foreign matter in drum 2. Adjust, repair or replace components as necessary. Refer to <u>Drum Brake System Diagnosis</u>.		
	Did you find and correct a condition?	Go to Step 6	Go to <u>Symptoms - Hydraulic Brakes</u>
	1. Install or connect components that were removed or disconnected during diagnosis. 2. Road test the vehicle in order to confirm proper		

6	operation. Refer to <u>Brake System Vehicle Road Test.</u>		
	Is the condition still present?	Go to Step 2	System OK

BRAKES DRAG

Brakes Drag

Step	Action	Yes	No
DEFINITION: Brake system does not fully release or has delayed release; vehicle motion may be hindered by brake system without applying brakes.			
1	Were you sent here from the Hydraulic Brake Symptom table?	Go to Step 2	Go to <u>Symptoms - Hydraulic Brakes</u>
2	Is the vehicle equipped with an adjustable stop lamp switch and/or an adjustable cruise control release switch?	Go to Step 3	Go to Step 4
3	1. Inspect the stop lamp switch for proper adjustment to ensure that the brake pedal is fully releasing. 2. Inspect the cruise control release switch, if equipped, for proper adjustment to ensure that the brake pedal is fully releasing.		
	Did you find and correct a condition?	Go to Step 15	Go to Step 4
4	Is the vehicle equipped with a drum-in-rotor type of park brake system?	Go to Step 5	Go to Step 7
5	Ensure the park brake shoes are not adjusted too tightly, possibly causing drag under certain conditions. Are the park brake shoes adjusted too tightly?	Go to Step 6	Go to Step 8
6	1. Clean and inspect the park brake shoes for excessive wear and/or damage. 2. Inspect the drum portion of the rotors for excessive wear, blueing discoloration and heat spots. 3. If any of these conditions are present, replace the affected components. 4. Adjust the park brake system.		
	Did you find and correct a condition?	Go to Step 15	Go to Step 8
	1. Inspect the drum brake system, if equipped, for the following conditions: • Improper adjustment • Weak or damaged return spring or springs • Distorted or damaged linings • Out of round or damaged drum • Weak or damaged hold down spring or		

7	springs • Lack of lubrication on backing plate • Distorted or damaged backing plate 2. Adjust, repair or replace components as necessary. Refer to <u>Drum Brake System Diagnosis</u>.		
	Did you find and correct a condition?	Go to Step 15	Go to Step 8
8	Inspect the park brake system for proper operation. Refer to <u>Park Brake System Diagnosis</u> . Did you find and correct a condition?	Go to Step 15	Go to Step 9
9	1. Inspect the disc brake system for the following conditions: • Binding, incorrectly installed or missing caliper hardware and/or lining hardware- Ensure free movement of linings and of caliper, if equipped with sliding type caliper. • Lack of lubrication or excessive corrosion on metal to metal contact surfaces • Distorted or damaged linings • Damaged or excessively worn caliper hardware and/or lining hardware • Bent or damaged caliper or mounting component 2. Adjust, repair or replace components as necessary. Refer to <u>Disc Brake System Diagnosis</u>.		
	Did you find and correct a condition?	Go to Step 15	Go to Step 10
10	1. Separate the brake booster pushrod from the brake pedal. 2. Inspect the brake corners to determine if the brake drag condition is still present.		
	Do the brake corners still exhibit the brake drag condition?	Go to Step 12	Go to Step 11
11	1. Inspect the pushrod for improper position and/or damage. Correctly position or replace the pushrod if necessary. 2. Inspect the brake pedal assembly for damage and replace if necessary.		-
	Did you complete the repair or replacement?	Go to Step 15	
	1. For vacuum boost systems, disconnect the vacuum check valve from the booster to relieve vacuum reserve.		

12	2. Separate the master cylinder from the brake booster. Do not disconnect any brake pipes. 3. Inspect the brake corners to determine if the brake drag condition is still present.		
	Do the brake corners still exhibit the brake drag condition?	Go to Step 14	Go to Step 13
13	Replace the brake booster assembly. Did you complete the replacement?	Go to Step 15	-
14	1. Inspect the hydraulic brake system for the following conditions: • Improper operation of wheel cylinder pistons, if equipped • Improper operation of caliper pistons • Contaminated brake fluid • Internally damaged flexible brake hoses; hindering brake release • Damaged or improperly operating master cylinder 2. Adjust, repair or replace components as necessary. Refer to <u>Hydraulic Brake System Diagnosis</u>.		
	Did you find and correct a condition?	Go to Step 15	Go to <u>Symptoms - Hydraulic Brakes</u>
15	1. Install or connect components that were removed or disconnected during diagnosis. 2. Road test the vehicle in order to confirm proper operation. Refer to <u>Brake System Vehicle Road Test</u>.		
	Is the condition still present?	Go to Step 2	System OK

BRAKE SYSTEM SLOW RELEASE

Brake System Slow Release

Step	Action	Yes	No
DEFINITION: Brake system releases and returns to rest slowly; vehicle motion is hindered by brake system briefly after release of brake pedal.			
1	Were you sent here from the Hydraulic Brake Symptom table?	Go to Step 2	Go to <u>Symptoms - Hydraulic Brakes</u>
	1. Inspect the hydraulic brake system for the following conditions: • Improper operation of wheel cylinder pistons, if equipped		

2	• Improper operation of caliper pistons • Internally damaged flexible brake hoses; hindering brake release • Contaminated brake fluid • Damaged or improperly operating master cylinder 2. Adjust, repair or replace components as necessary. Refer to <u>Hydraulic Brake System Diagnosis</u>.		
	Did you find and correct a condition?	Go to Step 6	Go to Step 3
3	1. Inspect the brake assist system for the following conditions: • Binding, bent or damaged pedal pushrod, pedal and pedal bracket • Damaged or improperly operating vacuum booster, if equipped • Restricted return hose from hydraulic booster, if equipped • Damaged or improperly operating hydraulic booster, if equipped 2. Adjust, repair or replace components as necessary. Refer to <u>Brake Assist System Diagnosis</u>.		
	Did you find and correct a condition?	Go to Step 6	Go to Step 4
4	1. Inspect the drum brake system, if equipped, for the following conditions: • Weak or damaged return spring or springs • Distorted or damaged linings • Out of round or damaged drum • Lack of lubrication on backing plate • Distorted or damaged backing plate 2. Adjust, repair or replace components as necessary. Refer to <u>Drum Brake System Diagnosis</u>.		
	Did you find and correct a condition?	Go to Step 6	Go to Step 5
	1. Inspect the disc brake system for the following conditions: • Damaged or excessively worn caliper hardware and/or lining hardware • Distorted or damaged linings • Lack of lubrication or excessive corrosion on		

5	metal to metal contact surfaces • Bent or damaged caliper or mounting component 2. Adjust, repair or replace components as necessary. Refer to <u>Disc Brake System Diagnosis</u>.		
	Did you find and correct a condition?	Go to Step 6	Go to <u>Symptoms - Hydraulic Brakes</u>
6	1. Install or connect components that were removed or disconnected during diagnosis. 2. Road test the vehicle in order to confirm proper operation. Refer to <u>Brake System Vehicle Road Test</u>.		
	Is the condition still present?	Go to Step 2	System OK

BRAKE FLUID LOSS

Brake Fluid Loss

Step	Action	Yes	No
DEFINITION: Brake fluid level is low not related to lining wear.			
1	Were you sent here from the Hydraulic Brake Symptom table?	Go to Step 2	Go to <u>Symptoms - Hydraulic Brakes</u>
2	1. Inspect the following hydraulic brake system components for brake fluid leaks: • Flexible brake hose connections; threaded and bolted • Flexible brake hose crimping joints • Brake pipe fittings • Caliper piston seals • Wheel cylinder piston seals, if equipped • Master cylinder reservoir • Master cylinder reservoir low pressure hose, if equipped • Brake pressure modulator valve (BPMV) assembly, if equipped 2. Repair or replace components as necessary. Refer to <u>Hydraulic Brake System Diagnosis</u>.		
	Did you find and correct a condition?	Go to Step 5	Go to Step 3
	1. Disconnect the vacuum check valve from the booster to relieve vacuum reserve. 2. Separate the master cylinder from the vacuum brake		

3	booster. Do not disconnect any brake pipes. 3. Inspect the rear of the master cylinder for a brake fluid leak. 4. Inspect for brake fluid in the vacuum brake booster. Did you find the brake fluid leak?	Go to Step 4	Go to <u>Symptoms - Hydraulic Brakes</u>
4	Replace the brake master cylinder and the vacuum brake booster. Did you complete the replacement?	Go to Step 5	-
5	1. Install or connect components that were removed or disconnected during diagnosis. 2. Road test the vehicle to confirm proper operation. Refer to <u>Brake System Vehicle Road Test.</u> Is the condition still present?	Go to Step 2	System OK

DISC BRAKE SYSTEM DIAGNOSIS

Test Description

The numbers below refer to the step numbers on the diagnostic table:

9

Lubricant leaks from non-brake system components may come in contact with and contaminate brake system components.

10

Lubricant leaks from non-brake system components may come in contact with and contaminate brake system components.

12

Disc brake rotor shields/backing plates that come in contact with disc brake rotors may cause brake system noise.

15

Disc brake rotor thickness variation that exceeds the maximum acceptable level can cause brake pulsation.

19

Disc brake rotor thickness variation that exceeds the maximum acceptable level can cause brake pulsation.

Disc brake rotor assembled lateral runout (LRO) that exceeds the maximum acceptable level can lead to thickness variation.

Disc Brake System Diagnosis

Step	Action	Yes	No
DEFINITION: This diagnostic table is designed to diagnose ONLY the components of the DISC brake system in order to determine if the DISC brake system is operating correctly. You will be directed by the appropriate Symptom table to go to other brake system diagnostic tables as appropriate.			
1	Were you sent here from a Brake Symptom table?	Go to Step 2	Go to <u>Symptoms - Hydraulic Brakes</u>
2	Visually inspect the disc brake pads for the following conditions: Refer to <u>Brake Pad Inspection</u> . • Lining thickness below specifications • Uneven and/or abnormal wear - edge-to-edge and/or side-to-side • Looseness or damage - including brake pad hardware • Evidence of contamination from an external substance Did you find any conditions to indicate a concern with any of the front and/or rear disc brake pads?	Go to Step 3	Go to Step 12
3	Are any of the front disc brake pads contaminated?	Go to Step 8	Go to Step 4
4	Are any of the front disc brake pads worn unevenly?	Go to Step 7	Go to Step 5
5	Are any of the front disc brake pads and/or brake pad hardware loose or damaged?	Go to Step 7	Go to Step 6
6	1. Remove and inspect the worn disc brake pads for glazing, looseness, heat spots or damage. 2. Replace the worn disc brake pads as a complete axle set. Refer to <u>Front Disc Brake Pads Replacement</u> . Did you complete the inspection and replacement?	Go to Step 12	-
	CAUTION: Support the brake caliper with heavy mechanic wire and equivalent, whenever it is separated from its mount and the hydraulic flexible brake hose is still connected. Failure to support the caliper in this manner will cause the flexible brake hose to bear the weight of the caliper,		

7	which may cause damage to the brake hose and in turn may cause a brake fluid leak. NOTE: Do NOT disconnect the hydraulic brake flex hoses from the calipers. 1. Remove the front brake caliper, as appropriate, from the mounting bracket and support the brake caliper. Refer to <u>Front Brake Caliper Replacement</u> . 2. Inspect the disc brake caliper mounting bracket and the mounting/sliding hardware for the following conditions: • Binding or seized hardware • Worn, damaged or missing hardware components • Loose, bent, cracked and damaged brake caliper mounting bracket 3. Replace components as required. Refer to <u>Front Brake Caliper Bracket Replacement</u> 4. Replace the unevenly-worn, loose or damaged disc brake pads as a complete axle set. Refer to <u>Front Disc Brake Pads Replacement</u> . Did you complete the inspection and replacement?	Go to Step 12	-
8	1. Inspect the disc brake calipers, brake hoses and brake pipes for evidence of an external brake fluid leak. 2. Replace any components found to be leaking brake fluid. Refer to the following procedures as required: • <u>Front Brake Caliper Overhaul</u> • <u>Front Brake Caliper Replacement</u> • <u>Front Brake Hose Replacement</u> • <u>Brake Pipe Replacement</u> Did you find and correct the source of the leak causing contamination of the brake pads?	Go to Step 11	Go to Step 9
	1. Inspect the wheel drive shaft outer seals for damage and evidence of a grease leak. 2. Replace any wheel drive shaft seal that is found to be leaking grease which may be the source of the		

9	contamination to the brake pads. Refer to <u>Front Wheel Drive Shaft Outer Joint Replacement</u> . Did you find and correct the source of the leak causing contamination of the brake pads?	Go to Step 11	Go to Step 10
10	1. Inspect the automatic transmission cooling system lines, if equipped, for damage and evidence of an external fluid leak which may be the source of the contamination to the pads. 2. Replace any components found to be leaking which may be the source of the contamination to the pads. Did you find and correct the source of the leak causing contamination of the pads?	Go to Step 11	-
11	1. Clean the remaining disc brake system components to remove any traces of the contaminant. CAUTION: Support the brake caliper with heavy mechanic wire and equivalent, whenever it is separated from its mount and the hydraulic flexible brake hose is still connected. Failure to support the caliper in this manner will cause the flexible brake hose to bear the weight of the caliper, which may cause damage to the brake hose and in turn may cause a brake fluid leak. NOTE: Do NOT disconnect the hydraulic brake flex hoses from the calipers. 2. Remove the front disc brake caliper from the brake caliper mounting bracket and support the brake caliper. Refer to <u>Front Brake Caliper Replacement</u> . 3. Inspect the disc brake caliper mounting/sliding hardware for the following conditions: Refer to <u>Front Disc Brake Mounting and Hardware Inspection</u> . • Binding or seized hardware • Distorted, worn, damaged or missing hardware components		-

	4. Replace the brake mounting/sliding hardware components as required. Refer to <u>Front Disc Brake Mounting and Hardware Inspection</u> . 5. Replace the contaminated brake pads as a complete axle set. Refer to <u>Front Disc Brake Pads Replacement</u> . Did you complete the cleaning, inspection and replacement?	Go to Step 12	
12	1. Check the thickness of each of the disc brake rotors. NOTE: Make the following determination and answer the question individually for EACH rotor. 2. Make a determination for each brake rotor if the brake rotor can be REFINISHED and REMAIN ABOVE the minimum requirements. Refer to <u>Brake Rotor Thickness Measurement</u> .Does the brake rotor meet the minimum requirements for REFINISHING?	Go to Step 13	Go to Step 16
13	NOTE: Make the following determination and answer the question individually for EACH rotor. Inspect each of the brake rotors for thickness variation that exceeds the maximum acceptable level. Refer to <u>Brake Rotor Thickness Variation Measurement</u> .Does the brake rotor exhibit thickness variation that exceeds the maximum acceptable level?	Go to Step 15	Go to Step 14
14	1. Inspect each of the brake rotors for the following surface and wear conditions: Refer to <u>Brake Rotor Surface and Wear Inspection</u> . • Heavy rust and/or pitting • Cracks and/or heat spots • Excessive blueing discoloration • Deep or excessive scoring beyond maximum acceptable level		

	NOTE: Make the following determination and answer the question individually for EACH rotor. 2. Make a determination for each brake rotor if the brake rotor requires refinishing based upon the results of the inspection. 3. If the brake rotor exhibits any of the conditions listed previously, it requires refinishing. Does the brake rotor require REFINISHING?	Go to Step 15	Go to Step 20
15	1. Refinish the brake rotor. Refer to <u>Brake Rotor Refinishing</u> . 2. Inspect the brake rotor thickness. Refer to <u>Brake Rotor Thickness Measurement</u> . Were you able to REFINISH the brake rotor within the minimum requirements?	Go to Step 20	Go to Step 19
16	Is the brake disc at or below the DISCARD requirements?	Go to Step 19	Go to Step 17
17	NOTE: Make the following determination and answer the question individually for EACH rotor. Inspect each of the brake rotors for thickness variation that exceeds the maximum acceptable level. Refer to <u>Brake Rotor Thickness Variation Measurement</u> .Does the brake rotor exhibit thickness variation that exceeds the maximum acceptable level?	Go to Step 19	Go to Step 18
18	1. Inspect each of the brake rotors for the following surface and wear conditions: Refer to <u>Brake Rotor Surface and Wear Inspection</u> . • Heavy rust and/or pitting • Cracks and/or heat spots • Excessive blueing discoloration • Deep or excessive scoring beyond maximum acceptable level NOTE: Make the following determination and answer the question individually for EACH rotor.		

	2. Make a determination for each brake rotor if the rotor requires replacement based upon the results of the inspection. If the brake rotor exhibits any of the conditions listed previously, it requires replacement. Does the brake rotor require REPLACEMENT?	Go to Step 19	Go to Step 20
19	NOTE: Whenever a brake rotor is replaced, the assembled lateral runout (LRO) of the brake rotor must be measured to ensure optimum performance of the disc brakes. Replace the brake rotor. Refer to <u>Front Brake Rotor Replacement</u> .Did you complete the replacement?	Go to Step 22	-
20	NOTE: Make the following determination and answer the question individually for EACH rotor. Inspect each of the brake rotors for assembled lateral runout (LRO) that exceeds the maximum acceptable level. Refer to <u>Brake Rotor Assembled Lateral Runout Measurement</u> .Does the brake rotor exhibit assembled LRO that exceeds the maximum acceptable level?	Go to Step 21	Go to Step 22
21	Correct the LRO for each brake rotor that was determined to have LRO exceeding the maximum acceptable level. Refer to <u>Brake Rotor Assembled Lateral Runout Correction</u> . Did you complete the operation?	Go to Step 22	-
22	Install or connect components that were removed or disconnected during diagnosis. Did you complete the operation?	Disc Brake System OK Return to Symptom Table	-

DRUM BRAKE SYSTEM DIAGNOSIS

Test Description

The number below refers to the step number on the diagnostic table:

18

Drum brake backing plates that come in contact with brake drums may cause brake system noise.

Drum Brake System Diagnosis

Step	Action	Yes	No
DEFINITION: This diagnostic table is designed to diagnose ONLY the components of the DRUM brake system in order to determine if the DRUM brake system is operating properly. You will be directed by the appropriate Symptom table to go to other brake system diagnostic tables as appropriate.			
1	Were you sent here from a Brake Symptom table?	Go to Step 2	Go to <u>Symptoms - Hydraulic Brakes</u>
2	1. Remove the brake drums. Refer to <u>Brake Drum Replacement</u> . 2. Inspect the drum brake shoes for the following conditions: • Lining thickness below specifications • Uneven and/or abnormal wear - edge-to-edge and/or side-to-side • Looseness, damage, glazing and incorrect lining material Did you find any conditions to indicate a concern with any of the drum brake shoes?	Go to Step 3	Go to Step 7
3	Are any of the brake shoes contaminated?	Go to Step 4	Go to Step 5
4	1. Inspect the wheel cylinders for evidence of an external brake fluid leak. 2. Replace any wheel cylinder that is found to be leaking brake fluid. Refer to <u>Rear Brake Cylinder Replacement</u> . Did you complete the inspection and replacement?	Go to Step 6	-
5	1. Inspect the drum brake hardware for any components which are worn, damaged, discolored due to stress, broken or missing. Refer to <u>Drum Brake Hardware Inspection</u> . 2. Replace components as required. Refer to <u>Drum Brake Hardware Replacement</u> . 3. Replace the drum brake shoes. Refer to <u>Brake Shoe Replacement</u> . Did you complete the inspection and replacement?	Go to Step 8	-
	1. Clean the remaining drum brake system components to remove any traces of the contaminants. 2. Inspect the drum brake hardware for any components which are worn, damaged, discolored due to stress, broken or missing. Refer to <u>Drum</u>		

6	<u>Brake Hardware Inspection</u> . - Replace the drum brake hardware components as required. Refer to <u>Drum Brake Hardware Replacement</u> . - Replace the contaminated brake shoes. Refer to <u>Brake Shoe Replacement</u> . Did you complete the cleaning, inspection and replacement?	Go to Step 8	-
7	- Inspect the drum brake hardware for any components which are worn, damaged, discolored due to stress, broken or missing. Refer to <u>Drum Brake Hardware Inspection</u> . - Replace components as required. Refer to <u>Drum Brake Hardware Replacement</u> . Did you complete the inspection and, if necessary, the replacement?	Go to Step 8	-
8	- Check the diameter of each of the brake drums. NOTE: Make the following determination and answer the question individually for EACH rotor. - Make a determination for each brake drum if the drum can be REFINISHED and REMAIN ABOVE the minimum requirements. Refer to <u>Brake Drum Diameter Measurement</u> .Does the brake drum meet the minimum requirements for REFINISHING?	Go to Step 9	Go to Step 11
	- Inspect each of the brake drums for the following surface and wear conditions: Refer to <u>Brake Drum Surface and Wear Inspection</u> . - Braking surface conditions - Heavy rust and/or pitting - Cracks and/or heat spots - Excessive blueing discoloration - Missing balance weights - Braking surface wear conditions		

9	○ Deep or excessive scoring beyond maximum acceptable level ○ Radial runout beyond maximum acceptable level NOTE: Make the following determination and answer the question individually for EACH rotor. 2. Make a determination for each brake drum if the drum requires refinishing based upon the results of the inspection. If the brake drum exhibits any of the following conditions, it requires refinishing: ● Drum exhibits one or more of the braking surface conditions listed previously. ● Drum is beyond the acceptable level in one or more of the braking surface wear conditions listed previously Does the brake drum require REFINISHING?	Go to Step 10	Go to Step 14
10	1. Refinish the brake drum. Refer to <u>Brake Drum Refinishing</u> . 2. Inspect the brake drum diameter. Refer to <u>Brake Drum Diameter Measurement</u> . Were you able to REFINISH the brake drum within the minimum requirements?	Go to Step 14	Go to Step 13
11	Is the brake drum at or below the DISCARD requirements?	Go to Step 13	Go to Step 12
	1. Inspect each of the brake drums for the following surface and wear conditions: Refer to <u>Brake Drum Surface and Wear Inspection</u> . ● Braking surface conditions ○ Heavy rust and/or pitting ○ Cracks and/or heat spots ○ Excessive blueing discoloration ○ Missing balance weights ● Braking surface wear conditions		

	○ Missing balance weights ○ Radial runout beyond maximum acceptable level NOTE: Make the following determination and answer the question individually for EACH rotor. 2. Make a determination for each brake drum if the drum requires replacement based upon the results of the inspection. If a brake drum exhibits any of the following conditions, it requires replacement: • Drum exhibits one or more of the braking surface conditions listed previously • Drum is beyond the acceptable level in one or more of the braking surface wear conditions listed previously		
12	Does the brake drum require REPLACEMENT?	Go to Step 13	Go to Step 14
13	Replace the brake drum. Refer to <u>Brake Drum Replacement</u> . Did you complete the replacement?	Go to Step 14	-
14	Inspect the brake shoes for proper adjustment. Refer to <u>Drum Brake Adjustment</u> . Are the brake shoes adjusted properly?	Go to Step 18	Go to Step 15
15	Inspect the components of the brake drum adjustment hardware system for free movement and correct operation. Refer to <u>Drum Brake Adjusting Hardware Inspection</u> . Do the drum brake adjusting hardware components operate freely and correctly?	Go to Step 17	Go to Step 16
16	Replace the drum brake adjusting hardware components as necessary. Refer to <u>Drum Brake Adjusting Hardware Replacement</u> . Is the replacement complete?	Go to Step 17	-
17	Adjust the drum brake shoes. Refer to <u>Drum Brake Adjustment</u> . Were you able to complete the adjustment?	Go to Step 20	Return to Symptom Table
18	Inspect the drum brake backing plate for the following: • Excessive wear or rust • Damage and/or evidence of contact with the brake drum		

	Does the drum brake backing plate exhibit any of these conditions?	Go to Step 19	Go to Step 20
19	Repair or replace the drum brake backing plate as necessary. Refer to <u>Rear Brake Backing Plate Replacement</u> . Did you complete the repair or replacement?	Go to Step 20	-
20	Install or connect components that were removed or disconnected during diagnosis. Did you complete the operation?	Drum Brake System OK Return to Symptom Table	-

HYDRAULIC BRAKE SYSTEM DIAGNOSIS

Hydraulic Brake System Diagnosis

Step	Action	Yes	No
DEFINITION: This diagnostic table is designed to diagnose ONLY the components of the HYDRAULIC brake system in order to determine if the HYDRAULIC brake system is operating properly. You will be directed by the appropriate Symptom table to go to other brake system diagnostic tables as appropriate.			
1	Were you sent here from a Brake Symptom table?	Go to Step 2	Go to <u>Symptoms - Hydraulic Brakes</u>
2	Inspect and adjust the brake fluid level in the brake master cylinder. Refer to <u>Master Cylinder Reservoir Filling</u> . Was the brake fluid level low?	Go to Step 3	Go to Step 4
3	- Inspect the brake fluid for the following conditions, indicating brake fluid contamination: - Fluid separation, indicating two types of fluid are present - Swirled appearance - oil-based substance - Layered appearance - silicone-based substance - Fluid discoloration - Cloudy appearance - moisture - Dark appearance/suspended particles in fluid - dirt, rust, corrosion, brake dust - Inspect the master cylinder reservoir cap diaphragm and the reservoir-to-master cylinder grommets for swelling, indicating fluid contamination. Do any of the above conditions exist?	Go to Step 5	Go to Step 6
	Inspect the brake fluid for the following conditions, indicating brake fluid contamination:		

4	• Fluid separation, indicating two types of fluid are present ○ Swirled appearance - oil-based substance ○ Layered appearance - silicone-based substance • Fluid discoloration ○ Cloudy appearance - moisture ○ Dark appearance/suspended particles in fluid - dirt, rust, corrosion, brake dust 2. Inspect the master cylinder reservoir cap diaphragm and the reservoir-to-master cylinder grommets for swelling, indicating fluid contamination. Do any of the above conditions exist?		
5	1. Flush the hydraulic brake system. Refer to <u>Hydraulic Brake System Flushing</u>. 2. If the brake fluid WAS contaminated with an oil-based or a silicone-based fluid, indicated by fluid separation and/or a swollen master cylinder reservoir cap diaphragm and/or swollen reservoir-to-master cylinder grommets, perform the following steps. Refer to the procedures indicated. 1. Remove ALL of the following components listed. Each component contains internal rubber seals/linings which have been contaminated. 2. Clean out the hydraulic brake pipes using denatured alcohol and equivalent. 3. Dry the brake pipes using non-lubricated, filtered air. 4. Repair or replace ALL of the following components listed. Each component contains internal rubber seals/linings which have been contaminated. • Replace the brake master cylinder reservoir cap diaphragm. • <u>Master Cylinder Replacement (Right Hand Drive), Master Cylinder Replacement (Left Hand Drive)</u> • Brake master cylinder reservoir: Clean the brake master cylinder reservoir using denatured alcohol and equivalent, then dry the reservoir using non-lubricated, filtered air and if necessary, replace the		-

	brake master cylinder reservoir. • <u>Front Brake Hose Replacement</u> • <u>Rear Brake Hose Replacement</u> • <u>Front Brake Caliper Overhaul</u> • <u>Front Brake Caliper Replacement</u> • <u>Rear Brake Cylinder Replacement</u> • <u>Brake Proportion Valve Replacement (Left Hand Drive), Brake Proportion Valve Replacement (Right Hand Drive)</u>, if equipped • <u>Brake Pressure Modulator Valve Replacement</u> , if equipped 3. If the brake fluid was NOT contaminated with an oil-based fluid, but WAS contaminated with water or dirt, rust, corrosion, and/or brake dust, replace the brake master cylinder reservoir cap diaphragm which may have allowed moisture or dirt to enter the system. 4. Refill and bleed the hydraulic brake system. Refer to <u>Hydraulic Brake System Bleeding (Manual)</u>, <u>Hydraulic Brake System Bleeding (Pressure)</u>. Did you complete the operation and any required repairs and/or replacements?		
6	1. Inspect the following hydraulic brake system components for external fluid leaks. Repair or replace any of the components found to be leaking brake fluid. Refer to the appropriate procedures: • Brake master cylinder reservoir cap diaphragm • <u>Master Cylinder Replacement (Right Hand Drive), Master Cylinder Replacement (Left Hand Drive)</u> • <u>Front Brake Hose Replacement</u> • <u>Rear Brake Hose Replacement</u> • <u>Brake Pipe Replacement</u> • <u>Front Brake Caliper Overhaul</u> • <u>Front Brake Caliper Replacement</u> • <u>Brake Proportion Valve Replacement (Left Hand Drive), Brake Proportion Valve Replacement (Right Hand Drive)</u>, if equipped • <u>Brake Pressure Modulator Valve Replacement</u> , if equipped 2. If you repaired or replaced any of the brake system		

	components listed, bleed the hydraulic brake system. Refer to <u>Hydraulic Brake System Bleeding (Manual)</u>, <u>Hydraulic Brake System Bleeding (Pressure)</u>. While bleeding the hydraulic brake system, observe for the following conditions: • The presence of air in the system at a bleeder valve location other than at the repair location, except if the brake master cylinder, and/or the proportioning valve assembly, was replaced • An unrestricted and even flow of brake fluid per axle during the bleeding procedure		
	Did you find and correct a condition?	Go to Step 7	Go to Step 12
7	Was there air in the system at a bleeder valve location other than at the repair location, except if the brake master cylinder, and/or the proportioning valve assembly, was replaced?	Go to Step 19	Go to Step 8
8	Was the flow of brake fluid unrestricted and even per axle during the bleeding procedure?	Go to Step 9	Go to Step 10
9	Inspect the hydraulic function of the brake calipers and/or wheel cylinders, if equipped for proper operation. Refer to <u>Hydraulic Brake Component Operation Visual Inspection</u>. Was the hydraulic function of the brake calipers/wheel cylinders operating properly?	Go to Step 21	Go to Step 14
10	Was the flow of brake fluid restricted or uneven through front axle hydraulic components during the bleeding procedure?	Go to Step 13	Go to Step 11
11	Was the flow of brake fluid restricted or uneven through rear axle hydraulic components during the bleeding procedure?	Go to Step 17	-
12	Inspect the hydraulic function of the brake calipers/wheel cylinders for proper operation. Refer to <u>Hydraulic Brake Component Operation Visual Inspection</u>. Was the hydraulic function of the brake calipers/wheel cylinders operating properly?	Go to Step 15	Go to Step 13
13	Determine if the brake caliper is restricting the flow of brake fluid and/or not operating properly: 1. Raise and support the vehicle. Refer to <u>Lifting and Jacking the Vehicle</u> . 2. Remove the tire and wheel assemblies. Refer to <u>Tire and Wheel Removal and Installation</u> . 3. Open the suspected brake caliper bleeder valve. 4. Using a large C-clamp, compress the brake caliper piston and observe for an unrestricted flow of brake		

	fluid and for free movement of the brake caliper piston. 5. Close the caliper bleeder valve. Was the flow of brake fluid unrestricted and did the caliper piston move freely?	Go to Step 17	Go to Step 14
14	Repair or replace any brake caliper/wheel cylinder that was not operating properly. Refer to the appropriate procedure. • <u>Front Brake Caliper Overhaul</u> • <u>Front Brake Caliper Replacement</u> • <u>Rear Brake Cylinder Replacement</u> Did you complete the repair and/or replacement?	Go to Step 21	-
15	Bleed the hydraulic brake system to observe for the presence of air in the system and to observe for an unrestricted and even flow of brake fluid per axle during the bleeding procedure. Refer to <u>Hydraulic Brake System Bleeding (Manual)</u>, <u>Hydraulic Brake System Bleeding (Pressure)</u>. Was there air in the system?	Go to Step 19	Go to Step 16
16	Was the flow of brake fluid unrestricted and even per axle during the bleeding procedure?	Go to Step 21	Go to Step 17
17	1. Inspect the hydraulic brake pipes and flexible brake hoses for signs of a fluid restriction; such as being bent, kinked, pinched or damaged. Refer to <u>Brake Pipe and Hose Inspection</u>. 2. Replace any of the hydraulic brake pipes and/or flexible brake hoses found to be bent, kinked, pinched and damaged. Refer to the following procedures as necessary: • <u>Front Brake Hose Replacement</u> • <u>Rear Brake Hose Replacement</u> 3. If none of the hydraulic brake pipes or flexible brake hoses were visibly bent, kinked, pinched and damaged, replace the hydraulic brake flex hose at the restricted location. Did you find and correct a condition?	Go to Step 21	Go to Step 18
	1. If equipped with non-ABS, replace the proportioning valve assembly. Refer to <u>Brake Proportion Valve Replacement (Left Hand Drive)</u>, <u>Brake Proportion Valve Replacement (Right Hand Drive)</u>.		

18	2. If equipped with ABS, replace the brake modulator assembly, in order to correct the hydraulic brake dynamic rear proportioning mechanical operation. Refer to <u>Brake Pressure Modulator Valve Replacement</u> . Did you complete the replacement?	Go to Step 21	-
19	1. Inspect the hydraulic brake system components for brake fluid seepage at a seal and/or fitting location, which may have drawn air into the system. 2. Inspect the hydraulic brake system components for evidence of a recent repair, which may have introduced air into the system. 3. Repair or replace any of the components found to be installed incorrectly or seeping brake fluid. Did you find and correct a condition?	Go to Step 21	Go to Step 20
20	1. Inspect the brake master cylinder for internal fluid leaks. Refer to <u>Brake System Internal Leak Test</u>. 2. Repair or replace the brake master cylinder if it is found to be leaking brake fluid internally. Refer to <u>Master Cylinder Replacement (Right Hand Drive)</u>, <u>Master Cylinder Replacement (Left Hand Drive)</u>. Did you find and correct a condition?	Go to Step 21	Return to Symptom Table
21	Install or connect components that were removed or disconnected during diagnosis. Did you complete the operation?	Hydraulic Brake System OK Return to Symptom Table	-

BRAKE ASSIST SYSTEM DIAGNOSIS

Brake Assist System Diagnosis

Step	Action	Yes	No
DEFINITION: This diagnostic table is designed to diagnose ONLY the components of the brake ASSIST system in order to determine if the brake ASSIST system is operating properly. You will be directed by the appropriate Symptom table to go to other brake system diagnostic tables as appropriate.			
1	Were you sent here from a Brake Symptom table?	Go to Step 3	Go to Step 2
2	Were you sent here directly from an electrical diagnostic to investigate vacuum as a possible concern?	Go to Step 5	<u>Symptoms - Hydraulic Brakes</u>
3	Inspect for proper brake pedal travel. Refer to <u>Brake Pedal Travel Measurement and Inspection</u>. Is the brake pedal travel distance within the acceptable limits?	Go to Step 5	Go to Step 4

4	- Inspect for worn, missing, misaligned, bent or damaged brake pedal system components. - For the brake pedal pushrod component inspection, refer to <u>Brake Pedal Pushrod Inspection</u>. - Inspect the brake pedal bushings for excessive wear and/or damage and inspect the brake pedal for a misaligned, bent and/or damaged condition. - Replace the brake pedal system components that are worn, missing, misaligned, bent or damaged. Did you find and replace any worn, missing, misaligned, bent or damaged brake pedal system components?	Go to Step 5	Go to <u>Hydraulic Brake System Diagnosis</u>
5	Check the engine vacuum source that supplies vacuum to the vacuum brake booster. Refer to <u>Brake System Vacuum Source Test</u>. Is the vacuum reading within the acceptable limits?	Go to Step 6	Go to Engine Controls Diagnostics Information
6	Does the condition occur during cold start-up conditions?	Go to Step 7	Go to Step 8
7	Check engine vacuum and vacuum pump operation, if equipped, under the same cold start-up conditions. Refer to Engine Controls Diagnostics. Did you find and correct a condition?	Go to Step 22	Go to Step 9
8	During the vacuum source test, did the vacuum booster check valve operate properly?	Go to Step 10	Go to Step 9
9	Replace the vacuum booster check valve. Refer to <u>Power Brake Booster Vacuum Check Valve and Hose Replacement (Left Hand Drive), Power Brake Booster Vacuum Check Valve and Hose Replacement (Right Hand Drive)</u>. Did you complete the replacement?	Go to Step 10	-
10	If equipped with a booster mounted separate vacuum sensor, inspect the vacuum sensor grommet for cracks, cuts, dry-rot and damage. Does the vacuum sensor grommet exhibit any of the conditions listed?	Go to Step 11	Go to Step 12
11	Replace the vacuum sensor grommet. Did you complete the replacement?	Go to Step 12	-
12	- If the vehicle is equipped with a vacuum sensor, install a scan tool. - Using the Data Display function, determine if brake booster vacuum sensor data is available within either the chassis brake controls area or the powertrain engine controls area.		

	Is vacuum sensor data available through the scan tool?	Go to Step 13	Go to Step 12
13	Perform the vacuum booster leak-down test using a scan tool: 1. Release the brake pedal. 2. Accelerate the engine to approximately 3000 RPM, then release the throttle. Wait 2-3 seconds and repeat once. 3. Turn the ignition OFF. 4. Turn the ignition ON. Do not start the engine. 5. Observe and record the vacuum sensor reading on the scan tool over a period of 60 seconds. NOTE: Vacuum readings will decrease by approximately 2.7 kPa (0.8 in Hg) for every 305 m (1000 ft) of elevation above seal level. 6. Determine the rate of vacuum leak. Specification Maximum allowable vacuum leak rate: 10 kPa (3 in Hg) in 60 seconds Was the rate of vacuum leak within the specified allowable range?		
14	1. Deplete the vacuum reserve by pressing the brake pedal several times and by removing the vacuum booster check valve. 2. Separate the master cylinder from the vacuum brake booster. Do not disconnect any brake pipes. Refer to <u>Master Cylinder Replacement (Right Hand Drive), Master Cylinder Replacement (Left Hand Drive)</u>. 3. If equipped with a vacuum seal on the rear of the master cylinder, inspect the seal for damage and correct positioning on the master cylinder. Replace the vacuum seal as necessary. 4. Carefully reinstall the master cylinder to the brake booster. Refer to <u>Master Cylinder Replacement (Right Hand Drive), Master Cylinder Replacement (Left Hand Drive)</u>.		-

	Did you complete the operation?	Go to Step 15	
15	Perform the vacuum booster leak-down test using a scan tool: 1. Release the brake pedal. 2. Accelerate the engine to approximately 3000 RPM, then release the throttle. Wait 2-3 seconds and repeat once. 3. Turn the ignition OFF. 4. Turn the ignition ON. Do not start the engine. 5. Observe and record the vacuum sensor reading on the scan tool over a period of 60 seconds. NOTE: Vacuum readings will decrease by approximately 2.7 kPa (0.8 in Hg) for every 305 m (1000 ft) of elevation above seal level. 6. Determine the rate of vacuum leak. Specification Maximum allowable vacuum leak rate: 10 kPa (3 in Hg) in 60 seconds Was the rate of vacuum leak within the specified allowable range?	Go to Step 22	Go to Step 21
16	1. Separate the master cylinder from the vacuum brake booster. Do not disconnect any brake pipes. Before removing the master cylinder, first deplete the vacuum by removing the check valve or applying the brake pedal several times. Refer to <u>Master Cylinder Replacement (Right Hand Drive), Master Cylinder Replacement (Left Hand Drive)</u>. 2. If equipped with a vacuum seal on the rear of the master cylinder, inspect the seal for damage and correct positioning on the master cylinder. 3. If equipped with a vacuum seal that is part of the booster, inspect the seal for damage. Does the vacuum seal exhibit any of the conditions listed?	Go to Step 17	Go to Step 18
	1. If equipped with a vacuum seal on the rear of the		

17	master cylinder, replace the vacuum seal as necessary. Ensure the seal is positioned correctly during installation. - If equipped with a vacuum seal that requires replacement and which is part of the booster, the booster assembly must be replaced. - Carefully install the master cylinder to the brake booster. Refer to <u>Master Cylinder Replacement (Right Hand Drive), Master Cylinder Replacement (Left Hand Drive)</u>. Did you complete the replacement?	Go to Step 18	-
18	Perform the vacuum booster functional test: - If still separated, reinstall the master cylinder to the booster. Refer to <u>Master Cylinder Replacement (Right Hand Drive), Master Cylinder Replacement (Left Hand Drive)</u>. - If the engine was started after reinstalling the master cylinder to the booster, perform the following: - With the engine OFF, depress the brake pedal several times to deplete the vacuum reserve. - Depress and maintain moderate foot pressure on the brake pedal - Start the engine and observe pedal operation. - Observe for audible vacuum leaks. The brake pedal should fall slightly, then hold. Is there an audible vacuum leak coming from the brake pedal area?	Go to Step 21	Go to Step 19
19	Did the brake pedal fall slightly after the engine was started, then hold?	Go to Step 20	Go to Step 21
	Perform the vacuum booster leak-down test: - Release the brake pedal. - Accelerate the engine to approximately 3000 RPM, then release the throttle. Wait 2-3 seconds and repeat once. - Turn the ignition OFF.		

20	4. Wait 60 seconds. 5. Depress the brake pedal 2 times to check for vacuum booster available vacuum reserve. Observe pedal effort. - Both pedal applies should be assisted. - The amount of assist could diminish slightly with the second apply.		
	Were both pedal applies power assisted?	Go to Step 22	Go to Step 21
21	Replace the vacuum brake booster. Refer to <u>Power Vacuum Brake Booster Replacement (Left Hand Drive), Power Vacuum Brake Booster Replacement (Right Hand Drive)</u> . Did you complete the replacement?	Go to Step 22	-
22	Install or connect the components that were removed or disconnected during diagnosis. Did you complete the operation?	Brake Assist System OK Return to Symptom Table	-

BRAKE SYSTEM VEHICLE ROAD TEST

Preliminary Inspections

1. Visually inspect easily accessible brake system components for obvious damage and/or leaks which may indicate that the vehicle should not be driven until further inspections have been completed.
2. Inspect the brake master cylinder reservoir fluid level and adjust only if necessary for brake system road testing. Refer to **Master Cylinder Reservoir Filling**.
3. Inspect the tire inflation pressures and adjust as necessary.
4. Inspect the tire tread patterns to ensure that they are the same or very similar, especially per axle.
5. Ensure that the vehicle is not loaded unevenly prior to brake system road testing.

Road Testing Procedure

WARNING: Road test a vehicle under safe conditions and while obeying all traffic laws. Do not attempt any maneuvers that could jeopardize vehicle control. Failure to adhere to these precautions could lead to serious personal injury and vehicle damage.

1. Start the engine and allow it to idle.
2. Visually inspect if the brake warning indicator lamp remains illuminated.
3. If the brake system warning lamp remains illuminated, DO NOT proceed to test drive the vehicle until it is diagnosed and repaired. Refer to **Symptoms - Hydraulic Brakes**.
4. Select a smooth, dry, clean and level road or large lot that is as free of traffic and obstacles as possible for

brake system low speed road testing.

5. With the transmission in PARK or Neutral, lightly apply the brake pedal. Observe both the pedal feel and the pedal travel.
 - If the brake pedal apply felt spongy and the pedal travel was excessive, DO NOT drive the vehicle until it is repaired.
 - If the brake pedal apply did not feel spongy and the pedal travel was excessive, proceed to step 6.
6. Release and apply the brakes.
7. While continuing to apply the brakes, shift the transmission into DRIVE or 1st, release the brakes and allow the engine to idle the vehicle away from the stopped position. Observe for a slow release of the brake system.
8. With the aid of an assistant to observe the vehicle's performance from outside of the vehicle, drive the vehicle at a low speed and lightly apply the brakes while driving past the assistant. Have the assistant observe for brake system noise from the side of the vehicle closest to them, while you observe both the pedal effort and the pedal travel.
 - If the brake pedal apply effort was excessive and the pedal travel was excessive, DO NOT continue to test drive the vehicle until it is repaired.
 - If the brake pedal apply effort was not excessive and the pedal travel was not excessive, proceed to step 9.
9. Drive the vehicle in the opposite direction, at the same low speed and lightly apply the brakes while driving past the assistant. Have the assistant observe for brake system noise from the side of the vehicle closest to the assistant.
10. Drive the vehicle at a low speed and shift the transmission into NEUTRAL without applying the brakes. Observe for a rapid deceleration in vehicle speed, indicating possible brake drag.
11. Select a smooth, dry, clean and level road that is as free of heavy traffic as possible for brake system moderate speed road testing.
12. Drive the vehicle at a moderate speed. Observe for a pull and/or incorrect tracking of the vehicle without the brakes applied.
13. While continuing to drive the vehicle at a moderate speed, perform several light applies of the brakes. Observe the pedal effort and the pedal travel, observe for brake system noise, pulsation and/or brake drag.
 - If the brake pedal apply effort was excessive and the pedal travel was excessive, DO NOT continue to test drive the vehicle until it is repaired.
 - If the brake pedal apply effort was not excessive and the pedal travel was not excessive, proceed to step 14.
14. While continuing to drive the vehicle at a moderate speed, perform several moderate applies of the brakes. Observe the pedal effort and the pedal travel, observe for brake system pulsation and/or uneven braking action - either side to side and front to rear.

A small amount of vehicle front end dip is expected during a moderate apply of the brakes.

15. If the brake pedal apply effort was excessive and the pedal travel was excessive, DO NOT continue to test drive the vehicle until it is repaired.

BRAKE PEDAL TRAVEL MEASUREMENT AND INSPECTION

Special Tools

CH-28662 Brake Pedal Effort Gauge

For equivalent regional tools, refer to **Special Tools**.

1. With the ignition OFF and the brakes cool, apply the brakes 3-5 times and until the brake pedal becomes firm, in order to deplete the brake booster power reserve.

Fig. 2: Steering Wheel, Brake Pedal And Gauge
Courtesy of GENERAL MOTORS COMPANY

2. Install the **CH-28662** gauge (1) and equivalent, to the brake pedal (3).
3. Measure and record the distance (a) from the brake pedal (3) to the rim of the steering wheel (2). Note the points of measurement.

Fig. 3: Brake Pedal Components And Travel Measurement
Courtesy of GENERAL MOTORS COMPANY

4. Apply and maintain a force of 445 N (100 lb) to the brake pedal, as indicated on the **CH-28662** gauge (1) and equivalent.
5. While maintaining 445 N (100 lb) of force to the brake pedal (3), measure and record the distance (b) from the same point on the brake pedal (3) to the same point on the rim of the steering wheel (2).
6. Release the brake pedal (3) and repeat steps 4 and 5 to obtain a second measurement. After obtaining a second measurement, proceed to step 7.
7. Average the first and second measurements recorded for the 2 applies of the brakes.
8. Subtract the initial unapplied distance (a), from the average applied distance (b) to obtain the brake pedal travel measurement (c).

Specification

Maximum brake pedal travel - measured with the ignition OFF, brake booster power assist depleted and

the brakes cool.

BRAKE SYSTEM VACUUM SOURCE TEST

NOTE:

- **Engine temperature, accessory load and elevation level will affect engine vacuum.**
- **Vacuum readings will decrease by approximately 2.7 kPa (0.8 in Hg) for every 305 m (1000 ft) of elevation above sea level.**

1. Disconnect the engine vacuum hose from the vacuum brake booster check valve.
2. Install a vacuum gauge to the engine vacuum hose.
3. Start the engine and allow the engine to idle until normal operating temperatures are reached.

NOTE:

To obtain the gauge pressure from the manifold absolute pressure (MAP) sensor, subtract the absolute pressure of the MAP sensor from atmospheric pressure.

4. With the vehicle in PARK or NEUTRAL with the park brake on, the engine idling and the air conditioning (A/C) system OFF, check to see if the engine vacuum reading is the gauge pressure calculated from the pressure of the MAP sensor indicated on the scan tool.
5. Turn the ignition OFF.
6. If the engine vacuum reading is within the specified normal range, proceed to step 10.
7. If the engine vacuum reading is NOT within the specified normal range, inspect the engine vacuum hose for the following conditions.
 - Loose connection to the engine
 - Collapse, deformation or contamination
 - Cracks, cuts and brittleness
8. If any of these conditions were found with the engine vacuum hose, replace the hose, then repeat steps 2-4.
9. If none of these conditions were found with the engine vacuum hose, then there is an engine vacuum source problem, check the engine vacuum system.
10. Remove the vacuum brake booster check valve from the booster.
11. Install the check valve to the engine vacuum hose.
12. Install the vacuum gauge to the check valve.
13. Start the engine and allow the engine to idle in park or neutral with the park brake on and with the A/C system OFF, until normal operating temperatures are reached.
14. Turn the ignition OFF.

NOTE:

To obtain the gauge pressure from the manifold absolute pressure (MAP) sensor, subtract the absolute pressure of the MAP sensor from atmospheric pressure.

15. Visually inspect the engine vacuum reading is maintained at the same gauge pressure as the pressure obtained from the MAP sensor as indicated on the scan tool.
16. If the engine vacuum reading is maintained within the specified normal range, proceed to step 18.
17. If the engine vacuum reading is NOT maintained within the specified normal range, replace the vacuum brake booster check valve, then repeat steps 11-15.
18. Inspect the vacuum brake booster check valve grommet for the following conditions:
 - Loose connection to the vacuum brake booster
 - Deformation or contamination
 - Cracks, cuts or brittleness
19. If any of these conditions were found with the check valve grommet, replace the grommet.

BRAKE SYSTEM EXTERNAL LEAK INSPECTION

WARNING: Refer to Brake Fluid Irritant Warning .

CAUTION: Refer to Brake Fluid Effects on Paint and Electrical Components Caution .

1. In order to inspect for external brake fluid leaks, first inspect the fluid level in the master cylinder.

While a slight brake fluid level drop can be considered a normal condition due to brake lining wear, a very low level may indicate a brake fluid leak in the hydraulic system.

2. If the fluid level is abnormally low, adjust the brake fluid level. Refer to **Master Cylinder Reservoir Filling**.
3. Start the engine and allow it to idle.
4. Apply constant, moderate foot pressure to the brake pedal.

If the brake pedal gradually falls away while under foot pressure, there may be a brake fluid leak.

5. Turn the ignition OFF.
6. Visually inspect the following brake system components for brake fluid leaks, excessive corrosion and damage. Give particular attention to all brake pipe and flexible hose connections to ensure that there are not any slight brake fluid leaks - even though the brake pedal may feel firm and hold steady:
 - Master cylinder brake pipe fittings
 - All brake pipe connections
 - Brake pipes
 - Brake hoses and connections
 - Brake calipers and/or wheel cylinders
7. While slight dampness around the master cylinder reservoir can be considered acceptable, brake fluid leaking from any of the brake system components requires immediate attention. If any of these

components exhibit signs of brake fluid leakage, repair or replace those components. After the repair or replacement, reinspect the hydraulic brake system to assure proper function.

BRAKE SYSTEM INTERNAL LEAK TEST

WARNING: Refer to Brake Fluid Irritant Warning .

CAUTION: Refer to Brake Fluid Effects on Paint and Electrical Components Caution .

1. Start the engine and allow it to idle.
2. Apply light, steady pressure to the brake pedal. Observe both the brake pedal feel and travel.
3. Release the brakes and turn the ignition OFF.
4. If the brake pedal apply felt spongy, but the brake pedal travel was not excessive, perform the following steps:
 1. Inspect the brake system for external leaks. Refer to Brake System External Leak Inspection.
 2. Pressure bleed the brake system in order to purge any air that may be trapped in the system. Refer to Hydraulic Brake System Bleeding (Manual), Hydraulic Brake System Bleeding (Pressure).

Fig. 4: Master Cylinder Inspection Points
Courtesy of GENERAL MOTORS COMPANY

5. If the brake pedal apply did not feel spongy, but the brake pedal travel was excessive, perform the following steps:
 1. Loosen the master cylinder-to-vacuum brake booster retaining nuts.
 2. Carefully pull the master cylinder away from the vacuum brake booster just enough to inspect the mounting surface of the master cylinder.
 3. Inspect the master cylinder mounting surface at the primary piston (2) for brake fluid leaks.
6. If the master cylinder exhibits any leakage around the primary piston (2), then the primary piston primary seal (4) and/or secondary seal (3) is leaking and the master cylinder requires overhaul or replacement.
7. If the master cylinder primary piston (2) does not exhibit any leakage, pressure bleed the brake system. Refer to **Hydraulic Brake System Bleeding (Manual)**, **Hydraulic Brake System Bleeding (Pressure)**.
8. If the brake pedal apply did not feel spongy and the brake pedal travel was initially steady and not excessive, but then gradually fell, then the master cylinder requires overhaul or replacement due to an internal leak past the secondary piston (1) from the secondary piston primary seal (6) or secondary seal (5).
9. If the brake pedal apply did not feel spongy and the brake pedal travel was initially steady and not excessive, then fell slightly, then became steady again, then the brake pressure modulator valve (BPMV) may be leaking internally and may require replacement.

HYDRAULIC BRAKE COMPONENT OPERATION VISUAL INSPECTION

Disc Brake

Fig. 5: Hydraulic Brake Component Operation
Courtesy of GENERAL MOTORS COMPANY

1. With the tire and wheel assemblies removed and the brake rotors retained by wheel lug nuts, visually inspect the brake caliper piston dust boot (2) sealing area to ensure that there are no brake fluid leaks.
2. If any evidence of a brake fluid leak is present, the brake caliper requires overhaul or replacement.
3. While the brake system is at rest (4), observe the position of the brake caliper piston (1) in relation to the brake caliper housing.
4. Have an assistant apply and release the brake pedal several times while you observe the operation of the hydraulic brake caliper.
 1. Observe the brake caliper piston (1) for unrestricted and even movement during each apply of the brake system (5).
 2. Observe the brake caliper piston (1) for an unrestricted and even return motion during each release of the brake system (6).
5. If the brake caliper piston (1) did not exhibit unrestricted and even movement during brake system apply and/or release, the piston square seal (3) may be worn or damaged and the brake caliper may require overhaul or replacement.

Drum Brakes

Fig. 6: Wheel Cylinder Piston Boot sealing Areas
Courtesy of GENERAL MOTORS COMPANY

1. With the rear tire and wheel assemblies and the brake drums removed, visually inspect the wheel cylinder pistons boot sealing areas to ensure that there are no brake fluid leaks.
2. If any evidence of a brake fluid leak is present, the brake wheel cylinder requires replacement.
3. Using firm hand pressure, simultaneously and evenly apply force on both brake shoes in order to compress the wheel cylinder pistons into their bore.
4. Evenly release the force from both brake shoes to allow the wheel cylinder pistons to return.
5. If one or both of the wheel cylinder pistons did not exhibit unrestricted and even movement during apply and/or release of force, the wheel cylinder may require replacement.

BRAKE PIPE AND HOSE INSPECTION

WARNING: Refer to Brake Fluid Irritant Warning .

CAUTION: Refer to Brake Fluid Effects on Paint and Electrical Components Caution .

1. Visually inspect all of the brake pipes for the following conditions:
 - Kinks, incorrect routing, missing or damaged retainers
 - Leaking fittings, excessive corrosion
2. If any of the brake pipes exhibited any of the conditions listed, then the identified pipe and pipes, require replacement.
3. Ensure that the vehicle axles are correctly supported at ride height in order to maintain the proper relationship of the flexible brake hoses to the chassis.

Fig. 7: Flexible Brake Hose Inspection Points
Courtesy of GENERAL MOTORS COMPANY

4. Visually inspect all of the flexible brake hoses for the following conditions:
 - Kinks (1), improper routing, twists, chafing, missing or damaged retainers
 - Leaking connections, perished, cracked, blistered, brittle or bulging hoses
5. If any of the flexible brake hoses exhibited any of the conditions listed, then the identified flexible brake hose and hoses require replacement.
6. Squeeze the flexible brake hoses with firm finger pressure to inspect for soft spots (2), indicating an internal restriction. Inspect the entire length of each flexible brake hose.
7. If any of the flexible brake hoses were found to have soft spots (2), then the identified flexible brake hose and hoses require replacement.

BRAKE PEDAL PUSHROD INSPECTION

Fig. 8: Brake Pedal Pushrod

Courtesy of GENERAL MOTORS COMPANY

1. Disconnect the brake pedal pushrod (2) from the brake pedal.
2. Reposition the pedal pushrod boot (1) toward the front of the vehicle to expose as much of the pedal pushrod (2) as possible.
3. Inspect the brake pedal pushrod (2) for straightness.
4. If the brake pedal pushrod (2) is not straight, then the pushrod requires replacement.
5. Return the pedal pushrod boot (1) to its original position on the pedal pushrod (2).
6. Connect the brake pedal pushrod (2) to the brake pedal.

REPAIR INSTRUCTIONS

MASTER CYLINDER RESERVOIR FILLING

WARNING: Refer to Brake Fluid Irritant Warning .

CAUTION: Refer to Brake Fluid Effects on Paint and Electrical Components Caution .

Fig. 9: Brake Master Cylinder Reservoir
Courtesy of GENERAL MOTORS COMPANY

1. Visually inspect the brake fluid level through the brake master cylinder reservoir (1).
2. If the brake fluid level is at or below the minimum allowable level (3) during routine fluid checks, the brake system should be inspected for wear and possible brake fluid leaks.

NOTE: If brake fluid is to be added to the brake master cylinder reservoir (1), clean the outside of the reservoir and around the reservoir cap prior to removing the cap.

3. If the brake fluid level is at or below the minimum allowable level (3) and an inspection of the brake system did not reveal wear or brake fluid leaks, the brake fluid may be topped up to the maximum fill level (2).
4. If a brake system service was just completed, the brake fluid may be topped up to the maximum fill level (2).
5. If the brake fluid level is above the minimum allowable level (3), adding brake fluid is not recommended under normal conditions.

MASTER CYLINDER RESERVOIR REPLACEMENT

Fig. 10: Master Cylinder Reservoir
Courtesy of GENERAL MOTORS COMPANY

Master Cylinder Reservoir Replacement

Callout	Component Name
WARNING: Refer to <u>Brake Fluid Irritant Warning</u>	
CAUTION: Refer to <u>Brake Fluid Effects on Paint and Electrical Components Caution</u>	
Preliminary Procedure Remove the brake master cylinder. Refer to <u>Master Cylinder Replacement (Right Hand Drive)</u> , <u>Master Cylinder Replacement (Left Hand Drive)</u> .	
1	Brake Fluid Indicator Switch Connector
2	Brake Fluid Level Indicator Switch
3	Brake Master Cylinder Reservoir Pin
4	Brake Master Cylinder Reservoir Procedure Drain the brake fluid from the reservoir.
5	Brake Master Cylinder Reservoir Seal Procedure Apply a small amount of the clean recommended brake fluid to the seals.

MASTER CYLINDER REPLACEMENT (RIGHT HAND DRIVE)**Removal Procedure**

WARNING: Refer to Brake Fluid Irritant Warning .

CAUTION: Refer to Brake Fluid Effects on Paint and Electrical Components Caution .

1. Place the ignition switch in the OFF position.
2. Remove the radiator surge tank to gain easy tool access. Refer to Radiator Surge Tank Replacement (LL0) , Radiator Surge Tank Replacement (LFM) .
3. Apply and release the brake pedal several times until the pedal becomes firm to deplete the power vacuum brake booster vacuum reserve.
4. Thoroughly clean the master cylinder reservoir and the master cylinder body to remove any dirt and debris.
5. Disconnect the brake fluid level indicator switch electrical connector.

Fig. 11: Master Cylinder Reservoir
Courtesy of GENERAL MOTORS COMPANY

6. Siphon the brake fluid out of the master cylinder reservoir (1) using an air vacuum pump or a hand vacuum pump (2).

Fig. 12: Master Cylinder Secondary Brake Pipe Fitting
Courtesy of GENERAL MOTORS COMPANY

7. Disconnect the master cylinder secondary brake pipe fitting (1).

Cap the brake pipe fitting and plug the master cylinder outlet port to prevent brake fluid loss and contamination.

Fig. 13: Master Cylinder Primary Brake Pipe Fitting
Courtesy of GENERAL MOTORS COMPANY

8. Disconnect the master cylinder primary brake pipe fitting (1).

Cap the brake pipe fitting and plug the master cylinder outlet port to prevent brake fluid loss and contamination.

Fig. 14: Master Cylinder Nuts

Courtesy of GENERAL MOTORS COMPANY

9. Remove the master cylinder nuts (1).

Fig. 15: Master Cylinder

Courtesy of GENERAL MOTORS COMPANY

10. Remove the master cylinder (1) from the power vacuum brake booster.
11. Remove the brake fluid level indicator switch, if necessary. Refer to **Brake Fluid Level Indicator Switch Replacement**.
12. Remove the master cylinder reservoir, if necessary. Refer to **Master Cylinder Reservoir Replacement**.

Installation Procedure

1. Install the master cylinder reservoir, if removed. Refer to **Master Cylinder Reservoir Replacement**.
2. Bench bleed the master cylinder. Refer to **Master Cylinder Bench Bleeding**.
3. Install the brake fluid level indicator switch, if removed. Refer to **Brake Fluid Level Indicator Switch Replacement**.

Fig. 16: Master Cylinder

Courtesy of GENERAL MOTORS COMPANY

4. Install the master cylinder (1) to the power vacuum brake booster.

Fig. 17: Master Cylinder Nuts

Courtesy of GENERAL MOTORS COMPANY

CAUTION: Refer to Fastener Caution .

5. Install the master cylinder nuts (1) and tighten the nuts to 13 N.m (115 lb in).

Fig. 18: Master Cylinder Primary Brake Pipe Fitting
Courtesy of GENERAL MOTORS COMPANY

6. Connect the master cylinder primary brake pipe fitting (1) and tighten to 18 N.m (13 lb in).

Fig. 19: Master Cylinder Secondary Brake Pipe Fitting
Courtesy of GENERAL MOTORS COMPANY

7. Connect the master cylinder secondary brake pipe fitting (1) and tighten to 18 N.m (13 lb in).
8. Connect the brake fluid level indicator switch electrical connector.
9. Install the radiator surge tank. Refer to **Radiator Surge Tank Replacement (LL0)** , **Radiator Surge Tank Replacement (LFM)** .
10. Bleed the hydraulic brake system. Refer to **Hydraulic Brake System Bleeding (Manual)**, **Hydraulic Brake System Bleeding (Pressure)**.

MASTER CYLINDER REPLACEMENT (LEFT HAND DRIVE)

Removal Procedure

WARNING: Refer to **Brake Fluid Irritant Warning** .

CAUTION: Refer to **Brake Fluid Effects on Paint and Electrical Components Caution** .

1. Place the ignition switch in the OFF position.

2. Remove the battery. Refer to **Battery Replacement** .
3. Remove the air cleaner and air inlet hose as an assembly. Refer to **Air Cleaner Assembly Replacement** .

Fig. 20: Engine Control Module (ECM) Bracket Bolts
Courtesy of GENERAL MOTORS COMPANY

4. Remove the engine control module (ECM) bracket bolts (1) and position the ECM and ECM bracket aside. Refer to **Engine Control Module Replacement** .
5. Apply and release the brake pedal several times until the pedal becomes firm to deplete the power vacuum brake booster vacuum reserve.
6. Thoroughly clean the master cylinder reservoir and the master cylinder body to remove any dirt and debris.
7. Disconnect the brake fluid level indicator switch electrical connector.

Fig. 21: Master Cylinder Reservoir

Courtesy of GENERAL MOTORS COMPANY

8. Siphon the brake fluid out of the master cylinder reservoir (1) using an air vacuum pump or a hand vacuum pump (2).

Fig. 22: Master Cylinder Secondary Brake Pipe Fitting
Courtesy of GENERAL MOTORS COMPANY

9. Disconnect the master cylinder secondary brake pipe fitting (1).

Cap the brake pipe fitting and plug the master cylinder outlet port to prevent brake fluid loss and contamination.

Fig. 23: Master Cylinder Primary Brake Pipe Fitting
Courtesy of GENERAL MOTORS COMPANY

10. Disconnect the master cylinder primary brake pipe fitting (1).

Cap the brake pipe fitting and plug the master cylinder outlet port to prevent brake fluid loss and contamination.

Fig. 24: Master Cylinder Nuts
Courtesy of GENERAL MOTORS COMPANY

11. Remove the master cylinder nuts (1).

Fig. 25: Master Cylinder

Courtesy of GENERAL MOTORS COMPANY

12. Remove the master cylinder (1) from the power vacuum brake booster.
13. Remove the brake fluid level indicator switch, if necessary. Refer to **Brake Fluid Level Indicator Switch Replacement**.
14. Remove the master cylinder reservoir, if necessary. Refer to **Master Cylinder Reservoir Replacement**.

Installation Procedure

1. Install the master cylinder reservoir, if removed. Refer to **Master Cylinder Reservoir Replacement**.
2. Bench bleed the master cylinder. Refer to **Master Cylinder Bench Bleeding**.
3. Install the brake fluid level indicator switch, if removed. Refer to **Brake Fluid Level Indicator Switch Replacement**.

Fig. 26: Master Cylinder

Courtesy of GENERAL MOTORS COMPANY

4. Install the master cylinder (1) to the power vacuum brake booster.

Fig. 27: Master Cylinder Nuts

Courtesy of GENERAL MOTORS COMPANY

CAUTION: Refer to Fastener Caution .

5. Install the master cylinder nuts (1) and tighten to 13 N.m (115 lb in).

Fig. 28: Master Cylinder Primary Brake Pipe Fitting
Courtesy of GENERAL MOTORS COMPANY

6. Connect the master cylinder primary brake pipe fitting (1) and tighten to 18 N.m (13 lb ft).

Fig. 29: Master Cylinder Secondary Brake Pipe Fitting
Courtesy of GENERAL MOTORS COMPANY

7. Connect the master cylinder secondary brake pipe fitting (1) and tighten to 18 N.m (13 lb ft).
8. Connect the brake fluid level indicator switch electrical connector.

Fig. 30: Engine Control Module (ECM) Bracket Bolts
Courtesy of GENERAL MOTORS COMPANY

9. Position the ECM and ECM bracket to the original place and install the ECM bracket bolts (1). Refer to **Engine Control Module Replacement** .
10. Install the air cleaner and air inlet hose as an assembly. Refer to **Air Cleaner Assembly Replacement** .
11. Install the battery. Refer to **Battery Replacement** .
12. Bleed the hydraulic brake system. Refer to **Hydraulic Brake System Bleeding (Manual)**, **Hydraulic Brake System Bleeding (Pressure)**.

MASTER CYLINDER BENCH BLEEDING

Fig. 31: Depressing And Releasing Primary Piston
Courtesy of GENERAL MOTORS COMPANY

WARNING: Refer to Brake Fluid Irritant Warning .

CAUTION: Refer to Brake Fluid Effects on Paint and Electrical Components Caution .

1. Secure the mounting flange of the brake master cylinder in a bench vice so that the rear of the primary piston is accessible.
2. Remove the master cylinder reservoir cap and diaphragm.
3. Install suitable fittings to the master cylinder ports that match the type of flare seat required and also provide for hose attachment.
4. Install transparent hoses to the fittings installed to the master cylinder ports, then route the hoses into the master cylinder reservoir.
5. Fill the master cylinder reservoir to the maximum fill level with brake fluid from a clean, sealed brake fluid container. Refer to **Master Cylinder Reservoir Filling**.
6. Ensure that the ends of the transparent hoses running into the master cylinder reservoir are fully submerged in the brake fluid.

7. Using a smooth, round-ended tool, depress and release the primary piston as far as it will travel, a depth of about 25 mm (1 in), several times. Observe the flow of fluid coming from the ports.

As air is bled from the primary and secondary pistons, the effort required to depress the primary piston will increase and the amount of travel will decrease.

8. Continue to depress and release the primary piston until fluid flows freely from the ports with no evidence of air bubbles.
9. Remove the transparent hoses from the master cylinder reservoir.
10. Install the master cylinder reservoir cap and diaphragm.
11. Remove the fittings with the transparent hoses from the master cylinder ports. Wrap the master cylinder with a clean shop cloth to prevent brake fluid spills.
12. Remove the master cylinder from the vice.

BRAKE FLUID LEVEL INDICATOR SWITCH REPLACEMENT

Fig. 32: Brake Fluid Level Indicator Switch
Courtesy of GENERAL MOTORS COMPANY

Brake Fluid Level Indicator Switch Replacement

Callout	Component Name
1	Brake Fluid Indicator Switch Connector
2	Brake Fluid Level Indicator Switch TIP: Using needle nose pliers, carefully depress the retaining tab on the indicator switch

and remove indicator switch from the reservoir.

BRAKE PEDAL ASSEMBLY REPLACEMENT (LEFT HAND DRIVE)

Removal Procedure

1. Remove the inflatable restraint instrument panel lower module in drive side if equipped. Refer to **Instrument Panel Lower Airbag Replacement - Driver Side** .
2. Remove the steering column opening filler. Refer to **Steering Column Opening Filler Replacement** .
3. Remove the left floor air outlet duct. Refer to **Floor Air Outlet Duct Replacement - Left Side (Left Hand Drive)** .
4. Remove the steering column lower trim cover. Refer to **Steering Column Lower Trim Cover Replacement** .
5. Remove the intermediate steering shaft if the electrical power steering is not equipped or remove the steering column if the electrical power steering is equipped. Refer to **Intermediate Steering Shaft Replacement** and **Steering Column Replacement (Electric Power Steering)** .

Fig. 33: Electrical Connector Of Stop Lamp Switch
Courtesy of GENERAL MOTORS COMPANY

6. Disconnect the electrical connector of the stop lamp switch (1).

Fig. 34: Accelerator Cable And Accelerator Pedal
Courtesy of GENERAL MOTORS COMPANY

7. Disconnect the accelerator cable from the accelerator pedal by pulling and raising the cable end (1).

Fig. 35: Push Rod Retainer

Courtesy of GENERAL MOTORS COMPANY

8. If equipped, disconnect the push rod retainer (1) from the clutch pedal.

Fig. 36: Retaining Clip And Pin

Courtesy of GENERAL MOTORS COMPANY

9. Remove the retaining clip (1) and pin (2) from the brake pedal.
10. Release the brake booster pushrod from the brake pedal.

Fig. 37: Clutch (ABC) Pedal Module Retaining Nuts
Courtesy of GENERAL MOTORS COMPANY

11. Remove the brake booster-to-accelerator, brake and clutch (ABC) pedal module retaining nuts (1) from the ABC pedal module.

Fig. 38: ABC Module-To-Dash Panel Retaining Nuts
Courtesy of GENERAL MOTORS COMPANY

12. Remove the ABC module-to-dash panel retaining nuts (1) from the ABC pedal module.
13. Remove the ABC pedal module from the vehicle.
14. Remove the accelerator pedal from the ABC pedal module, if necessary.

Installation Procedure

1. Install the accelerator pedal to the ABC pedal module, if necessary.
2. Install the ABC pedal module into the vehicle.

Fig. 39: ABC Module-To-Dash Panel Retaining Nuts
Courtesy of GENERAL MOTORS COMPANY

CAUTION: Refer to Fastener Caution .

3. Install the ABC module-to-dash panel retaining nuts (1) and tighten to 22 (16 lb ft).

Fig. 40: Clutch (ABC) Pedal Module Retaining Nuts
Courtesy of GENERAL MOTORS COMPANY

4. Loosely install the brake booster-to-ABC pedal module retaining nuts (1).

Fig. 41: Retaining Clip And Pin

Courtesy of GENERAL MOTORS COMPANY

5. Connect the brake booster pushrod to the brake pedal.
6. Install the pushrod pin (2) to the brake pedal and insert the retaining clip (1) to the pin (2).

Fig. 42: Clutch (ABC) Pedal Module Retaining Nuts
Courtesy of GENERAL MOTORS COMPANY

7. Completely tighten the brake booster-to-ABC pedal module retaining nuts (1) and tighten to 22 (16 lb ft).
8. Connect the push rod retainer to the clutch pedal, if equipped.
9. Connect the accelerator cable to the accelerator pedal.
10. Connect the electrical connector of the stop lamp switch.
11. Install the intermediate steering shaft or the steering column as necessary. Refer to **Intermediate Steering Shaft Replacement** and **Steering Column Replacement (Electric Power Steering)** .
12. Install the steering column lower trim cover. Refer to **Steering Column Lower Trim Cover Replacement** .
13. Install the left floor air outlet duct. Refer to **Floor Air Outlet Duct Replacement - Left Side (Left Hand Drive)** .
14. Install the steering column opening filler. Refer to **Steering Column Opening Filler Replacement** .
15. Install the inflatable restraint instrument panel lower module in drive side as necessary. Refer to **Instrument Panel Lower Airbag Replacement - Driver Side** .

BRAKE PEDAL ASSEMBLY REPLACEMENT (RIGHT HAND DRIVE)

Removal Procedure

1. Remove the instrument panel (I/P) pad assembly. Refer to **Instrument Panel Assembly Replacement** .
2. Remove the I/P tie bar. Refer to **Instrument Panel Tie Bar Replacement** .

Fig. 43: Accelerator Cable And Accelerator Pedal
Courtesy of GENERAL MOTORS COMPANY

3. Disconnect the accelerator cable from the accelerator pedal by pulling and raising the cable end (1).

Fig. 44: Push Rod Retainer

Courtesy of GENERAL MOTORS COMPANY

4. If equipped, disconnect the push rod retainer (1) from the clutch pedal.

Fig. 45: Retaining Clip And Pin

Courtesy of GENERAL MOTORS COMPANY

5. Remove the retaining clip (1) and pin (2) from the brake pedal.
6. Release the brake booster pushrod from the brake pedal.

Fig. 46: Clutch (ABC) Pedal Module Retaining Nuts
Courtesy of GENERAL MOTORS COMPANY

7. Remove the brake booster-to-accelerator, brake and clutch (ABC) pedal module retaining nuts (1) from the ABC pedal module.

Fig. 47: ABC Module-To-Dash Panel Retaining Nuts
Courtesy of GENERAL MOTORS COMPANY

8. Remove the ABC module-to-dash panel retaining nuts (1) from the ABC pedal module.
9. Remove the ABC pedal module from the vehicle.
10. Remove the accelerator pedal from the ABC pedal module, if necessary.

Installation Procedure

1. Install the accelerator pedal to the ABC pedal module, if necessary.
2. Install the ABC pedal module into the vehicle.

Fig. 48: ABC Module-To-Dash Panel Retaining Nuts
Courtesy of GENERAL MOTORS COMPANY

CAUTION: Refer to Fastener Caution .

3. Install the ABC module-to-dash panel retaining nuts (1) and tighten to 22 (16 lb ft).

Fig. 49: Clutch (ABC) Pedal Module Retaining Nuts
Courtesy of GENERAL MOTORS COMPANY

4. Loosely install the brake booster-to-ABC pedal module retaining nuts (1).

Fig. 50: Retaining Clip And Pin

Courtesy of GENERAL MOTORS COMPANY

5. Connect the brake booster pushrod to the brake pedal.
6. Install the pushrod pin (2) to the brake pedal and insert the retaining clip (1) to the pin (2).

Fig. 51: Clutch (ABC) Pedal Module Retaining Nuts
Courtesy of GENERAL MOTORS COMPANY

7. Completely tighten the brake booster-to-ABC pedal module retaining nuts (1) to 22 (16 lb ft).
8. Connect the push rod retainer to the clutch pedal.
9. Connect the accelerator cable to the accelerator pedal.
10. Install the I/P pad assembly. Refer to **Instrument Panel Assembly Replacement** .
11. Install the I/P tie bar. Refer to **Instrument Panel Tie Bar Replacement** .

BRAKE PROPORTION VALVE REPLACEMENT (LEFT HAND DRIVE)

Removal Procedure

WARNING: Refer to **Brake Fluid Irritant Warning** .

CAUTION: Refer to **Brake Fluid Effects on Paint and Electrical Components Caution** .

1. Apply and release the brake pedal several times until the pedal becomes firm to deplete the power vacuum brake booster vacuum reserve.

2. Thoroughly clean the master cylinder reservoir and the master cylinder body to remove any dirt and debris.
3. Disconnect the brake fluid indicator switch electrical connector.

Fig. 52: Master Cylinder Reservoir
Courtesy of GENERAL MOTORS COMPANY

4. Siphon the brake fluid out of the master cylinder reservoir (1) using an air vacuum pump or a hand vacuum pump (2).

Fig. 53: Brake Pipe Fitting

Courtesy of GENERAL MOTORS COMPANY

5. Disconnect the proportion valve outlet brake pipe fitting (1).

Cap the brake pipe fitting to prevent brake fluid loss and contamination.

Fig. 54: Removing Proportion Valve
Courtesy of GENERAL MOTORS COMPANY

6. Remove the proportion valve (1) from the master cylinder.

Installation Procedure

Fig. 55: Removing Proportion Valve
Courtesy of GENERAL MOTORS COMPANY

CAUTION: Refer to Fastener Caution .

1. Install the brake proportion valve (1) to the master cylinder and tighten to 35 N.m (26 lb ft).

Fig. 56: Brake Pipe Fitting

Courtesy of GENERAL MOTORS COMPANY

2. Connect the proportion valve outlet brake pipe fitting (1) and tighten to 18 N.m (13 lb ft).
3. Bleed the hydraulic brake system. Refer to **Hydraulic Brake System Bleeding (Manual)**, **Hydraulic Brake System Bleeding (Pressure)**.

BRAKE PROPORTION VALVE REPLACEMENT (RIGHT HAND DRIVE)

Removal Procedure

WARNING: Refer to **Brake Fluid Irritant Warning** .

CAUTION: Refer to **Brake Fluid Effects on Paint and Electrical Components Caution** .

1. Place the ignition switch in the OFF position.
2. Remove the battery. Refer to **Battery Replacement** .
3. Remove the air cleaner and air inlet hose as an assembly to get easy tool access. Refer to **Air Cleaner Assembly Replacement** .

4. Remove the engine control module (ECM) bolts and position the ECM and ECM bracket aside to get easy tool access. Refer to **Engine Control Module Replacement** .
5. Apply and release the brake pedal several times until the pedal becomes firm to deplete the power vacuum brake booster vacuum reserve.
6. Thoroughly clean the master cylinder reservoir and the master cylinder body to remove any dirt and debris.
7. Disconnect the brake fluid indicator switch electrical connector.

Fig. 57: Master Cylinder Reservoir
Courtesy of GENERAL MOTORS COMPANY

8. Siphon the brake fluid out of the master cylinder reservoir (1) using an air vacuum pump or a hand vacuum pump (2).

Fig. 58: Master Cylinder Primary Inlet Brake Pipe Fitting
Courtesy of GENERAL MOTORS COMPANY

9. Disconnect the master cylinder primary inlet brake pipe fitting (1).
Cap the brake pipe fitting to prevent brake fluid loss and contamination.
10. Disconnect the master cylinder secondary inlet brake pipe fitting (2).
Cap the brake pipe fitting to prevent brake fluid loss and contamination.

Fig. 59: Lf Brake Pipe Fitting

Courtesy of GENERAL MOTORS COMPANY

11. Disconnect the LF brake pipe fitting (1).

Cap the brake pipe fitting to prevent brake fluid loss and contamination.

12. Disconnect the RR brake pipe fitting (2).

Cap the brake pipe fitting to prevent brake fluid loss and contamination.

13. Disconnect the RF brake pipe fitting (3).

Cap the brake pipe fitting to prevent brake fluid loss and contamination.

14. Disconnect the LR brake pipe fitting (4).

Cap the brake pipe fitting to prevent brake fluid loss and contamination.

Fig. 60: Brake Proportion Valve Retaining Nut
Courtesy of GENERAL MOTORS COMPANY

15. Remove the brake proportion valve retaining nut (1).
16. Remove the brake proportioning valve (2) from the vehicle.

Installation Procedure

Fig. 61: Brake Proportion Valve Retaining Nut
Courtesy of GENERAL MOTORS COMPANY

1. Install the brake proportion valve (2) to the vehicle.

CAUTION: Refer to Fastener Caution .

2. Install the brake proportion valve retaining nut (1) and tighten to 9 N.m (80 lb in).

Fig. 62: Lf Brake Pipe Fitting

Courtesy of GENERAL MOTORS COMPANY

3. Connect the LR brake pipe fitting (4) and tighten to 18 N.m (13 lb ft).
4. Connect the RF brake pipe fitting (3) and tighten to 18 N.m (13 lb ft).
5. Connect the RR brake pipe fitting (2) and tighten to 18 N.m (13 lb ft).
6. Connect the LF brake pipe fitting (1) and tighten to 18 N.m (13 lb ft).

Fig. 63: Master Cylinder Primary Inlet Brake Pipe Fitting
Courtesy of GENERAL MOTORS COMPANY

7. Connect the master cylinder secondary inlet brake pipe fitting (2) and tighten to 18 N.m (13 lb ft).
8. Connect the master cylinder primary inlet brake pipe fitting (1) and tighten to 18 N.m (13 lb ft).
9. Connect the brake fluid indicator switch electrical connector.
10. Put the ECM and ECM bracket to the original position and install the ECM bracket bolts. Refer to **Engine Control Module Replacement** .
11. Install the air cleaner and inlet hose as an assembly. Refer to **Air Cleaner Assembly Replacement** .
12. Install the battery. Refer to **Battery Replacement** .
13. Bleed the hydraulic brake system. Refer to **Hydraulic Brake System Bleeding (Manual)**, **Hydraulic Brake System Bleeding (Pressure)**.

BRAKE PIPE REPLACEMENT

Brake pipe is provided as the whole completed component. If the brake pipe is defective, replace with the completed component. For the specified torque of the brake pipe fasteners, refer to **Fastener Tightening Specifications**.

FRONT BRAKE HOSE REPLACEMENT

Removal Procedure

WARNING: Refer to Brake Dust Warning .

WARNING: Refer to Brake Fluid Irritant Warning .

CAUTION: Refer to Brake Fluid Effects on Paint and Electrical Components Caution .

1. Raise and support the vehicle. Refer to Lifting and Jacking the Vehicle .
2. Remove the tire and wheel assembly. Refer to Tire and Wheel Removal and Installation .
3. Clean all dirt and foreign material from the brake hose and the brake pipe fittings.

Fig. 64: Brake Pipe Fitting

Courtesy of GENERAL MOTORS COMPANY

4. Disconnect the brake pipe fitting (1) from the brake hose (2).

Cap the brake pipe fitting to prevent brake fluid loss and contamination.

Fig. 65: Brake Hose Retaining Clip
Courtesy of GENERAL MOTORS COMPANY

5. Remove the brake hose retaining clip (1) from the brake hose mounting bracket on the body frame.
6. Detach the brake hose from the brake hose mounting bracket.

Fig. 66: Brake Hose

Courtesy of GENERAL MOTORS COMPANY

7. Detach the brake hose (1) from the strut mounted brake hose retaining bracket (2).

Fig. 67: Copper Brake Hose Sealing Washers And Brake Hose
Courtesy of GENERAL MOTORS COMPANY

8. Remove the brake hose-to-brake caliper banjo retaining bolt (1).
9. Remove the two copper brake hose sealing washers (2) from the brake hose (3).

Discard the two copper brake hose sealing washers.

10. Remove the brake hose (3) from the vehicle.

Installation Procedure

Fig. 68: Copper Brake Hose Sealing Washers And Brake Hose
Courtesy of GENERAL MOTORS COMPANY

1. Assemble the brake hose-to-brake caliper banjo retaining bolt (1) with 2 new copper brake hose sealing washers (2) to the brake hose (3).

CAUTION: Refer to Fastener Caution .

2. Install the brake hose assembly to the caliper and tighten the banjo retaining bolt to 40 N.m (30 lb ft).

Fig. 69: Brake Hose

Courtesy of GENERAL MOTORS COMPANY

3. Install the brake hose (1) to the strut mounted brake hose retaining bracket (2).

Fig. 70: Brake Hose Retaining Clip

Courtesy of GENERAL MOTORS COMPANY

4. Install the brake hose to the brake hose mounting bracket on the body frame.
5. Install the brake hose retaining clip (1) to the brake hose mounting bracket.

Fig. 71: Brake Pipe Fitting

Courtesy of GENERAL MOTORS COMPANY

6. Connect the brake pipe fitting (1) to the brake hose (2) and tighten to 18 N.m (13 lb ft).
7. Bleed the hydraulic brake system. Refer to Hydraulic Brake System Bleeding (Manual), Hydraulic Brake System Bleeding (Pressure).
8. Install the tire and wheel assembly. Refer to Tire and Wheel Removal and Installation .

REAR BRAKE HOSE REPLACEMENT

Removal Procedure

WARNING: Refer to Brake Fluid Irritant Warning .

CAUTION: Refer to Brake Fluid Effects on Paint and Electrical Components Caution .

1. Raise and support the vehicle. Refer to Lifting and Jacking the Vehicle .
2. Remove the tire and wheel assembly. Refer to Tire and Wheel Removal and Installation .
3. Clean all dirt and foreign material from the brake hose ends and brake pipe fittings.

Fig. 72: Brake Pipe Fitting

Courtesy of GENERAL MOTORS COMPANY

4. Disconnect the brake pipe fitting (1) from the brake hose at the rear brake pipe side.
Cap or plug the brake pipe fitting end to prevent brake fluid loss and contamination.

Fig. 73: Brake Pipe Fitting

Courtesy of GENERAL MOTORS COMPANY

5. Disconnect the brake pipe fitting (1) from the brake hose at the wheel cylinder side.
Cap or plug the brake pipe fitting end to prevent brake fluid loss and contamination.

Fig. 74: Brake Hose Retaining Clip

Courtesy of GENERAL MOTORS COMPANY

6. Remove the brake hose retaining clip (1) from the brake hose mounting bracket on the body frame.
7. Detach the brake hose from the brake hose mounting bracket.

Fig. 75: Brake Hose Retaining Clip
Courtesy of GENERAL MOTORS COMPANY

8. Remove the brake hose retaining clip (1) from the brake hose mounting bracket on the rear axle.
9. Remove the brake hose from the brake hose mounting bracket.

Installation Procedure

Fig. 76: Brake Hose Retaining Clip

Courtesy of GENERAL MOTORS COMPANY

1. Install the brake hose to the brake hose mounting bracket on the rear axle.
2. Install the brake hose retaining clip (1) onto the hose fitting at the brake hose mounting bracket.

Fig. 77: Brake Hose Retaining Clip
Courtesy of GENERAL MOTORS COMPANY

3. Install the brake hose to the brake hose mounting bracket on the body frame.
4. Install the brake hose retaining clip (1) onto the hose fitting at the brake hose mounting bracket.

Fig. 78: Brake Pipe Fitting

Courtesy of GENERAL MOTORS COMPANY

CAUTION: Refer to Fastener Caution .

5. Connect the brake pipe fitting (1) to the brake hose at the wheel cylinder side and tighten to 18 N.m (13 lb ft).

Fig. 79: Brake Pipe Fitting

Courtesy of GENERAL MOTORS COMPANY

6. Connect the brake pipe fitting (1) to the brake hose at the rear brake pipe side and tighten to 18 Y (13 lb ft).
7. Bleed the hydraulic brake system. Refer to **Hydraulic Brake System Bleeding (Manual)**, **Hydraulic Brake System Bleeding (Pressure)**.
8. Install the tire and wheel assembly. Refer to **Tire and Wheel Removal and Installation** .
9. Lower the vehicle.

HYDRAULIC BRAKE SYSTEM BLEEDING (MANUAL)

WARNING: Refer to **Brake Fluid Irritant Warning** .

CAUTION: Refer to **Brake Fluid Effects on Paint and Electrical Components Caution** .

1. Place a clean shop cloth beneath the brake master cylinder to catch brake fluid spills.
2. With the ignition OFF and the brakes cool, apply the brakes 3-5 times and until the brake pedal effort

increases significantly, to deplete the brake booster power reserve.

3. If you have performed a brake master cylinder bench bleeding on this vehicle and if you have disconnected the brake pipes from the proportioning valve assembly or the brake pressure modulator assembly, you **MUST** perform the following steps to bleed air at the ports of the hydraulic component.
 1. Fill the master cylinder reservoir to the maximum-full level with the approved brake fluid from a clean, sealed brake fluid container.

If removal of the reservoir cap and diaphragm is necessary, clean the outside of the reservoir on and around the cap prior to removal.

2. With the brake pipes installed securely to the master cylinder, proportioning valve assembly and brake pressure modulator valve assembly, loosen and separate one of the brake pipes from the port of the component.

NOTE: **For the proportioning valve assembly or the brake pressure modulator valve assembly, perform these steps in the sequence of system flow; begin with the fluid feed pipes on the master cylinder.**

3. Allow a small amount of brake fluid to gravity bleed from the open port of the component.
 4. Connect the brake pipe fitting to the component and tighten securely.
 5. Have an assistant slowly depress the brake pedal fully and maintain steady pressure on the pedal.
 6. Loosen the same brake pipe fitting to purge air from the open port of the component.
 7. Tighten the brake pipe fitting, then have the assistant slowly release the brake pedal.
 8. Wait 15 seconds, then repeat steps 3.3-3.7 until all air is purged from the same port of each component.
 9. With the brake pipe fitting installed securely to the master cylinder, proportioning valve assembly and brake pressure modulator valve assembly after all air has been purged from the first port of the component that was bled, loosen and separate the next brake pipe from the component and repeat steps 3.3-3.8 until each of the ports on the component has been bled.
 10. After completing the final component port bleeding procedure, ensure that each of the brake pipe fittings is properly tightened.
4. Fill the master cylinder reservoir to the maximum-full level with the approved brake fluid from a clean, sealed brake fluid container. Ensure the master cylinder reservoir remains at least half-full during this bleeding procedure. Add fluid as needed to maintain the proper level.

Clean the outside of the reservoir on and around the reservoir cap prior to removing the cap and diaphragm.

Fig. 80: Wheel Hydraulic Circuit Bleeder Valve & Draining Container
 Courtesy of GENERAL MOTORS COMPANY

5. Install a proper box-end wrench onto the RIGHT REAR wheel hydraulic circuit bleeder valve (1).
6. Install a transparent hose over the end of the wheel hydraulic circuit bleeder valve (1).
7. Submerge the open end of the transparent hose into a transparent container partially filled with the approved brake fluid from a clean, sealed brake fluid container.
8. Have an assistant slowly depress the brake pedal fully and maintain steady pressure on the pedal.
9. Loosen the bleeder valve to purge air from the wheel hydraulic circuit.
10. Tighten the bleeder valve, then have the assistant slowly release the brake pedal.
11. Wait 15 seconds, then repeat steps 8-10 until all air is purged from the wheel hydraulic circuit.
12. Tighten the wheel circuit bleeder valve securely.
13. Install a proper box-end wrench onto the LEFT FRONT wheel hydraulic circuit bleeder valve.
14. Install a transparent hose over the end of the bleeder valve, then repeat steps 7-12.
15. Install a proper box-end wrench onto the LEFT REAR wheel hydraulic circuit bleeder valve.
16. Install a transparent hose over the end of the bleeder valve, then repeat steps 7-12.
17. Install a proper box-end wrench onto the RIGHT FRONT wheel hydraulic circuit bleeder valve.
18. Install a transparent hose over the end of the bleeder valve, then repeat steps 7-12.
19. After completing the final wheel hydraulic circuit bleeding procedure, ensure that each of the 4 wheel

hydraulic circuit bleeder valves is properly tightened.

20. Fill the brake master cylinder reservoir to the maximum-full level with the approved brake fluid from a clean, sealed brake fluid container.
21. Slowly depress and release the brake pedal. Observe the brake pedal feel.
22. If the brake pedal feels spongy, repeat the bleeding procedure again. If the brake pedal still feels spongy after repeating the bleeding procedure, perform the following steps:
 1. Inspect the brake system for external leaks. Refer to **Brake System External Leak Inspection**.
 2. Pressure bleed the hydraulic brake system in order to purge any air that may still be trapped in the system.
23. Turn the ignition ON, with the engine OFF. Check to see if the brake system warning lamp remains illuminated.

NOTE: **DO NOT allow the vehicle to be driven until it is diagnosed and repaired.**

24. If the brake system warning lamp remains illuminated, refer to **Symptoms - Hydraulic Brakes**.

HYDRAULIC BRAKE SYSTEM BLEEDING (PRESSURE)

Special Tools

- **CH-29532** Diaphragm Type Brake Pressure Bleeder
- **CH-50253** Brake Pressure Bleeder Adapter

WARNING: Refer to **Brake Fluid Irritant Warning** .

CAUTION: Refer to **Brake Fluid Effects on Paint and Electrical Components Caution** .

1. Place a clean shop cloth beneath the brake master cylinder reservoir to catch brake fluid spills.
2. With the ignition OFF and the brakes cool, apply the brakes 3-5 times and until the brake pedal effort increases significantly, to deplete the brake booster power reservoir.
3. If you have performed a master cylinder bench bleeding on this vehicle and if you have disconnected the brake pipes from the proportioning valve assembly or the brake modulator assembly, you must perform the following steps to bleed air at the ports of the hydraulic components.
 1. Fill the master cylinder reservoir to the maximum-full level with the approved brake fluid from a clean, sealed brake fluid container.

If removal of the reservoir cap and diaphragm is necessary, clean the outside of the reservoir on and around the cap prior to removal.

2. With the brake pipes installed securely to the master cylinder, proportioning valve assembly and the brake pressure modulator valve assembly, loosen and separate one of the brake pipes from the

port of the component.

NOTE: For the proportioning valve assembly or the brake pressure modulator valve assembly, perform these steps in the sequence of system flow; begin with the fluid feed pipes on the master cylinder.

3. Allow a small amount of brake fluid to gravity bleed from the open port of the component.
 4. Connect the brake pipe fitting to the component and tighten securely.
 5. Have an assistant slowly depress the brake pedal fully and maintain steady pressure on the pedal.
 6. Loosen the same brake pipe fitting to purge air from the open port of the component.
 7. Tighten the brake pipe fitting, then have the assistant slowly release the brake pedal.
 8. Wait 15 seconds, then repeat steps 3.3-3.7 until all air is purged from the same port of each component.
 9. With the brake pipe fitting installed securely to the master cylinder, proportioning valve assembly and brake pressure modulator assembly after all air has been purged from the first port of the component that was bled, loosen and separate the next brake pipe from the component and repeat steps 3.3-3.8 until each of the ports on the component has been bled.
 10. After completing the final component port bleeding procedure, ensure that each of the brake pipe fittings is properly tightened.
4. Fill the brake master cylinder reservoir to the maximum-fill level with the approved brake fluid from a clean, sealed brake fluid container. Ensure the master cylinder reservoir remains at least half-full during this bleeding procedure. Add fluid as needed to remain the proper level.

Clean the outside of the reservoir on and around the reservoir cap prior to removing the cap and diaphragm.

5. Set up the brake pressure bleeder following the manufacturer's instructions.
6. Open the brake pressure bleeder fluid valve to allow pressurized brake fluid to enter the brake system.
7. Wait approximately 30 seconds and then inspect the entire hydraulic brake system in order to ensure that there are no existing external brake fluid leaks.

Any brake fluid leaks identified require repair prior to completing this procedure.

Fig. 81: Wheel Hydraulic Circuit Bleeder Valve & Draining Container
Courtesy of GENERAL MOTORS COMPANY

8. Install a proper box-end wrench onto the RIGHT REAR wheel hydraulic circuit bleeder valve (1).
9. Install a transparent hose over the end of the wheel hydraulic circuit bleeder valve (1).
10. Submerge the open end of the transparent hose into a transparent container (2) partially filled with the approved brake fluid from a clean, sealed brake fluid container.
11. Loosen the bleeder valve to purge air from the wheel hydraulic circuit. Allow fluid to flow until air bubbles stop flowing from the bleeder, then tighten the bleeder valve.
12. Tighten the wheel circuit bleeder valve securely.
13. Install a proper box-end wrench onto the LEFT FRONT wheel hydraulic circuit bleeder valve.
14. Install a transparent hose over the end of the wheel hydraulic circuit bleeder valve, then repeat steps 10-12.
15. Install a proper box-end wrench onto the LEFT REAR wheel hydraulic circuit bleeder valve.
16. Install a transparent hose over the end of the wheel hydraulic circuit bleeder valve, then repeat steps 10-12.
17. Install a proper box-end wrench onto the RIGHT FRONT wheel hydraulic circuit bleeder valve.
18. Install a transparent hose over the end of the wheel hydraulic circuit bleeder valve, then repeat steps 10-12.
19. After completing the final wheel hydraulic circuit bleeding procedure, ensure that each of the 4 wheel

hydraulic circuit bleeder valves is properly tightened.

20. Close the brake pressure bleeder fluid valve.
21. Remove the brake pressure bleeder from the brake master cylinder reservoir.
22. Fill the brake master cylinder reservoir to the maximum-full level with the approved brake fluid from a clean, sealed brake fluid container.
23. Slowly depress and release the brake pedal. Observe the feel of the brake pedal.
24. If the brake pedal feels spongy, repeat the bleeding procedure again. If the brake pedal still feels spongy after repeating the bleeding procedure, perform the following step:
 1. Inspect the brake system for external leaks. Refer to **Brake System External Leak Inspection**.
 2. If equipped with antilock brakes, using a scan tool, perform the antilock brake system automated bleeding procedure to remove any air that may have been trapped in the brake pressure modulator valve (BPMV). Refer to **Antilock Brake System Automated Bleed**
25. Turn the ignition ON, with the engine OFF. Check to see if the brake system warning lamp is illuminated.

NOTE: DO NOT allow the vehicle to be driven until it is diagnosed and repaired.

26. If the brake system warning lamp remains illuminated, refer to **Symptoms - Hydraulic Brakes**.

HYDRAULIC BRAKE SYSTEM FLUSHING

WARNING: Refer to Brake Fluid Irritant Warning .

CAUTION: Refer to Brake Fluid Effects on Paint and Electrical Components Caution .

1. Inspect the brake fluid for the following conditions, indicating brake fluid contamination:
 - Fluid separation, indicating 2 types of fluid are present. A substance other than the recommended brake fluid has been introduced into the brake hydraulic system.
 - Swirled appearance - oil-based substance
 - Layered appearance - silicone-based substance
 - Fluid discoloration, indicating the presence of moisture or particles that have been introduced into the brake hydraulic system.
 - Cloudy appearance - moisture
 - Dark appearance/suspended particles in fluid - dirt, rust, corrosion and/or brake dust
2. Inspect the master cylinder reservoir cap diaphragm and the reservoir-to-master cylinder grommets for swelling, indicating brake fluid contamination.
3. If the brake fluid WAS contaminated with an oil-based or a silicone-based substance, indicated by fluid separation and/or a swollen master cylinder reservoir cap diaphragm and/or swollen reservoir-to-master cylinder grommets, perform the following:
 1. Remove ALL of the following components listed from the vehicle. Each component contains

internal rubber seals/linings which have been contaminated by the contaminated brake fluid in the brake hydraulic system.

Refer to the procedures indicated:

- **Master Cylinder Replacement (Right Hand Drive), Master Cylinder Replacement (Left Hand Drive)**
 - **Front Brake Hose Replacement**
 - **Rear Brake Hose Replacement**
 - **Front Brake Caliper Replacement**
 - **Rear Brake Cylinder Replacement**
 - **Brake Proportion Valve Replacement (Left Hand Drive), Brake Proportion Valve Replacement (Right Hand Drive)**, if equipped
 - **Brake Pressure Modulator Valve Replacement** , if equipped
2. Clean out all the hydraulic brake pipes using denatured alcohol and equivalent.
 3. Dry the brake pipes using non-lubricated, filtered air.
 4. Repair or replace ALL of the following components listed and install them to the vehicle. Each component contains internal rubber seals/linings which have been contaminated by the contaminated brake fluid in the brake hydraulic system.

Refer to the procedures indicated:

- **Master Cylinder Replacement (Right Hand Drive), Master Cylinder Replacement (Left Hand Drive)** ; also perform the following:
 - Clean the brake master cylinder reservoir using denatured alcohol and equivalent, then dry the reservoir using non-lubricated, filtered air. Inspect the reservoir for cracks and/or damage and replace if necessary. Refer to [Master Cylinder Reservoir Replacement](#).
 - **Front Brake Hose Replacement**
 - **Rear Brake Hose Replacement**
 - **Front Brake Caliper Replacement**
 - **Rear Brake Cylinder Replacement**
 - **Brake Proportion Valve Replacement (Left Hand Drive), Brake Proportion Valve Replacement (Right Hand Drive)**, if equipped
 - **Brake Pressure Modulator Valve Replacement** , if equipped
4. If the brake fluid WAS NOT contaminated with an oil-based or a silicone-based substance, but WAS contaminated with water or dirt, rust, corrosion, and/or brake dust, replace the brake master cylinder reservoir cap diaphragm which may have allowed the moisture or particles to enter the hydraulic system.
 5. Fill the brake master cylinder reservoir to the maximum-fill level with the approved brake fluid from a clean, sealed brake fluid container.
 6. Pressure bleed the hydraulic brake system. Begin the procedure with the pressure bleeder reservoir filled to the maximum-fill level with the correct brake fluid as indicated. Refer to [**Hydraulic Brake System Bleeding \(Manual\), Hydraulic Brake System Bleeding \(Pressure\)**](#).

POWER VACUUM BRAKE BOOSTER REPLACEMENT (LEFT HAND DRIVE)

Removal Procedure

WARNING: Refer to Brake Fluid Irritant Warning .

CAUTION: Refer to Brake Fluid Effects on Paint and Electrical Components Caution .

1. Apply and release the brake pedal several times until it becomes firm to deplete the brake booster vacuum reserve.
2. Remove the master cylinder. Refer to Master Cylinder Replacement (Right Hand Drive), Master Cylinder Replacement (Left Hand Drive).
3. Remove the power vacuum brake booster check valve and hose assembly from the brake booster grommet.
4. Remove the steering column opening filler. Refer to Steering Column Opening Filler Replacement .

Fig. 82: Retaining Clip And Pin

Courtesy of GENERAL MOTORS COMPANY

5. Remove the retaining clip (1) and pin (2) from brake pedal.
6. Separate the brake booster pushrod from the brake pedal.

Fig. 83: Clutch (ABC) Pedal Module Retaining Nuts
Courtesy of GENERAL MOTORS COMPANY

7. Remove the brake booster to accelerator, brake and clutch (ABC) pedal module retaining nuts (1) from the ABC pedal module.

Fig. 84: Power Vacuum Brake Booster
Courtesy of GENERAL MOTORS COMPANY

8. Remove the power vacuum brake booster (1).

Fig. 85: Power Vacuum Brake Booster Gasket
Courtesy of GENERAL MOTORS COMPANY

9. Remove the power vacuum brake booster gasket (1).

Inspect the power vacuum brake booster gasket for damage and replace if necessary.

Installation Procedure

Fig. 86: Power Vacuum Brake Booster Gasket
Courtesy of GENERAL MOTORS COMPANY

1. Install the power vacuum brake booster gasket (1).

Fig. 87: Power Vacuum Brake Booster
Courtesy of GENERAL MOTORS COMPANY

2. Install the power vacuum brake booster (1).

Fig. 88: Clutch (ABC) Pedal Module Retaining Nuts
Courtesy of GENERAL MOTORS COMPANY

3. Loosely install the brake booster to ABC pedal module retaining nuts (1).

Fig. 89: Retaining Clip And Pin

Courtesy of GENERAL MOTORS COMPANY

4. Connect the brake booster pushrod to the brake pedal.
5. Install the pushrod pin (2) to the brake pedal and insert the retaining clip (1) to the pin (2).

Fig. 90: Clutch (ABC) Pedal Module Retaining Nuts
Courtesy of GENERAL MOTORS COMPANY

CAUTION: Refer to Fastener Caution .

6. Completely tighten the brake booster to ABC pedal module retaining nuts (1) and tighten to 22 N.m (16 lb ft).
7. Install the steering column opening filler. Refer to Steering Column Opening Filler Replacement .
8. Install the power vacuum brake booster check valve and hose assembly to the brake booster grommet.
9. Install the master cylinder. Refer to Master Cylinder Replacement (Right Hand Drive), Master Cylinder Replacement (Left Hand Drive).

POWER VACUUM BRAKE BOOSTER REPLACEMENT (RIGHT HAND DRIVE)

Removal Procedure

WARNING: Refer to Brake Fluid Irritant Warning .

CAUTION: Refer to Brake Fluid Effects on Paint and Electrical Components Caution .

1. Apply and release the brake pedal several times until it becomes firm to deplete the brake booster vacuum reserve.
2. Remove the plenum lower panel. Refer to **Plenum Lower Panel Replacement** .
3. Remove the master cylinder. Refer to **Master Cylinder Replacement (Right Hand Drive)**, **Master Cylinder Replacement (Left Hand Drive)**.
4. Remove the power vacuum brake booster check valve and hose assembly from the brake booster grommet.
5. Remove the steering column opening filler. Refer to **Steering Column Opening Filler Replacement** .

Fig. 91: Retaining Clip And Pin

Courtesy of GENERAL MOTORS COMPANY

6. Remove the retaining clip (1) and pin (2) from brake pedal.
7. Separate the brake booster pushrod from the brake pedal.

Fig. 92: Clutch (ABC) Pedal Module Retaining Nuts
Courtesy of GENERAL MOTORS COMPANY

8. Remove the brake booster to accelerator, brake and clutch (ABC) pedal module retaining nuts (1) from the ABC pedal module.

Fig. 93: Power Vacuum Brake Booster
Courtesy of GENERAL MOTORS COMPANY

9. Remove the power vacuum brake booster (1).

Fig. 94: Power Vacuum Brake Booster Gasket
Courtesy of GENERAL MOTORS COMPANY

10. Remove the power vacuum brake booster gasket (1).

Inspect the power vacuum brake booster gasket for damage and replace if necessary.

Installation Procedure

Fig. 95: Power Vacuum Brake Booster Gasket
Courtesy of GENERAL MOTORS COMPANY

1. Install the power vacuum brake booster gasket (1).

Fig. 96: Power Vacuum Brake Booster
Courtesy of GENERAL MOTORS COMPANY

2. Install the power vacuum brake booster (1).

Fig. 97: Clutch (ABC) Pedal Module Retaining Nuts
Courtesy of GENERAL MOTORS COMPANY

3. Loosely install the brake booster to ABC pedal module retaining nuts (1).

Fig. 98: Retaining Clip And Pin

Courtesy of GENERAL MOTORS COMPANY

4. Connect the brake booster pushrod to the brake pedal.
5. Install the pushrod pin (2) to the brake pedal and insert the retaining clip (1) to the pin (2).

Fig. 99: Clutch (ABC) Pedal Module Retaining Nuts
Courtesy of GENERAL MOTORS COMPANY

CAUTION: Refer to Fastener Caution .

6. Completely tighten the brake booster to ABC pedal module retaining nuts (1) to 22 N.m (16 lb ft).
7. Install the steering column opening filler. Refer to Steering Column Opening Filler Replacement .
8. Install the power vacuum brake booster check valve and hose assembly to the brake booster grommet.
9. Install the master cylinder. Refer to Master Cylinder Replacement (Right Hand Drive), Master Cylinder Replacement (Left Hand Drive).
10. Install the plenum lower panel. Refer to Plenum Lower Panel Replacement .

POWER BRAKE BOOSTER VACUUM CHECK VALVE AND HOSE REPLACEMENT (LEFT HAND DRIVE)

Removal Procedure

1. Apply and release the brake pedal several times until the pedal becomes firm to deplete the power brake booster vacuum reserve.

Fig. 100: Vacuum Hose Retaining Clamp And Vacuum Hose
Courtesy of GENERAL MOTORS COMPANY

2. Compress the vacuum hose retaining clamp (2) at the intake manifold vacuum port (3) and slide 50 mm (2 in) along the vacuum hose (1).
3. Disconnect the vacuum hose (1) from the intake manifold vacuum port (3).

Fig. 101: Vacuum Hose

Courtesy of GENERAL MOTORS COMPANY

4. Detach the vacuum hose (1) from the intake manifold mounted vacuum hose retaining brackets (2).

Fig. 102: Vacuum Brake Booster Check Valve
Courtesy of GENERAL MOTORS COMPANY

5. Remove the vacuum hose and the vacuum brake booster check valve (1) from the vacuum brake booster.

Fig. 103: Vacuum Brake Booster Check Valve
Courtesy of GENERAL MOTORS COMPANY

6. Remove the vacuum brake booster check valve (1) from the vacuum hose (2), if necessary.

Installation Procedure

Fig. 104: Vacuum Brake Booster Check Valve
Courtesy of GENERAL MOTORS COMPANY

1. Install the vacuum brake booster check valve (1) to the vacuum hose (2).

Fig. 105: Vacuum Brake Booster Check Valve
Courtesy of GENERAL MOTORS COMPANY

2. Install the vacuum hose and the vacuum brake booster check valve (1) to the vacuum brake booster.

Fig. 106: Vacuum Hose

Courtesy of GENERAL MOTORS COMPANY

3. Attach the vacuum hose (1) to the intake manifold mounted vacuum hose retaining brackets (2).

Fig. 107: Vacuum Hose Retaining Clamp And Vacuum Hose
Courtesy of GENERAL MOTORS COMPANY

4. Connect the vacuum hose (1) to the intake manifold vacuum port (3).
5. Compress the vacuum hose retaining clamp (2) and slide along the vacuum hose (1) to the correct location, to secure the vacuum hose (1) to the intake manifold vacuum port (3).

POWER BRAKE BOOSTER VACUUM CHECK VALVE AND HOSE REPLACEMENT (RIGHT HAND DRIVE)

Removal Procedure

1. Apply and release the brake pedal several times until the pedal becomes firm to deplete the power brake booster vacuum reserve.

Fig. 108: Vacuum Hose Retaining Clamp And Vacuum Hose
Courtesy of GENERAL MOTORS COMPANY

2. Compress the vacuum hose retaining clamp (2) at the intake manifold vacuum port (3) and slide 50 mm (2 in) along the vacuum hose (1).
3. Disconnect the vacuum hose (1) from the intake manifold vacuum port (3).

Fig. 109: Vacuum Hose

Courtesy of GENERAL MOTORS COMPANY

4. Detach the vacuum hose (1) from the intake manifold mounted vacuum hose retaining brackets (2).
5. Remove the vacuum hose and the vacuum brake booster check valve (1) from the vacuum brake booster (3).

Fig. 110: Vacuum Brake Booster Check Valve
Courtesy of GENERAL MOTORS COMPANY

6. Remove the vacuum brake booster check valve (1) from the vacuum hose (2), if necessary.

Installation Procedure

Fig. 111: Vacuum Brake Booster Check Valve
Courtesy of GENERAL MOTORS COMPANY

1. Install the vacuum brake booster check valve (1) to the vacuum hose (2).

Fig. 112: Vacuum Hose

Courtesy of GENERAL MOTORS COMPANY

2. Install the vacuum hose and the vacuum brake booster check valve (1) to the vacuum brake booster (3).
3. Attach the vacuum hose (1) to the intake manifold mounted vacuum hose retaining brackets (2).

Fig. 113: Vacuum Hose Retaining Clamp And Vacuum Hose
Courtesy of GENERAL MOTORS COMPANY

4. Connect the vacuum hose (1) to the intake manifold vacuum port (3).
5. Compress the vacuum hose retaining clamp (2) and slide along the vacuum hose (1) to the correct location, to secure the vacuum hose (1) to the intake manifold vacuum port (3).

POWER BRAKE BOOSTER VACUUM SENSOR REPLACEMENT

Removal Procedure

1. With the engine OFF, apply and release the brake pedal several times to deplete the power vacuum brake booster vacuum reserve.
2. Remove the battery. Refer to **Battery Replacement** .
3. Remove the ECM bracket bolts and then position the ECM and ECM bracket aside. Refer to **Engine Control Module Replacement** .
4. Disconnect the power brake booster pump electrical connector.

Fig. 114: Power Brake Booster Vacuum Hose Quick Connector
Courtesy of GENERAL MOTORS COMPANY

5. Remove the power brake booster vacuum hose quick connector (1) from the power brake booster pump.

Fig. 115: Power Brake Booster Vacuum Hose Quick Connector
Courtesy of GENERAL MOTORS COMPANY

6. Disconnect the power brake booster vacuum hose quick connector (1) from the intake manifold fitting.
7. Disconnect the power brake booster vacuum hose from the brackets (2) on the intake manifold.
8. Disconnect and remove the power brake booster vacuum hose and vacuum switch assembly (1) from the power vacuum brake booster grommet.

Installation Procedure

1. Install and connect the power brake booster vacuum hoses and switch assembly to the power vacuum brake booster grommet.

Fig. 116: Power Brake Booster Vacuum Hose Quick Connector
Courtesy of GENERAL MOTORS COMPANY

2. Connect the power brake booster vacuum hose to the brackets (2) on the intake manifold.
3. Connect the power brake booster vacuum pipe quick connector (1) to the intake manifold fitting.

Fig. 117: Power Brake Booster Vacuum Hose Quick Connector
Courtesy of GENERAL MOTORS COMPANY

4. Connect the power brake booster vacuum hose quick connect (1) to the power brake booster pump.
5. Connect the power brake booster vacuum switch electrical connector.
6. Install the ECM and ECM bracket. Refer to **Engine Control Module Replacement** .
7. Install the battery. Refer to **Battery Replacement** .

POWER BRAKE BOOSTER VACUUM HOSE REPLACEMENT

Removal Procedure

1. With the engine OFF, apply and release the brake pedal several times to deplete the power vacuum brake booster vacuum reserve.
2. Remove the battery. Refer to **Battery Replacement** .

Fig. 118: ECM Bracket Bolts

Courtesy of GENERAL MOTORS COMPANY

3. Remove the ECM bracket bolts (1) and then position the ECM and ECM bracket aside. Refer to **Engine Control Module Replacement** .
4. Disconnect the power brake booster vacuum switch electrical connector (1).

Fig. 119: Power Brake Booster Vacuum Hose Quick Connect
Courtesy of GENERAL MOTORS COMPANY

5. Disconnect the power brake booster vacuum hose quick connect (1) from the power brake booster pump.

Fig. 120: Power Brake Booster Vacuum Hose Quick Connect

5. Connect the power brake booster vacuum pipe quick connect (1) to the intake manifold fitting.

Fig. 128: Power Brake Booster Vacuum Hose Quick Connect
Courtesy of GENERAL MOTORS COMPANY

6. Connect the power brake booster vacuum hose quick connect (1) to the power brake booster pump.

Fig. 129: ECM Bracket Bolts

Courtesy of GENERAL MOTORS COMPANY

7. Connect the power brake booster vacuum switch electrical connector (1).
8. Install the ECM and ECM bracket. Refer to **Engine Control Module Replacement** .
9. Install the battery. Refer to **Battery Replacement** .

POWER BRAKE BOOSTER PUMP REPLACEMENT (AUTOMATIC TRANSMISSION)

Removal Procedure

1. With the engine OFF, apply and release the brake pedal several times to deplete the power vacuum brake booster vacuum reserve.
2. Remove the battery. Refer to **Battery Replacement** .
3. Remove the ECM bracket bolts (1) and then position the ECM and ECM bracket aside. Refer to **Engine Control Module Replacement** .
4. Remove the battery tray. Refer to **Battery Tray Replacement** .
5. Disconnect the power brake booster pump electrical connector.

Fig. 130: Power Brake Booster Vacuum Hose Quick Connector
Courtesy of GENERAL MOTORS COMPANY

6. Remove the power brake booster vacuum hose quick connector (1) from the power brake booster pump.

Fig. 131: Power Brake Booster Pump Bracket And Transmission Bracket Bolts
Courtesy of GENERAL MOTORS COMPANY

7. Remove the power brake booster pump bracket to transmission bracket bolts (1).
8. Remove the power brake booster pump and bracket assembly from the vehicle.

Fig. 132: Power Brake Booster Pump Ventilation Hose
Courtesy of GENERAL MOTORS COMPANY

9. Remove the power brake booster pump ventilation hose (1) from the pump and bracket assembly.

Fig. 133: Power Brake Booster Pump And Bracket Bolts
Courtesy of GENERAL MOTORS COMPANY

10. Remove the power brake booster pump to bracket bolts (1), nuts (2) and bushings (3).

Fig. 134: Power Brake Booster Pump
Courtesy of GENERAL MOTORS COMPANY

11. Remove the power brake booster pump from the bracket.
12. Remove the power brake booster pump dampeners (1) from the power brake booster pump.

Installation Procedure

Fig. 135: Power Brake Booster Pump
Courtesy of GENERAL MOTORS COMPANY

1. Install the power brake booster pump dampeners (1) to the power brake booster pump.
2. Install the power brake booster pump to the bracket.

Fig. 136: Power Brake Booster Pump And Bracket Bolts
Courtesy of GENERAL MOTORS COMPANY

CAUTION: Refer to Fastener Caution .

3. Install the power brake booster pump dampener bushing (3) and install the power brake booster pump to bracket bolts (1) and nuts (2) and tighten to 7 (62 lb in).

Fig. 137: Power Brake Booster Pump Ventilation Hose
Courtesy of GENERAL MOTORS COMPANY

4. Install the power brake booster pump ventilation hose (1) to the pump and bracket assembly.
5. Install the power brake booster pump and bracket assembly to the vehicle.

Fig. 138: Power Brake Booster Pump Bracket And Transmission Bracket Bolts
Courtesy of GENERAL MOTORS COMPANY

6. Install the power brake booster pump bracket to transmission bracket bolts (1) and tighten to 22 (16 lb ft).

Fig. 139: Power Brake Booster Vacuum Hose Quick Connector
Courtesy of GENERAL MOTORS COMPANY

7. Install the power brake booster vacuum hose quick connector (1).
8. Connect the power brake booster pump electrical connector.
9. Install the battery tray. Refer to **Battery Tray Replacement** .
10. Install the ECM and ECM bracket. Refer to **Engine Control Module Replacement** .
11. Install the battery. Refer to **Battery Replacement** .

POWER BRAKE BOOSTER PUMP REPLACEMENT (MANUAL TRANSMISSION)

Removal Procedure

1. With the engine OFF, apply and release the brake pedal several times to deplete the power vacuum brake booster vacuum reserve.
2. Remove the battery. Refer to **Battery Replacement** .
3. Remove the ECM bracket bolts (1) and then position the ECM and ECM bracket aside. Refer to **Engine Control Module Replacement** .
4. Remove the battery tray. Refer to **Battery Tray Replacement** .
5. Disconnect the power brake booster pump electrical connector.

Fig. 140: Power Brake Booster Vacuum Hose Quick Connector

Courtesy of GENERAL MOTORS COMPANY

6. Install the power brake booster pump bracket to transmission case bolt (1) and tighten to 22 (16 lb ft).

Fig. 150: Power Brake Booster Pump Bracket
Courtesy of GENERAL MOTORS COMPANY

7. Install the power brake booster pump bracket to transmission bracket bolts (1) and tighten to 22 (16 lb ft).

Fig. 151: Power Brake Booster Vacuum Hose Quick Connector
Courtesy of GENERAL MOTORS COMPANY

8. Install the power brake booster vacuum hose quick connector (1).
9. Connect the power brake booster pump electrical connector.
10. Install the battery tray. Refer to **Battery Tray Replacement** .
11. Install the ECM and ECM bracket. Refer to **Engine Control Module Replacement** .
12. Install the battery. Refer to **Battery Replacement** .

POWER BRAKE BOOSTER PUMP REPLACEMENT (CVT)

Removal Procedure

1. With the engine OFF, apply and release the brake pedal several times to deplete the power vacuum brake booster vacuum reserve.
2. Remove the air cleaner assembly. Refer to **Air Cleaner Assembly Replacement** .
3. Remove the heated oxygen sensor - 1. Refer to **Heated Oxygen Sensor Replacement - Sensor 1** .
4. Remove the exhaust manifold heat shield. Refer to **Exhaust Manifold Heat Shield Replacement** .
5. Disconnect the power brake booster pump electrical connector.

Fig. 152: Power Brake Booster Vacuum Hose Quick Connector
Courtesy of GENERAL MOTORS COMPANY

6. Remove the power brake booster vacuum hose quick connector (1) from the power brake booster pump.

Fig. 153: Power Brake Booster Pump Bracket Bolt
Courtesy of GENERAL MOTORS COMPANY

7. Remove the power brake booster pump bracket bolt (1).

Fig. 154: Power Brake Booster Pump Bracket Bolts
Courtesy of GENERAL MOTORS COMPANY

8. Remove the power brake booster pump bracket bolts (1).
9. Remove the power brake booster pump and bracket assembly from the vehicle.

Installation Procedure

1. Install the power brake booster pump and bracket assembly to the vehicle.

Fig. 155: Power Brake Booster Pump Bracket Bolts
Courtesy of GENERAL MOTORS COMPANY

CAUTION: Refer to Fastener Caution .

2. Install the power brake booster pump bracket bolts (1) and tighten to 22 (16 lb ft).

Fig. 156: Power Brake Booster Pump Bracket Bolt
Courtesy of GENERAL MOTORS COMPANY

3. Install the power brake booster pump bracket bolt (1) and tighten to 22 (16 lb ft).

Fig. 157: Power Brake Booster Vacuum Hose Quick Connector
Courtesy of GENERAL MOTORS COMPANY

4. Install the power brake booster vacuum hose quick connector (1).
5. Connect the power brake booster pump electrical connector.
6. Install the exhaust manifold heat shield. Refer to **Exhaust Manifold Heat Shield Replacement** .
7. Install the heated oxygen sensor - 1. Refer to **Heated Oxygen Sensor Replacement - Sensor 1** .
8. Install the air cleaner assembly. Refer to **Air Cleaner Assembly Replacement** .

DESCRIPTION AND OPERATION

BRAKE ASSIST SYSTEM DESCRIPTION AND OPERATION

System Component Description

The brake assist system consists of the following:

Brake Pedal

Receives, multiplies and transfers brake system input force from driver.

Brake Pedal Pushrod

Transfers multiplied input force received from the brake pedal to the vacuum brake booster.

Vacuum Brake Booster

Uses source vacuum to decrease effort required by driver when applying brake system input force. At rest, source vacuum is applied to both sides of the vacuum diaphragm for single booster. Return springs maintain the booster in a rest position. When brake system input force is applied, vacuum to the rear of the diaphragm is cut off and air at atmospheric pressure is admitted in its place. This provides a decrease in brake pedal effort required. When input force is removed, vacuum again replaces atmospheric pressure within the booster.

Vacuum Source

Supplies force used by vacuum brake booster to decrease brake pedal effort. The source vacuum for a spark ignition engine is normally derived from the intake manifold.

Vacuum Source Delivery System

Enables delivery and retention of source vacuum for vacuum brake booster.

System Operation

Under normal driving conditions, without the brakes applied, vacuum is allowed to act on both sides of the diaphragm within the vacuum brake booster. When the brake pedal is applied, the effort by the driver is multiplied due to the relative length of the brake pedal in relationship to its pivot point and the point at which the push rod to the vacuum brake booster is attached.

Movement of the push rod causes a valve within the vacuum brake booster to close between the two sides of the diaphragm, thus isolating each side. It also allows a valve to open that allows atmospheric pressure to act on the pedal side of the vacuum brake booster while maintaining vacuum on the vacuum source side of the diaphragm. The movement of the brake pedal pushrod is transferred to the hydraulic brake master cylinder via the vacuum brake booster. The pressure differential within the vacuum brake booster reduces the effort required by the driver in applying the brakes.

BRAKE BOOSTER VACUUM ASSIST DESCRIPTION AND OPERATION

System Component Description

The brake booster vacuum assist system consists of the following:

Brake Booster Auxiliary Vacuum Pump

The brake booster vacuum pump is a secondary vacuum supply to the brake booster to maintain sufficient vacuum for brake assist.

Vacuum Brake Booster

Uses source vacuum to decrease effort required by driver when applying the brake. When brake system

input force is applied, air at atmospheric pressure is admitted to the rear of both vacuum diaphragms, providing a decrease in brake pedal effort required. When input force is removed, vacuum replaces atmospheric pressure within the booster.

Vacuum Source

Vacuum is supplied by engine vacuum or by the brake booster vacuum pump.

System Operation

The brake booster vacuum switch is activated by the amount of vacuum available to the power brake booster. When the ignition switch is at the ON position and the vacuum within the system drops, the switch within the brake booster vacuum switch closes allowing voltage to be supplied to the brake booster pump motor.

BRAKE WARNING SYSTEM DESCRIPTION AND OPERATION

Brake Warning Indicator

Hydraulic Brakes Block Diagram

Fig. 158: Hydraulic Brake Warning System Diagram
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
HW	Hard-Wired

HW	Hard-Wired
DA	Serial Data
B80	B80 Park Brake Switch
B20	B20 Brake Fluid Level Switch
K9	K9 Body Control Module
K17	K17 Electronic Brake Control Module
P16	P16 Instrument Cluster

The instrument cluster turns the brake warning indicator ON when the following occurs:

- The instrument cluster performs the bulb check. The brake warning indicator illuminates for 5 s.
- When the Electronic Brake Control Module (EBCM) detects low brake fluid level it sets DTC C0267 and sends a serial data message to the instrument cluster, which will illuminate the red brake indicator.
- The Body Control Module (BCM) detects that the parking brake is engaged. The instrument cluster receives a serial data message from the BCM requesting illumination.

Driver Information Center Messages

When the Electronic Brake Control Module (EBCM) detects low brake fluid level it sets DTC C0267 and sends a serial data message to the Driver Information Center, which will display Brake Fluid Low message.

HYDRAULIC BRAKE SYSTEM DESCRIPTION AND OPERATION

System Component Description

The hydraulic brake system consists of the following:

Hydraulic Brake Master Cylinder Reservoir

Contains a supply of brake fluid for the hydraulic brake system.

Hydraulic Brake Master Cylinder

Converts mechanical input force into hydraulic output pressure.

Hydraulic output pressure is distributed from the master cylinder through two hydraulic circuits, supplying diagonally-opposed wheel apply circuits.

Hydraulic Brake Pressure Balance Control System

Regulates brake fluid pressure delivered to hydraulic brake wheel circuits, in order to control the distribution of braking force. Pressure balance control on non-ABS equipped vehicles, is achieved through a proportioning valve assembly. Pressure balance control on ABS equipped vehicles, is achieved through electronic brake distribution (EBD), which is a function of the ABS modulator.

Hydraulic Brake Pipes and Flexible Brake Hoses

Carries brake fluid to and from hydraulic brake system components.

Hydraulic Brake Wheel Apply Components

Converts hydraulic input pressure into mechanical output force.

System Operation

Mechanical force is converted into hydraulic pressure by the master cylinder, regulated to meet braking system demands by the pressure balance control system and delivered to the hydraulic brake wheel circuits by the pipes and flexible hoses. The wheel apply components then convert the hydraulic pressure back into mechanical force which presses brake linings against rotating brake system components.

DTC B2955: SECURITY SENSOR

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

DTC Descriptor

DTC B2955

Security Sensor Data Circuit

For symptom byte information, refer to **Symptom Byte List** .

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
B+	B2955 00	B2955 00	-	-
Serial Data	B2955 00	B2955 00	B2955 00	B2955 00
Low Reference	-	B2955 00	-	-

Circuit/System Description

When an ignition key is inserted into the ignition lock cylinder and the ignition is switched ON, the transponder embedded in the key is energized by the exciter coil surrounding the ignition lock cylinder. The transponder transmits a signal to the immobilizer control module. The immobilizer control module translates this signal to a serial data message which is sent to the body control module (BCM). The BCM then compares this value to a value stored in memory. If the value is correct, the BCM will send the prerelease password via the serial data circuit to the engine control module (ECM). If the learned key code does not match or a transponder value is not received, the BCM will send the start disable password to the ECM.

Conditions for Running the DTC

Ignition is in the Accessory or Run position.

Conditions for Setting the DTC

The BCM detects a circuit fault on the immobilizer antenna circuits.

Action Taken When the DTC Sets

- Vehicle starting will be disabled.
- The security indicator in the instrument cluster will be illuminated. A service message will be displayed in the driver information center.

Conditions for Clearing the DTC

- A current DTC will be cleared when the condition for setting the DTC are no longer present.
- A history DTC will be cleared after 100 malfunction-free ignition cycles.

Diagnostic Aids

Because of how the key information is stored in the BCM and the ECM, it may be necessary to begin immobilizer programming with a new vehicle key if DTC B2955 sets immediately after attempting to program a new BCM. This will allow the key information to be transferred between the BCM and the ECM. DTC P0633 may also be set in the ECM and a "No Communication with driver ID Device" error may be displayed during the BCM programming. After programming has begun with the new vehicle key, the existing vehicle keys may then be programmed.

Scan Tool Reference

Control Module References for scan tool information

Circuit/System Testing

1. Verify DTC B2955 did not set immediately after the replacement or programming of the K9 Body Control Module or after performing the Immobilizer System Component Programming procedure.
 - **If the DTC set immediately after the replace or programming of the K9 Body Control Module or after performing the Immobilizer System Component Programming procedure.**

Perform the Immobilizer System Component Programming procedure using a new vehicle key. After the new key has been learned, the existing vehicle keys may be learned to the vehicle.

- **If the DTC did not set immediately after the replace or programming of the K9 Body Control Module or after performing the Immobilizer System Component Programming procedure.**
2. Ignition OFF and all vehicle systems OFF, disconnect the harness connector at the K89 Immobilizer Control Module. It may take up to 2 min for all vehicle systems to power down.
3. Verify a test lamp illuminates between the low reference circuit terminal 1 and B+.
 - **If the test lamp does not illuminate**
 1. Ignition OFF, disconnect the harness connector at the K9 Body Control Module.
 2. Test for less than 2 ohms in the low reference circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, replace the K9 Body Control Module.

- **If the test lamp illuminates**

4. Ignition ON.

NOTE: In some instances, the K9 Body Control Module may only apply voltage for 3 s immediately after the ignition is turned ON. It may be necessary to monitor the DMM while turning the ignition ON to observe the voltage.

5. Test for greater than 9 V between the B+ circuit terminal 3 and ground.

- **If 9 V or less**

1. Ignition OFF, disconnect the harness connector at the K9 Body Control Module.
2. Test for infinite resistance between the B+ circuit and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance
3. Test for less than 2 ohms in the B+ circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, replace the K9 Body Control Module.

- **If greater than 9 V**

6. Test for greater than 4 V between the serial data circuit terminal 2 and ground.

- **If 4 V or less**

1. Ignition OFF, disconnect the harness connector at the K9 Body Control Module.
2. Test for infinite resistance between the serial data circuit and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance
3. Test for less than 2 ohms in the serial data circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, replace the K9 Body Control Module.

- **If greater than 4 V**

7. Ignition OFF, disconnect the X3 harness connector at the K9 Body Control Module, ignition ON.

8. Test for less than 1 V between the K89 Immobilizer Control Module serial data circuit terminal 2 and ground.

- **If 1 V or greater**

Repair the short to voltage on the circuit.

- **If less than 1 V**

9. Replace the K89 Immobilizer Control Module.

10. Verify DTC B2955 does not set while operating the vehicle under the conditions for running the DTC.

- **If DTC B2955 is set**

Replace the K9 Body Control Module.

- If DTC B2955 is not set

11. All OK.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

Control Module References for body control module or immobilizer control module replacement, programming and setup.

DTC B302A: MOBILE TELEPHONE COMMUNICATIONS INTERFACE

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

DTC Descriptor

DTC B302A

Mobile Telephone Communications Interface Requested Immobilization

For symptom byte information, refer to **Symptom Byte List** .

Circuit/System Description

As part of the vehicle telematics enhanced services, a request may be sent to the body control module (BCM) to disable vehicle starting. If a valid message is received by the BCM requesting that starting be disabled, the start enable message will not be sent to the engine control module (ECM).

Conditions for Running the DTC

The BCM continuously monitors for this DTC.

Conditions for Setting the DTC

A start disable message has been received from the telematics module.

Action Taken When the DTC Sets

Vehicle starting will be suspended and the security indicator will be illuminated.

Conditions for Clearing the DTC

- A current DTC will clear when the telematics start disable request is no longer received.

- A history DTC will clear after 100 ignition cycles in which the telematic start disable request is not seen.

Diagnostic Aids

- DTC B302A is only an indicator that a start disable request has been received from the vehicle telematics system and does not indicate a fault in the immobilizer or telematics system.
- To remove the start disable request, the vehicle account must be updated with the OnStar stolen vehicle team. This will require that a law enforcement agency or the customer contact OnStar to indicate that the vehicle has been successfully and safely recovered.
- If the OnStar system has been disabled or damaged during a theft attempt, the system will not be able to communicate and the start disable request will not be removed. OnStar must be functioning properly for the start disable request to be removed.

Scan Tool Reference

Control Module References for scan tool information

Circuit/System Verification

1. Verify the OnStar system is not damaged and is operating properly, with no DTCs set.
 - **If the OnStar system is damaged, inoperative or any OnStar DTCs are set**

These concerns must be corrected before the start disable can be removed.

- **If the OnStar system is not damaged and is operating properly**

2. Press the blue OnStar button and ask the advisor to be transferred to the stolen vehicle team to verify the vehicle account has been updated.
3. Verify that OnStar is aware the vehicle has been recovered and that the vehicle account has been updated.
 - **If OnStar has not been notified that the vehicle has been recovered**

Contact the customer and advise them that for security purposes, they must contact OnStar and the law enforcement agency to update the vehicle account.

- **If the account has been properly updated**

4. Once the vehicle account has been updated and the start disable request has been removed, DTC B302A will transition to a history DTC. Clear the history DTC.

DTC B3031: SECURITY CONTROLLER IN LEARN MODE

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

DTC B3031

Security Controller In Learn Mode

For symptom byte information, refer to **Symptom Byte List** .

Circuit/System Description

When learning a coded key, the body control module (BCM) is placed in learn mode. DTC B3031 will set automatically as an indicator that the system is in learn mode and not as a fault indicator. Once the coded key is learned, learn mode will be exited and the DTC cleared. If the BCM does not exit learn mode, DTC B3031 will remain current and indicate a fault. The instrument cluster security indicator will illuminate and the driver information center will display a message.

Conditions for Running the DTC

The immobilizer system is the learn coded keys state.

Conditions for Setting the DTC

The DTC will set any time the BCM enters the learn coded keys state.

Action Taken When the DTC Sets

The security indicator will illuminate. The driver information center will display a message.

Conditions for Clearing the DTC

- A current DTC B3031 will be cleared upon the successful exit of learn mode.
- A history DTC will be cleared after 100 malfunction-free ignition cycles.

Circuit/System Verification

1. Verify all available keys are correct for the vehicle. This can be accomplished by comparing the part number that is laser etched on the key to the part number listed in the parts catalog.
 - **If a key is not correct**

Replace the key
 - **If all keys are correct**
2. Perform the Replacing Keys procedure. Refer to **Key with Integrated Transmitter Programming**.
3. Verify the K9 Body Control Module learns the vehicle key and exits the learn coded key state. The scan tool Master Keys Learned parameter should increment to 1.
 - **If the K9 Body Control Module does not exit the learn coded key state after the programming**

attempt

Replace the K9 Body Control Module

- **If the K9 Body Control Module exits the learn coded key state after the programming attempt**

4. All OK.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

Control Module References for body control module replacement, programming and setup.

DTC B3055: NO TRANSPONDER MODULATION

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

DTC Descriptor

DTC B3055

No Transponder Modulation or No Transponder

For symptom byte information, refer to **Symptom Byte List** .

Circuit/System Description

Without BTM and/or ATH/ATS

When an ignition key is inserted into the ignition lock cylinder and the ignition is switched ON, the transponder embedded in the key is energized by the exciter coil surrounding the ignition lock cylinder. The transponder transmits a signal to the immobilizer control module. The immobilizer control module translates this signal to a serial data message which is sent to the body control module (BCM). The BCM then compares this value to a value stored in memory. If the value is correct, the BCM will send the prerelease password via the serial data circuit to the engine control module (ECM). If the learned key code does not match or a transponder value is not received, the BCM will send the start disable password to the ECM.

With BTM and/or ATH/ATS

When a ignition key is inserted into the key pocket/slot and the ignition mode switch is pressed, the transponder embedded in the key is energized by the immobilizer antenna exciter coil. The transponder transmits a signal to the immobilizer control module. The immobilizer control module translates this signal to a serial data message

which is sent to the body control module (BCM). The BCM then compares this value to a value stored in memory. If the value is correct, the BCM will send the prerelease password via the serial data circuit to the engine control module (ECM). If the learned key code does not match or a transponder value is not received, the BCM will send the start disable password to the ECM.

Conditions for Running the DTC

Ignition is in the Accessory or Run position.

Conditions for Setting the DTC

The BCM is unable to measure the ignition key transponder value.

Action Taken When the DTC Sets

- Vehicle starting will be disabled.
- The security indicator will illuminate. A service message will be displayed in the driver information center.

Conditions for Clearing the DTC

- A current DTC will be cleared when the BCM detects a valid transponder value from the ignition key.
- A history DTC will be cleared after 100 malfunction-free ignition cycles.

Diagnostic Aids

- Because DTC B3055 may be caused by a malfunctioning vehicle key, it is necessary to have all available vehicle keys at the time of diagnosis. A possible scenario would be a customer leaving the vehicle with a spare key during the service visit, but the key which they use everyday, not the spare key, is the cause of the DTC. Not having all available keys in this instance would result in the customer concern not being duplicate or a misdiagnosis.
- Ensure that the immobilizer control module is properly installed and fully seated. An audible and/or tactile click will indicate that the immobilizer control module is fully seated. To ensure proper transponder communication, the key must be in a specific location in relation to the immobilizer control module. If the immobilizer control module is not fully seated, transponder communication may not occur and DTC B3055 will set.
- For vehicle without BTM and/or ATH/ATS, verify the customer is not attempting to turn the ignition with the vehicle key partially folded. To ensure proper transponder communication, the key must be in a specific location in relation to the immobilizer control module. Attempting to start the vehicle with the key in the ignition and partially folded will result in no transponder communication and DTC B3055 will set.

Circuit/System Verification

Without BTM and/or ATH/ATS

1. Ignition ON.
2. Verify that DTC B1370, B1380 or B1441 is not set.
 - **If any of the DTCs are set**

Refer to **Diagnostic Trouble Code (DTC) List - Vehicle** .

- **If none of the DTCs are set**
3. Verify the scan tool body control module Accessory parameter changes between Active and Inactive when turning the ignition ON and OFF.
 - **If the parameter does not change**

Refer to **Vehicle Will Not Change Power Mode** .

- **If the parameter changes**
4. Verify all available keys are correct for the vehicle. This can be accomplished by comparing the part number that is laser etched on the key to the part number listed in the parts catalog.
 - **If a key is not correct**

Replace the appropriate key.

- **If all keys are correct**
5. Verify that DTC B3055 does not set while attempting to start the vehicle with each available key.

- **If DTC B3055 sets when attempting to start the vehicle with only one of the available keys**

Replace the appropriate key.

- **If DTC B3055 sets when attempting to start the vehicle with all of the available keys**

Replace the K89 Immobilizer Control Module.

- **If DTC B3055 does not set**

6. All OK.

With BTM and/or ATH/ATS

1. Ignition ON.

2. Verify that DTC B1370, B1380 or B1441 is not set.

- **If any of the DTCs are set**

Refer to **Diagnostic Trouble Code (DTC) List - Vehicle** .

- **If none of the DTCs are set**

3. Verify the scan tool body control module Accessory parameter changes between Active and Inactive when turning the ignition ON and OFF.

- **If the parameter does not change**

Refer to **Power Mode Mismatch** .

- **If the parameter changes**

4. Verify all available keys are correct for the vehicle. This can be accomplished by comparing the part number that is laser etched on the key to the part number listed in the parts catalog.

- **If a key is not correct**

Replace the appropriate key.

- **If all keys are correct**

5. Remove the battery from each of the available vehicle keys.

6. Verify that DTC B3055 does not set while attempting to start the vehicle with each available key. To start the vehicle with the key battery removed, the key must be placed in the key pocket/slot.

- **If DTC B3055 sets when attempting to start the vehicle with only one of the available keys**

Replace the appropriate key.

- **If DTC B3055 sets when attempting to start the vehicle with all of the available keys**

Replace the K89 Immobilizer Control Module.

- If DTC B3055 does not set

7. All OK.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

Control Module References for immobilizer control module replacement, programming and setup.

DTC B305C: IMMOBILIZER TRANSPONDER OF WRONG TYPE PROGRAMMED

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

DTC Descriptor

DTC B305C

Immobilizer Transponder of Wrong Type Programmed

For symptom byte information, refer to **Symptom Byte List** .

Circuit/System Description

Without BTM and/or ATH/ATS

When an ignition key is inserted into the ignition lock cylinder and the ignition is switched ON, the transponder embedded in the key is energized by the exciter coil surrounding the ignition lock cylinder. The transponder transmits a signal to the immobilizer control module. The immobilizer control module translates this signal to a serial data message which is sent to the body control module (BCM). The BCM then compares this value to a value stored in memory. If the value is correct, the BCM will send the prerelease password via the serial data circuit to the engine control module (ECM). If the learned key code does not match or a transponder value is not received, the BCM will send the start disable password to the ECM.

With BTM and/or ATH/ATS

When a ignition key is inserted into the key pocket/slot and the ignition mode switch is pressed, the transponder embedded in the key is energized by the immobilizer antenna exciter coil. The transponder transmits a signal to the immobilizer control module. The immobilizer control module translates this signal to a serial data message which is sent to the body control module (BCM). The BCM then compares this value to a value stored in memory. If the value is correct, the BCM will send the prerelease password via the serial data circuit to the engine control module (ECM). If the learned key code does not match or a transponder value is not received, the BCM will send the start disable password to the ECM.

Conditions for Running the DTC

- Ignition is in the Accessory or Run position
- Battery voltage is greater than 9 volts
- Transponder authentication has occurred

Conditions for Setting the DTC

- The programmed transponder type does not match the equipped system on the vehicle.
- A transponder used for vehicles without BTM and/or ATH/ATS has been programmed to a vehicle with BTM and/or ATH/ATS.
- A transponder used for vehicles with BTM and/or ATH/ATS has been programmed to a vehicle without BTM and/or ATH/ATS.

Action Taken When the DTC Sets

No action is taken.

Conditions for Clearing the DTC

- A current DTC will be cleared when the BCM detects a programmed transponder type that matches the equipped system on the vehicle.
- A history DTC will be cleared after 100 malfunction-free ignition cycles.

DTC B3060: UNPROGRAMMED TRANSPONDER IDENTIFICATION CODE RECEIVED

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

DTC Descriptor

DTC B3060

Unprogrammed Transponder Identification Code Received

For symptom byte information, refer to **Symptom Byte List** .

Circuit/System Description

Without BTM and/or ATH/ATS

When an ignition key is inserted into the ignition lock cylinder and the ignition is switched ON, the transponder embedded in the key is energized by the exciter coil surrounding the ignition lock cylinder. The transponder transmits a signal to the body control module (BCM). The BCM then compares this value to a value stored in memory. If the value is correct, the BCM will send the prerelease password via the serial data circuit to the engine control module (ECM). If the learned key code does not match or a transponder value is not received,

the BCM will send the start disable password to the ECM.

With BTM and/or ATH/ATS

When a keyless entry transmitter is inserted into the transmitter pocket/slot and the ignition mode switch is pressed, the transponder embedded in the transmitter is energized by the immobilizer antenna exciter coil. The transponder transmits a signal to the body control module (BCM). The BCM then compares this value to a value stored in memory. If the value is correct, the BCM will send the prerelease password via the serial data circuit to the engine control module (ECM). If the learned key code does not match or a transponder value is not received, the BCM will send the start disable password to the ECM.

Conditions for Running the DTC

Ignition is in the Accessory or Run position.

Conditions for Setting the DTC

The transponder value measured by the BCM is incorrect or not learned to the vehicle.

Action Taken When the DTC Sets

- Vehicle starting will be disabled.
- The security indicator in the instrument cluster will be illuminated. The driver information center will display a service message.

Conditions for Clearing the DTC

- A current DTC will be cleared when the BCM detects a valid transponder value from the ignition key.
- A history DTC will be cleared after 100 malfunction-free ignition cycles.

Circuit/System Verification

1. Perform the Replacing Keys procedure. Refer to **Key with Integrated Transmitter Programming**.
2. Verify the K9 Body Control Module learns the vehicle key. The scan tool Master Keys Learned parameter should increment to indicate another key has been learned.
 - **If the BCM does not learn the key**

Replace the key.
 - **If the BCM learns the key**
3. All OK.

DTC B389A: ENVIRONMENT IDENTIFICATION

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

DTC Descriptor

DTC B389A

Environment Identification

For symptom byte information, refer to **Symptom Byte List** .

Circuit/System Description

When certain modules are programmed and configured during installation, the module learns a specific environment identifier which is unique to the vehicle. The environment identifier is used to prevent the swapping modules between vehicles. The body control module (BCM) is the keeper of the environment identifier. The Instrument Cluster, Electronic Brake Control Module, HVAC Control Module, Inflatable Restraint Sensing and Diagnostic Module, engine control module (ECM) and Steering Column Lock Module (if equipped) each learn the environment identifier during their configuration process. During vehicle operation, the BCM sends the immobilizer identifier as a challenge and each module responds to the challenge by sending the environment identifier back to the BCM. If the BCM sends an incorrect immobilizer identifier or a specific

number of incorrect environment identifiers are received, vehicle starting is disabled.

Conditions for Running the DTC

Ignition is in the ACCESSORY or RUN position.

Conditions for Setting the DTC

An incorrect immobilizer identifier was broadcast by the BCM.

Action Taken When the DTC Sets

- The security indicator in the instrument cluster will illuminate.
- Vehicle starting will be disabled.

Conditions for Clearing the DTC

A current DTC will be cleared when the BCM broadcasts a correct immobilizer identifier.

Diagnostic Aids

If BCM programming is not completed after BCM replacement, the immobilizer identifier will not be learned. If DTC B389A sets immediately after the replacement and programming of a BCM, perform the programming procedure again.

- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

DTC Descriptor

DTC B3935

Transponder Authentication

For symptom byte information, refer to **Symptom Byte List** .

Circuit/System Description

Without BTM and/or ATH/ATS

When an ignition key is inserted into the ignition lock cylinder and the ignition is switched ON, the transponder embedded in the key is energized by the exciter coil surrounding the ignition lock cylinder. The transponder transmits a signal to the immobilizer control module. The immobilizer control module translates this signal to a serial data message which is sent to the body control module (BCM). The BCM then compares this value to a value stored in memory. If the value is correct, the BCM will send the prerelease password via the serial data circuit to the engine control module (ECM). If the learned key code does not match or a transponder value is not received, the BCM will send the start disable password to the ECM.

With BTM and/or ATH/ATS

When a ignition key is inserted into the key pocket/slot and the ignition mode switch is pressed, the transponder embedded in the key is energized by the immobilizer antenna exciter coil. The transponder transmits a signal to the immobilizer control module. The immobilizer control module translates this signal to a serial data message which is sent to the body control module (BCM). The BCM then compares this value to a value stored in memory. If the value is correct, the BCM will send the prerelease password via the serial data circuit to the engine control module (ECM). If the learned key code does not match or a transponder value is not received, the BCM will send the start disable password to the ECM.

Conditions for Running the DTC

- Ignition is in the Accessory or Run position.
- A valid transponder value has been read.

Conditions for Setting the DTC

The transponder calculation of the challenge from the BCM does not match the BCM calculation.

Action Taken When the DTC Sets

- Vehicle starting will be disabled.
- The security indicator will illuminate. The driver information center will display a service message.

Conditions for Clearing the DTC

- A current DTC will be cleared when a valid transponder value has been read and authenticated.
- A history DTC will be cleared after 100 malfunction-free ignition cycles.

DTC Descriptor

DTC B3976

Unconfigured Transponder

For symptom byte information, refer to **Symptom Byte List** .

Circuit/System Description

Without BTM and/or ATH/ATS

When an ignition key is inserted into the ignition lock cylinder and the ignition is switched ON, the transponder embedded in the key is energized by the exciter coil surrounding the ignition lock cylinder. The transponder transmits a signal to the immobilizer control module. The immobilizer control module translates this signal to a serial data message which is sent to the body control module (BCM). The BCM then compares this value to a value stored in memory. If the value is correct, the BCM will send the prerelease password via the serial data circuit to the engine control module (ECM). If the learned key code does not match or a transponder value is not received, the BCM will send the start disable password to the ECM.

With BTM and/or ATH/ATS

When a ignition key is inserted into the key pocket/slot and the ignition mode switch is pressed, the transponder embedded in the key is energized by the immobilizer antenna exciter coil. The transponder transmits a signal to the immobilizer control module. The immobilizer control module translates this signal to a serial data message which is sent to the body control module (BCM). The BCM then compares this value to a value stored in memory. If the value is correct, the BCM will send the prerelease password via the serial data circuit to the engine control module (ECM). If the learned key code does not match or a transponder value is not received, the BCM will send the start disable password to the ECM.

Conditions for Running the DTC

- Ignition is in the Accessory or Run position.
- The BCM is in the learn coded key state.

Conditions for Setting the DTC

The BCM has determined the current key is not configured as a proper vehicle key.

Action Taken When the DTC Sets

- Vehicle starting will be disabled.
- The security indicator in the instrument cluster will be illuminated. A service message will be displayed in the driver information center.

Conditions for Clearing the DTC

- A current DTC will be cleared when the BCM detects a properly configured vehicle key.
- A history DTC will be cleared after 100 malfunction-free ignition cycles.

DTC P0513: IMMOBILIZER KEY INCORRECT

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

DTC Descriptor

DTC P0513

Immobilizer Key Incorrect

Circuit/System Description

The body control module (BCM) sends the pre-release information to the engine control module (ECM) via the serial data circuit. The ECM then sends a challenge to the BCM. Both the ECM and BCM perform a calculation on this challenge. If the calculated response from the BCM equals the calculation performed by the ECM, the ECM will allow vehicle starting.

Conditions for Running the DTC

Ignition is in the ACCESSORY or RUN position.

Conditions for Setting the DTC

The calculated response from the BCM does not equal the calculation performed by the ECM.

Action Taken When the DTC Sets

- The security indicator in the instrument cluster will illuminate.
- Vehicle starting will be disabled.

Conditions for Clearing the DTC

- A current DTC will be cleared when a valid calculation is received.
- A history DTC will be cleared after 40 malfunction-free ignition cycles.

Diagnostic Aids

DTC P0513 may be caused by a loose connection or intermittent poor continuity on the ECM ground or at the negative battery cable. Be sure to check the ECM ground(s) and negative battery cable if normal system diagnosis does not correct the concern.

○ **If no immobilizer DTCs are set in the K9 Body Control Module**
2. Perform the K9 Body Control Module immobilizer learn using the body control module IMMO Function with Existing Transponder or Remote Key in SPS. Refer to **Immobilizer System Component Programming**.
3. Verify the engine starts after the K9 Body Control Module completes the learn procedure.
 - **If the engine does not start**

Perform the K20 Engine Control Module immobilizer learn using the engine control module IMMO Learn in SPS. Refer to **Immobilizer System Component Programming**.

○ **If the engine starts**
4. All OK.

DTC P0633: IMMOBILIZER KEY NOT PROGRAMMED

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.

- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

DTC Descriptor

DTC P0633

Immobilizer Key Not Programmed

Circuit/System Description

When learning the immobilizer data, as well as the challenge and response sequence, the engine control module (ECM) is placed in learn mode. DTC P0633 will set automatically as an indicator that the system is in learn mode and not as a fault indicator. Once the immobilizer data and challenge/response are learned, learn mode will be exited when the engine is successfully started. If the ECM does not exit learn mode, DTC P0633 will remain current and indicate a fault.

Conditions for Running the DTC

The ECM is in learn mode.

Conditions for Setting the DTC

DTC P0633 will set any time the ECM enters learn mode.

Action Taken When the DTC Sets

The security indicator in the instrument cluster will illuminate.

Conditions for Clearing the DTC

- A current DTC will be cleared upon a successful engine start after exit of learn mode.
- A history DTC will be cleared after 100 malfunction-free ignition cycles.

Circuit/System Verification

NOTE: DTC P0633 will clear upon a successful engine start. Any malfunction that will cause a no-start condition will prevent DTC P0633 from clearing. Prior to diagnosing DTC P0633, ensure that all power moding and engine control systems are operating properly and all conditions that may cause a no-start have been corrected. Do not replace the K20 Engine Control Module. Replacing the K20 Engine Control Module will not correct the no-start condition.

1. Verify there are no immobilizer DTCs set in the K9 Body Control Module.
 - **If any immobilizer DTCs are set in the K9 Body Control Module**

Refer to **Diagnostic Trouble Code (DTC) List - Vehicle** .

- **If no immobilizer DTCs are set in the K9 Body Control Module**
2. Perform the K20 Engine Control Module immobilizer learn using the engine control module IMMO Learn in SPS. Refer to **Immobilizer System Component Programming**.
 3. Verify the engine starts after the K20 Engine Control Module completes the learn procedure.
 - **If the engine does not start**

An undiagnosed no-start condition exists. Refer to the appropriate subsection and diagnostic to correct the no-start condition.

- **If the engine starts**
4. All OK.

DTC P162B: REMOTE VEHICLE SPEED LIMITING SIGNAL MESSAGE COUNTER

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

DTC Descriptor

DTC P162B

Remote Vehicle Speed Limiting Signal Message Counter Incorrect

Circuit/System Description

When a remote slow-down request is sent from OnStar, the vehicle communication interface control module sends a serial data message to the engine control module (ECM) indicating that reduced vehicle speed has been requested. Once the request is active, the ECM begins reducing engine torque to match the requested vehicle speed and the REDUCED ENGINE POWER message is displayed.

Conditions for Running the DTC

- The engine run time is greater than 5 s
- A remote slow-down request is sent from OnStar

Conditions for Setting the DTC

- The VIN embedded in the slow-down request does not match the VIN stored in the ECM.
- The rolling code counter embedded in the slow-down request does not increment for ten consecutive messages.

Action Taken When the DTC Sets

- ECM ignores all reduced vehicle speed request messages from the vehicle communication interface module.
- The ECM stores DTC P162B in history.

Conditions for Clearing the DTC

- The condition responsible for setting the DTC no longer exists.
- A history DTC will clear after 40 malfunction-free ignition cycles have occurred.

DTC P1631: IMMOBILIZER FUEL ENABLE SIGNAL

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

DTC Descriptor

DTC P1631

Immobilizer Fuel Enable Signal Not Correct

Circuit/System Description

The body control module (BCM) sends the pre-release information to the engine control module (ECM) via the serial data circuit. The ECM then sends a challenge to the BCM. Both the ECM and BCM perform a calculation on this challenge. If the calculated response from the BCM equals the calculation performed by the ECM, the ECM will allow vehicle starting. The BCM follows this action by sending the remaining immobilizer data to the ECM. If the immobilizer data sent by the BCM matches that stored by the ECM, the ECM will allow the engine to remain running.

Conditions for Running the DTC

Ignition is in the ACCESSORY or RUN position.

Conditions for Setting the DTC

The ECM receives incorrect immobilizer data from the BCM.

Action Taken When the DTC Sets

- The security indicator in the instrument cluster will illuminate.
- Vehicle starting will be disabled.

Conditions for Clearing the DTC

- A current DTC will be cleared when correct immobilizer data is received.
- A history DTC will be cleared after 40 malfunction-free ignition cycles.

Perform the K20 Engine Control Module immobilizer learn using the engine control module IMMO Learn in SPS. Refer to **Immobilizer System Component Programming**.
 - **If the engine starts**
4. All OK.

DTC P1649: IMMOBILIZER SECURITY CODE NOT PROGRAMMED

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

DTC Descriptor

DTC P1649

Immobilizer Security Code Not Programmed

Circuit/System Description

When learning the security code, as well as the challenge and response sequence, the engine control module (ECM) is placed in learn mode. Once the security code and challenge/response are learned, learn mode will be exited when the engine is successfully started.

Conditions for Running the DTC

The ECM is in learn mode.

Conditions for Setting the DTC

The ECM has not learned a security code.

Action Taken When the DTC Sets

The security indicator in the instrument cluster will illuminate.

Conditions for Clearing the DTC

- A current DTC will be cleared upon a successful engine start after exit of learn mode.
- A history DTC will be cleared after 100 malfunction-free ignition cycles.

SYMPTOMS - IMMOBILIZER

IMPORTANT: The following steps must be completed before using the symptom tables.

1. Perform the **Diagnostic System Check - Vehicle** before using the symptom tables in order to verify that all of the following are true:
 - There are no DTCs set.
 - The control modules can communicate via the serial data links.
2. Review the system operation in order to familiarize yourself with the system functions. Refer to **Immobilizer Description and Operation**.

Visual/Physical Inspection

- Inspect for aftermarket devices which could affect the operation of the systems. Refer to **Checking Aftermarket Accessories** .
- Inspect the easily accessible or visible system components for obvious damage or conditions which could cause the symptom.

Intermittent

Faulty electrical connections or wiring may be the cause of intermittent conditions. Refer to **Testing for Intermittent Conditions and Poor Connections** .

Symptom List

Refer to **OnStar Stolen Vehicle Slowdown Active** to diagnose the symptom.

ONSTAR STOLEN VEHICLE SLOWDOWN ACTIVE

Diagnostic Instructions

NOTE: **This procedure is not used in Brazil.**

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

Circuit/System Description

When a remote slow-down request is sent from OnStar, the Telematics Communication Interface Control Module sends a serial data message to the engine control module (ECM) indicating that reduced vehicle speed has been requested. Once the request is active, the ECM begins reducing engine torque to match requested vehicle speed and the REDUCED ENGINE POWER message is displayed.

Circuit/System Verification

1. Verify the vehicle is not in the OnStar initiated Stolen Vehicle Slowdown mode. This can be accomplished by verifying the scan tool Telematics Enhanced Service Immobilization parameter is No.
 - **If the scan tool Telematics Enhanced Service Immobilization parameter is Yes**
 1. Perform the Remote Vehicle Speed Limiting Reset procedure with the scan tool.
 2. Press the blue OnStar button and inform the advisor that you need to be transferred to the stolen vehicle team to update the vehicle account.
 - **If the scan tool BCM Telematics Enhanced Service Immobilization parameter is No**
2. All OK.

REPAIR INSTRUCTIONS

THEFT DETERRENT MODULE REPLACEMENT

Fig. 2: Theft Deterrent Module
Courtesy of GENERAL MOTORS COMPANY

Theft Deterrent Module Replacement

Callout	Component Name
WARNING: Refer to <u>Battery Disconnect Warning</u> .	
Preliminary Procedure	

1. Remove the steering column lower trim cover. Refer to **Steering Column Lower Trim Cover Replacement** .
2. Disconnect battery negative cable. Refer to **Battery Negative Cable Disconnection and Connection** .

1	Theft Deterrent Module Screw (Qty: 2) CAUTION: Refer to <u>Fastener Caution</u> . Tighten 3 (27 lb in)
2	Theft Deterrent Module Procedure 1. Disconnect the electrical connector. 2. Carefully unclip the bracket from ignition key housing.

IMMOBILIZER SYSTEM COMPONENT PROGRAMMING

This procedure will learn the immobilizer function. If the battery voltage is low, charge the battery before proceeding with the learn. If the body control module (BCM) or engine control module (ECM) have been replaced, they must be programmed before performing this learn procedure.

Depending on the immobilizer function being learned or the component replaced, different learn functions are required to be performed. These learn functions are as follows:

Immobilizer System Component Programming

Function name on SPS tool:	Function description:	When the function should be used:	Notes:
Body Control Module IMMO Function with Existing Transponder or Remote Key	The BCM will relearn the immobilizer passwords and data while reusing the existing vehicle keys	The BCM has been replaced and the existing vehicle keys are being reused or a diagnostic has instructed to perform the learn	-
Body Control Module IMMO Function with New Transponder or Remote Key	The BCM will relearn the immobilizer passwords and data while using new vehicle keys	The BCM has been replaced and new vehicle keys are being reused	-
Engine Control Module IMMO Learn	The ECM will relearn the immobilizer passwords and data	The ECM has been replaced or a diagnostic has instructed to perform the learn	-

Engine Control Module and Body Control Module IMMO Learn	The ECM and BCM will learn new immobilizer passwords and data	Both the ECM and BCM have been replaced (this selection will REQUIRE new vehicle keys be used)	Because both the ECM and BCM have been replaced and are learning new immobilizer passwords and data, all vehicle keys must also be replaced
Program Transponder or Remote Key (Add)	A new vehicle key will learn the immobilizer passwords and data	A new vehicle key is being added (does not affect other vehicle keys)	This function may not be available in all sales regions. Refer to the SPS application to determine if a particular vehicle is able to add keys using this method.
Program Transponder or Remote Key (Delete)	All existing vehicle keys will be invalidated and any desired keys are relearned	All vehicle keys are desired to be invalidated and certain keys relearned or a diagnostic has instructed to perform the learn	This procedure may be used if a customer has had their keys lost or stolen and wishes to invalidate the keys, making them unable to start the vehicle

1. Connect a scan tool to the vehicle and access SPS.
2. Turn ON the ignition, with the engine OFF.
3. Ensure that all power consuming devices are turned OFF on the vehicle.
4. Select SPS application and follow the on-screen instructions.
5. Select Reprogram ECU.
6. Select IMMO Immobilizer Learn - Setup.
7. Select the appropriate programming function based on the component that was replaced or is being programmed. Refer to the table at the top of this document for assistance in choosing the correct programming function.
8. Follow the on-screen instructions.
9. After programming all keys "Programming Complete" is displayed.
10. Press the lock and unlock button on each transmitter that was programmed. This will awaken each transmitter and allow keyless entry functions to be established.
11. With a scan tool, clear any DTCs.
12. Verify each key is operating properly. Operate each of the keyless entry functions using the buttons on the transmitter and then start the vehicle. When verifying operation, make sure that no other keys are near the vehicle.

KEY WITH INTEGRATED TRANSMITTER PROGRAMMING

Keys can be programming in various ways using the procedures outlined below. Using the Replacing Keys procedures will first erase all the known keys from the vehicle. Any existing keys and any new keys will then

be programmed. This procedure should be used any time a key is required to be unlearned or erased from a vehicle. If a new key is being learned to a vehicle to replace a damaged, inoperative or stolen key, the Replacing Keys procedure must be used. This ensures that the old key cannot be used to access or start the vehicle after programming.

The Adding Keys procedure does not erase any keys prior to programming. The procedure will simply program the key into the next available slot. The Adding Keys procedure should only be used when adding an additional key to the vehicle. The Adding Keys procedure should never be used to program a key to a vehicle that is having a key replaced, regardless of the cause for the replacement.

Replacing Keys (With SPS)

NOTE:

- **This procedure may be used with or without existing learned keys being present.**
- **A total of eight keys maybe be learned to a single vehicle.**
- **This procedure will only learn the vehicle key information. This procedure will not learn any immobilizer information between the body control module (BCM) and engine control module (ECM).**
- **If the battery voltage is low, charge the battery before continuing with the procedure.**

1. Connect a scan tool to the vehicle and access SPS.
2. Ensure that all power consuming devices are turned OFF on the vehicle.
3. Select the SPS application and follow the on-screen instructions.
4. Select Reprogram ECU.
5. Select IMMO Immobilizer Learn - Setup.
6. Select the Program Transponder or Remote Key (Delete) function.
7. Follow the on-screen instructions.
8. After programming all keys, "Programming Complete" is displayed.
9. Press the lock and unlock button on each key that was programmed. This will awaken each key and allow keyless entry functions to be established.
10. With a scan tool, clear any DTCs.
11. Verify each key is operating properly. Operate each of the keyless entry functions using the buttons on the key and then start the vehicle. When verifying operation, make sure that no other keys are near the vehicle.

Replacing Keys (Without SPS) - United States only

NOTE:

- **This procedure should be used without existing learned keys being present.**
- **A total of eight keys maybe be learned to a single vehicle.**
- **This procedure will only learn the vehicle key information. This procedure will not learn any immobilizer information between the body control**

module (BCM) and engine control module (ECM).

- **If the battery voltage is low, charge the battery before continuing with the procedure.**

1. With an unlearned master vehicle key, turn ON the ignition, with the engine OFF.
2. Observe the security indicator, after approximately 10 min the indicator will turn off.
3. Turn OFF the ignition and wait 5 s.
4. Repeat steps 1 - 3 two more times for a total of 3 cycles or 30 min.

NOTE: **The body control module learns the key transponder information upon the ignition transition from OFF to ON. You must turn the ignition OFF before attempting to start the vehicle.**

5. Start the vehicle. The vehicle has now learned the key transponder information.
6. Additional keys may be learned using the Adding Keys procedure.
7. Clear all DTCs.

Adding Keys (Without SPS) - North America, except Canada

- NOTE:**
- **To initiate, this procedure requires that 1 learned key be available.**
 - **A total of eight keys maybe be learned to a single vehicle.**
 - **This procedure adds keys only. The procedure does not erase previously learned keys.**
 - **The keys to be learned must duplicate the mechanical cut of the current key.**

1. With a previously learned key, turn the ignition ON.
2. Turn the ignition OFF and remove the key.
3. Within 10 seconds of turning OFF the ignition, insert the key to be learned and turn ON the ignition. The vehicle has now learned the new key and key.

Adding Keys (Without SPS) - Canada, Europe, South America, Asia and Middle East

- NOTE:**
- **To initiate, this procedure requires that 2 learned key be available.**
 - **A total of eight keys maybe be learned to a single vehicle.**
 - **This procedure adds keys only. The procedure does not erase previously learned keys.**
 - **The keys to be learned must duplicate the mechanical cut of the current key.**

1. With a previously learned key, turn the ignition ON.
2. Turn the ignition OFF and remove the key.

3. With a second previously learned key, turn the ignition ON.
4. Turn the ignition OFF and remove the key.
5. Within 10 seconds of turning OFF the ignition, insert the key to be learned and turn ON the ignition. The vehicle has now learned the new key and key.

Adding Keys (With SPS) - North America

NOTE:

- **This procedure may be used with or without existing learned keys being present.**
- **A total of eight keys maybe be learned to a single vehicle.**
- **This procedure will only learn the vehicle key information. This procedure will not learn any immobilizer information between the body control module (BCM) and engine control module (ECM).**
- **If the battery voltage is low, charge the battery before continuing with the procedure.**

1. Connect a scan tool to the vehicle and access SPS.
2. Ensure that all power consuming devices are turned OFF on the vehicle.
3. Select the SPS application and follow the on-screen instructions.
4. Select Reprogram ECU.
5. Select IMMO Immobilizer Learn - Setup.
6. Select the Program Transponder or Remote Key (Add) function.
7. Follow the on-screen instructions.
8. After programming all keys, "Programming Complete" is displayed.
9. Press the lock and unlock button on each key that was programmed. This will awaken each key and allow keyless entry functions to be established.
10. With a scan tool, clear any DTCs.
11. Verify each key is operating properly. Operate each of the keyless entry functions using the buttons on the key and then start the vehicle. When verifying operation, make sure that no other keys are near the vehicle.

DESCRIPTION AND OPERATION

IMMOBILIZER DESCRIPTION AND OPERATION

Fig. 3: Immobilizer Diagram Without BTM
 Courtesy of GENERAL MOTORS COMPANY

The immobilizer system functions are provided by the body control module (BCM) and the engine control module (ECM), as well as any control modules which store and report the environment identifier.

When an ignition key is inserted into the ignition lock cylinder and the ignition is switched ON, the transponder in the key is energized by the immobilizer coil surrounding the ignition lock cylinder. This immobilizer coil is part of the immobilizer control module. The transponder transmits a signal that contains its unique value, which is received by the BCM through the immobilizer coil. The BCM then compares this value to a value stored in memory. The BCM also monitors various control modules to determine if the stored environment identifiers match.

If both the environment identifier and the value received from the transponder match, the BCM will send the prerelease password via serial data to the ECM. If the encrypted code's unique value is incorrect or the environment identifier does not match, the BCM will send the start disable message to the ECM.

When the ECM receives the BCM prerelease password, the ECM will challenge the password. The ECM sends this challenge to the BCM via serial data. Both the ECM and BCM perform a calculation on this challenge. If the BCM calculated response to the challenge equals the calculation performed by the ECM, the ECM will allow vehicle starting.

The components of the theft system are as follows:

- BCM

- ECM
- Immobilizer control module
- Ignition key
- Security indicator
- Various control modules which store and report the environment identifier

Body Control Module (BCM)

The immobilizer system is an integral part of the BCM and is controlled internally within the BCM. The BCM can learn up to 8 keys (transponder values).

The BCM uses the following inputs:

- Environment identifier exchange with various modules
- Encrypted code from the vehicle key, received by the immobilizer control module

The BCM uses the following outputs:

- Prerelease password communication with ECM
- Challenge/response with ECM

When an ignition key is inserted into the ignition lock cylinder and the ignition is switched ON, the encrypted code in the key is energized by the immobilizer control module surrounding the ignition lock cylinder. The energized transponder transmits a signal that contains its unique value, which is received by the BCM. The BCM then compares this value to the learned key code stored in memory. The BCM then performs one of the following functions:

- If the encrypted code value matches the values stored in the BCM memory, the BCM will send the prerelease password to the ECM via serial data.
- If the encrypted code unique value does not match the value stored in the BCM, the BCM will send the start disable message to the ECM via serial data.
- If the BCM is unable to measure the ignition key encrypted code value, the BCM will not send any messages to the ECM.

Engine Control Module (ECM)

When the ECM receives the BCM prerelease password, the ECM will challenge the password. The ECM sends this challenge to the BCM via the serial data circuit. Both the ECM and BCM perform a calculation on this challenge. If the calculated response from the BCM equals the calculation performed by the ECM, the ECM will allow vehicle starting.

The ECM will disable vehicle starting if any of the following immobilization conditions occur:

- The prerelease password is invalid.
- The start disable password is sent by the BCM.

- No passwords are received. There is no communication with the BCM.
- The BCM calculated response to the challenge does not equal the calculation performed by the ECM.

Immobilizer Control Module

The immobilizer control module contains an immobilizer coil which surrounds the ignition cylinder. The coil passively powers the transponder located in the ignition key when the key is in the ignition. When powered, the key transmits its unique value to the immobilizer control module, which is then relayed to the BCM via a discrete serial data circuit. The immobilizer control module also receives B+ and ground from the BCM.

The immobilizer control module is used to:

1. Learn keys
2. To start the vehicle

Ignition Key

Each ignition key contains a transponder with a unique encrypted value. The transponder's encrypted value is fixed and unable to be changed. The immobilizer system uses the ignition key transponder value to determine if a valid ignition key is being used to start the vehicle.

Environment Identifier

Various modules throughout the vehicle learn a specific environment identifier during the module programming process. The environment identifier is learned by each individual module and matches the environment identifier stored in the BCM. Prior to starting after a battery disconnect, each of the modules which store a environment identifier will compare their identifier to that of the identifier stored in the BCM. If all the identifiers match, the engine starting process will continue. If the environment identifiers do not match, engine starting will be disabled.

Security Indicator

The BCM will command the instrument cluster to illuminate the security indicator when the ignition is in the ON position to indicate a fault has occurred within the immobilizer system and when the engine starting is disabled.

REMOTE VEHICLE SPEED LIMITING DESCRIPTION AND OPERATION

Certain vehicles equipped with OnStar® now have an additional feature that allows for remote limiting of the vehicle's speed. This OnStar® feature is called Stolen Vehicle Slow-Down and is now part of the OnStar® Stolen Vehicle Assistance service. This feature, when used in conjunction with local law enforcement and strict guidelines at the OnStar® Call Center, will slow the vehicle by interacting with the engine control system.

When the engine control system receives a valid request from the OnStar® telematics communications interface module, it will enter into a reduced engine power/vehicle speed limiting mode, which will decelerate the vehicle. Once the request is active the engine control module begins reducing engine torque to match requested vehicle speed and a REDUCED ENGINE POWER indication is displayed. No DTCs will be set during this

process.

DTC B0158: OUTSIDE AIR TEMPERATURE DISPLAY MALFUNCTION

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

DTC Descriptors

DTC B0158 02

Ambient Air Temperature Sensor Circuit Short to Ground

DTC B0158 05

Ambient Air Temperature Sensor Circuit High Voltage/Open

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Ambient Air Temperature Sensor Signal	B0158 02	B0158 05	B0158 05	-
Low Reference	-	B0158 05	-	-

Circuit/System Description

The instrument cluster monitors the ambient air temperature sensor with a low reference circuit and 5 V signal circuit. The instrument cluster monitors the voltage drop across the sensor, which is proportional to temperature. When the ambient air temperatures are cold, the resistance of the sensor is high and the voltage signals are high. When the ambient air temperatures are hot, the resistance of the sensors is low and the voltage signals are low. The instrument cluster converts the voltage value to a temperature value of Celsius or Fahrenheit that will be displayed by the driver information center.

Conditions for Running the DTC

The system voltage is between 9-16 V

Conditions for Setting the DTC

B0158 02

The instrument cluster detects the sensor signal circuit is more than 88°C (190°F).

B0158 05

The instrument cluster detects the sensor signal circuit is less than -40°C (-40°F).

Action Taken When the DTC Sets

The instrument cluster uses a default air temperature value for further calculations. The driver information center displays ---°C (---°F).

Conditions for Clearing the DTC

The DTC will become history if the instrument cluster no longer detects a malfunction.

Scan Tool Reference

Control Module References for scan tool information

Circuit/System Verification

1. Ignition ON.
2. Verify the scan tool Ambient Air Temperature parameter between -40°C (-40°F) to +88°C (+190°F) and changes with air temperature changes.
 - **If parameter is not between -40°C (-40°F) to +88°C (+190°F) or changes with air temperature changes**

Refer to Circuit/System Testing.

- **If parameter is between -40°C (-40°F) to +88°C (+190°F) and changes with air temperature changes**

3. All OK.

Circuit/System Testing

1. Ignition OFF and all vehicle systems OFF, disconnect the harness connector at the B9 Ambient Air Temperature Sensor. It may take up to 2 minutes for all vehicle systems to power down.
2. Test for less than 1 V between the low reference circuit terminal B and ground.

- **If 1 V or greater**

Repair the short to voltage on the circuit.

- **If less than 1 V**

3. Test for less than 10 ohms between the low reference circuit terminal B and ground.

- **If 10 ohms or greater**

1. Ignition OFF, disconnect the harness connector at the P16 Instrument Cluster.
2. Test for less than 2 ohms in the low reference circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, replace the P16 Instrument Cluster.

- **If less than 10 ohms**

4. Ignition ON.

5. Verify the scan tool Ambient Air Temperature parameter is greater than 98%.

- **If 98% or less**

1. Ignition OFF, disconnect the harness connector at the P16 Instrument Cluster.
2. Test for infinite resistance between the signal circuit and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance, replace the P16 Instrument Cluster.

- **If greater than 98%**

6. Install a 3 A fused jumper wire between the signal circuit terminal A and the low reference circuit terminal B.

7. Verify the scan tool Ambient Air Temperature parameter is less than 8%.

- **If 8% or greater**

1. Ignition OFF, disconnect the harness connector at the P16 Instrument Cluster, ignition ON.
2. Test for less than 1 V between the signal circuit and ground.
 - If 1 V or greater, repair the short to voltage on the circuit.
 - If less than 1 V

3. Ignition OFF

4. Test for less than 2 ohms in the signal circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.

- If less than 2 ohms, replace the P16 Instrument Cluster.
 - **If less than 8%**
8. Test or replace the B9 Ambient Air Temperature Sensor.

Component Testing

Static Test

1. Test the B9 Ambient Air Temperature Sensor by varying the sensor temperature while monitoring the sensor resistance.
2. Compare the readings with the **Ambient Air Temperature Sensor Resistance**
 - **If not within the specified range**

Replace the B9 Ambient Air Temperature Sensor.

- **If within specified range**
3. All OK.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

- **Control Module References** for instrument cluster replacement, programming and setup.

DTC B0550: ODOMETER CIRCUIT GENERAL MEMORY

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

DTC Descriptor

DTC B0550 32

Odometer Circuit General Memory Malfunction

Circuit/System Description

The Instrument Cluster is equipped with odometers that indicate the distance traveled by the vehicle. One type of odometer is the season odometer where the traveled distance can not be reset by the driver. This information is also stored in the Body Control Module (BCM). In addition to storing the season odometer value for the vehicle, the Instrument Cluster and the BCM store the VIN. Software checks are performed to ensure these modules and their stored season odometer information, can not be moved or transferred between different vehicles.

Conditions for Running the DTC

The ignition is ON.

Conditions for Setting the DTC

The BCM has detected an internal memory malfunction.

Action Taken When the DTC Sets

DTC B0550 32 is stored in the BCM memory.

Conditions for Clearing the DTC

The BCM no longer detects a malfunction.

DTC B1370: CONTROL MODULE IGNITION ON AND START CIRCUIT

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

DTC Descriptors

DTC B1370 01

Control Module Ignition On and Start Circuit Short to Battery

DTC B1370 06

Control Module Ignition On and Start Circuit Open

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Instrument Cluster Ignition (Instrument Panel terminal 31)	B1370 06	B1370 06	B1370 01	-
Ignition Run/Crank Relay Ignition (Relay terminal 85)	B1370 06	B1370 06	-	-
Ignition Run/Crank Relay Ground (Relay terminal 86)	-	B1370 06	-	-
Ignition Run/Crank Relay B+ (Relay terminal 30)	-	B1370 06	-	-

Circuit/System Description

The vehicle power mode master is the body control module (BCM). The Ignition Switch is a low current switch with multiple discrete circuits to the BCM.

The power mode master will activate relays and other direct outputs of the power mode master as needed according to the calculated power mode. Some relays controlled by the BCM are switched ignition voltage outputs that are pass through circuits within the BCM directly from the Ignition Switch. If these circuits short to ground, the B+ circuit fuse to the Ignition Switch will open.

Conditions for Running the DTC

B1370 01

Ignition switch is in the Accessory position.

B1370 06

Ignition switch is in the Accessory, Run or Crank positions.

Conditions for Setting the DTC

B1370 01

Ignition circuit is shorted to voltage.

B1370 06

- Ignition circuit is open.
- Ignition or run/crank relay circuit is shorted to ground.
- B+ circuit of the ignition run/crank relay is open or shorted to ground.
- Ignition run/crank relay control circuit open, including relay coil and ground.

Action Taken When the DTC Sets

The Instrument Cluster still functions except check engine light is always off.

Conditions for Clearing the DTC

- The condition responsible for setting the DTC no longer exists.
- A history DTC will clear once 50 consecutive malfunction-free ignition cycles have occurred.

Circuit/System Verification

1. Verify that DTC B144B is not set.
 - **If DTC B144B is set**

Refer to **Diagnostic Trouble Code (DTC) List - Vehicle** .

- **If DTC B144B is not set**
2. Refer to Circuit/System Testing.

Circuit/System Testing

1. Ignition OFF and all vehicle systems OFF, disconnect the KR74 Ignition Run Relay. It may take up to 2 minutes for all vehicle systems to power down.
2. Test for less than 10 ohms between the ground circuit terminal 86 and ground.
 - **If 10 ohms or greater**
 1. Test for less than 2 ohms in the ground circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, repair the open/high resistance in the ground connection.
 - **If less than 10 ohms**
3. Verify a test lamp illuminates between the B+ circuit terminal 30 and ground.

- **If the test lamp does not illuminate and the circuit fuse is OK**
- 1. Test for less than 2 ohms in the B+ circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, verify the fuse is OK and there is voltage at the fuse.
- **If the test lamp does not illuminate and the circuit fuse is open**
- 1. Test for infinite resistance between the B+ circuit and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance
- 2. Test for infinite resistance between the control circuit terminal 87 and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance, replace the KR74 Ignition Run Relay.
- **If the test lamp illuminates**
- 4. Ignition ON.
- 5. Verify that a test lamp illuminates between the ignition circuit terminal 85 and ground.
 - **If the test lamp does not illuminate**
 - 1. Ignition OFF.
 - 2. Test the for less than 2 ohms in the ignition circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, replace the K9 Body Control Module.
 - **If the test lamp illuminates**
- 6. Ignition OFF, connect the KR74 Ignition Run Relay, disconnect the harness connector at the P16 Instrument Cluster.
- 7. Verify that a test lamp does not illuminate between the ignition circuit terminal 31 and ground.
 - **If the test lamp illuminates**
 - 1. Disconnect the KR74 Ignition Run Relay
 - 2. Test for less than 1 V between the ignition circuit and ground.
 - If 1 V or greater, repair the short to voltage on the circuit.
 - If less than 1 V, replace the KR74 Ignition Run Relay.
 - **If the test lamp does not illuminate**
- 8. Ignition ON.
- 9. Verify that a test lamp illuminates between the ignition terminal 31 and ground.
 - **If the test lamp does not illuminate and the Ignition fuse is good**
 - 1. Ignition OFF, disconnect the KR74 Ignition Run Relay.
 - 2. Test for less than 2 ohms in the ignition circuit end to end
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, replace the KR74 Ignition Run Relay.
 - **If the test lamp does not illuminate and the Ignition fuse is open**
 - 1. Ignition OFF, disconnect the KR74 Ignition Run Relay.

2. Test for infinite resistance between the ignition circuit and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance, replace the P16 Instrument Cluster.
 - **If the test lamp illuminates**

10. Replace the P16 Instrument Cluster.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

- **Relay Replacement (Within an Electrical Center)** , **Relay Replacement (Attached to Wire Harness)**

DTC P0461-P0464: FUEL GAUGE MALFUNCTION

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

DTC Descriptors

DTC P0461

Fuel Level Sensor Performance

DTC P0462

Fuel Level Sensor Circuit Low Voltage

DTC P0463

Fuel Level Sensor Circuit High Voltage

DTC P0464

Fuel Level Sensor Circuit Intermittent

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Fuel Level Sensor 1 Signal	P0462	P0463	P0463	P0461

Low Reference	-	1	P0463, P0464	P0461
1. Fuel Gauge Malfunction				

Circuit/System Description

The fuel level sensor changes resistance based on fuel level. The engine control module (ECM) monitors the signal circuit of the fuel level sensor in order to determine the fuel level. When the fuel tank is full, the resistances of the fuel level sensor is low and the ECM senses a low signal voltage on the signal circuit of the fuel level sensor. When the fuel tank is empty, the resistance of the fuel level sensor is high and the ECM senses a high signal voltage. The ECM uses the signal circuit of the fuel level sensor in order to calculate the percentage of remaining fuel in the tank. The ECM sends the fuel level percentage via serial data to the body control module (BCM). The BCM then sends the fuel level percentage via serial data to the instrument cluster in order to control the fuel gauge.

Conditions for Running the DTC

- The engine is running
- The system voltage is between 11-16 V

Conditions for Setting the DTC

P0461 00

The ECM detects a change in fuel level of less than a specified amount (typically 3-10 L or 0.8-2.6 gal) over a specified driving distance (typically 240-320 km or 150-200 miles).

P0462

- The signal voltage is less than 0.25 V.
- The above conditions must be met for 5 seconds.

P0463

- The signal voltage is greater than 4.7 V.
- The above conditions must be met for 5 seconds.

P0464

- The fuel level change is greater than 10%.
- The above conditions must be met for 30 seconds.
- DTC P0464 runs and fails 2 out of 3 test cycles.

Action Taken When the DTC Sets

- P0461, P0462, P0463 and P0464 are Type B DTCs
- The fuel gauge defaults to empty

- The low fuel indicator illuminates

Conditions for Clearing the DTC

- P0461, P0462, P0463 and P0464 are Type B DTCs
- The DTC becomes history when the conditions for setting the DTC are no longer present.
- The history DTC clears after 40 malfunction-free warm-up cycles.

Circuit/System Verification

1. Ignition ON.
2. Verify the scan tool Fuel Remaining in Tank parameter is between 5-95% and varies with fuel level.
 - **If not between 5-95% or does not vary with fuel level**

Refer to Circuit/System Testing.

- **If between 5-95% and varies with fuel level**
- 3. Verify that all fuel level gauge segments illuminate when performing the scan tool Driver Information Center Segments control function.

- **If any fuel level gauge segments do not illuminate**

Replace the P16 Instrument Cluster.

- **If all fuel level gauge segments illuminate**
- 4. All OK.

Circuit/System Testing

1. Ignition OFF and all vehicle systems OFF, disconnect the harness connector at the A7 Fuel Pump and Level Sensor Assembly. It may take up to 2 minutes for all vehicle systems to power down.
2. Test for less than 10 ohms between the low reference circuit terminal 3 and ground.
 - **If 10 ohms or greater**
 1. Ignition OFF, disconnect the harness connector at the K20 Engine Control Module.
 2. Test for less than 2 ohms in the low reference circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, replace the K20 Engine Control Module.
 - **If less than 10 ohms**
3. Ignition ON.
4. Test for less than 1 V between the low reference circuit and ground.
 - **If 1 V or greater**

Repair the short to voltage on the circuit.

- **If less than 1 V**
5. Verify the scan tool Remaining Fuel In Tank parameter is greater than 95%.
 - **If 95% or less**
 1. Ignition OFF, disconnect the harness connector at the K20 Engine Control Module, ignition ON.
 2. Test for less than 1 V between the signal circuit and ground.
 - If 1 V or greater, repair the short to voltage on the circuit.
 - If less than 1 V, replace the K20 Engine Control Module.
 - **If greater than 95%**
 6. Ignition OFF, disconnect the harness connector at the K20 Engine Control Module, ignition ON.
 7. Test for infinite resistance between the signal circuit terminal 4 and ground.
 - **If less than infinite resistance**

Repair the short to ground on the circuit.

- **If infinite resistance**

8. Ignition OFF

9. Test for less than 2 ohms in the signal circuit end to end.

- **If 2 ohms or greater**

Repair the open/high resistance in the circuit.

- **If less than 2 ohms**

10. Test or replace the B46 Fuel Level Sensor.

Component Testing

1. Ignition OFF, remove the A7 Fuel Pump and Level Sensor Assembly.

2. Sweep the Fuel Level Sensor through its full range of motion while measuring resistance between the signal terminal 4 and the low reference terminal 3.

3. Test for a minimum resistance value of 37-43 ohms and a maximum value of 245-255 ohms without any spikes or dropouts.

- **If minimum resistance is not 37-43 ohms, maximum resistance is not 245-255 ohms or if there are any spikes or dropouts**

Replace the B46 Fuel Level Sensor.

- **If minimum resistance is 37-43 ohms, maximum resistance is 245-255 ohms and if there are no spikes or dropouts**

4. All OK.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

DTC P0520: ENGINE OIL PRESSURE SWITCH

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

DTC Descriptor

DTC P0520

Engine Oil Pressure Switch Circuit Malfunction

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Signal	1	P0520	1	-
1. Engine Oil Pressure Indicator Malfunction				

Typical Scan Tool Data

ECM - Engine Oil Pressure Switch

Circuit	Short to Ground	Open	Short to Voltage
Operating Conditions: Engine Running Parameter Normal Range: OK			
Signal	Low	OK	OK

Circuit/System Description

The Engine Oil Pressure Switch is a normally closed switch that opens with the proper oil pressure. With the ignition switch turned ON and the engine not running, the Engine Control Module (ECM) should detect a low signal voltage input. With the engine running, the Engine Oil Pressure Switch opens and the ECM should detect a high signal voltage input. When the oil pressure is low, the ECM sends a message via serial data to the Body Control Module (BCM). The BCM then sends a message via serial data to the Instrument Cluster requesting the engine oil pressure indicator turned ON.

Conditions for Running the DTC

The engine is running.

Conditions for Setting the DTC

- The ECM detects that the engine oil pressure switch signal circuit is pulled low.
- The above condition is present for greater than 10 seconds.

Action Taken When the DTC Sets

The Instrument Cluster illuminates the service vehicle soon indicator and the oil pressure low indicator.

Conditions for Clearing the DTC

The DTC becomes history when the conditions for setting the DTC are no longer present.

Diagnostic Aids

Low engine oil pressure will also cause this DTC to set. If low engine oil pressure is suspected, refer to **Oil Pressure Diagnosis and Testing** .

DTC P0521: ENGINE OIL PRESSURE SENSOR

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

DTC Descriptor

DTC P0521

Engine Oil Pressure Sensor Performance Malfunction

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Signal	1	P0521	1	P0521
1. Engine Oil Pressure Indicator Malfunction				

Typical Scan Tool Data

ECM - Engine Oil Pressure Switch

Circuit	Short to Ground	Open	Short to Voltage
Operating Conditions: Engine Running Parameter Normal Range: OK			
Signal	Low	OK	OK

Circuit/System Description

The engine oil pressure switch is a normally closed switch that opens with the proper oil pressure. With the ignition switch turned ON and the engine not running, the Engine Control Module (ECM) should detect a low signal voltage input. With the engine running, the Engine Oil Pressure Switch opens and the ECM should detect a high signal voltage input. When the oil pressure is low, the ECM sends a message via serial data to the body control module (BCM). The BCM then sends a message via serial data to the Instrument Cluster requesting the engine oil pressure indicator turned ON.

Conditions for Running the DTC

The engine is running.

Conditions for Setting the DTC

- The ECM detects that the engine oil pressure switch signal circuit is pulled low.
- The engine oil pressure is outside of a calculated working range determined by engine speed and temperature.
- The above condition is present for greater than 10 seconds.

Action Taken When the DTC Sets

The Instrument Cluster illuminates the service vehicle soon indicator and the oil pressure low indicator.

Conditions for Clearing the DTC

The DTC becomes history when the conditions for setting the DTC are no longer present.

Diagnostic Aids

DTC P0521 can set if engine oil pressure is outside the calculated engine oil pressure model stored in the engine control module. This can be an indication of mechanical engine issues causing lower than expected engine oil pressure.

SYMPTOMS - DISPLAYS AND GAUGES

NOTE: The following steps must be completed before using the symptom diagnostic tables.

1. Before using the symptom diagnostic tables, perform the **Diagnostic System Check - Vehicle**
2. Review the system operation in order to understand the system functions. Refer to the following description and operations:
 - **Instrument Cluster Description and Operation**
 - **Indicator/Warning Message Description and Operation**
 - **Driver Information Center (DIC) Description and Operation**
 - **Audible Warnings Description and Operation**

Visual/Physical Inspection

- Inspect for aftermarket devices which can affect the operation of the instrument panel cluster or the audible warning systems. Refer to **Checking Aftermarket Accessories**
- Inspect the accessible system components or the visible system components for obvious damage or for obvious conditions which can cause the symptom.
- Inspect for the proper fluid levels.

Intermittent

Faulty electrical connections or wiring may be the cause of intermittent conditions. Refer to **Testing for Intermittent Conditions and Poor Connections**

Symptom List

Refer to a symptom diagnostic procedure from the following list in order to diagnose the symptom:

Gauges and Odometer

- **Fuel Gauge Malfunction - DTC P0461-P0464**
- **Odometer Trip/Reset Switch Malfunction**
- **Speedometer and/or Odometer Malfunction**
- **Tachometer Inaccurate or Inoperative**

Indicators

- **ABS Indicator Malfunction**
- **Airbag Indicator Malfunction (Driver) , Airbag Indicator Malfunction (Passenger)**
- **Brake Warning Indicator Malfunction**
- **Charge Indicator Malfunction**
- **Door Ajar Indicator Malfunction**

- **Seat Belt Indicator Malfunction - Driver**
- **Turn Signal Lamps and/or Indicators Malfunction**
- **Washer Malfunction**

Driver Information Center

- **Driver Information Center Display Malfunction**
- **Outside Air Temperature Display Malfunction - DTC B0158**

Audible Warnings

Chime Malfunction

CHARGE INDICATOR MALFUNCTION

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

Circuit/System Description

The engine Control Module (ECM) uses the generator turn ON signal circuit to control the load of the generator on the engine. A high side driver in the ECM applies voltage to the voltage regulator. This signals the voltage regulator to turn the field circuit ON and OFF. The ECM monitors the state of the generator turn ON signal circuit. The ECM should detect low voltage on the generator turn on signal circuit when the ignition is ON and the engine is OFF or when the charging system malfunctions. With the engine running, the ECM should detect high voltage on the generator turn on signal circuit. The ECM performs key ON and RUN tests to determine the status of the generator turn on signal circuit. If a malfunction is detected the ECM will illuminate the charge indicator in the instrument cluster.

Circuit/System Verification

1. Ignition ON, engine running.
2. Verify the scan tool Battery Voltage parameter is between 12.5-15.5 V.
 - **If not 12.5-15.5 V**

Refer to **Charging System Test** .

- **If 12.5-15.5 V**
3. Verify the charge indicator turns on and off when commanding the All Indicators test ON and OFF with the scan tool.
 - **If the charge indicator always stays on or always stays off**

Replace the P16 Instrument Cluster.

- **If the charge indicator turns on and off as commanded**
4. All OK.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

CHIME MALFUNCTION

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

Circuit/System Description

The radio generates the audible warnings. The instrument cluster, the body control module (BCM), the inflatable restraint sensing and diagnostic module (SDM) or the object alarm module request audible warnings via serial data.

Scan Tool Reference

Control Module References for scan tool information

Circuit/System Verification

NOTE: Before performing this diagnostics, make sure no indicators are illuminated after the instrument cluster performs a lamp test. If any indicators are illuminated after the bulb test, perform the indicator diagnostics before this diagnostics.

1. Ignition ON.
2. Verify all the radio speakers operate by adjust the radio balance and fade to each speaker.
 - If any speaker does not operate properly

Refer to **Speaker Malfunction** .

- **If the speakers operate properly**

3. Verify the scan tool Driver Seat Belt Status and Passenger Seat Belt Status parameters are Buckled when both front seat belts are buckled.

- **If not Buckled**

Refer to **Seat Belt Indicator Malfunction - Driver** .

- **If buckled**

4. Verify the scan tool Headlamp On Switch parameter is Inactive when the headlamps are OFF.

- **If not Inactive**

Refer to **Headlamps Malfunction** .

- **If Inactive**

5. Verify the scan tool Park Lamps Switch parameter is Inactive when the park lamp switch is OFF.

- **If not Inactive**

Refer to **Park, License, and/or Tail Lamps Malfunction** .

- **If Inactive**

6. Verify the scan tool Left Turn Signal Switch and Right Turn Signal Switch parameters are Inactive while the turn signal switch is OFF.

- **If not Inactive**

Refer to **Turn Signal Lamps and/or Indicators Malfunction** .

- **If Inactive**

7. Verify the scan tool Park Brake Switch parameter is Inactive when the park brake is OFF.

- **If not Inactive**

Refer to **Park Brake System Diagnosis** .

- **If Inactive**

8. Verify that all scan tool parameters listed below are Inactive when all the doors are closed.

- Driver Door Ajar Switch
- Passenger Door Ajar Switch
- Left Rear Door Ajar Switch
- Right Rear Door Ajar Switch

- **If not Inactive**

Refer to **Door Ajar Indicator Malfunction** .

- **If Inactive**

9. Verify the scan tool Key in Ignition Status parameter is Inactive when the key is out of the ignition.

- **If not Inactive**

Refer to Circuit/System Testing.

- **If Active**

10. All OK

Circuit/System Testing

1. Ignition ON, disconnect the harness connector at the S39 Ignition Switch while the ignition is ON.

2. Verify a test lamp illuminates between the B+ circuit terminal 5 and ground.

- **If the test lamp does not illuminate and the circuit fuse is OK**

1. Ignition OFF.

2. Test for less than 2 ohms in the B+ circuit end to end.

- If 2 ohms or greater, repair the open/high resistance in the circuit.

- If less than 2 ohms, verify the fuse is OK and there is voltage at the fuse.

- **If the test lamp does not illuminate and the circuit fuse is open**

1. Test for infinite resistance between the B+ circuit and ground.

- If less than infinite resistance, repair the short to ground on the circuit.

- If infinite resistance

2. Test for infinite resistance between the signal circuit and ground.

- If less than infinite resistance, repair the short to ground on the circuit.

- If infinite resistance, replace the K9 Body Control Module.

- **If the test lamp illuminates**

3. Verify the scan tool Key in Ignition Status parameter is Inactive.

- **If not Inactive**

1. Disconnect the X3 harness connector at the K9 Body Control Module.

2. Test for less than 1 V between the signal circuit terminal 3 and ground.

- If 1 V or greater, repair the short to voltage on the circuit.

- If less than 1 V, replace the K9 Body Control Module.

- **If Inactive**

4. Install a 3 A fused jumper wire between the signal circuit terminal 3 and the B+ circuit terminal 5.

5. Verify the scan tool Key in Ignition Status parameter is Active.

- **If not Active**

1. Connect harness connector at Ignition Switch, Ignition OFF, disconnect harness connector at Ignition Switch.

2. Disconnect the X3 harness connector at the K9 Body Control Module.

3. Test for less than 2 ohms in the signal circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, replace the K9 Body Control Module.

- **If Active**

6. Test or replace the S39 Ignition Switch.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

DRIVER INFORMATION CENTER DISPLAY MALFUNCTION

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

Circuit/System Description

The Instrument Cluster contains a Driver Information Center which displays vehicle information such as the engine coolant temperature, fuel level, vehicle speed and other information based on the information received from various modules on the vehicle's serial data bus. The Driver Information Center illuminates a combination of indicators and messages to display the status of various vehicle systems.

Circuit/System Verification

1. Ignition ON.
2. Verify no DTC is set.
 - **If any DTC is set,**

Diagnose any DTCs first. Refer to **Diagnostic Trouble Code (DTC) List - Vehicle** .
 - **If no DTCs are set**
3. Verify all indicators except the engine malfunction indicator illuminate and turn off as commanded when performing the All Indicators test with the scan tool.
 - **If any indicators do not illuminate and turn off as commanded**

Replace the P16 Instrument Cluster.
 - **If all indicators respond properly**
4. Verify all segments illuminate when performing the Driver Information Center Segments test with the scan tool.
 - **If any segments do not illuminate**

Replace the P16 Instrument Cluster.
 - **If all segments illuminate properly**
5. All OK.

ENGINE OIL PRESSURE INDICATOR MALFUNCTION

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Signal	1	P0520, P0521	1	P0521
1. Engine Oil Pressure Indicator Malfunction				

Circuit/System Description

The engine oil pressure switch is a normally closed switch that opens with the proper oil pressure. With the ignition switch turned ON and the engine not running, the engine control module (ECM) should detect a low signal voltage input. With the engine running, the engine oil pressure switch opens and the ECM should detect a high signal voltage input. When the oil pressure is low, the ECM sends a message via serial data to the body control module (BCM). The BCM then sends a message via serial data to the instrument cluster requesting the engine oil pressure indicator turned ON.

Circuit/System Verification

1. Ignition ON.
2. Verify the engine oil pressure indicator turns on & off when commanding the All Indicators ON and OFF with a scan tool.

- **If the engine oil pressure Indicator does not turn on and off.**

Replace the P16 instrument cluster.

- **If the engine oil pressure Indicator turns on and off**

3. Verify the scan tool Engine Oil Pressure Switch parameter is Low.

- **If not Low**

Refer to Circuit/System Testing.

- **If Low**

4. Engine running.

5. Verify the scan tool Engine Oil Pressure Switch parameter is OK.

- **If not OK**

Refer to Circuit/System Testing.

- **If OK**

6. All OK.

Circuit/System Testing

1. Ignition OFF, disconnect the harness connector at the B37 Engine Oil Pressure Switch, ignition ON.

2. Verify the scan tool Engine Oil Pressure Switch parameter is OK.

- **If not OK**

1. Ignition OFF, disconnect the harness connector at the K20 Engine Control Module.

2. Test for infinite resistance between the signal circuit terminal 1 and ground.

- If less than infinite resistance, repair the short to ground on the circuit.

- If infinite resistance, replace the K20 Engine Control Module.

- **If OK**

3. Install a 3 A fused jumper wire between the signal circuit terminal 1 and ground.

4. Verify the scan tool Engine Oil Pressure Switch parameter is Low.

- **If not Low**

1. Ignition OFF, disconnect the harness connector at the K20 Engine Control Module, ignition ON.

2. Test for less than 1 V between the signal circuit and ground.

- If 1 V or greater, repair the short to voltage on the circuit.

- If less than 1 V

3. Test for less than 2 ohms in the signal circuit end to end.

- If 2 ohms or greater, repair the open/high resistance in the circuit.

- If less than 2 ohms, replace the K20 Engine Control Module.

- **If Low**

5. Test or replace the B37 Engine Oil Pressure Switch.

ODOMETER TRIP/RESET SWITCH MALFUNCTION

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

Circuit/System Description

The instrument cluster displays the travelled distance based on the information from the engine control module (ECM). The ECM converts the data from the vehicle speed sensor to a distance signal. The ECM sends the distance information via serial data to the body control module (BCM). The BCM then sends the information via serial data to the instrument cluster to display the vehicle odometer and trip odometer. The instrument cluster detects the activation of the trip reset switch and a press and hold of the trip reset switch resets the trip odometer information to zero.

Scan Tool Reference

Control Module References for scan tool information

Circuit/System Verification

1. Ignition ON.
2. Verify the odometer trip reset switch resets the trip odometer display when the switch is pressed.
 - **If the odometer trip reset switch does not reset the trip odometer**

Replace the P16 Instrument Cluster.

- **If the odometer trip reset switch resets the trip odometer**
3. All OK.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

Control Module References for instrument cluster replacement, programming and setup.

SPEEDOMETER AND/OR ODOMETER MALFUNCTION

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

Circuit/System Description

The instrument cluster displays the engine coolant temperature, fuel level, vehicle speed and the engine speed based on the information from the engine control module (ECM). The ECM sends information via serial data to the body control module (BCM). The BCM then sends the information via serial data to the instrument cluster to display the engine coolant temperature, fuel level, the engine speed, the vehicle speed and the distance travelled, either in kilometers or miles, based on the vehicle requirements. The instrument cluster will display dashes when its VIN does not match the VIN received from the BCM.

Diagnostic Aids

If the VIN mismatch is corrected the odometer will once again be displayed in the instrument cluster. If the vehicle is driven for a calibrated distance with a VIN mismatch, it will cause the instrument cluster odometer to enter into an error mode and lock itself. When this occurs the dashes will remain on the display even after correcting the VIN mismatch. The vehicle odometer status data display on the scan tool can be used to identify a locked odometer. The only way to unlock the instrument cluster (clear the dashes from the display) is to perform an SPS programming event. Failure to follow the diagnostic and programming procedures may result in either an improper odometer value or a module replacement.

Scan Tool Reference

Control Module References for scan tool information

Circuit/System Verification

1. Verify no DTC is set.
 - **If any DTC is set**

Diagnose DTCs first. Refer to Diagnostic Trouble Code (DTC) List - Vehicle .
 - **If no DTCs are set**
2. Ignition ON.
3. Verify the speedometer sweeps from low to high position when performing the Speedometer Sweep Test with the scan tool.
 - **If speedometer does not sweep**

Replace the P16 Instrument Cluster.
 - **If speedometer sweeps properly**
4. Verify the speedometer gauge value matches the scan tool Vehicle Speed parameter while driving the vehicle.
 - **If the values do not match**

Replace the P16 Instrument Cluster.

- **If the speedometer value matches the scan tool parameter**

5. Verify the odometer display and the displayed distance counts up while driving the vehicle.

- **If the odometer displays only "----" (dashes)**

Refer to Circuit/System Testing.

- **If the odometer display does not count up**

Replace the P16 Instrument Cluster.

- **If speedometer sweeps and displays the correct value and the odometer display counts up**

6. All OK.

Circuit/System Testing

NOTE: If there are multiple modules not original to the vehicle and they are used or incorrectly configured service parts, SPS may not be able to properly read or recover the vehicle odometer value. Follow government rules and documentation (including vehicle identification) regarding inaccurate/unknown odometer values.

Perform circuit/system verification first.

Correcting VIN mismatch: Instrument Cluster is Showing "----" (Dashes), odometer is still unlocked

1. Verify the scan tool Odometer Status parameter is Unlocked.

- **If the reading is Locked**

Refer to correcting VIN mismatch - odometer locked.

- **If the reading is Unlocked**

2. Verify the scan tool BCM VIN parameter matches the vehicle's VIN placard.

- **If the VIN does not match**

Reprogram the BCM, then proceed to Step 3.

- **If the VIN matches**

3. Verify the scan tool Instrument Cluster VIN parameter matches the vehicle's VIN placard.

- **If the VIN does not match**

Reprogram the instrument cluster. Then proceed with step 4.

- **If the VIN matches**

4. Ignition ON.
5. Verify the instrument cluster is displaying the correct value.
 - **If the instrument cluster is still displaying "----" (dashes)**

Replace the P16 Instrument Cluster.

6. All OK.

Correcting VIN mismatch: Instrument Cluster is Showing "----" (Dashes), odometer is locked

1. Verify the scan tool Odometer Status parameter is Locked.
 - **If the reading is Unlocked**

Refer to Correcting VIN mismatch - odometer unlocked.

 - **If the reading is Locked**
2. Verify the scan tool Instrument Cluster VIN parameter matches the vehicle's VIN placard.
 - **If the VIN does not match**

Reprogram the Instrument Cluster. Then proceed with step 3.

- **If the VIN matches**
3. Perform the BCM setup procedure in SPS.
 4. Ignition ON.
 5. Verify the instrument cluster is displaying the correct value.
 - **If the instrument cluster is still displaying "----" (dashes)**

Replace the P16 Instrument Cluster.

 - **If instrument cluster is displaying the correct value**
 6. All OK.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

Control Module References for instrument cluster, BCM or ECM replacement, programming and setup.

TACHOMETER INACCURATE OR INOPERATIVE

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.

- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

Circuit/System Description

The instrument cluster displays the engine coolant temperature, fuel level, vehicle speed and the engine speed based on the information from the engine control module (ECM). The ECM sends information via serial data to the body control module (BCM). The BCM then sends the information via a serial data to the instrument cluster to display the engine coolant temperature, fuel level, the engine speed, the vehicle speed and the distance travelled, either in kilometers or miles, based on the vehicle requirements.

REPAIR INSTRUCTIONS

INFORMATION CENTER TELLTALE ASSEMBLY REPLACEMENT

Fig. 5: Information Center Telltale Assembly
Courtesy of GENERAL MOTORS COMPANY

Information Center Telltale Assembly Replacement

Callout	Component Name
Preliminary Procedures 1. Disconnect the battery negative cable. 2. Remove I/P center molding. Refer to <u>Instrument Panel Center Molding Replacement</u> .	
1	Driver Information Center Telltale Assembly Procedure 1. Disconnect electrical components. 2. Carefully unclip the retainer.

INSTRUMENT CLUSTER REPLACEMENT

Fig. 6: Instrument Cluster

Courtesy of GENERAL MOTORS COMPANY

Instrument Cluster Replacement

Callout	Component Name
Preliminary Procedure Remove steering column lower trim cover. Refer to <u>Steering Column Lower Trim Cover Replacement</u> .	
1	Instrument Cluster Nut Cover
	Instrument Cluster Screw (Qty: 2)

2	CAUTION: Refer to <u>Fastener Caution</u> . Tighten 10 (89 lb in)
3	Instrument Cluster Assembly Procedure 1. Remove the cluster rear cover. 2. Disconnect electrical components. 3. After repairs, refer to <u>Control Module References</u> .

INSTRUMENT PANEL MULTIFUNCTION SWITCH REPLACEMENT

Fig. 7: Instrument Panel Multifunction Switch
Courtesy of GENERAL MOTORS COMPANY

Instrument Panel Multifunction Switch Replacement

Callout	Component Name
	Instrument Panel Multifunction Switch Assembly
	Procedure

1	1. Disconnect the tabs (the arrows in the illustration) carefully to prevent the damage for the switch and molding. 2. Disconnect the electrical connector.
---	---

DESCRIPTION AND OPERATION

AUDIBLE WARNINGS DESCRIPTION AND OPERATION

The audible warnings alert the driver of a system concern or a critical vehicle condition. The radio generates the audible warnings through the speakers. The radio receives audible warning requests via the serial data circuit. If the radio receives multiple audible warning requests, the warning with the highest priority sounds first. The radio is the chime producer. The following lists the audible warning sounds:

1. Single pulse gong
2. Multiple pulse gong
3. Single pulse beep
4. Multiple pulse beep
5. Click
6. Clack

Fasten Safety Belt Warning

The chime producer activates the fasten safety belt audible warning as requested by the body control module (BCM). The BCM sends a serial data message to the chime producer indicating the chime as a multiple gong. The fasten safety belt warning sounds and the fasten safety belt indicator illuminates when the following occurs:

- The ignition switch transitions to ON.
- The inflatable restraint sensing and diagnostic module (SDM) detects that the drivers seat belt is not buckled and the signal is low. The SDM sends a serial data message to the BCM indicating the seat belt status. The instrument cluster receives a serial data message from the BCM indicating the driver seat belt status.

If the seat belt is buckled when the ignition is turned ON, the chime does not sound. If the seat belt is buckled while the chime is sounding, the chime stops. If the seat belt is unbuckled after the initial transition to ON, the chime does not sound.

Lights On Warning

The chime producer activates the lights on warning as requested by the BCM. The BCM sends a serial data message to the chime producer indicating the chime as a multiple gong. The lights on warning sounds when the following occurs:

- The ignition is OFF.
- The BCM determines that the driver door is open and the signal circuit is low.

- The BCM determines that the headlamp switch is in the park or head position.

Brake Warning

The chime producer activates the brake audible warning as requested by multiple control modules. The BCM, electronic brake control module or the parking brake control module sends a serial data message to the chime producer indicating the chime as a multiple gong. The brake warning sounds and the BRAKE indicator illuminates when the following occurs:

- The ignition is ON.
- The vehicle speed is greater than 8 km/h (4.9 MPH). The instrument cluster receives a serial data message from the engine control module (ECM) indicating the vehicle speed.
- The BCM determines that the parking brake is engaged and the signal circuit is low.
- The brake fluid is low.

Key-In-Ignition Warning

The chime producer activates the key-in-ignition audible warning as requested by the BCM. The BCM sends a serial data message to the chime producer indicating the chime as a multiple gong. The key-in-ignition warning sounds when the following occurs:

- The ignition switch is OFF.
- The BCM determines that the driver door is open and the signal circuit is low.

Door Ajar Warning

The chime producer activates the door ajar audible warning as requested by the BCM. The BCM sends a serial data message to the chime producer indicating the chime frequency of a medium rate and continuous duration. The door ajar warning sounds and the appropriate door ajar indicator illuminates in the driver information center when the BCM determines that a door (driver door, passenger door, left rear door, right rear door) is open and the signal circuit is low. The instrument cluster also receives a serial data message from the BCM indicating the door ajar status.

Object Detection

The chime producer activates the object detection audible warning as requested by the object alarm module. When an object is within the measuring range of the sensor, the ultrasonic pulse is reflected and is received by the sending or a neighboring sensor. The sensor converts this signal into a voltage signal and sends this signal to the object alarm module. The object alarm module evaluates the received sensor signals. As soon as an object is within the measuring range, the object alarm module sends a message via CAN-Bus to the chime producer in order to give out the acoustic distance signal. The measuring range is between 30-120 cm (11.81-47.24 in). From a distance of 120 cm (47.24 in), the acoustic signal is active. The frequency of the beep sound increases with decreasing distance. From a distance less than 30 cm (11.81 in), the sound becomes continuous.

Additional Warnings

The following warnings have an associated instrument cluster indicator or driver information center message:

- Turn Signal Indicators-The chime producer activates the audible warning as requested by the BCM. The chime produces two different chimes, one when the turn signal turns off and another when the turn signal turns on.
- Vehicle Overspeed Message-The chime producer activates the audible warning as requested by the BCM. The BCM sends a serial data message to the chime producer.
- Fuel Level Low Message-The chime producer activates the audible warning as requested by the BCM. The BCM sends a serial data message to the chime producer.
- Oil Pressure Indicator-The chime producer activates the audible warning as requested by the BCM. The BCM sends a serial data message to the chime producer.
- Park Assist Fault Clean Rear Bumper Message-The chime producer activates the audible warning as requested by the BCM. The BCM sends a serial data message to the chime producer.
- Tire Pressure Low Indicator-The chime producer activates the audible warning as requested by the BCM. The BCM sends a serial data message to the chime producer.

Refer to **Indicator/Warning Message Description and Operation**.

DRIVER INFORMATION CENTER (DIC) DESCRIPTION AND OPERATION

In the lower middle of the instrument cluster, an additional display is installed. Its task is to give additional information, such as an odometer or error codes/warning messages. Refer to **Indicator/Warning Message Description and Operation**.

There are 4 switch functions for the driver information center:

- Menu
- Set/Clear
- Up
- Down

Menu

The Menu switch is used to navigate between the Vehicle Information Menu and the Trip/Fuel Information Menu. Cycle through the following vehicle parameters by successive pressing of the Menu switch.

Up and Down

The Up and the Down switches are used to navigate within the menus. Cycle through the following menu parameters by successive pressing of the Down switch.

Vehicle Information Menu

- Units Menu
- Speed Warning

Trip/Fuel Information Menu

- Trip A
- Fuel Range
- Average Fuel Economy
- Instantaneous Fuel Economy
- Average Vehicle Speed

Trip A

The trip odometer can be accessed through the driver information center switch Up/Down function.

Trip Display

Driver Information Center Trip Display	Range		
	Europe-SI	USA	GB
TRIP A	#####.km	#####.# miles	#####.# miles

Fuel Range

This message indicates the estimated distance that the vehicle can travel under the current fuel economy and fuel level conditions since the last battery connection to the instrument cluster. Fuel Range is calculated using the equation: Fuel Range = Range Distance/Range Fuel Used.

- Range Distance = The accumulated distance travelled since the last reset of this value.
- Fuel Used = The accumulated fuel delivered since the last reset of this value

The engine control module (ECM) sends the fuel range value to the instrument cluster. The instrument cluster receives a serial data message with fuel information. The fuel range value is retained during ignition OFF and can be changed between Europe-SI, USA and GB units by accessing the driver information center Units menu. The Fuel Range display cannot be reset. LOW is displayed when fuel range is below a predetermined value.

Average Fuel Economy

Average fuel economy is calculated using the equation: Average Fuel Economy = Distance/Fuel

- Distance = The accumulated distance travelled since the last reset of this value
- Fuel = The accumulated fuel consumption since the last reset of this value

The ECM sends the average fuel economy serial data message to the instrument cluster. The value of this mode is retained during ignition OFF and can be changed between English units and metric units by selecting from the driver information center options menu.

Instantaneous Fuel Economy

The ECM sends the instantaneous fuel economy serial data message to the instrument cluster. The value of this mode can be changed between English units and metric units by selecting from the driver information center options menu.

Average Vehicle Speed

Average speed is calculated using the equation: $\text{Average Speed} = \text{Average Speed Distance} / \text{Average Speed Time}$

- Distance = The accumulated distance travelled since the last reset of this value
- Ignition ON = The accumulated ignition on time since the last reset of this value

Outside Air Temperature

The outside air temperature can be accessed through the driver information center Trip/Fuel switch function. The driver information center shows the outside air temperature as a damped value. The time and rate of the temperature update is based on an algorithm in the instrument cluster. Factors such as last temperature reading, current temperature reading, length of time the vehicle was off, current vehicle speed and the distance driven effect when the displayed temperature is updated. To get the vehicle to display the most accurate temperature faster, drive the vehicle. Constant moving traffic will update the display to the correct temperature more quickly than stop and go traffic.

Units Menu

The unit mode is used to toggle between Europe-SI, USA and GB units and can be accessed through the driver information center Menu switch and the driver information center Set/Reset switch.

Compass

The vehicle may have a compass display on the Driver Information Center. The compass receives its heading and other information from the Global Positioning System (GPS) antenna. If applicable, the GPS antenna is located with the telematics communication interface control module.

Odometer

The instrument cluster displays the vehicle odometer in the driver information center. The ECM send a distance rolling count message on GMLAN to the body control module (BCM). The BCM uses this information to calculate the vehicle odometer. This odometer value is then sent to the instrument cluster on GMLAN. The instrument cluster does not calculate the odometer. The odometer displays miles or kilometers as selected in the Units menu.

The odometer value is stored in multiple modules. The instrument cluster is a secondary storage module for the odometer, while the BCM is the primary storage and accumulator.

In addition to storing the odometer value for the vehicle, the instrument cluster and the BCM store the VIN. Software checks are performed to ensure these modules and their stored odometer information, can not be move or transferred between different vehicles.

If the VINs do not match, the instrument cluster will go into an error mode and display "----" (dashes). If the VIN mismatch exists over a calibrated distance, the instrument cluster will "lock" the odometer display and only show dashes, even if the VIN mismatch is subsequently correct. The only way to clear or "unlock" the instrument cluster is to perform a BCM programming event using SPS.

Language

The driver information center is capable of displaying in different languages, corresponding to the radio language settings. The instrument cluster receives a serial data message with language information from the radio. This message is only sent one time, after a new language is selected. To set the language, see the owners manual.

INDICATOR/WARNING MESSAGE DESCRIPTION AND OPERATION

Indicator LIGHT ON

Refer to the owner's manual for the descriptions and explanations of all indicator lights.

For diagnosis and repair information related to an indicator light, refer to the System Diagnosis and the Description of Operation that the message relates to.

Message Displayed

Refer to the owner's manual for descriptions and explanations of all messages displayed.

For diagnosis and repair information related to a displayed message, refer to the System Diagnosis and the Description of Operation that the message relates to.

CHANGE TIMING BELT MESSAGE

The Instrument Cluster monitors the odometer mileage to determine when timing belt (if equipped) replacement may be necessary. After the vehicle has accumulated approximately 100, 000 miles (160, 000 kilometers), the Instrument Cluster may display the CHANGE TIMING BELT message. After the engine timing belt has been replaced, reset the CHANGE TIMING BELT message by locating and removing the fuses that supply power to the Instrument Cluster for two minutes.

Transmission Shift Lever Position Indicator

The Transmission Shift Lever Position Indicator (if equipped) is located on the center console and indicates the current transmission shift lever position. The Transmission Shift Lever Position Indicator receives power and ground and is controlled by the Body Control Module (BCM) via serial data. The Transmission Control Module determines transmission shift lever position based on signals from the Transmission Internal Mode Switch and sends the shift lever position information to the BCM via serial data.

Displays Test

Certain instrument cluster features are tested when the ignition is turned on in order to verify the features are working properly. The following occurs when the ignition is turned on:

- The ABS indicator illuminates briefly.
- The airbag indicator illuminates briefly.
- The battery indicator illuminates briefly.
- The brake indicator illuminates briefly.
- The door ajar indicator illuminates briefly.
- The fuel level low indicator illuminates briefly.
- The oil pressure low indicator illuminates briefly.
- The park assist service indicator illuminates briefly.
- The press clutch indicator illuminates briefly.
- The security indicator illuminates briefly.
- The service vehicle soon indicator illuminates briefly.
- The vehicle dynamic caution service indicator illuminates briefly.
- The vehicle dynamics caution off indicator illuminates briefly.

Indicators and Warning Messages

Refer to **Indicator/Warning Message Description and Operation**

Engine Coolant Temperature Gauge

The instrument cluster displays the engine coolant temperature as determined by the engine control module (ECM). The ECM sends the engine coolant temperature information via a High Speed CAN-Bus signal to the body control module (BCM). The BCM then sends the information via a Low Speed CAN-Bus signal to the instrument cluster to display the engine coolant temperature. The engine coolant temperature gauge defaults to 40°C (104°F) or below if:

- The ECM detects a malfunction in the engine coolant temperature sensor circuit.
- The BCM detects a loss of serial data communications with the ECM.
- The instrument cluster detects a loss of serial data communications with the BCM.

Fuel Level Gauge

The instrument cluster displays the fuel level based on the information from the ECM. The ECM converts the data from the fuel level sensors to a fuel level signal. The ECM sends the fuel level signal via a High Speed CAN-Bus signal to the BCM. The BCM then sends the information via a Low Speed CAN-Bus signal to the instrument cluster to display the fuel level. If the fuel level falls under 11% the instrument cluster switches on the low fuel level indicator. The fuel gauge defaults to empty if:

- The ECM detects a malfunction in the fuel level sensor circuit.
- The BCM detects a loss of serial data communications with the ECM.
- The instrument cluster detects a loss of serial data communications with the BCM.

Speedometer

The instrument cluster displays the vehicle speed based on the information from the ECM. The ECM sends the vehicle speed information via a High Speed CAN-Bus signal to the BCM. The BCM then sends the vehicle speed information via a Low Speed CAN-Bus signal to the instrument cluster in order to display the vehicle speed, either in kilometers or miles, based on the vehicle requirements. The speedometer defaults to 0 km/h (0 MPH) if:

- The BCM detects a loss of serial data communications with the ECM.
- The instrument cluster detects a loss of serial data communications with the BCM.

Tachometer

The instrument cluster displays the engine speed based on the information from the ECM. The ECM converts the data from the engine speed sensor to an engine revolution signal. The ECM sends the engine speed information via a High Speed CAN-Bus signal to the BCM. The BCM then sends the information via a Low Speed CAN-Bus signal to the instrument cluster to display the engine speed. The tachometer defaults to 0 RPM if:

- The ECM detects a malfunction in the engine speed sensor circuit.
- The BCM detects a loss of serial data communications with the ECM.
- The instrument cluster detects a loss of serial data communications with the BCM.

Driver Information Center Display

In the lower middle of the instrument cluster, an additional display is installed. Its task is to give additional information, such as an odometer or error codes. This part of the instrument cluster is available in 4 different variants, mostly depending on the assembled engine. For further information refer to **Driver Information Center (DIC) Description and Operation**.

REPAIR INSTRUCTIONS

FRONT SIDE DOOR WINDOW SWITCH BEZEL REPLACEMENT

Fig. 1: Front Side Door Window Switch Bezel
 Courtesy of GENERAL MOTORS COMPANY

Front Side Door Window Switch Bezel Replacement

Callout	Component Name
Preliminary Procedure Remove the front side door trim. Refer to <u>Front Side Door Trim Panel Replacement</u> .	
1	Front Side Door Window Switch Bezel Screw (Qty: 9) CAUTION: Refer to <u>Fastener Caution</u> . Tighten 2 N.m (18 lb in)
2	Front Side Door Window Switch Bezel Assembly

REAR SIDE DOOR WINDOW SWITCH BEZEL REPLACEMENT

Fig. 2: Rear Side Door Window Switch Bezel
 Courtesy of GENERAL MOTORS COMPANY

Rear Side Door Window Switch Bezel Replacement

Callout	Component Name
Preliminary Procedure Remove the rear side door trim. Refer to <u>Rear Side Door Trim Panel Replacement</u> .	
1	Rear Side Door Window Switch Bezel Screw (Qty: 2) CAUTION: Refer to <u>Fastener Caution</u> . Tighten 2 N.m (18 lb in)
2	Rear Side Door Window Switch Bezel Assembly

FRONT SIDE DOOR TRIM PANEL REPLACEMENT

Fig. 3: Front Side Door Trim Panel
 Courtesy of GENERAL MOTORS COMPANY

Front Side Door Trim Panel Replacement

Callout	Component Name
Preliminary Procedure	
Remove the front side door upper trim panel. Refer to .	
1	Front Side Door Pull Handle Fastener CAUTION: Refer to Fastener Caution .
2	Front Side Door Trim Clip (Qty: 9)
3	Front Side Door Trim Assembly Procedure Disconnect the electrical connectors.

FRONT SIDE DOOR TRIM PANEL APPLIQUE REPLACEMENT

Fig. 4: Front Side Door Trim Panel Applique
 Courtesy of GENERAL MOTORS COMPANY

Front Side Door Trim Panel Applique Replacement

Preliminary Procedure	
Remove the front side door trim panel. Refer to Front Side Door Trim Panel Replacement .	
1	Front Side Door Trim Panel Applique Screw (Qty: 2) CAUTION: Refer to Fastener Caution . Tighten 2 N.m (18 lb in)
2	Front Side Door Trim Panel Applique Assembly

REAR SIDE DOOR TRIM PANEL REPLACEMENT

Fig. 5: Rear Side Door Trim Panel

Courtesy of GENERAL MOTORS COMPANY

Rear Side Door Trim Panel Replacement

Callout	Component Name
Preliminary Procedure Remove the rear side door upper rear trim panel. Refer to <u>Rear Side Door Upper Rear Trim Panel Replacement</u> .	
1	Rear Side Door Pull Handle Screw CAUTION: Refer to <u>Fastener Caution</u> . Tighten 2 (18 lb in)
2	Rear Side Door Trim Clip (Qty: 9)
3	Rear Side Door Trim Assembly Procedure Disconnect the electrical connectors.

REAR SIDE DOOR UPPER REAR TRIM PANEL REPLACEMENT

Fig. 6: Rear Side Door Upper Rear Trim Panel
 Courtesy of GENERAL MOTORS COMPANY

Rear Side Door Upper Rear Trim Panel Replacement

Callout	Component Name
1	Rear Side Door Upper Rear Trim Panel Clip (Qty: 2)
2	Rear Side Door Upper Rear Trim Panel Assembly
Procedure Pull the door upper rear trim panel away from the rear side door.	

REAR SEAT CUP HOLDER REPLACEMENT

Fig. 7: Rear Seat Cup Holder
 Courtesy of GENERAL MOTORS COMPANY

Rear Seat Cup Holder Replacement

Callout	Component Name
1	Rear Seat Cup Holder Procedure 1. Using flat-bladed tool, pull the rear portion of the rear seat cup holder up. 2. Remove the cup holder following the arrow.

FRONT SIDE DOOR SILL TRIM PLATE REPLACEMENT

Fig. 8: Front Side Door Sill Trim Plate
 Courtesy of GENERAL MOTORS COMPANY

Front Side Door Sill Trim Plate Replacement

Callout	Component Name
1	Front Side Door Sill Trim Plate Retainer (Qty: 1)
2	Front Side Door Sill Trim Plate Push Pin Clip (Qty: 1)
3	Front Side Door Sill Trim Plate Clip (Qty: 3)
4	Front Side Door Sill Trim Plate

REAR SIDE DOOR SILL TRIM PLATE REPLACEMENT

Fig. 9: Rear Side Door Sill Trim Plate Assembly
 Courtesy of GENERAL MOTORS COMPANY

Rear Side Door Sill Trim Plate Replacement

Callout	Component Name
Preliminary Procedure Remove the rear seat cushion. Refer to <u>Rear Seat Cushion Removal and Installation</u> .	
1	Rear Side Door Sill Trim Plate Push Clip (Qty: 1)
2	Rear Side Door Sill Trim Plate Screw (Qty: 1) CAUTION: Refer to <u>Fastener Caution</u> . Tighten 2 N.m (18 lb in)
3	Rear Side Door Sill Trim Plate Clip (Qty: 1)
4	Rear Side Door Sill Trim Plate Assembly

ASSIST HANDLE REPLACEMENT

Fig. 10: Assist Handle Assembly
 Courtesy of GENERAL MOTORS COMPANY

Assist Handle Replacement

Callout	Component Name
1	Assist Handle Bolt Cover
2	Assist Handle Bolt (Qty: 2) CAUTION: Refer to <u>Fastener Caution</u> . Tighten 5 N.m (44 lb in)
3	Assist Handle Assembly

SUNSHADE REPLACEMENT

Fig. 11: Sunshade Assembly
 Courtesy of GENERAL MOTORS COMPANY

Sunshade Replacement

Callout	Component Name
1	Sunshade Support Screw Cover
2	Sunshade Support Screw (Qty: 1) CAUTION: Refer to <u>Fastener Caution</u> Tighten 2 N.m (18 lb in)
3	Sunshade Support
4	Sunshade Screw (Qty: 2) Tighten 2 N.m (18 lb in)
5	Sunshade Assembly

WINDSHIELD GARNISH MOLDING REPLACEMENT

Fig. 12: Windshield Garnish Molding
 Courtesy of GENERAL MOTORS COMPANY

Windshield Garnish Molding Replacement

Callout	Component Name
Preliminary Procedure Disable the SIR system. Refer to <u>SIR Disabling and Enabling</u> .	
1	Windshield Garnish Molding Clip (Qty: 1) Procedure 1. Tabs must be installed prior to retainers. 2. Tabs to be fully seated in the instrument panel (I/P) trim panel retainer and valance panel. 3. Disconnect the electrical connectors. 4. Ensure the tether is reattached when installed.
2	Windshield Garnish Molding

CENTER PILLAR UPPER TRIM PANEL REPLACEMENT

Fig. 13: Center Pillar Upper Trim Panel
 Courtesy of GENERAL MOTORS COMPANY

Center Pillar Upper Trim Panel Replacement

Callout	Component Name
Preliminary Procedures 1. Remove the center pillar lower trim panel. Refer to <u>Center Pillar Lower Trim Panel Replacement</u>. 2. Remove the front seat belt lower anchor bolt. Refer to <u>Driver or Passenger Seat Retractor Side Belt Replacement</u>.	
1	Center Pillar Upper Trim Panel Screw (Qty: 1) CAUTION: Refer to <u>Fastener Caution</u>. Tighten 2 (18 lb in)
2	Center Pillar Upper Trim Panel Clip (Qty: 1)
3	Center Pillar Upper Trim Panel Assembly Procedure When replacing the center pillar upper trim panel, remove the seat belt through the panel.

CENTER PILLAR LOWER TRIM PANEL REPLACEMENT

Fig. 14: Center Pillar Lower Trim Panel
Courtesy of GENERAL MOTORS COMPANY

Center Pillar Lower Trim Panel Replacement

Callout	Component Name
Preliminary Procedure	
1. Remove the front side door sill trim plate. Refer to <u>Front Side Door Sill Trim Plate Replacement.</u>	
2. Remove the rear side door sill trim plate. Refer to <u>Rear Side Door Sill Trim Plate Replacement.</u>	
1	Center Pillar Lower Trim Panel Assembly

QUARTER WINDOW GARNISH MOLDING REPLACEMENT

Fig. 15: Quarter Window Garnish Molding
 Courtesy of GENERAL MOTORS COMPANY

Quarter Window Garnish Molding Replacement

Callout	Component Name
Preliminary Procedure	
Remove the quarter lower rear trim panel. Refer to <u>Quarter Lower Rear Trim Panel Replacement</u> .	
1	Quarter Window Garnish Molding Screw (Qty: 1) CAUTION: Refer to <u>Fastener Caution</u> . Tighten 2 N.m (18 lb in)
2	Quarter Window Garnish Molding Clip (Qty: 4)
3	Quarter Window Garnish Molding Assembly

QUARTER LOWER REAR TRIM PANEL REPLACEMENT

Fig. 16: Quarter Lower Rear Trim Panel
 Courtesy of GENERAL MOTORS COMPANY

Quarter Lower Rear Trim Panel Replacement

Callout	Component Name
Preliminary Procedure Remove the rear wheel house trim finish panel. Refer to <u>Rear Wheelhouse Trim Finish Panel Replacement</u> .	
1	Quarter Lower Rear Trim Panel Screw (Qty: 3) CAUTION: Refer to <u>Fastener Caution</u> . Tighten 2 N.m (18 lb in)
2	Quarter Lower Rear Trim Panel TIP: If necessary, disconnect the speaker electric wiring connector.

REAR WHEELHOUSE TRIM FINISH PANEL REPLACEMENT

Fig. 17: Rear Wheelhouse Trim Finish Panel Assembly
 Courtesy of GENERAL MOTORS COMPANY

Rear Wheelhouse Trim Finish Panel Replacement

Callout	Component Name
Preliminary Procedures 1. Remove the rear side door sill trim plate. Refer to <u>Rear Side Door Sill Trim Plate Replacement</u>. 2. Remove the rear seat back. Refer to <u>Rear Seat Back Cushion Removal and Installation</u>. 3. Remove the rear seat belt lower bolt. Refer to <u>Shoulder Belt Replacement - Rear</u>.	
1	Rear Wheel House Trim Finish Panel Screw (Qty: 2) CAUTION: Refer to <u>Fastener Caution</u> . Tighten 2 N.m (18 lb in)
2	Rear Wheelhouse Trim Finish Panel Clip (Qty: 2)
3	Rear Wheelhouse Trim Finish Panel Assembly

REAR COMPARTMENT STOWAGE SHELF REPLACEMENT

Fig. 18: Rear Compartment Stowage Shelf
Courtesy of GENERAL MOTORS COMPANY

Rear Compartment Stowage Shelf Replacement

Callout	Component Name
1	Rear Compartment Stowage Shelf Procedure Detach rear compartment stowage shelf from upper supports.

LIFTGATE TRIM PANEL REPLACEMENT

Fig. 19: Liftgate Trim Panel Assembly
 Courtesy of GENERAL MOTORS COMPANY

Liftgate Trim Panel Replacement

Callout	Component Name
1	Liftgate Trim Panel Screw (Qty: 1) CAUTION: Refer to <u>Fastener Caution</u> . Tighten 2 N.m (18 lb in)
2	Liftgate Trim Panel Clip (Qty: 8)
3	Liftgate Trim Panel Assembly (Qty: 9)

Low Reference	-	B3101 00	-	-

Circuit/System Description

The body control module communicates with the remote control door lock receiver through the keyless entry serial data circuits. When any button on the keyless entry transmitter is pressed, the transmitter sends a signal to the remote control door lock receiver. The remote control door lock receiver sends a function request to the body control module, depending on which button is pressed on the transmitter. The body control module receives the message and performs the appropriate function.

Conditions for Running the DTC

The body control module monitors for this DTC at all times.

Conditions for Setting the DTC

No response is received from the remote control door lock receiver after the body control module requests information from or sends configuration commands to the remote control door lock receiver.

Action Taken When the DTC Sets

In the case of power loss, the remote control door lock receiver is disabled for 65 s. Otherwise no action is taken.

Conditions for Clearing the DTC

- A current DTC will clear when the fault is no longer present.
- A history DTC will clear after 40 consecutive ignition cycles without a fault present.

Scan Tool Reference

Control Module References for scan tool information

Circuit/System Testing

1. Ignition OFF and all vehicle systems OFF, scan tool disconnected, disconnect the harness connector at the K77 Remote Control Door Lock Receiver. It may take up to 2 min for all vehicle systems to power down.
2. Test for less than 30 ohms between the low reference circuit terminal 1 and ground.
 - **If 30 ohms or greater**
 1. Ignition OFF, disconnect the harness connector at the K9 Body Control Module.
 2. Test for less than 2 ohms in the low reference circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, replace the K9 Body Control Module.
 - **If less than 30 ohms**
3. Ignition ON.
4. Test for greater than 11.5 V between the B+ circuit terminal 4 and ground.
 - **If 11.5 V or less**
 1. Ignition OFF, disconnect the harness connector at the K9 Body Control Module.
 2. Test for infinite resistance between the B+ circuit and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If Infinite resistance.
 3. Test for less than 2 ohms in the B+ circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, replace the K9 Body Control Module.
 - **If greater than 11.5 V**
5. Test for 1-6 V between the serial data circuit terminal 2 and ground.
 - **If less than 1 V**
 1. Ignition OFF, disconnect the harness connector at the K9 Body Control Module.
 2. Test for infinite resistance between the serial data circuit and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance
 3. Test for less than 2 ohms in the serial data circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, replace the K9 Body Control Module.
 - **If greater than 6 V**
 1. Ignition OFF, disconnect the harness connector at the K9 Body Control Module, ignition ON.
 2. Test for less than 1 V between the serial data circuit and ground.
 - If 1 V or greater, repair the short to voltage on the circuit.
 - If less than 1 V, replace the K9 Body Control Module.

- **If between 3-6 V**

6. Ignition OFF, disconnect the X1 and X2 harness connectors at the K9 Body Control Module, ignition ON.
7. Test for less than 1 V between the K9 Body Control Module serial data circuit terminal 26 X1 and ground.

- **If 1 V or greater**

Repair the short to voltage on the circuit.

- **If less than 1 V**

8. Ignition OFF.
9. Test for infinite resistance between the K9 Body Control Module serial data circuit terminal 26 X1 and ground.

- **If less than infinite resistance**

Repair the short to ground on the circuit.

- **If infinite resistance**

10. Test for less than 2 ohms between the K9 Body Control Module serial data circuit terminal 26 X1 and the K77 Remote Control Door Lock Receiver serial data circuit terminal 3.

- **If 2 ohms or greater**

Repair the open/high resistance in the circuit.

- **If less than 2 ohms**

11. Replace the K77 Remote Control Door Lock Receiver.
12. Verify DTC B3101 does not set while operating the vehicle under the conditions for running the DTC.

- **If the DTC sets**

Replace the K9 Body Control Module

- **If the DTC does not set**

13. All OK.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

Control Module References for body control module or remote control door lock receiver replacement, programming, and setup.

DTC B3105: KEYLESS ENTRY TRANSMITTERS

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

DTC Descriptor

DTC B3105

Keyless Entry Transmitters

For symptom byte information, refer to **Symptom Byte List** .

Circuit/System Description

The body control module monitors the number of keyless entry transmitters programmed. Until at least one transmitter is programmed, the body control module determines a malfunction condition exists.

Conditions for Running the DTC

The body control module has been set up without transmitters being programmed.

Conditions for Setting the DTC

No keyless entry transmitter programmed to the body control module.

Action Taken When the DTC Sets

The keyless entry system is inoperative.

Conditions for Clearing the DTC

A current DTC is cleared when at least one transmitter has been programmed to the body control module.

Circuit/System Verification

1. Verify that the transmitter is a correct transmitter for the vehicle. This can be accomplished by comparing the part number printed on the transmitter to the appropriate part number in the parts catalog.
 - **If the transmitter is incorrect**

Replace the transmitter.
 - **If the transmitter is correct**
2. Program the transmitter. Refer to **Key with Integrated Transmitter Programming**.
3. Verify the transmitter has successfully completed the programming procedure.
 - **If the transmitter does not program successfully**

Replace the transmitter.
 - **If the transmitter programs successfully**
4. All OK.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

DTC Descriptor

DTC B3106

Keyless Entry Data Link

For symptom byte information, refer to **Symptom Byte List** .

Circuit/System Description

The body control module communicates with the remote control door lock receiver through the keyless entry serial data circuits. When any button on the keyless entry transmitter is pressed, the transmitter sends a signal to the remote control door lock receiver. The remote control door lock receiver sends a function request to the body control module, depending on which button is pressed on the transmitter. The body control module receives the message and performs the appropriate function.

Conditions for Running the DTC

A keyless transmitter button is pressed.

Conditions for Setting the DTC

The transmitter that is sending a signal to the remote control door lock receiver is different from those transmitters stored in the body control module.

Action Taken When the DTC Sets

No action is taken.

Conditions for Clearing the DTC

- A current DTC will clear when the fault is no longer present and the ignition switch is cycled.
- A history DTC will clear after 40 consecutive ignition cycles without a fault present.

Keyless Entry Transmitter 3 Battery

DTC B3112

Keyless Entry Transmitter 4 Battery

DTC B3113

Keyless Entry Transmitter 5 Battery

For symptom byte information, refer to **Symptom Byte List** .

Circuit/System Description

With each press of a keyless entry transmitter button, a message containing the current battery state of the transmitter is sent to the remote control door lock receiver, along with the commanded keyless entry function. The remote control door lock receiver sends this to the body control module to perform the requested function.

Conditions for Running the DTC

A keyless transmitter button is pressed.

Conditions for Setting the DTC

Three consecutive low battery signals are received from the same transmitter.

Action Taken When the DTC Sets

The keyless entry system is inoperative.

Conditions for Clearing the DTC

The DTC is cleared when a normal transmitter voltage signal is received from the transmitter that set the DTC.

1. Verify none of the DTCs listed below are set:
 - DTC B310D
 - DTC B310E
 - DTC B310F
 - **If any of the DTCs are set**
 1. Replace the battery in the appropriate keyless entry transmitter and operate the transmitter three consecutive times.
 2. Verify the DTC does not set.
 - If the DTC sets, replace the keyless entry transmitter.
 - If the DTC does not set
 3. All OK.
 - **If none of the DTCs are set**
2. All OK.

SYMPTOMS - REMOTE FUNCTIONS

IMPORTANT: The following steps must be completed before using the symptom tables.

1. Perform **Diagnostic System Check - Vehicle** before using the Symptom Tables in order to verify that all of the following are true:
 - There are no DTCs set.
 - The control modules can communicate via the serial data link.
2. Review the system operation in order to familiarize yourself with the system functions. Refer to **Keyless Entry System Description and Operation**.

Visual/Physical Inspection

- Inspect for aftermarket devices which could affect the operation of the Keyless Entry System. Refer to **Checking Aftermarket Accessories**.
- Inspect the easily accessible or visible system components for obvious damage or conditions which could cause the symptom.

Intermittent

Faulty electrical connections or wiring may be the cause of intermittent conditions. Refer to **Testing for Intermittent Conditions and Poor Connections** .

Symptom List

Refer to a symptom diagnostic procedure from the following list in order to diagnose the symptom:

Keyless Entry System Malfunction

KEYLESS ENTRY SYSTEM MALFUNCTION

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

Circuit/System Description

The keyless entry transmitter is part of the vehicle key. The keyless entry system will unlock the vehicle doors or open/unlock the rear compartment when a corresponding button on the keyless entry transmitter is pressed. This is accomplished by the keyless entry transmitter sending a radio frequency to the remote control door lock receiver, which then sends the signal to the body control module (BCM). The BCM interprets the signal and activates the requested function. A low transmitter battery or radio frequency (RF) interference from aftermarket devices such as 2-way radios, power inverters, cellular phone chargers, computers, etc. may cause a system malfunction. High RF traffic areas, such as gas stations which use pay-at-the-pump RF transponders, may also cause interference that could lead to a malfunction.

Diagnostic Aids

- Unwanted or inadvertent door lock/unlock activation may be requested by the OnStar® Remote Link app. It is possible that a customer may be unaware of account usage, result in an unwanted or phantom door lock/unlock. If normal system diagnosis does results in an inability to verify the customer's concern, contact Technical Assistance Center (TAC).
- If available, the EL 43241 Keyless Entry Tester may be used to diagnose a low transmitter battery or a malfunctioning transmitter. To test, place the transmitter on the test pad of the EL 43241 and press each transmitter button one at a time, holding each button for three seconds. If the green light on the tester does not illuminate and a tone does not sound, first replace the transmitter battery and retest. If the malfunction continues after replacing the transmitter battery, replace the transmitter.
- When using the EL 43241 Keyless Entry Tester, first inspect the keyless entry transmitter part number to determine that it is the correct model for the vehicle. An incorrect part number transmitter may pass the test, but it will not activate the keyless entry system.
- When the vehicle key is in the ignition, the keyless entry functions are disabled from all keyless entry transmitters.

Circuit/System Verification

1. Verify that the vehicle key is correct for the vehicle. This can be accomplished by comparing the part number printed on the key to the appropriate part number in the parts catalog.
 - **If the vehicle key is incorrect**

Replace the vehicle key.
 - **If the vehicle key is correct**
2. Operate the transmitter while observing the scan tool Key Fob Function parameter for the appropriate transmitter.
3. Verify the scan tool Key Fob Function parameter corresponds with the function selected on the transmitter.
 - **If the Key Fob Function parameter does not correspond with the transmitter selection**

NOTE: Before replacing the transmitter, inspect the transmitter battery

contacts for any corrosion or damage. If no corrosion or damage is found, replace the transmitter battery and retest before replacing the transmitter.

1. Replace the vehicle key.
2. Operate the new transmitter while observing the scan tool Key Fob Function parameter for the transmitter.
3. Verify the scan tool Key Fob Function parameter correspond with the function selected on the transmitter.
 - If the Key Fob Function parameter does not correspond with the transmitter selection, replace the K9 Body Control Module
 - If the Key Fob Function parameter corresponds with the transmitter selection
4. All OK.
 - **If the Key Fob Function parameter corresponds with the transmitter selection**
4. All OK.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

- **Key with Integrated Transmitter Programming**
- **Control Module References** for body control module replacement, programming, and setup

REPAIR INSTRUCTIONS

REMOTE CONTROL DOOR LOCK RECEIVER REPLACEMENT

Fig. 2: Remote Control Door Lock Receiver
 Courtesy of GENERAL MOTORS COMPANY

Remote Control Door Lock Receiver Replacement

Callout	Component Name
Preliminary Procedures 1. Remove the instrument panel compartment. Refer to <u>Instrument Panel Compartment Replacement</u> . 2. Remove the radio. Refer to <u>Radio Replacement</u> .	
1	Remote Control Door Lock Receiver Nut (Qty: 2) CAUTION: Refer to <u>Fastener Caution</u> . Tighten 8 (71 lb in)
2	Remote Control Door Lock Receiver Procedure 1. Disconnect the electrical connector. 2. Remove the remote control door lock receiver and bracket assembly. 3. Remove the remote control door lock receiver from the bracket.

DESCRIPTION AND OPERATION

KEYLESS ENTRY SYSTEM DESCRIPTION AND OPERATION

The keyless entry system is a vehicle entry device. The keyless entry system is used in conjunction with the door locks to unlock the vehicle. Keyless entry will lock/unlock the vehicle doors or open the rear compartment lid when a corresponding button on the keyless entry transmitter is pressed. This is accomplished by the transmitter sending a radio frequency to the remote control door lock receiver antenna that has a direct link to the body control module (BCM). The BCM interprets the signal and activates the requested function or request the appropriate control module to activate the function via a serial data message. A low transmitter battery or radio frequency interference from aftermarket devices, such as 2-way radios, power inverters, computers, etc., may cause a system malfunction. High radio frequency traffic areas, such as gas stations that use pay-at-the-pump radio frequency transponders, may also cause interference that could lead to a malfunction. Keyless entry allows you to operate the following features:

- Door lock/unlock
- Liftgate lock/unlock, if equipped
- Trunk release, if equipped
- Power liftgate, if equipped
- Panic alarm/vehicle locator
- Remote vehicle starting, if equipped

The keyless entry system has the following components:

- Keyless entry transmitters
- Body control module
- Remote control door lock receiver

Keyless Entry Transmitters

NOTE: When the vehicle key is in the ignition, keyless entry functions from all keyless entry transmitter are disabled.

The keyless entry transmitters are used to perform various entry functions while away from the immediate area of the vehicle. Keyless entry functions may work at up to 20 m (65 ft) away from the vehicle. Ambient conditions may affect the performance of the keyless entry transmitter and reduce the range at which keyless entry functions operate. Up to eight transmitters may be programmed to a single vehicle. The keyless entry transmitter is an integral part of the vehicle key.

OnStar® Remote Link (if equipped)

A vehicle operator may have the ability to perform some of the keyless entry functions using applications on personal devices such as a smart phone. Unwanted or inadvertent door lock/unlock activation may be requested by the OnStar® Remote Link application. It is possible that a customer may be unaware of account usage, resulting in an unwanted or phantom door lock/unlock. If normal system diagnosis results in an inability to

verify the customer's concern, contact Technical Assistance Center (TAC).

Body Control Module (BCM)

The BCM is a multifunction module that operates the keyless entry system. When a radio frequency message is received from a keyless entry transmitter, the BCM interprets this signal and performs the specific function, i.e. door lock, door unlock, or vehicle locate.

Remote Control Door Lock Receiver

The remote control door lock receiver acts as an antenna for the keyless entry system and communicates with the BCM through a dedicated serial data link. When a button is pressed on a keyless entry transmitter, the remote control door lock receiver receives this signal and sends the request to the BCM. The BCM interprets the signal and performs the specific function, i.e. door lock, door unlock, or vehicle locate.

Unlock Doors

Momentarily press the transmitter UNLOCK button in order to perform the following functions:

- Unlock only the driver door or all doors and liftgate (if equipped); this is customized through the driver information center.
- Illuminate the interior lamps for a determined length of time or until the ignition is turned ON.
- Flash the exterior lights; this is customized through the driver information center.
- Disarm the content theft deterrent system, if equipped.
- Deactivate the content theft deterrent system when in the alarm mode.

Lock All Doors

Press the transmitter LOCK button to perform the following functions:

- Lock all vehicle doors.
- Immediately turn OFF the interior lamps.
- Flash the exterior lights and/or sound the horn; this is customized through the driver information center.
- Arm the content theft deterrent system.

Trunk Release, if equipped

Press the trunk release button on the transmitter to open the trunk.

Power Liftgate, if equipped

Press and hold the power liftgate button to perform the following functions:

- Open or close the liftgate using the power liftgate function.
- Flash the tail lamps.
- Sound the interior power liftgate chime.

Vehicle Locator/Panic Alarm

A single press of the panic button performs the following functions. Some functions may be dependent on personalization settings:

- Pulse the horn three times.
- Flash the exterior lamps three times.

A press and hold of the panic button performs the following functions:

- Illuminate the interior lamps.
- Pulse the horn and flash the exterior lamps for 30 seconds or until the following conditions occur:
 - The panic button is pressed.
 - The ignition switch is turned to the RUN position with a valid key.

Remote Vehicle Start, if equipped

The remote vehicle start function allows engine starting while not in the vehicle. It also allows the vehicle HVAC system and other vehicle systems to enable, providing a comfortable vehicle upon entry. The remote vehicle start sequence begins by pressing and releasing the lock button and then pressing and holding the remote vehicle start buttons on the keyless entry transmitter. The turn signal lamps will illuminate to indicate the vehicle has received the remote start request. Each time a remote vehicle start is performed, the vehicle doors are locked, however they may then be unlocked/locked with the transmitter at any time. Only the first and second vehicle transmitters are able to control the remote vehicle start function. Any additional remote transmitters programmed to the vehicle will perform all other remote functions. Once activated, the engine is allowed to run for 10 minutes. The remote vehicle start time may be extended by an additional 10 minutes by again pressing and releasing the lock button and then pressing and holding the remote vehicle start buttons on the transmitter. This feature is called a remote vehicle start continue and allows a maximum of 20 minutes of engine running. If the remote vehicle start continue is performed at 7 minutes into the initial 10 minute time-out, a total of 17 minutes of engine running would occur. The remote vehicle start event may be suspended at any time by pressing only the remote vehicle start button on the transmitter or by entering the vehicle and turning ON the hazard lamps.

In between ignition cycles, only two remote vehicle start events may occur or be attempted. Once two events or attempts have been made, future remote vehicle start events will be suspended until the vehicle is started using the ignition.

Enable/Disable Remote Vehicle Start

Using the driver information center, remote vehicle start may be enabled or disabled as a part of vehicle personalization. Refer to the vehicle owners manual for more information.

Hood Ajar Switch

The hood switch provides status of the hood to the BCM for remote vehicle start purposes. The switch is integrated into the hood latch assembly.

Remote Vehicle Start Circuit Description

The BCM receives a signal from the keyless entry transmitter indicating a remote vehicle start request. A message is then sent to the BCM which determines if a crank request message will be sent to the ECM to allow engine starting. To determine if conditions are correct for a remote vehicle start event, the BCM will ensure the following conditions are met:

- A valid hood ajar switch closed signal is present.
- The doors are locked.
- The low fuel warning light is off.
- The hazard switch is OFF.
- The vehicle power mode is correct.
- No content theft deterrent alarm triggers are present.

When the BCM determines all conditions meet those required for a remote vehicle start event, a message is sent via serial data to the ECM. The ECM relies on the remote vehicle start message from the BCM to enable remote vehicle start when the crank request signal is received. If the ECM does not receive a valid remote vehicle start message, it will not attempt to start the engine. While the ECM is in remote vehicle start mode it will suspend engine operation if any of the following additional conditions occur:

- Vehicle speed is greater than 0
- Transmission is not in PARK
- Excessive engine coolant temperature
- Low oil pressure
- The malfunction indicator lamp (MIL) is commanded ON
- Engine crank time is greater than 30 seconds
- Excessive engine speed
- Accelerator pedal position too high
- Remote start timer equals 0
- Immobilizer system indicates tamper

Keyless Entry Personalization

Vehicle lock/unlock functions and remote vehicle start settings may be personalized. For functional descriptions and personalization instructions, refer to the vehicle owners manual.

1. Interior Backlighting Malfunction				

Circuit/System Description

The instrument panel dimmer switch is used to increase and decrease the brightness of the interior backlighting components. The instrument panel dimmer switch provides a voltage signal to the body control module (BCM) that will increase as the brightness of the lights are increased and decrease as the brightness of the lights are decreased. The BCM provides B+, low reference, and signal circuits to the instrument panel dimmer switch. When the instrument panel dimmer switch is placed in the desired position, the dimmed voltage setting is applied from the instrument panel dimmer switch through the instrument panel dimmer switch signal circuit to the BCM. The BCM interprets the signal and applies a pulse width modulated (PWM) voltage through the LED dimming 1 and dimming 2 control circuits illuminating the interior backlighting to the requested level of brightness.

Conditions for Running the DTC

- Battery voltage must be between 9-16 V.
- Park Lamps ON.

Conditions for Setting the DTC

DTC B1395 03

- The BCM detects a short to ground in the instrument panel dimmer switch B+ reference circuit.
- The BCM detects a short to ground in the instrument panel dimmer switch signal circuit.
- The BCM detects a short to ground or an open/high resistance in the F1DA (BCM 1) fuse B+ circuit.

DTC B1395 07

The BCM detects a short to voltage in the instrument panel dimmer switch B+ reference circuit.

Actions Taken When the DTC Sets

The BCM will not dim any interior backlighting. All interior backlighting will default to maximum brightness.

Conditions for Clearing the DTC

- The condition responsible for setting the DTC no longer exists.
- A history DTC will clear once 100 consecutive malfunction-free ignition cycles have occurred.

Circuit/System Testing

1. Ignition OFF, disconnect the harness connector at the S36 Instrument Panel Dimmer Switch, ignition ON.
2. Verify a test lamp illuminates between the low reference circuit terminal 2 and B+.
 - **If the test lamp does not illuminate**
 1. Ignition OFF, disconnect the X1 harness connector at the K9 Body Control Module, ignition ON.
 2. Test for less than 1 V between the low reference circuit terminal 2 and ground.
 - If 1 V or greater, repair the short to voltage on the circuit.
 - If less than 1 V
 3. Test for less than 2 ohms in the low reference circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, replace the K9 Body Control Module.
 - **If the test lamp illuminates**
3. Test for B+ between the B+ reference circuit terminal 1 and ground.
 - **If less than B+**
 1. Ignition OFF, disconnect the X1 harness connector at the K9 Body Control Module.
 2. Test for infinite resistance between the B+ reference circuit and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.

- If infinite resistance
- 3. Test for less than 2 ohms in the B+ reference circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, replace the K9 Body Control Module.
- **If B+**
- 4. Verify a test lamp does not illuminate between the B+ reference circuit terminal 1 and ground.
 - **If the test lamp illuminates**
 1. Ignition OFF, disconnect the X1 harness connector at the K9 Body Control Module, ignition ON.
 2. Test for less than 1 V between the B+ reference circuit terminal 2 and ground.
 - If 1 V or greater, repair the short to voltage on the circuit.
 - If less than 1 V, replace the K9 Body Control Module.
 - **If the test lamp does not illuminate**
- 5. Park lamps ON, verify a test lamp does not illuminate between the signal circuit terminal 3 and ground.
 - **If the test lamp illuminates**
 1. Ignition OFF, disconnect the X2 harness connector at the K9 Body Control Module, ignition ON.
 2. Test for less than 1 V between the signal circuit terminal 3 and ground.
 - If 1 V or greater, repair the short to voltage on the circuit.
 - If less than 1 V, replace the K9 Body Control Module.
 - **If the test lamp does not illuminate**
- 6. Ignition ON, park lamps OFF, test for between 57.4 K ohms and 58 K ohms between the signal circuit terminal 3 and ground.
 - **If not between 57.4 K ohms and 58 K ohms**
 1. Ignition OFF, disconnect the X2 harness connector at the K9 Body Control Module.
 2. Test for infinite resistance between the signal circuit and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance
 3. Test for less than 2 ohms in the signal circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, replace the K9 Body Control Module.
 - **If between 57.4 K ohms and 58 K ohms**
- 7. Test or replace the S36 Instrument Panel Dimmer Switch.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

Reading Lamps Control	B1480 02	1	1	-
Dome Lamp Ground	-	1, 2	-	-
1. Courtesy Lamps Malfunction 2. Dome Lamps Malfunction				

Circuit/System Description

The body control module (BCM) supplies battery voltage to the reading lamps via the courtesy lamp control circuit. The front reading lamps controlled by an individual switch that is activated by the operator when additional cabin lighting is required. In the event that the reading lamp were to remain illuminated for more than 10 min with the ignition switch in the OFF position the BCM will deactivate the reading lamp control circuit to prevent total battery discharge.

Conditions for Running the DTC

Battery voltage must be between 9-16 V.

Conditions for Setting the DTC

The BCM detects a short to ground in the reading lamp control circuit.

Actions Taken When the DTC Sets

The BCM will disable the circuit and the reading lamp will be inoperative.

Conditions for Clearing the DTC

- The condition responsible for setting the DTC no longer exists.

- A history DTC will clear once 100 consecutive malfunction-free ignition cycles have occurred.

Circuit/System Testing

1. Ignition OFF, exterior lamps OFF, disconnect the harness connectors at the E36AH Dome Lamp.
2. Connect a test lamp between the appropriate control circuit terminal listed below and ground.
 - E36AH Dome Lamp - terminal 1 (with UE1)
 - E36AH Dome Lamp - terminal 4 (without UE1)
3. Verify the test lamp turns ON and OFF when commanding the Inadvertent Load ON and OFF with a scan tool.
 - **If the test lamp is always OFF**
 1. Ignition OFF, disconnect the X7 harness connector at the K9 Body Control Module.
 2. Test for infinite resistance between the control circuit and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance
 3. Test for less than 2 ohms in the control circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.

- If less than 2 ohms, replace the K9 Body Control Module.
- **If the test lamp is always ON**
 1. Ignition OFF, disconnect the X7 harness connector at the K9 Body Control Module, ignition ON.
 2. Test for less than 1 V between the control circuit terminal and ground.
 - If 1 V or greater, repair the short to voltage on the circuit.
 - If less than 1 V, replace the K9 body control module.
- **If the test lamp turns ON and OFF**
- 4. Test or replace the E36AH Dome Lamp.

Front Fog Lamp Ground - Left	-	1	-	-
Front Fog Lamp Ground - Right	-	1	-	-
Turn Signal/Multifunction Switch Ground	-	1	-	-
1. Front Fog Lamps Malfunction				

Circuit/System Description

The front fog lamp relay is supplied with battery voltage at all times. The front fog lamp switch signal circuit is grounded momentarily by pressing the front fog lamp switch. The body control module (BCM) energizes the front fog lamp relay by applying ground to the front fog lamp relay control circuit. When the front fog lamp relay is energized, the relay switch contacts close and battery voltage is applied through the front fog lamps fuse to the front fog lamp control circuit which illuminates the front fog lamps.

Conditions for Running the DTC

- Battery voltage must be between 9-16 V.
- Front fog lamps ON.

Conditions for Setting the DTC

DTC B2530 01

The BCM detects a short to voltage in the front fog lamp relay control circuit for 5 seconds or greater.

DTC B2530 02

The BCM detects a short to ground in the front fog lamp relay control circuit.

DTC B2530 04

The BCM detects an open in the front fog lamp relay control circuit.

Actions Taken When the DTC Sets

DTC B2530 01 and B2530 04

The front fog lamps will not operate when the park lamps are ON and the front fog lamp switch is active.

DTC B2530 02

The front fog lamps always ON.

Conditions for Clearing the DTC

- The condition responsible for setting the DTC no longer exists.
- A history DTC will clear once 100 consecutive malfunction-free ignition cycles have occurred.

Scan Tool Reference

Control Module References for scan tool information

Circuit/System Testing

1. Ignition OFF, disconnect the KR46 front fog lamp relay, ignition ON.
2. Verify a test lamp illuminates between the B+ circuit terminal 30 and ground.
 - **If the test lamp does not illuminate**

Replace the X50A fuse block - underhood.

- **If the test lamp illuminates**

3. Verify a test lamp illuminates between the B+ circuit terminal 86 and ground.
 - **If the test lamp does not illuminate**

Replace the X50A fuse block - underhood.

- **If the test lamp illuminates**

4. Ignition OFF, connect a test lamp between the control circuit terminal 85 and B+, ignition ON.
5. Verify the test lamp turns ON and OFF when commanding the Front Fog Lamps ON and OFF with a scan

tool.

- **If the test lamp is always OFF**

1. Ignition OFF, disconnect the X5 harness connector at the K9 body control module, ignition ON.
2. Test for less than 1 V between the control circuit terminal and ground.
 - If 1 V or greater, repair the short to voltage on the circuit.
 - If less than 1 V
3. Ignition OFF.
4. Test for less than 2 ohms in the control circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, replace the K9 body control module.

- **If the test lamp is always ON**

1. Ignition OFF, disconnect the X5 harness connector at the K9 body control module.
2. Test for infinite resistance between the control circuit terminal and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance, replace the K9 body control module.

- **If the test lamp turns ON and OFF**

6. Test or replace the KR46 front fog lamp relay.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

- **Relay Replacement (Within an Electrical Center)** , **Relay Replacement (Attached to Wire Harness)**
- **Fuse Block Replacement**
- **Control Module References** for BCM replacement, programming, and setup

DTC B2545: BACKUP LAMPS CIRCUIT

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

Backup Lamp Ground - Left	-	1	-	-
Backup Lamp Ground - Right	-	1	-	-
1. Backup Lamps Malfunction				

Circuit/System Description

Automatic Transmission

With the engine running and the transmission in the reverse position, the transmission control module (TCM) sends a serial data message to the body control module (BCM). The message indicates that the gear selector is in the reverse position. The BCM applies battery voltage to the backup lamps control circuit illuminating the backup lamps. Once the driver moves the gear selector out of the reverse position, a message is sent by the TCM via serial data requesting the BCM to remove battery voltage from the backup lamps control circuit. The engine must be running for the backup lamps to operate.

Manual Transmission

The engine control module (ECM) provides a signal circuit to the backup lamp switch which is permanently grounded. With the engine running and the transmission in the reverse position, the backup lamp switch signal circuit is pulled low and the ECM responds by sending a serial data message to the body control module (BCM). The message indicates that the gear selector is in the reverse position. The BCM applies battery voltage to the backup lamps control circuit illuminating the backup lamps. Once the driver moves the gear selector out of the reverse position, a message is sent by the ECM via serial data requesting the BCM to remove battery voltage from the backup lamps control circuit. The engine must be running for the backup lamps to operate.

Conditions for Running the DTC

- Battery voltage must be between 9-16 V.

- Engine RUNNING.
- Transmission placed in REVERSE gear.

Conditions for Setting the DTC

DTC B2545 01 and DTC B2545 04

- The BCM detects an open/high resistance in the backup lamps control circuit.
- The BCM detects a short to ground or an open/high resistance in the F6DA (BCM 6) fuse B+ circuit.

DTC B2545 02

The BCM detects a short to ground in the backup lamps control circuit.

Actions Taken When the DTC Sets

DTC B2545 02 and B2545 04

The backup lamps will not operate.

DTC B2545 01

The backup lamps are always ON.

Conditions for Clearing the DTC

- The condition responsible for setting the DTC no longer exists.
- A history DTC will clear once 100 consecutive malfunction-free ignition cycles have occurred.

Diagnostic Aids

When testing at the backup lamp bulb socket, make sure all measurements and test lamp connections are in the correct terminal location and do not come in contact with each other during testing.

Circuit/System Testing

1. Ignition OFF, disconnect the X5 harness connector at the K9 body control module, ignition ON.
2. Verify a test lamp illuminates between the B+ circuit terminal 4 and ground.
 - **If the test lamp does not illuminate and the circuit fuse is good**
 1. Ignition OFF.
 2. Test for less than 2 ohms in the B+ circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, verify the fuse is not open and there is voltage at the fuse.
 - **If the test lamp does not illuminate and the circuit fuse is open**
 1. Ignition OFF.
 2. Test for infinite resistance between the B+ circuit and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance, replace the K9 body control module.
 - **If the test lamp illuminates**
3. Ignition OFF, connect the X5 harness connector at the K9 body control module.
4. Ignition OFF, exterior lamps OFF, remove the appropriate E5 backup lamp bulb at the appropriate E42 tail lamp assembly. It may take up to 2 minutes for all vehicle systems to power down.
5. Test for less than 5 ohms between the ground circuit at the socket terminal and ground.
 - **If 5 ohms or greater**
 1. Ignition OFF.
 2. Test for less than 2 ohms in the ground circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, repair the open/high resistance in the ground connection.
 - **If less than 5 ohms**
6. Connect a test lamp between the control circuit at the socket terminal and ground, ignition ON.
7. Verify the test lamp turns ON and OFF when commanding the Backup Lamps ON and OFF with a scan tool.

- **If the test lamp is always OFF**

1. Ignition OFF, disconnect the X7 harness connector at the K9 body control module.
2. Test for infinite resistance between the control circuit and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance
3. Test for less than 2 ohms in the control circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, replace the K9 body control module.

- **If the test lamp is always ON**

1. Ignition OFF, disconnect the X7 harness connector at the K9 body control module, ignition ON.
2. Test for less than 1 V between the control circuit terminal and ground.
 - If 1 V or greater, repair the short to voltage on the circuit.
 - If less than 1 V, replace the K9 body control module.

- **If the test lamp turns ON and OFF**

8. Test or replace the appropriate E5 backup lamp.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

- **Tail Lamp Bulb Replacement**
- **Control Module References** for BCM replacement, programming, and setup

DTC B2570: TRUNK LAMP CONTROL CIRCUIT

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

DTC Descriptor

DTC B2570 02

Trunk Lamp Control Circuit Short to Ground

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Rear Compartment Courtesy Lamp Control	B2570 02	1	1	-

Rear Compartment Courtesy Lamp Ground	-	1	-	-
1. Rear Compartment Lamp Malfunction				

Circuit/System Description

The body control module (BCM) applies battery voltage to the rear compartment courtesy lamp through the rear compartment lamp control circuit. When the BCM receives a rear compartment lid open input from the rear compartment lid latch, the BCM applies battery voltage to the rear compartment lamp control circuit illuminating the rear compartment courtesy lamp. In the event that the rear compartment lamp were to remain illuminated for more than 10 minutes with the ignition switch in the OFF position and no doors opened, the BCM will deactivate the rear compartment lamp control circuit to prevent total battery discharge.

Conditions for Running the DTC

- Battery voltage must be between 9-16 V.
- Rear compartment OPEN.

Conditions for Setting the DTC

The BCM detects a short to ground on the rear compartment courtesy lamp control circuit.

Actions Taken When the DTC Sets

The rear compartment lamp is inoperative.

Conditions for Clearing the DTC

- The condition responsible for setting the DTC no longer exists.
- A history DTC will clear once 100 consecutive malfunction-free ignition cycles have occurred.

1. Headlamps Malfunction				

Circuit/System Description

With the headlamp switch in the ON position, the headlamp switch headlamp ON signal circuit is grounded through the headlamp switch. The body control module (BCM) responds by applying battery positive voltage to the left and right low beam headlamp control circuits illuminating the low beam headlamps.

Conditions for Running the DTC

- Battery voltage must be between 9-16 V.
- Low beam headlamps ON.

Conditions for Setting the DTC

DTC B2575 01 and B2575 04

- The BCM detects a short to voltage or an open/high resistance in the left low beam headlamp control circuit.
- The BCM detects a short to ground or an open/high resistance in the F4DA (BCM 4) fuse B+ circuit.

DTC B2575 02

The BCM detects a short to ground in the left low beam headlamp control circuit.

DTC B2699 01 and B2699 04

- The BCM detects a short to voltage or an open/high resistance in the right low beam headlamp control circuit.
- The BCM detects a short to ground or an open/high resistance in the F3DA (BCM 3) fuse B+ circuit.

DTC B2699 02

The BCM detects a short to ground in the right low beam headlamp control circuit.

Actions Taken When the DTC Sets

- When DTC B2575 sets, the left low beam headlamp will be inoperative.
- When DTC B2699 sets, the right low beam headlamp will be inoperative.

Conditions for Clearing the DTC

- The condition responsible for setting the DTC no longer exists.
- A history DTC will clear once 100 consecutive malfunction-free ignition cycles have occurred.

Circuit/System Testing

DTC B2575

1. Ignition OFF, disconnect the X1 harness connector at the K9 Body Control Module, ignition ON.
2. Verify a test lamp illuminates between the B+ circuit terminal 2 and ground.
 - **If the test lamp does not illuminate and the circuit fuse is good**
 1. Ignition OFF.
 2. Test for less than 2 ohms in the B+ circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, verify the fuse is not open and there is voltage at the fuse.
 - **If the test lamp does not illuminate and the circuit fuse is open**
 1. Ignition OFF.

2. Test for infinite resistance between the B+ circuit and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance, replace the K9 Body Control Module.
 - **If the test lamp illuminates**
3. Ignition OFF, connect the X1 harness connector at the K9 Body Control Module.
4. Ignition OFF, exterior lamps OFF, disconnect the harness connector at the E13L Headlamp - Left.
5. Test for less than 5 ohms between the appropriate ground circuit terminal listed below and ground.
 - E13L Headlamp - Left terminal 1 (with T90)
 - E13L Headlamp - Left terminal 2 (without T90)
 - **If 5 ohms or greater**
 1. Ignition OFF.
 2. Test for less than 2 ohms in the ground circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, repair the open/high resistance in the ground connection.
 - **If less than 5 ohms**
6. Connect a test lamp between the appropriate control circuit terminal listed below and ground, ignition ON.
 - E13L Headlamp - Left terminal 2 (with T90)
 - E13L Headlamp - Left terminal 1 (without T90)
7. Verify the test lamp turns ON and OFF when commanding the Left Low Beam/Daytime Running Lamp ON and OFF with a scan tool.
 - **If the test lamp is always OFF**
 1. Ignition OFF, disconnect the X4 harness connector at the K9 Body Control Module.
 2. Test for infinite resistance between the control circuit and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance
 3. Test for less than 2 ohms in the control circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, replace the K9 Body Control Module.
 - **If the test lamp is always ON**
 1. Ignition OFF, disconnect the X4 harness connector at the K9 Body Control Module, ignition ON.
 2. Test for less than 1 V between the control circuit terminal and ground.
 - If 1 V or greater, repair the short to voltage on the circuit.
 - If less than 1 V, replace the K9 Body Control Module.
 - **If the test lamp turns ON and OFF**
8. Test or replace the E13L Headlamp - Left.

DTC B2699

1. Ignition OFF, disconnect the X1 harness connector at the K9 Body Control Module, ignition ON.
2. Verify a test lamp illuminates between the B+ circuit terminal 3 and ground.
 - **If the test lamp does not illuminate and the circuit fuse is good**
 1. Ignition OFF.
 2. Test for less than 2 ohms in the B+ circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, verify the fuse is not open and there is voltage at the fuse.
 - **If the test lamp does not illuminate and the circuit fuse is open**
 1. Ignition OFF.
 2. Test for infinite resistance between the B+ circuit and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance, replace the K9 Body Control Module.
 - **If the test lamp illuminates**
3. Ignition OFF, connect the X1 harness connector at the K9 Body Control Module.
4. Ignition OFF, exterior lamps OFF, disconnect the harness connector at the E13R Headlamp - Right.
5. Test for less than 5 ohms between the appropriate ground circuit terminal listed below and ground.
 - E13R Headlamp - Right terminal 1 (with T90)
 - E13R Headlamp - Right terminal 2 (without T90)
 - **If 5 ohms or greater**
 1. Ignition OFF.
 2. Test for less than 2 ohms in the ground circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, repair the open/high resistance in the ground connection.
 - **If less than 5 ohms**
6. Connect a test lamp between the appropriate control circuit terminal listed below and ground, ignition ON.
 - E13R Headlamp - Right terminal 2 (with T90)
 - E13R Headlamp - Right terminal 1 (without T90)
7. Verify the test lamp turns ON and OFF when commanding the Right Low Beam/Daytime Running Lamp ON and OFF with a scan tool.
 - **If the test lamp is always OFF**
 1. Ignition OFF, disconnect the X4 harness connector at the K9 Body Control Module.
 2. Test for infinite resistance between the control circuit and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance
 3. Test for less than 2 ohms in the control circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, replace the K9 Body Control Module.

- **If the test lamp is always ON**

1. Ignition OFF, disconnect the X4 harness connector at the K9 Body Control Module, ignition ON.
2. Test for less than 1 V between the control circuit terminal and ground.
 - If 1 V or greater, repair the short to voltage on the circuit.
 - If less than 1 V, replace the K9 Body Control Module.

- **If the test lamp turns ON and OFF**

8. Test or replace the E13R Headlamp - Right.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

- **Control Module References** for BCM replacement, programming, and setup

DTC B257A: HEADLAMP SWITCH INPUT SIGNALS

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

DTC Descriptor

DTC B257A 00

Headlamp Switch Input Signals Correlation Malfunction

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Headlamp Switch Park Lamps ON Signal	2	B257A 00	2	-
Headlamp Switch Headlamps ON Signal	B257A 00	1	1	-
Turn Signal/Multifunction Switch Ground	-	1	-	-
1. Headlamps Malfunction 2. Park, License, and/or Tail Lamps Malfunction				

Circuit/System Description

For headlamp operation, the body control module (BCM) monitors two signal circuits from the headlamp switch. With the headlamp switch in the PARK LAMPS position, the headlamp switch park lamps ON signal circuit is grounded, indicating that the park lamps have been requested. When the headlamp switch is in the HEADLAMP position, both the headlamp switch park lamps ON signal circuit and the headlamp switch headlamps ON signal circuit are grounded. The BCM responds by commanding the park lamps and headlamps ON.

Conditions for Running the DTC

Battery voltage must be between 9-16 V.

Conditions for Setting the DTC

- The BCM detects an open/high resistance in the headlamp switch park lamps ON signal circuit.
- The BCM detects a short to ground in the headlamp switch headlamps ON signal circuit.

Actions Taken When the DTC Sets

- When DTC B257A 00 is present on the headlamp switch headlamps ON signal circuit, the low beam headlamps are always ON. The BCM disregards all headlamp switch inputs.
- When DTC B257A 00 is present on the headlamp switch park lamps ON signal circuit, the park lamps and low beam headlamps are inoperative in the PARK and HEAD positions.

Conditions for Clearing the DTC

- The condition responsible for setting the DTC no longer exists.
- A history DTC will clear once 100 consecutive malfunction-free ignition cycles have occurred.

Circuit/System Testing

1. Ignition OFF, all doors closed, all accessories OFF, disconnect the harness connector at the S78 turn signal/multifunction switch. It may take up to 2 minutes for all vehicle systems to power down.
2. Test for less than 15 ohms between the ground circuit terminal 1 and ground.
 - **If 15 ohms or greater**
 1. Ignition OFF.
 2. Test for less than 2 ohms in the ground circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, repair the open/high resistance in the ground connection.
 - **If less than 15 ohms**
3. Ignition ON.
4. Verify the scan tool Park Lamps Switch parameter is Inactive.
 - **If not Inactive**
 1. Ignition OFF, disconnect the X1 harness connector at the K9 body control module.
 2. Test for infinite resistance between the signal circuit terminal 2 and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance, replace the K9 body control module.
 - **If Inactive**
5. Install a 3 A fused jumper wire between the signal circuit terminal 2 and the ground circuit terminal 1.
6. Verify the scan tool Park Lamps Switch parameter is Active.
 - **If not Active**
 1. Ignition OFF, disconnect the X1 harness connector at the K9 body control module, ignition ON.
 2. Test for less than 1 V between the signal circuit terminal 2 and ground.
 - If 1 V or greater, repair the short to voltage on the circuit.
 - If less than 1 V
 3. Test for less than 2 ohms in the signal circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, replace the K9 body control module.
 - **If Active**
7. Verify the scan tool Headlamps On Switch parameter is Inactive.
 - **If not Inactive**
 1. Ignition OFF, disconnect the X1 harness connector at the K9 body control module.

2. Test for infinite resistance between the signal circuit terminal 3 and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance, replace the K9 body control module.
 - **If Inactive**
8. Install a 3 A fused jumper wire between the signal circuit terminal 3 and the ground circuit terminal 1.
9. Verify the scan tool Headlamps On Switch parameter is Active.
 - **If not Active**
 1. Ignition OFF, disconnect the X1 harness connector at the K9 body control module, ignition ON.
 2. Test for less than 1 V between the signal circuit terminal 3 and ground.
 - If 1 V or greater, repair the short to voltage on the circuit.
 - If less than 1 V
 3. Test for less than 2 ohms in the signal circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, replace the K9 body control module.
 - **If Active**
10. Test or replace the S78 turn signal/multifunction switch.

Headlamp Ground - Right	-	B2699 01, B2699 04	-	-
1. Headlamps Malfunction				

Circuit/System Description

The high beam and flash to pass functions are contained within the turn signal/multifunction switch. The BCM provides the turn signal/multifunction switch with two signal circuits, the high beam signal circuit and the flash to pass signal circuit. When the low beam headlamps are ON and the turn signal/multifunction switch is placed in the high beam position, ground is applied to the BCM through the high beam signal circuit. The BCM responds to the high beam request by applying ground to the high beam relay control circuit which energizes the high beam relay. With the high beam relay energized, the switch contacts close allowing battery voltage to flow through the high beam fuses to the high beam control circuits illuminating the high beam headlamps.

Conditions for Running the DTC

- Battery voltage must be between 9-16 V.
- High beam headlamps ON.

Conditions for Setting the DTC

DTC B2580 01

The BCM detects a short to voltage in the headlamp high beam relay control circuit.

DTC B2580 02

The BCM detects a short to ground in the headlamp high beam relay control circuit.

DTC B2580 04

The BCM detects an open in the headlamp high beam relay control circuit.

Actions Taken When the DTC Sets

The high beam headlamps and flash to pass will not operate.

Conditions for Clearing the DTC

- The condition responsible for setting the DTC no longer exists.
- A history DTC will clear once 100 consecutive malfunction-free ignition cycles have occurred.

Circuit/System Testing

1. Ignition OFF, remove the KR48 headlamp high beam relay.
2. Connect a test lamp between the control circuit terminal 86 and B+, ignition ON.
3. Verify the test lamp turns ON and OFF when commanding the High Beams ON and OFF with a scan tool.
 - **If the test lamp is always OFF**
 1. Ignition OFF, disconnect the X5 harness connector at the K9 body control module, ignition ON.

2. Test for less than 1 V between the control circuit terminal and ground.
 - If 1 V or greater, repair the short to voltage on the circuit.
 - If less than 1 V
3. Ignition OFF.
4. Test for less than 2 ohms in the control circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, replace the K9 body control module.
 - **If the test lamp is always ON**
1. Ignition OFF, disconnect the X5 harness connector at the K9 body control module.
2. Test for infinite resistance between the control circuit terminal and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance, replace the K9 body control module.
 - **If the test lamp turns ON and OFF**
4. Test or replace the KR48 headlamp high beam relay.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

1. Park, License, and/or Tail Lamps Malfunction 2. Park Lamp Switch Malfunction				

Circuit/System Description

When the headlamp switch is placed in the HEAD or PARK position, ground is applied to the park lamp switch ON signal circuit to the body control module (BCM). The BCM responds by applying voltage to the park lamps, tail lamps, and license lamps control circuits illuminating the park, tail, and license lamps.

Conditions for Running the DTC

- Battery voltage must be between 9-16 V.
- Park lamps ON.

Conditions for Setting the DTC

DTC B2585 01 and B2585 04

The BCM detects a short to voltage or an open/high resistance in the left park lamps control circuit.

DTC B2585 02

The BCM detects a short to ground in the left park lamps control circuit.

DTC B3867 01 and B3867 04

- The BCM detects a short to voltage or an open/high resistance in the right park lamps control circuit.
- The BCM detects a short to ground or an open/high resistance in the F5DA (BCM 5) fuse B+ circuit.

DTC B3867 02

The BCM detects a short to ground in the right park lamps control circuit.

Actions Taken When the DTC Sets

DTC B2585 01

The left park lamps are always ON.

DTC B2585 02 and B2585 04

The left park lamps are always OFF.

DTC B3867 01

The right park lamps are always ON.

DTC B3867 02 and B3867 04

The right park lamps are always OFF.

Conditions for Clearing the DTC

- The condition responsible for setting the DTC no longer exists.
- A history DTC will clear once 100 consecutive malfunction-free ignition cycles have occurred.

Diagnostic Aids

When testing at the park lamp bulb sockets, make sure all measurements and test lamp connections are in the correct terminal location and do not come in contact with each other during testing.

Circuit/System Testing

DTC B2585

1. Ignition OFF, exterior lamps OFF, disconnect the harness connector at the appropriate left front park lamp or left rear tail lamp. It may take up to 2 minutes for all vehicle systems to power down.
2. Test for less than 5 ohms between the appropriate ground circuit terminal listed below and ground.
 - E4N park/turn signal lamp - left socket terminal
 - E5AA tail lamp - left rear socket terminal
 - **If 5 ohms or greater**
 1. Ignition OFF.
 2. Test for less than 2 ohms in the ground circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, repair the open/high resistance in the ground connection.
 - **If less than 5 ohms**

3. Connect a test lamp between the appropriate control circuit terminal listed below and ground, ignition ON.
 - E4N park/turn signal lamp - left socket terminal
 - E5AA tail lamp - left rear socket terminal
4. Verify the test lamp turns ON and OFF when commanding the Left Park Lamps ON and OFF with a scan tool.
 - **If the test lamp is always OFF**
 1. Ignition OFF, disconnect the X4 harness connector at the K9 body control module.
 2. Test for infinite resistance between the control circuit and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance
 3. Test for less than 2 ohms in the control circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, replace the K9 body control module.
 - **If the test lamp is always ON**
 1. Ignition OFF, disconnect the X4 harness connector at the K9 body control module, ignition ON.
 2. Test for less than 1 V between the control circuit terminal and ground.
 - If 1 V or greater, repair the short to voltage on the circuit.
 - If less than 1 V, replace the K9 body control module.
 - **If the test lamp turns ON and OFF**
5. Test or replace the appropriate left park/tail lamp.

DTC B3867

1. Ignition OFF, disconnect the X2 harness connector at the K9 body control module, ignition ON.
2. Verify a test lamp illuminates between the B+ circuit terminal 3 and ground.
 - **If the test lamp does not illuminate and the circuit fuse is good**
 1. Ignition OFF.
 2. Test for less than 2 ohms in the B+ circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, verify the fuse is not open and there is voltage at the fuse.
 - **If the test lamp does not illuminate and the circuit fuse is open**
 1. Ignition OFF.
 2. Test for infinite resistance between the B+ circuit and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance, replace the K9 body control module.
 - **If the test lamp illuminates**
3. Ignition OFF, connect the X2 harness connector at the K9 body control module.
4. Ignition OFF, exterior lamps OFF, disconnect the harness connector at the appropriate right front park

lamp or right rear side marker lamp. It may take up to 2 minutes for all vehicle systems to power down.

5. Test for less than 5 ohms between the appropriate ground circuit terminal listed below and ground.
 - E4P park/turn signal lamp - right socket terminal
 - E5AB tail lamp - right rear socket terminal
 - **If 5 ohms or greater**
 1. Ignition OFF.
 2. Test for less than 2 ohms in the ground circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, repair the open/high resistance in the ground connection.
 - **If less than 5 ohms**
6. Connect a test lamp between the appropriate control circuit terminal listed below and ground, ignition ON.
 - E4P park/turn signal lamp - right socket terminal
 - E5AB tail lamp - right rear socket terminal
7. Verify the test lamp turns ON and OFF when commanding the Right Park Lamps ON and OFF with a scan tool.
 - **If the test lamp is always OFF**
 1. Ignition OFF, disconnect the X4 harness connector at the K9 body control module.
 2. Test for infinite resistance between the control circuit and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance
 3. Test for less than 2 ohms in the control circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, replace the K9 body control module.
 - **If the test lamp is always ON**
 1. Ignition OFF, disconnect the X4 harness connector at the K9 body control module, ignition ON.
 2. Test for less than 1 V between the control circuit terminal and ground.
 - If 1 V or greater, repair the short to voltage on the circuit.
 - If less than 1 V, replace the K9 body control module.
 - **If the test lamp turns ON and OFF**
8. Test or replace the appropriate right park/tail lamp.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

- **Tail Lamp Replacement**

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
LED Backlight Dimming Control Terminal 8 X2	B2610 02	B2610 04, 1	B2610 01, 1	-
1. Interior Backlighting Malfunction				

Circuit/System Description

The instrument panel dimmer switch is used to increase and decrease the brightness of the interior backlighting components. The instrument panel dimmer switch provides a voltage signal to the body control module (BCM) that will increase as the brightness of the lights are increased and decrease as the brightness of the lights are decreased. The BCM provides a low reference signal and a B+ voltage reference to the instrument panel dimmer switch. When the instrument panel dimmer switch is placed in the desired position, the dimmed voltage setting is applied from the instrument panel dimmer switch through the instrument panel dimmer switch signal circuit to the BCM. The BCM interprets the signal and applies a pulse width modulated (PWM) voltage through the LED dimming 1 and dimming 2 control circuits illuminating the interior backlighting to the requested level of brightness.

Conditions for Running the DTC

- Battery voltage must be between 9-16 V.
- Park lamps ON.

Conditions for Setting the DTC

DTC B2610 01

The BCM detects a short to battery in the LED backlight dimming control circuit terminal 8 X2.

DTC B2610 02

The BCM detects a short to ground in the LED backlight dimming control circuit terminal 8 X2.

DTC B2610 04

The BCM detects an open/high resistance in the LED backlight dimming control circuit terminal 8 X2.

Actions Taken When the DTC Sets

The BCM will disable the LED backlight dimming control circuits.

Conditions for Clearing the DTC

- The condition responsible for setting the DTC no longer exists.
- A history DTC will clear once 100 consecutive malfunction-free ignition cycles have occurred.

Circuit/System Testing

NOTE: Each component with backlighting may need to be disconnected to isolate a short to voltage or short to ground. Use the schematics to identify the following:

- Backlighting components the vehicle is equipped with
- Each component's control and ground circuit terminals
- Component locations on the backlighting control circuit

1. Ignition OFF, all doors closed, all accessories OFF, disconnect the harness connector at the component with inoperative backlighting. It may take up to 2 minutes for all vehicle systems to power down.
2. Test for less than 15 ohms between the appropriate ground circuit terminal listed below and ground.
 - S13D Door Lock Switch - Driver terminal 3
 - S13P Door Lock Switch - Passenger terminal 3
 - S36 Instrument Panel Dimmer Switch - terminal 5
 - S46B Liftgate Unlatch Switch - terminal 6
 - S32D Seat Heating Switch - Driver terminal 5
 - S32P Seat Heating Switch - Passenger terminal 5
 - S70L Steering Wheel Controls Switch - Left terminal 2
 - S70R Steering Wheel Controls Switch - Right terminal 2
 - S75 Traction Control Switch - terminal 3
 - S3 Transmission Shift Lever - terminal 3
 - **If 15 ohms or greater**
 1. Ignition OFF.
 2. Test for less than 2 ohms in the ground circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, repair the open/high resistance in the ground connection.
 - **If less than 15 ohms**
3. Connect a test lamp between the appropriate control circuit terminal listed below and ground.
 - K33 HVAC control module - terminal 6 X1
 - S13D Door Lock Switch - Driver terminal 1
 - S13P Door Lock Switch - Passenger terminal 1
 - S36 Instrument Panel Dimmer Switch - terminal 4
 - S46B Liftgate Unlatch Switch - terminal 5
 - S32D Seat Heating Switch - Driver terminal 6
 - S32P Seat Heating Switch - Passenger terminal 6
 - S70L Steering Wheel Controls Switch - Left terminal 1
 - S70R Steering Wheel Controls Switch - Right terminal 1

- S75 Traction Control Switch - terminal 2
 - S3 Transmission Shift Lever - terminal 8
4. Verify the test lamp turns ON and OFF when commanding the LED Backlight Dimming ON and OFF with a scan tool.
 - **If the test lamp is always OFF**
 1. Ignition OFF, disconnect the X2 harness connector at the K9 Body Control Module.
 2. Test for infinite resistance between the control circuit and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance
 3. Test for less than 2 ohms in the control circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, replace the K9 Body Control Module.
 - **If the test lamp is always ON**
 1. Ignition OFF, disconnect the X2 harness connector at the K9 Body Control Module, ignition ON.
 2. Test for less than 1 V between the control circuit terminal and ground.
 - If 1 V or greater, repair the short to voltage on the circuit.
 - If less than 1 V, replace the K9 Body Control Module.
 - **If the test lamp turns ON and OFF**
 5. Test or replace the component with inoperative backlighting.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

- **Hazard Warning Switch Replacement**
- **Transmission Control Replacement**
- **Steering Wheel Control Switch Assembly Replacement**
- **Control Module References** for BCM or HVAC control module replacement, programming, and setup

DTC B2615: PASSENGER COMPARTMENT DIMMING

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

DTC Descriptor

DTC B2615 02

Passenger Compartment Dimming 2 Circuit Short to Ground

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
F6DA (BCM 6) Fuse B+	B2545 01, B2545 04, B2615 02	B2545 01, B2545 04, B2615 02	-	-
Dome Lamp Control	B2615 02	2	2	-
Reading Lamp Control	B1480 02	1	1	-
Dome Lamp Ground	-	1, 2	-	-
1. Courtesy Lamps Malfunction 2. Dome Lamps Malfunction				

Circuit/System Description

The body control module (BCM) applies battery voltage to the dome/reading lamps through the dome/reading lamp control circuit. When any door is opened, the jam switch contacts close and the BCM receives a door-ajar input. If the BCM receives a door lock or unlock input or a rear hatch open input, the BCM will activate the dome/reading lamp control circuit, providing battery voltage to dome/reading lamps. In the event that any of these courtesy lamps were to remain illuminated for more than 10 min with the ignition switch in the OFF position, the BCM will deactivate the courtesy lamp control circuit to prevent total battery discharge.

Conditions for Running the DTC

Battery voltage must be between 9-16 V.

Conditions for Setting the DTC

- The BCM detects a short to ground in the dome lamp control circuit.
- The BCM detects a short to ground or an open/high resistance in the F6DA (BCM 6) fuse B+ circuit.

Actions Taken When the DTC Sets

The BCM will disable the dome lamps control circuit.

Conditions for Clearing the DTC

- The condition responsible for setting the DTC no longer exists.
- A history DTC will clear once 100 consecutive malfunction-free ignition cycles have occurred.

- Park lamps ON.

Conditions for Setting the DTC

The BCM detects a short to ground in the hazard warning switch backlight dimming control circuit.

Actions Taken When the DTC Sets

The BCM will disable the hazard warning switch backlight dimming control circuit.

Conditions for Clearing the DTC

- The condition responsible for setting the DTC no longer exists.
- A history DTC will clear once 100 consecutive malfunction-free ignition cycles have occurred.

Control Module References for scan tool information

Circuit/System Testing

1. Ignition OFF, scan tool disconnected, all doors closed, all accessories OFF, disconnect the harness connector at the S26 Hazard Warning Switch. It may take up to 2 minutes for all vehicle systems to

power down.

2. Test for less than 5 ohms between the ground circuit terminal 3 and ground.
 - **If 5 ohms or greater**
 1. Ignition OFF.
 2. Test for less than 2 ohms in the ground circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, repair the open/high resistance in the ground connection.
 - **If less than 5 ohms**
3. Connect a test lamp between the control circuit terminal 2 and ground, ignition ON.
4. Verify the test lamp turns ON and OFF when commanding the Hazard Lamps Switch Backlight ON and OFF with a scan tool.
 - **If the test lamp is always OFF**
 1. Ignition OFF, disconnect the X1 harness connector at the K9 Body Control Module.
 2. Test for infinite resistance between the control circuit and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance
 3. Test for less than 2 ohms in the control circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, replace the K9 Body Control Module.
 - **If the test lamp is always ON**
 1. Ignition OFF, disconnect the X1 harness connector at the K9 Body Control Module, ignition ON.
 2. Test for less than 1 V between the control circuit terminal and ground.
 - If 1 V or greater, repair the short to voltage on the circuit.
 - If less than 1 V, replace the K9 Body Control Module.
 - **If the test lamp turns ON and OFF**
5. Test or replace the S26 Hazard Warning Switch.

DTC Descriptor

DTC B3596 00

Hazard Lamps Request Circuit Malfunction

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Hazard Warning Switch Signal	1	1	1	B3596 00
Hazard Warning Switch LED Backlighting Control	B2652 02	2	2	-
Hazard Warning Switch Ground	-	1	-	-
1. Hazard Lamps Malfunction 2. Hazard Warning Switch Backlighting Malfunction				

Circuit/System Description

The hazard flashers may be activated in any power mode. The hazard warning switch signal circuit is momentarily grounded when the hazard warning switch is pressed. The body control module (BCM) responds to the hazard warning switch signal input by supplying battery voltage to all four turn signal lamps in an ON and OFF duty cycle. When the hazard warning switch is activated, the BCM sends a serial data message to the instrument cluster requesting both turn signal indicators to be cycled ON and OFF.

Conditions for Running the DTC

- Battery voltage must be between 9-16 V.
- Hazard lamps ON.

Conditions for Setting the DTC

The hazard warning switch input is Active for longer than 60 seconds.

Actions Taken When the DTC Sets

The hazard warning lamps are inoperative.

Conditions for Clearing the DTC

- The condition responsible for setting the DTC no longer exists.
- A history DTC will clear once 100 consecutive malfunction-free ignition cycles have occurred.

Instrument Panel Dimmer Switch Low Reference	1	1	1	-
1. Interior Backlighting Malfunction				

Circuit/System Description

The instrument panel dimmer switch is used to increase and decrease the brightness of the interior backlighting components. The instrument panel dimmer switch provides a voltage signal to the body control module (BCM) that will increase as the brightness of the lights are increased and decrease as the brightness of the lights are decreased. The BCM provides a low reference signal and a B+ voltage reference to the instrument panel dimmer switch. When the instrument panel dimmer switch is placed in the desired position, the dimmed voltage setting is applied from the instrument panel dimmer switch through the instrument panel dimmer switch signal circuit to the BCM. The BCM interprets the signal and applies a pulse width modulated (PWM) voltage through the LED dimming 1 and dimming 2 control circuits illuminating the interior backlighting to the requested level of brightness.

Conditions for Running the DTC

- Battery voltage must be between 9-16 V.
- Park Lamps ON.

Conditions for Setting the DTC

DTC B3600 03

- The BCM detects a short to ground or an open/high resistance in the instrument panel dimmer switch B+ reference circuit.
- The BCM detects a short to ground or an open/high resistance in the instrument panel dimmer switch signal circuit.

DTC B3600 07

The BCM detects a short to voltage in the instrument panel dimmer switch signal circuit.

Actions Taken When the DTC Sets

The BCM will not dim any interior backlighting. All interior backlighting will default to maximum brightness.

Conditions for Clearing the DTC

- The condition responsible for setting the DTC no longer exists.

- A history DTC will clear once 100 consecutive malfunction-free ignition cycles have occurred.

Circuit/System Testing

1. Ignition OFF, disconnect the harness connector at the S36 Instrument Panel Dimmer Switch, ignition ON.
2. Verify a test lamp illuminates between the low reference circuit terminal 2 and B+.
 - **If the test lamp does not illuminate**
 1. Ignition OFF, disconnect the X1 harness connector at the K9 Body Control Module, ignition ON.
 2. Test for less than 1 V between the low reference circuit terminal 2 and ground.
 - If 1 V or greater, repair the short to voltage on the circuit.
 - If less than 1 V
 3. Test for less than 2 ohms in the low reference circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, replace the K9 Body Control Module.
 - **If the test lamp illuminates**
 - 3. Test for B+ between the B+ reference circuit terminal 1 and ground.
 - **If less than B+**

1. Ignition OFF, disconnect the X1 harness connector at the K9 Body Control Module.
2. Test for infinite resistance between the B+ reference circuit and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance
3. Test for less than 2 ohms in the B+ reference circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, replace the K9 Body Control Module.
 - **If B+**
4. Verify a test lamp does not illuminate between the B+ reference circuit terminal 1 and ground.
 - **If the test lamp illuminates**
 1. Ignition OFF, disconnect the X1 harness connector at the K9 Body Control Module, ignition ON.
 2. Test for less than 1 V between the B+ reference circuit terminal 2 and ground.
 - If 1 V or greater, repair the short to voltage on the circuit.
 - If less than 1 V, replace the K9 Body Control Module.
 - **If the test lamp does not illuminate**
5. Park lamps ON, verify a test lamp does not illuminate between the signal circuit terminal 3 and ground.
 - **If the test lamp illuminates**
 1. Ignition OFF, disconnect the X2 harness connector at the K9 Body Control Module, ignition ON.
 2. Test for less than 1 V between the signal circuit terminal 3 and ground.
 - If 1 V or greater, repair the short to voltage on the circuit.
 - If less than 1 V, replace the K9 Body Control Module.
 - **If the test lamp does not illuminate**
6. Ignition ON, park lamps OFF, test for between 57.4 K ohms and 58 K ohms between the signal circuit terminal 3 and ground.
 - **If not between 57.4 K ohms and 58 K ohms**
 1. Ignition OFF, disconnect the X2 harness connector at the K9 Body Control Module.
 2. Test for infinite resistance between the signal circuit and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance
 3. Test for less than 2 ohms in the signal circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, replace the K9 Body Control Module.
 - **If between 57.4 K ohms and 58 K ohms**
7. Test or replace the S36 Instrument Panel Dimmer Switch.

Repair Instructions

DTC B3650: HIGH BEAM REQUEST SIGNAL

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

DTC Descriptor

DTC B3650 08

High Beam Request Signal Circuit Performance - Signal Invalid

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Headlamp Switch Headlamps ON Signal	B257A 00	1	1	-
Headlamp Switch Park Lamps ON Signal	2	B257A 00	2	-
Turn Signal/Multifunction Switch Flash To Pass Signal	B3806 00	1	1	-
Turn Signal/Multifunction Switch High Beam Signal	B3650 08	1	1	-
Turn Signal/Multifunction Switch Ground	-	1	-	-
1. Headlamps Malfunction 2. Park, License, and/or Tail Lamps Malfunction				

Circuit/System Description

When the low beam headlamps are on and the turn signal/multifunction switch is placed in the high beam position, ground is applied to the body control module (BCM) through the high beam signal circuit. The BCM responds to the high beam request by applying ground to the high beam relay control circuit which energizes the high beam relay. With the high beam relay energized, the switch contacts close allowing battery voltage to flow through the high beam fuses to the high beam control circuits illuminating the high beam headlamps.

Conditions for Running the DTC

Battery voltage must be between 9-16 V.

Conditions for Setting the DTC

The BCM detects a short to ground in the turn signal/multifunction switch high beam signal circuit.

Actions Taken When the DTC Sets

The high beam headlamps will not operate.

Conditions for Clearing the DTC

- The condition responsible for setting the DTC no longer exists.
- A history DTC will clear once 100 consecutive malfunction-free ignition cycles have occurred.

DTC B3806: HIGH BEAM AND HEADLAMP FLASH SELECT

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

DTC Descriptor

DTC B3806 00

High Beam and Headlamp Flash Select Circuit Malfunction

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Headlamp Switch Headlamps ON Signal	B257A 00	1	1	-
Headlamp Switch Park Lamps ON Signal	2	B257A 00	2	-
Turn Signal/Multifunction Switch Flash To Pass Signal	B3806 00	1	1	-
Turn Signal/Multifunction Switch High Beam Signal	B3650 08	1	1	-
Turn Signal/Multifunction Switch Ground	-	1	-	-
1. Headlamps Malfunction 2. Park, License, and/or Tail Lamps Malfunction				

Circuit/System Description

When the turn signal/multifunction switch is momentarily placed in the flash to pass position, ground is applied to the body control module (BCM) through the flash to pass signal circuit. The BCM responds to the flash to pass request by applying ground to the high beam relay control circuit which energizes the high beam relay. With the high beam relay energized, the switch contacts close allowing battery voltage to flow through the high beam fuses to the high beam control circuits illuminating the high beam headlamps. The high beam headlamps will only illuminate for as long as the flash to pass switch is activated.

Conditions for Running the DTC

Battery voltage must be between 9-16 V.

Conditions for Setting the DTC

The BCM detects a short to ground in the turn signal/multifunction switch flash to pass signal circuit.

Actions Taken When the DTC Sets

The high beam lamps and the high beam indicator on the instrument cluster are always ON.

Conditions for Clearing the DTC

- The condition responsible for setting the DTC no longer exists.
- A history DTC will clear once 100 consecutive malfunction-free ignition cycles have occurred.

Circuit/System Description

The brake pedal position (BPP) sensor is used to sense the action of the driver application of the brake pedal. The BPP sensor provides an analog voltage signal that will increase as the brake pedal is applied. The body control module (BCM) provides a low reference signal and a 5-volt reference voltage to the BPP sensor. When the variable signal reaches a voltage threshold indicating the brakes have been applied, the BCM will apply battery voltage to the left and right stop lamp control circuits as well as the center high mounted stop lamp (CHMSL) control circuit illuminating the left and right stop lamps and the CHMSL.

Conditions for Running the DTC

- Battery voltage must be between 9-16 V.
- Brakes APPLIED.

Conditions for Setting the DTC

DTC B3881 01 and B3881 04

- The BCM detects a short to voltage or an open/high resistance in the left stop lamp control circuit.
- The BCM detects a short to ground or an open/high resistance in the F5DA (BCM 5) fuse B+ circuit.

DTC B3881 02

The BCM detects a short to ground in the left stop lamp control circuit.

DTC B3882 01

The BCM detects a short to voltage in the right stop lamp control circuit.

DTC B3882 02

The BCM detects a short to ground in the right stop lamp control circuit.

DTC B3882 04

The BCM detects an open/high resistance in the right stop lamp control circuit.

Actions Taken When the DTC Sets

The appropriate stop lamp will not operate.

Conditions for Clearing the DTC

- The condition responsible for setting the DTC no longer exists.
- A history DTC will clear once 100 consecutive malfunction-free ignition cycles have occurred.

Diagnostic Aids

When testing at the stop lamp bulb socket, make sure all measurements and test lamp connections are in the correct terminal location and do not come in contact with each other during testing.

Circuit/System Testing

DTC B3881

1. Ignition OFF, disconnect the X2 harness connector at the K9 body control module, ignition ON.
2. Verify a test lamp illuminates between the B+ circuit terminal 3 and ground.
 - **If the test lamp does not illuminate and the circuit fuse is good**
 1. Ignition OFF.
 2. Test for less than 2 ohms in the B+ circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, verify the fuse is not open and there is voltage at the fuse.
 - **If the test lamp does not illuminate and the circuit fuse is open**
 1. Ignition OFF.
 2. Test for infinite resistance between the B+ circuit and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance, replace the K9 body control module.

- **If the test lamp illuminates**
- 3. Ignition OFF, connect the X2 harness connector at the K9 body control module.
- 4. Ignition OFF, exterior lamps OFF, remove the E5AA tail/stop lamp bulb - left. It may take up to 2 minutes for all vehicle systems to power down.
- 5. Test for less than 5 ohms between the ground circuit at the socket terminal and ground.
 - **If 5 ohms or greater**
 - 1. Ignition OFF.
 - 2. Test for less than 2 ohms in the ground circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, repair the open/high resistance in the ground connection.
 - **If less than 5 ohms**
- 6. Connect a test lamp between the control circuit at the socket terminal and ground, ignition ON.
- 7. Verify the test lamp turns ON and OFF when commanding the Left Brake Lamp ON and OFF with a scan tool.
 - **If the test lamp is always OFF**
 - 1. Ignition OFF, disconnect the X4 harness connector at the K9 body control module.
 - 2. Test for infinite resistance between the control circuit and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance
 - 3. Test for less than 2 ohms in the control circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, replace the K9 body control module.
 - **If the test lamp is always ON**
 - 1. Ignition OFF, disconnect the X4 harness connector at the K9 body control module, ignition ON.
 - 2. Test for less than 1 V between the control circuit terminal and ground.
 - If 1 V or greater, repair the short to voltage on the circuit.
 - If less than 1 V, replace the K9 body control module.
 - **If the test lamp turns ON and OFF**
- 8. Test or replace the E5AA tail/stop lamp - left.

DTC B3882

- 1. Ignition OFF, exterior lamps OFF, remove the E5AB tail/stop lamp bulb - right. It may take up to 2 minutes for all vehicle systems to power down.
- 2. Test for less than 5 ohms between the ground circuit at the socket terminal and ground.
 - **If 5 ohms or greater**
 - 1. Ignition OFF.
 - 2. Test for less than 2 ohms in the ground circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.

- If less than 2 ohms, repair the open/high resistance in the ground connection.
- **If less than 5 ohms**
- 3. Connect a test lamp between the control circuit at the socket terminal and ground, ignition ON.
- 4. Verify the test lamp turns ON and OFF when commanding the Right Brake Lamp ON and OFF with a scan tool.
 - **If the test lamp is always OFF**
 1. Ignition OFF, disconnect the X5 harness connector at the K9 body control module.
 2. Test for infinite resistance between the control circuit and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance
 3. Test for less than 2 ohms in the control circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, replace the K9 body control module.
 - **If the test lamp is always ON**
 1. Ignition OFF, disconnect the X5 harness connector at the K9 body control module, ignition ON.
 2. Test for less than 1 V between the control circuit terminal and ground.
 - If 1 V or greater, repair the short to voltage on the circuit.
 - If less than 1 V, replace the K9 body control module.
 - **If the test lamp turns ON and OFF**
- 5. Test or replace the E5AB tail/stop lamp - right.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

- **Tail Lamp Replacement**
- **Control Module References** for BCM replacement, programming, and setup

DTC B3883: LICENSE PLATE LAMP CIRCUIT

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

DTC Descriptors

DTC B3883 01

License Plate Lamp Circuit Short to Battery

DTC B3883 02

License Plate Lamp Circuit Short to Ground

DTC B3883 04

License Plate Lamp Circuit Open

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
License Plate Lamp Control	B3883 02	B3883 01, B3883 04	B3883 01, B3883 04	-
License Plate Lamp Ground	-	B3883 01, B3883 04	-	-

Circuit/System Description

When the headlamp switch is placed in the HEAD or PARK position, ground is applied to the park lamp switch ON signal circuit to the body control module (BCM). The BCM responds by applying voltage to the park lamps, tail lamps, and license lamps control circuits illuminating the park, tail, and license lamps.

Conditions for Running the DTC

Battery voltage must be between 9-16 V.

DTC B3883 01

Headlamp switch in OFF position.

DTC B3883 02 or B3883 04

Headlamp switch in PARK or ON positions.

Conditions for Setting the DTC

DTC B3883 01

- The BCM detects a short to voltage in the license lamp control circuit.
- The BCM detects an open/high resistance in the license lamp ground circuit.

DTC B3883 02

The BCM detects a short to ground in the license lamp control circuit.

DTC B3883 04

- The BCM detects an open/high resistance in the license lamp control circuit.
- The BCM detects an open/high resistance in the license lamp ground circuit.

Actions Taken When the DTC Sets

DTC B3883 01

License lamp always ON.

DTC B3883 02 or B3883 04

License lamp inoperative.

Conditions for Clearing the DTC

- The condition responsible for setting the DTC no longer exists.
- A history DTC will clear once 100 consecutive malfunction-free ignition cycles have occurred.

Circuit/System Testing

1. Ignition OFF, exterior lamps OFF, remove the E7 license plate lamp bulb. It may take up to 2 minutes for

all vehicle systems to power down.

2. Test for less than 5 ohms between the ground circuit terminal 1 and ground.
 - **If 5 ohms or greater**
 1. Ignition OFF.
 2. Test for less than 2 ohms in the ground circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, repair the open/high resistance in the ground connection.
 - **If less than 5 ohms**
3. Connect a test lamp between the control circuit terminal 2 and ground, ignition ON.
4. Verify the test lamp turns ON and OFF when commanding the License Plate Lamps ON and OFF with a scan tool.
 - **If the test lamp is always OFF**
 1. Ignition OFF, disconnect the X4 harness connector at the K9 body control module.
 2. Test for infinite resistance between the control circuit and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance
 3. Test for less than 2 ohms in the control circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, replace the K9 body control module.
 - **If the test lamp is always ON**
 1. Ignition OFF, disconnect the X4 harness connector at the K9 body control module, ignition ON.
 2. Test for less than 1 V between the control circuit terminal and ground.
 - If 1 V or greater, repair the short to voltage on the circuit.
 - If less than 1 V, replace the K9 body control module.
 - **If the test lamp turns ON and OFF**
5. Test or replace the E7 license plate lamp bulb.

DTC B3884: CENTER HIGH MOUNTED BRAKE LAMP

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

DTC Descriptor

DTC B3884 02

Center High Mounted Brake Lamp Circuit Short to Ground

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Center High Mounted Stop Lamp Control	B3884 02	1	1	-
Center High Mounted Stop Lamp Ground	-	1	-	-
1. Stop Lamps Malfunction				

Circuit/System Description

The brake pedal position sensor is used to sense the action of the driver application of the brake pedal. The brake pedal position sensor provides an analog voltage signal that will increase as the brake pedal is applied. The body control module (BCM) provides a low reference signal and a 5 V reference voltage to the brake pedal position sensor. When the variable signal reaches a voltage threshold indicating the brakes have been applied, the BCM will apply battery voltage to the right and left stop lamp control circuits, engine control module (ECM), and center high mounted stop lamp control circuit.

Conditions for Running the DTC

- Battery voltage must be between 9-16 V.
- Brakes APPLIED.

Conditions for Setting the DTC

The BCM detects a short to ground in the center high mounted stop lamp control circuit.

Actions Taken When the DTC Sets

The BCM will not illuminate the center high mounted stop lamp.

Conditions for Clearing the DTC

- The condition responsible for setting the DTC no longer exists.
- A history DTC will clear once 100 malfunction-free ignition cycles have occurred.

Circuit/System Testing

1. Ignition OFF, exterior lamps OFF, disconnect the harness connector at the E6 center high mounted stop lamp. It may take up to 2 minutes for all vehicle systems to power down.
2. Test for less than 5 ohms between the ground circuit terminal 2 and ground.
 - **If 5 ohms or greater**
 1. Ignition OFF.
 2. Test for less than 2 ohms in the ground circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, repair the open/high resistance in the ground connection.
 - **If less than 5 ohms**
3. Connect a test lamp between the control circuit terminal 1 and ground, ignition ON.
4. Verify the test lamp turns ON and OFF when commanding the Center Brake Lamp ON and OFF with a scan tool.
 - **If the test lamp is always OFF**
 1. Ignition OFF, disconnect the X4 harness connector at the K9 body control module.
 2. Test for infinite resistance between the control circuit and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance
 3. Test for less than 2 ohms in the control circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.

- If less than 2 ohms, replace the K9 body control module.
 - **If the test lamp is always ON**
 1. Ignition OFF, disconnect the X4 harness connector at the K9 body control module, ignition ON.
 2. Test for less than 1 V between the control circuit terminal and ground.
 - If 1 V or greater, repair the short to voltage on the circuit.
 - If less than 1 V, replace the K9 body control module.
 - **If the test lamp turns ON and OFF**
5. Test or replace the E6 center high mounted stop lamp.

1. Turn Signal Lamps and/or Indicators Malfunction				

Circuit/System Description

Ground is applied at all times to the turn signal/multifunction switch. The turn signal lamps may only be activated with the ignition switch in the ON or START positions. When the turn signal/multifunction switch is placed in either the turn left or turn right position, ground is applied to the body control module (BCM) through either the right turn or left turn signal switch signal circuit. The BCM responds to the turn signal switch input by applying a pulsating voltage to the front and rear turn signal lamps through their respective control circuits. When a turn signal request is received by the BCM, a serial data message is sent to the instrument cluster requesting the respective turn signal indicator be pulsed ON and OFF.

Conditions for Running the DTC

- Battery voltage must be between 9-16 V.
- Ignition ON.

Conditions for Setting the DTC

DTC B3948 01 and B3948 04

- The BCM detects an open/high resistance in the left front turn signal control circuit.
- The BCM detects an open/high resistance in the left front turn signal ground circuit.
- The BCM detects a short to ground or an open/high resistance in the F7DA (BCM 7) fuse B+ circuit.

DTC B3948 02

The BCM detects a short to ground in the left front turn signal control circuit.

DTC B3949 01 and B3949 04

- The BCM detects an open/high resistance in the right front turn signal control circuit.
- The BCM detects an open/high resistance in the right front turn signal ground circuit.
- The BCM detects a short to ground or an open/high resistance in the F5DA (BCM 5) fuse B+ circuit.

DTC B3949 02

The BCM detects a short to ground in the right front turn signal control circuit.

Actions Taken When the DTC Sets

DTC B3948

- The left front turn signal is inoperative.
- The left turn signal indicator on the instrument cluster flashes rapidly.

DTC B3949

- The right front turn signal is inoperative.
- The right turn signal indicator on the instrument cluster flashes rapidly.

Conditions for Clearing the DTC

- The condition responsible for setting the DTC no longer exists.
- A history DTC will clear once 100 consecutive malfunction-free ignition cycles have occurred.

Diagnostic Aids

When testing at the turn signal lamp bulb socket, make sure all measurements and test lamp connections are in the correct terminal location and do not come in contact with each other during testing.

Circuit/System Testing

DTC B3948

1. Ignition OFF, disconnect the X5 harness connector at the K9 body control module, ignition ON.
2. Verify a test lamp illuminates between the B+ circuit terminal 3 and ground.

- **If the test lamp does not illuminate and the circuit fuse is good**

1. Ignition OFF.
2. Test for less than 2 ohms in the B+ circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, verify the fuse is not open and there is voltage at the fuse.

- **If the test lamp does not illuminate and the circuit fuse is open**

1. Ignition OFF.
2. Test for infinite resistance between the B+ circuit and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance, replace the K9 body control module.

- **If the test lamp illuminates**

3. Ignition OFF, connect the X5 harness connector at the K9 body control module.
4. Ignition OFF, exterior lamps OFF, remove the appropriate E4 turn signal lamp bulb - left front. It may take up to 2 minutes for all vehicle systems to power down.
5. Test for less than 5 ohms between the appropriate ground circuit terminal listed below and ground.
 - E4N park/turn signal lamp - left socket terminal C
 - E4Y turn signal repeater lamp - left socket terminal 1
 - **If 5 ohms or greater**
 1. Ignition OFF.
 2. Test for less than 2 ohms in the ground circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, repair the open/high resistance in the ground connection.
 - **If less than 5 ohms**
6. Connect a test lamp between the appropriate control circuit terminal listed below and ground, ignition ON.
 - E4N park/turn signal lamp - left socket terminal A
 - E4Y turn signal repeater lamp - left socket terminal 2
7. Verify the test lamp turns ON and OFF when commanding the Left Front Turn Signal Lamp ON and OFF with a scan tool.
 - **If the test lamp is always OFF**
 1. Ignition OFF, disconnect the X5 harness connector at the K9 body control module.
 2. Test for infinite resistance between the control circuit and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance
 3. Test for less than 2 ohms in the control circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, replace the K9 body control module.
 - **If the test lamp is always ON**

1. Ignition OFF, disconnect the X5 harness connector at the K9 body control module, ignition ON.
2. Test for less than 1 V between the control circuit terminal and ground.
 - If 1 V or greater, repair the short to voltage on the circuit.
 - If less than 1 V, replace the K9 body control module.
 - **If the test lamp turns ON and OFF**
8. Test or replace the appropriate E4 turn signal lamp bulb - left front.

DTC B3949

1. Ignition OFF, disconnect the X2 harness connector at the K9 body control module, ignition ON.
2. Verify a test lamp illuminates between the B+ circuit terminal 3 and ground.
 - **If the test lamp does not illuminate and the circuit fuse is good**
 1. Ignition OFF.
 2. Test for less than 2 ohms in the B+ circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, verify the fuse is not open and there is voltage at the fuse.
 - **If the test lamp does not illuminate and the circuit fuse is open**
 1. Ignition OFF.
 2. Test for infinite resistance between the B+ circuit and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance, replace the K9 body control module.
 - **If the test lamp illuminates**
3. Ignition OFF, connect the X2 harness connector at the K9 body control module.
4. Ignition OFF, exterior lamps OFF, remove the E4P turn signal lamp bulb - right front. It may take up to 2 minutes for all vehicle systems to power down.
5. Test for less than 5 ohms between the appropriate ground circuit terminal listed below and ground.
 - E4P park/turn signal lamp - right socket terminal C
 - E4Z turn signal repeater lamp - right socket terminal 1
 - **If 5 ohms or greater**
 1. Ignition OFF.
 2. Test for less than 2 ohms in the ground circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, repair the open/high resistance in the ground connection.
 - **If less than 5 ohms**
6. Connect a test lamp between the appropriate control circuit terminal listed below and ground, ignition ON.
 - E4P park/turn signal lamp - right socket terminal A
 - E4Z turn signal repeater lamp - right socket terminal 2
7. Verify the test lamp turns ON and OFF when commanding the Right Front Turn Signal Lamp ON and

OFF with a scan tool.

- **If the test lamp is always OFF**

1. Ignition OFF, disconnect the X4 harness connector at the K9 body control module.
2. Test for infinite resistance between the control circuit and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance
3. Test for less than 2 ohms in the control circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, replace the K9 body control module.

- **If the test lamp is always ON**

1. Ignition OFF, disconnect the X4 harness connector at the K9 body control module, ignition ON.
2. Test for less than 1 V between the control circuit terminal and ground.
 - If 1 V or greater, repair the short to voltage on the circuit.
 - If less than 1 V, replace the K9 body control module.

- **If the test lamp turns ON and OFF**

8. Test or replace the appropriate E4 turn signal lamp bulb - right front.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

Turn Signal/Multifunction Switch Ground	-	1	-	-
1. Turn Signal Lamps and/or Indicators Malfunction				

Circuit/System Description

Ground is applied at all times to the turn signal/multifunction switch. The turn signal lamps may only be activated with the ignition switch in the ON or START positions. When the turn signal/multifunction switch is placed in either the turn right or turn left position, ground is applied to the body control module (BCM) through either the right turn or left turn signal switch signal circuit. The BCM responds to the turn signal switch input by applying a pulsating voltage to the front and rear turn signal lamps through their respective control circuits. When a turn signal request is received by the BCM, a serial data message is sent to the instrument cluster requesting the respective turn signal indicator be pulsed ON and OFF.

Conditions for Running the DTC

- Battery voltage must be between 9-16 V.
- Ignition ON.

Conditions for Setting the DTC

DTC B3950 01 and B3950 04

- The BCM detects an open/high resistance in the left rear turn signal control circuit.
- The BCM detects an open/high resistance in the left rear turn signal ground circuit.
- The BCM detects a short to ground or an open/high resistance in the F5DA (BCM 5) fuse B+ circuit.

DTC B3950 02

The BCM detects a short to ground in the left rear turn signal control circuit.

DTC B3951 01 and B3951 04

- The BCM detects an open/high resistance in the right rear turn signal control circuit.
- The BCM detects an open/high resistance in the right rear turn signal ground circuit.
- The BCM detects a short to ground or an open/high resistance in the F7DA (BCM 7) fuse B+ circuit.

DTC B3951 02

The BCM detects a short to ground in the right rear turn signal control circuit.

Actions Taken When the DTC Sets

DTC B3950

- The left rear turn signal is inoperative.
- The left turn signal indicator on the instrument cluster flashes rapidly.

DTC B3951

- The right rear turn signal is inoperative.
- The right turn signal indicator on the instrument cluster flashes rapidly.

Conditions for Clearing the DTC

- The condition responsible for setting the DTC no longer exists.
- A history DTC will clear once 100 consecutive malfunction-free ignition cycles have occurred.

Diagnostic Aids

When testing at the turn signal lamp bulb socket, make sure all measurements and test lamp connections are in the correct terminal location and do not come in contact with each other during testing.

Circuit/System Testing

DTC B3950

1. Ignition OFF, disconnect the X2 harness connector at the K9 body control module, ignition ON.
2. Verify a test lamp illuminates between the B+ circuit terminal 3 and ground.
 - **If the test lamp does not illuminate and the circuit fuse is good**
 1. Ignition OFF.
 2. Test for less than 2 ohms in the B+ circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, verify the fuse is not open and there is voltage at the fuse.
 - **If the test lamp does not illuminate and the circuit fuse is open**
 1. Ignition OFF.
 2. Test for infinite resistance between the B+ circuit and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance, replace the K9 body control module.
 - **If the test lamp illuminates**
 - 3. Ignition OFF, connect the X2 harness connector at the K9 body control module.
 - 4. Ignition OFF, exterior lamps OFF, remove the E4LR turn signal lamp bulb - left rear. It may take up to 2 minutes for all vehicle systems to power down.
 - 5. Test for less than 5 ohms between the ground circuit at the socket terminal and ground.
 - **If 5 ohms or greater**
 1. Ignition OFF.
 2. Test for less than 2 ohms in the ground circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, repair the open/high resistance in the ground connection.
 - **If less than 5 ohms**
 - 6. Connect a test lamp between the control circuit at the socket terminal and ground, ignition ON.
 - 7. Verify the test lamp turns ON and OFF when commanding the Left Rear Turn Signal Lamp ON and OFF with a scan tool.
 - **If the test lamp is always OFF**
 1. Ignition OFF, disconnect the X5 harness connector at the K9 body control module.
 2. Test for infinite resistance between the control circuit and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance
 3. Test for less than 2 ohms in the control circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.

- If less than 2 ohms, replace the K9 body control module.
- **If the test lamp is always ON**
- 1. Ignition OFF, disconnect the X5 harness connector at the K9 body control module, ignition ON.
- 2. Test for less than 1 V between the control circuit terminal and ground.
 - If 1 V or greater, repair the short to voltage on the circuit.
 - If less than 1 V, replace the K9 body control module.
- **If the test lamp turns ON and OFF**
- 8. Test or replace the E4LR turn signal lamp bulb - left rear.

DTC B3951

1. Ignition OFF, disconnect the X5 harness connector at the K9 body control module, ignition ON.
2. Verify a test lamp illuminates between the B+ circuit terminal 3 and ground.
 - **If the test lamp does not illuminate and the circuit fuse is good**
 - 1. Ignition OFF.
 - 2. Test for less than 2 ohms in the B+ circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, verify the fuse is not open and there is voltage at the fuse.
 - **If the test lamp does not illuminate and the circuit fuse is open**
 - 1. Ignition OFF.
 - 2. Test for infinite resistance between the B+ circuit and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance, replace the K9 body control module.
 - **If the test lamp illuminates**
3. Ignition OFF, connect the X5 harness connector at the K9 body control module.
4. Ignition OFF, exterior lamps OFF, remove the E4RR turn signal lamp bulb - right rear. It may take up to 2 minutes for all vehicle systems to power down.
5. Test for less than 5 ohms between the ground circuit at the socket terminal and ground.
 - **If 5 ohms or greater**
 - 1. Ignition OFF.
 - 2. Test for less than 2 ohms in the ground circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, repair the open/high resistance in the ground connection.
 - **If less than 5 ohms**
6. Connect a test lamp between the control circuit at the socket terminal and ground, ignition ON.
7. Verify the test lamp turns ON and OFF when commanding the Right Rear Turn Signal Lamp ON and OFF with a scan tool.
 - **If the test lamp is always OFF**
 - 1. Ignition OFF, disconnect the X4 harness connector at the K9 body control module.

2. Test for infinite resistance between the control circuit and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance

3. Test for less than 2 ohms in the control circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, replace the K9 body control module.
 - **If the test lamp is always ON**

1. Ignition OFF, disconnect the X4 harness connector at the K9 body control module, ignition ON.

2. Test for less than 1 V between the control circuit terminal and ground.
 - If 1 V or greater, repair the short to voltage on the circuit.
 - If less than 1 V, replace the K9 body control module.

- **If the test lamp turns ON and OFF**

8. Test or replace the E4RR turn signal lamp bulb - right rear.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

Circuit/System Description

The brake pedal position (BPP) sensor is used to sense the action of the driver application of the brake pedal. The BPP sensor provides an analog voltage signal that will increase as the brake pedal is applied. The body control module (BCM) provides a low reference signal and a 5-volt reference voltage to the BPP sensor. When the variable signal reaches a voltage threshold indicating the brakes have been applied, the BCM will apply battery voltage to the left and right stop lamp control circuits as well as the center high mounted stop lamp (CHMSL) control circuit illuminating the left and right stop lamps and the CHMSL.

Conditions for Running the DTC

- Battery voltage must be between 9-16 V.
- Brakes APPLIED.

Conditions for Setting the DTC

DTC C0277 06

- The BCM detects a short to ground or an open/high resistance in the BPP sensor 5 V reference circuit.
- The BCM detects a short to ground or an open/high resistance in the BPP sensor signal circuit.

DTC C0277 07

- The BCM detects a short to voltage in the BPP sensor 5 V reference circuit.
- The BCM detects a short to voltage in the BPP sensor signal circuit.

DTC C0277 09

The BCM detects the BPP sensor signal is changing faster than possible under normal operating conditions.

DTC C0277 4B

The DTC will set when the BPP sensor home position is not learned.

DTC C0890 03

The BCM detects a short to ground in the BPP sensor 5 V reference circuit.

DTC C0890 07

- The BCM detects a short to voltage in the BPP sensor 5 V reference circuit.
- The BCM detects a short to voltage in the BPP sensor low reference circuit.

Actions Taken When the DTC Sets

- The Traction Control indicator is commanded ON.
- For DTC C0277 4B, the stop lamps may not activate at the expected brake pedal positions.

Conditions for Clearing the DTC

- The condition responsible for setting the DTC no longer exists.
- For DTC C0277 07 the ignition must be cycled before the code can be cleared.
- For DTC C0277 4B a successful brake pedal position sensor calibration has been performed.
- A history DTC will clear once 50 malfunction-free ignition cycles have occurred.
- A DTC will not clear the current status until the next ignition cycle.

DTC C0277 06, C0277 07, C0890 03, and C0890 07

1. Ignition OFF, disconnect the harness connector at the B22 Brake Pedal Position Sensor, ignition ON.
2. Verify a test lamp illuminates between the appropriate low reference circuit terminal listed below and B+.
 - Terminal A - with MX2
 - Terminal B - with MNG
 - **If the test lamp does not illuminate**
 1. Ignition OFF, disconnect the X1 harness connector at the K9 Body Control Module.
 2. Test for less than 2 ohms in the low reference circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, replace the K9 Body Control Module.
 - **If the test lamp illuminates**
3. Ignition ON.
4. Test for 4.8-5.2 V between the appropriate 5 V reference circuit terminal listed below and ground.
 - Terminal C - with MX2
 - Terminal A - with MNG

- **If less than 4.8 V**
 1. Ignition OFF, disconnect the X2 harness connector at the K9 Body Control Module.
 2. Test for infinite resistance between the 5 V reference circuit and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance
 3. Test for less than 2 ohms in the 5 V reference circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, replace the K9 Body Control Module.
- **If greater than 5.2 V**
 1. Ignition OFF, disconnect the X2 harness connector at the K9 Body Control Module, ignition ON.
 2. Test for less than 1 V between the 5 V reference circuit and ground.
 - If 1 V or greater, repair the short to voltage on the circuit.
 - If less than 1 V, replace the K9 Body Control Module.
- **If between 4.8-5.2 V**
- 5. Verify the scan tool Brake Pedal Applied parameter is Inactive.
 - **If not Inactive**
 1. Ignition OFF, disconnect the X2 harness connector at the K9 Body Control Module, ignition ON.
 2. Test for less than 1 V between the appropriate signal circuit terminal listed below and ground.
 - Terminal B - with MX2
 - Terminal C - with MNG
 - If 1 V or greater, repair the short to voltage on the circuit.
 - If less than 1 V, replace the K9 Body Control Module.
 - **If Inactive**
- 6. Install a 3 A fused jumper wire between the appropriate 5 V reference and signal circuit terminals listed below.
 - 5 V reference terminal C and signal terminal B - with MX2
 - 5 V reference terminal A and signal terminal C - with MNG
- 7. Verify the scan tool Brake Pedal Applied parameter is Active.
 - **If not Active**
 1. Ignition OFF, disconnect the X2 harness connector at the K9 Body Control Module.
 2. Test for infinite resistance between the signal circuit and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance
 3. Test for less than 2 ohms in the signal circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, replace the K9 Body Control Module.
 - **If Active**
- 8. Test or replace the B22 Brake Pedal Position Sensor.

DTC C0277 4B

1. Verify DTC C0277 4B is not set.
 - **If DTC C0277 4B is set**
 1. Ignition ON
 2. Perform the BPP sensor recalibration procedure for the K9 Body Control Module. Refer to **Brake Pedal Position Sensor Calibration**.
 3. Verify the DTC does not reset while operating the vehicle under the conditions for running the DTC.
 - If the DTC resets, replace the B22 Brake Pedal Position Sensor.
 - If the DTC does not reset
 4. All OK.
 - **If DTC C0277 4B is not set**
2. All OK.

DTC C0277 09

1. Verify DTC C0277 09 is not set.
 - **If DTC C0277 09 is set**
 1. Replace the B22 Brake Pedal Position Sensor.
 2. Perform the BPP sensor recalibration procedure for the K9 Body Control Module. Refer to **Brake Pedal Position Sensor Calibration**.
 3. Verify the DTC does not reset while operating the vehicle under the conditions for running the DTC.
 - If the DTC resets, replace the K9 Body Control Module.
 - If the DTC does not reset
 4. All OK.
 - **If DTC C0277 09 is not set**
2. All OK.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

- **Brake Pedal Position Sensor Replacement**
- **Brake Pedal Position Sensor Calibration**
- **Control Module References** for BCM replacement, programming, and setup

DTC C0297: BRAKE APPLIED OUTPUT CIRCUIT

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

DTC Descriptor

DTC C0297 02

Brake Applied Output Circuit Short to Ground

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Brake Applied Signal	C0297 02	C0297 02	1	-
1. Cruise Control Malfunction				

Circuit/System Description

The brake pedal position sensor is used to sense the action of the driver application of the brake pedal. The brake pedal position sensor provides an analog voltage signal that will increase as the brake pedal is applied. The body control module (BCM) provides a low reference signal and a 5 V reference voltage to the brake pedal position sensor. When the variable signal reaches a voltage threshold indicating the brakes have been applied, the BCM will apply battery voltage to the right and left stop lamp control circuits, engine control module (ECM), and center high mounted stop lamp control circuit.

Conditions for Running the DTC

- Battery voltage must be between 9-16 V.
- Brakes APPLIED.

Conditions for Setting the DTC

The BCM detects a short to ground or an open/high resistance on the brake applied signal circuit.

Actions Taken When the DTC Sets

The cruise control system is disabled.

Conditions for Clearing the DTC

- The condition responsible for setting the DTC no longer exists.
- A history DTC will clear once 50 consecutive malfunction-free ignition cycles have occurred.

Diagnostic Aids

Verify that the brake pedal position sensor is properly calibrated.

SYMPTOMS - LIGHTING

NOTE: **The following steps must be completed before using a symptom table.**

- Perform the **Diagnostic System Check - Vehicle** before using a symptom table in order to verify that all of the following conditions are true:
 - There are no DTCs set.
 - The control modules can communicate via the serial data link.
- Review the system description and operation in order to familiarize yourself with the system functions. Refer to the following:
 - **Exterior Lighting Systems Description and Operation**
 - **Interior Lighting Systems Description and Operation**

Visual/Physical Inspection

- Inspect for aftermarket devices which could affect the operation of the lighting system. Refer to **Checking Aftermarket Accessories** .
- Inspect the easily accessible or visible system components for obvious damage or conditions which could cause the symptom.

Intermittent

Thoroughly inspect the wiring and connectors. An incomplete inspection of the wiring and connectors may result in misdiagnosis causing part replacement with the reappearance of the malfunction. If an intermittent malfunction exists, refer to **Testing for Intermittent Conditions and Poor Connections** .

Symptom List

Refer to a symptom diagnostic procedure from the following list in order to diagnose the symptom:

- **Backup Lamps Malfunction (Automatic Transmission), Backup Lamps Malfunction (Manual Transmission)**

- Courtesy Lamps Malfunction
- Dome Lamps Malfunction
- Front Fog Lamps Malfunction
- Hazard Lamps Malfunction
- Headlamps Malfunction
- Interior Backlighting Malfunction
- Park, License, and/or Tail Lamps Malfunction
- Rear Compartment Lamp Malfunction
- Stop Lamps Malfunction
- Turn Signal Lamps and/or Indicators Malfunction

BACKUP LAMPS MALFUNCTION (AUTOMATIC TRANSMISSION)

Diagnostic Instructions

- Perform the Diagnostic System Check - Vehicle prior to using this diagnostic procedure.
- Review Strategy Based Diagnosis for an overview of the diagnostic approach.
- Diagnostic Procedure Instructions provides an overview of each diagnostic category.

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
F6DA (BCM 6) Fuse B+	B2545 01, B2545 04, B2615 02	B2545 01, B2545 04, B2615 02	-	-
Backup Lamps Control	B2545 02	B2545 01, B2545 04	B2545 01	-
Backup Lamp Ground - Left	-	1	-	-
Backup Lamp Ground - Right	-	1	-	-
1. Backup Lamps Malfunction				

Circuit/System Description

With the engine running and the transmission in the reverse position, the transmission control module (TCM) sends a serial data message to the body control module (BCM). The message indicates that the gear selector is in the reverse position. The BCM applies battery voltage to the backup lamps control circuit illuminating the backup lamps. Once the driver moves the gear selector out of the reverse position, a message is sent by the TCM via serial data requesting the BCM to remove battery voltage from the backup lamps control circuit. The engine must be running for the backup lamps to operate.

Diagnostic Aids

When testing at the backup lamp bulb socket, make sure all measurements and test lamp connections are in the

correct terminal location and do not come in contact with each other during testing.

Circuit/System Testing

1. Ignition OFF, disconnect the X5 harness connector at the K9 body control module, ignition ON.
2. Verify a test lamp illuminates between the B+ circuit terminal 4 and ground.
 - **If the test lamp does not illuminate and the circuit fuse is good**
 1. Ignition OFF.
 2. Test for less than 2 ohms in the B+ circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, verify the fuse is not open and there is voltage at the fuse.
 - **If the test lamp does not illuminate and the circuit fuse is open**
 1. Ignition OFF.
 2. Test for infinite resistance between the B+ circuit and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance, replace the K9 body control module.
 - **If the test lamp illuminates**

3. Ignition OFF, connect the X5 harness connector at the K9 body control module.
4. Ignition OFF, exterior lamps OFF, remove the appropriate E5 backup lamp bulb at the appropriate E42 tail lamp assembly. It may take up to 2 minutes for all vehicle systems to power down.
5. Test for less than 5 ohms between the ground circuit at the socket terminal and ground.
 - **If 5 ohms or greater**
 1. Ignition OFF.
 2. Test for less than 2 ohms in the ground circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, repair the open/high resistance in the ground connection.
 - **If less than 5 ohms**
6. Connect a test lamp between the control circuit at the socket terminal and ground, ignition ON.
7. Verify the test lamp turns ON and OFF when commanding the Backup Lamps ON and OFF with a scan tool.
 - **If the test lamp is always OFF**
 1. Ignition OFF, disconnect the X7 harness connector at the K9 body control module.
 2. Test for infinite resistance between the control circuit and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance
 3. Test for less than 2 ohms in the control circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, replace the K9 body control module.
 - **If the test lamp is always ON**
 1. Ignition OFF, disconnect the X7 harness connector at the K9 body control module, ignition ON.
 2. Test for less than 1 V between the control circuit and ground.
 - If 1 V or greater, repair the short to voltage on the circuit.
 - If less than 1 V, replace the K9 body control module.
 - **If the test lamp turns ON and OFF**
8. Test or replace the appropriate E5 backup lamp.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

Backup Lamp Ground - Left	-	1	-	-
Backup Lamp Ground - Right	-	1	-	-
1. Backup Lamps Malfunction				

Circuit/System Description

The engine control module (ECM) provides a signal circuit to the backup lamp switch which is permanently grounded. With the engine running and the transmission in the reverse position, the backup lamp switch signal circuit is pulled low and the ECM responds by sending a serial data message to the body control module (BCM). The message indicates that the gear selector is in the reverse position. The BCM applies battery voltage to the backup lamps control circuit illuminating the backup lamps. Once the driver moves the gear selector out of the reverse position, a message is sent by the ECM via serial data requesting the BCM to remove battery voltage from the backup lamps control circuit. The engine must be running for the backup lamps to operate.

Diagnostic Aids

When testing at the backup lamp bulb socket, make sure all measurements and test lamp connections are in the correct terminal location and do not come in contact with each other during testing.

Circuit/System Verification

1. Engine ON.
2. Verify the scan tool Reverse Position Switch parameter changes between ON and OFF while shifting the vehicle between the neutral and reverse gears.
 - **If the parameter does not change**

Refer to Backup Lamp Switch Malfunction.
 - **If the parameter changes**
3. Verify the backup lamps turn ON and OFF when commanding the Backup Lamps ON and OFF with a scan tool.
 - **If the backup lamps do not turn ON and OFF**

Refer to Backup Lamps Malfunction.
 - **If the backup lamps turn ON and OFF**
4. All OK.

Circuit/System Testing

Backup Lamp Switch Malfunction

1. Ignition OFF, exterior lamps OFF, all doors closed, disconnect the harness connector at the B16 backup lamp switch. It may take up to 2 minutes for all vehicle systems to power down.
2. Test for less than 5 ohms between the ground circuit terminal 2 and ground.
 - **If 5 ohms or greater**
 1. Ignition OFF.
 2. Test for less than 2 ohms in the ground circuit end to end.

- If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, repair the open/high resistance in the ground connection.
- **If less than 5 ohms**
- 3. Ignition ON.
- 4. Verify the scan tool Reverse Position Switch parameter is Off.
 - **If not Off**
 1. Ignition OFF, disconnect the X1 harness connector at the K20 engine control module.
 2. Test for infinite resistance between the signal circuit terminal 1 and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance, replace the K20 engine control module.
 - **If Off**
- 5. Install a 3 A fused jumper wire between the signal circuit terminal 1 and the ground circuit terminal 2.
- 6. Verify the scan tool Reverse Position Switch parameter is On.
 - **If not On**
 1. Ignition OFF, disconnect the X1 harness connector at the K20 engine control module.
 2. Test for less than 1 V between the signal circuit terminal 1 and ground.
 - If 1 V or greater, repair the short to voltage on the circuit.
 - If less than 1 V
 3. Test for less than 2 ohms in the signal circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, replace the K20 engine control module.
 - **If On**
- 7. Test or replace the B16 backup lamp switch.

Backup Lamps Malfunction

1. Ignition OFF, disconnect the X5 harness connector at the K9 body control module, ignition ON.
2. Verify a test lamp illuminates between the B+ circuit terminal 4 and ground.
 - **If the test lamp does not illuminate and the circuit fuse is good**
 1. Ignition OFF.
 2. Test for less than 2 ohms in the B+ circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, verify the fuse is not open and there is voltage at the fuse.
 - **If the test lamp does not illuminate and the circuit fuse is open**
 1. Ignition OFF.
 2. Test for infinite resistance between the B+ circuit and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance, replace the K9 body control module.

- **If the test lamp illuminates**
- 3. Ignition OFF, connect the X5 harness connector at the K9 body control module.
- 4. Ignition OFF, exterior lamps OFF, remove the appropriate E5 backup lamp bulb at the appropriate E42 tail lamp assembly. It may take up to 2 minutes for all vehicle systems to power down.
- 5. Test for less than 5 ohms between the ground circuit at the socket terminal and ground.
 - **If 5 ohms or greater**
 1. Ignition OFF.
 2. Test for less than 2 ohms in the ground circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, repair the open/high resistance in the ground connection.
 - **If less than 5 ohms**
- 6. Connect a test lamp between the control circuit at the socket terminal and ground, ignition ON.
- 7. Verify the test lamp turns ON and OFF when commanding the Backup Lamps ON and OFF with a scan tool.
 - **If the test lamp is always OFF**
 1. Ignition OFF, disconnect the X7 harness connector at the K9 body control module.
 2. Test for infinite resistance between the control circuit and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance
 3. Test for less than 2 ohms in the control circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, replace the K9 body control module.
 - **If the test lamp is always ON**
 1. Ignition OFF, disconnect the X7 harness connector at the K9 body control module, ignition ON.
 2. Test for less than 1 V between the control circuit terminal and ground.
 - If 1 V or greater, repair the short to voltage on the circuit.
 - If less than 1 V, replace the K9 body control module.
 - **If the test lamp turns ON and OFF**
- 8. Test or replace the appropriate E5 backup lamp.

1. Courtesy Lamps Malfunction 2. Dome Lamps Malfunction				

Circuit/System Description

The body control module (BCM) supplies battery voltage to the reading lamp via the courtesy lamp control circuit. The reading lamp is controlled by an individual switch that is activated by the operator when additional cabin lighting is required. In the event that the courtesy reading lamp were to remain illuminated for more than 10 min with the ignition switch in the OFF position the BCM will deactivate the courtesy lamp control circuit to prevent total battery discharge.

Circuit/System Testing

1. Ignition OFF, all doors closed, all accessories OFF, disconnect the harness connector at the E36AH Dome Lamp. It may take up to 2 min for all vehicle systems to power down.
2. Test for less than 10 ohms between the appropriate ground circuit terminal listed below and ground.
 - E36AH Dome Lamp - terminal 3 (with UE1)
 - E36AH Dome Lamp - terminal 2 (without UE1)
 - **If 10 ohms or greater**
 1. Ignition OFF.
 2. Test for less than 2 ohms in the ground circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, repair the open/high resistance in the ground connection.
 - **If less than 10 ohms**
3. Connect a test lamp between the appropriate control circuit terminal listed below and ground.
 - E36AH Dome Lamp - terminal 1 (with UE1)
 - E36AH Dome Lamp - terminal 4 (without UE1)
4. Verify the test lamp turns ON and OFF when commanding the Inadvertent Load ON and OFF with a scan tool.
 - **If the test lamp is always OFF**
 1. Ignition OFF, disconnect the X7 harness connector at the K9 Body Control Module.
 2. Test for infinite resistance between the control circuit and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance
 3. Test for less than 2 ohms in the control circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, replace the K9 Body Control Module.
 - **If the test lamp is always ON**
 1. Ignition OFF, disconnect the X7 harness connector at the K9 Body Control Module, ignition ON.
 2. Test for less than 1 V between the control circuit terminal and ground.
 - If 1 V or greater, repair the short to voltage on the circuit.
 - If less than 1 V, replace the K9 Body Control Module.
 - **If the test lamp turns ON and OFF**
5. Test or replace the E36AH Dome Lamp.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

Reading Lamp Control	B1480 02	1	1	-
Dome Lamp Ground	-	1, 2	-	-
1. Courtesy Lamps Malfunction 2. Dome Lamps Malfunction				

Circuit/System Description

When any door is opened, the door ajar switch contacts close and the body control module (BCM) receives a door-open input. The BCM illuminates the dome lamp when any door is opened or a door lock/unlock request is activated with the key fob. After all doors have been closed, the dome lamp will remain illuminated approximately 3 seconds after the last door closes. In the event that the dome lamp were to remain illuminated for more than 10 min with the ignition switch in the OFF position the BCM will deactivate the dome lamp control circuit to prevent total battery discharge.

Circuit/System Verification

1. Ignition ON.
2. Verify the scan tool Door Ajar Sw. parameter changes between Active and Inactive while opening and closing each vehicle door.
 - **If the parameter does not change**

Refer to **Door Ajar Indicator Malfunction** .

- **If the parameter changes**
3. Verify the dome lamps turn ON and OFF while commanding the Courtesy Lamps ON and OFF with a scan tool.
 - **If the dome lamps do not turn ON and OFF**

Refer to Circuit/System Testing.

- **If the dome lamps turn ON and OFF**
4. All OK.

Circuit/System Testing

1. Ignition OFF, all doors closed, all accessories OFF, disconnect the harness connector at the E36AH Dome Lamp. It may take up to 2 min for all vehicle systems to power down.
2. Test for less than 10 ohms between the appropriate ground circuit terminal listed below and ground.
 - E36AH Dome Lamp - terminal 3 (with UE1)
 - E36AH Dome Lamp - terminal 2 (without UE1)
 - **If 10 ohms or greater**

1. Ignition OFF.
2. Test for less than 2 ohms in the ground circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, repair the open/high resistance in the ground connection.
 - **If less than 10 ohms**
3. Connect a test lamp between the appropriate control circuit terminal listed below and ground.
 - E36AH Dome Lamp - terminal 2 (with UE1)
 - E36AH Dome Lamp - terminal 3 (without UE1)
4. Verify the test lamp turns ON and OFF when commanding the Courtesy Lamps ON and OFF with a scan tool.
 - **If the test lamp is always OFF**
 1. Ignition OFF, disconnect the X7 harness connector at the K9 Body Control Module.
 2. Test for infinite resistance between the control circuit and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance
 3. Test for less than 2 ohms in the control circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, replace the K9 Body Control Module.
 - **If the test lamp is always ON**
 1. Ignition OFF, disconnect the X7 harness connector at the K9 Body Control Module, ignition ON.
 2. Test for less than 1 V between the control circuit terminal and ground.
 - If 1 V or greater, repair the short to voltage on the circuit.
 - If less than 1 V, replace the K9 Body Control Module.
 - **If the test lamp turns ON and OFF**
 - 5. Test or replace the E36AH Dome Lamp.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

Front Fog Lamp Ground - Left	-	1	-	-
Front Fog Lamp Ground - Right	-	1	-	-
Turn Signal/Multifunction Switch Ground	-	1	-	-
1. Front Fog Lamps Malfunction				

Circuit/System Description

The front fog lamp relay is supplied with battery voltage at all times. The front fog lamp switch signal circuit is grounded momentarily by pressing the front fog lamp switch. The body control module (BCM) energizes the front fog lamp relay by applying ground to the front fog lamp relay control circuit. When the front fog lamp relay is energized, the relay switch contacts close and battery voltage is applied through the front fog lamps fuse to the front fog lamp control circuit which illuminates the front fog lamps.

Circuit/System Verification

1. Ignition ON, headlamps ON.
2. Verify the scan tool Front Fog Lamps Switch parameter changes between Active and Inactive while commanding the front fog lamps ON and OFF with the front fog lamp switch.
 - **If the parameter does not change**

Refer to Front Fog Lamp Switch Malfunction.
 - **If the parameter changes**
3. Verify the front fog lamps turn ON and OFF when commanding the Front Fog Lamps ON and OFF with a scan tool.
 - **If the front fog lamps do not turn ON and OFF**

Refer to Front Fog Lamps Malfunction.
 - **If the front fog lamps turn ON and OFF**
4. Verify the front fog lamp indicator on the instrument cluster turns ON and OFF while commanding the front fog lamps ON and OFF with the front fog lamp switch.
 - **If the front fog lamp indicator does not turn ON and OFF**

Refer to Front Fog Lamp Indicator Malfunction.
 - **If the front fog lamp indicator turns ON and OFF**
5. All OK.

Circuit/System Testing

Front Fog Lamp Switch Malfunction

1. Ignition OFF, all doors closed, all accessories OFF, disconnect the harness connector at the S78 turn signal/multifunction switch. It may take up to 2 minutes for all vehicle systems to power down.
2. Test for less than 15 ohms between the ground circuit terminal 1 and ground.
 - **If 15 ohms or greater**
 1. Ignition OFF.
 2. Test for less than 2 ohms in the ground circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, repair the open/high resistance in the ground connection.
 - **If less than 15 ohms**
3. Ignition ON.
4. Verify the scan tool Front Fog Lamps Switch parameter is Inactive.

- **If not Inactive**

1. Ignition OFF, disconnect the X7 harness connector at the K9 body control module.
2. Test for infinite resistance between the signal circuit terminal 8 and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance, replace the K9 body control module.

- **If Inactive**

5. Install a 3 A fused jumper wire between the signal circuit terminal 8 and the ground circuit terminal 1.
6. Verify the scan tool Front Fog Lamps Switch parameter is Active.

- **If not Active**

1. Ignition OFF, disconnect the X7 harness connector at the K9 body control module, ignition ON.
2. Test for less than 1 V between the signal circuit terminal 2 and ground.
 - If 1 V or greater, repair the short to voltage on the circuit.
 - If less than 1 V
3. Test for less than 2 ohms in the signal circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, replace the K9 body control module.

- **If Active**

7. Test or replace the S78 turn signal/multifunction switch.

Front Fog Lamps Malfunction

1. Ignition OFF, disconnect the KR46 front fog lamp relay, ignition ON.
2. Verify a test lamp illuminates between the B+ circuit terminal 30 and ground.

- **If the test lamp does not illuminate**

Replace the X50A fuse block - underhood.

- **If the test lamp illuminates**

3. Verify a test lamp illuminates between the B+ circuit terminal 86 and ground.

- **If the test lamp does not illuminate**

Replace the X50A fuse block - underhood.

- **If the test lamp illuminates**

4. Ignition OFF, connect a test lamp between the control circuit terminal 85 and B+, ignition ON.
5. Verify the test lamp turns ON and OFF when commanding the Front Fog Lamps ON and OFF with a scan tool.

- **If the test lamp is always OFF**

1. Ignition OFF, disconnect the X5 harness connector at the K9 body control module, ignition ON.
2. Test for less than 1 V between the control circuit terminal and ground.

- If 1 V or greater, repair the short to voltage on the circuit.
 - If less than 1 V
- 3. Ignition OFF.
- 4. Test for less than 2 ohms in the control circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, replace the K9 body control module.
 - **If the test lamp is always ON**
- 1. Ignition OFF, disconnect the X5 harness connector at the K9 body control module.
- 2. Test for infinite resistance between the control circuit terminal and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance, replace the K9 body control module.
 - **If the test lamp turns ON and OFF**
- 6. Ignition OFF, connect the KR46 front fog lamp relay.
- 7. Ignition OFF, exterior lamps OFF, disconnect the harness connector at the appropriate E29 fog lamp.
- 8. Test for less than 5 ohms between the ground circuit terminal A and ground.
 - **If 5 ohms or greater**
- 1. Ignition OFF.
- 2. Test for less than 2 ohms in the ground circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, repair the open/high resistance in the ground connection.
 - **If less than 5 ohms**
- 9. Connect a test lamp between the control circuit terminal B and ground, ignition ON.
- 10. Verify the test lamp turns ON and OFF when commanding the Front Fog Lamps ON and OFF with a scan tool.
 - **If the test lamp is always OFF**
- 1. Ignition OFF, disconnect the X1 harness connector at the X50A fuse block - underhood.
- 2. Test for infinite resistance between the control circuit and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance
- 3. Test for less than 2 ohms in the control circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, replace the KR46 front fog lamp relay.
 - **If the test lamp is always ON**
- 1. Ignition OFF, disconnect the X1 harness connector at the X50A fuse block - underhood, ignition ON.
- 2. Test for less than 1 V between the control circuit terminal and ground.
 - If 1 V or greater, repair the short to voltage on the circuit.
 - If less than 1 V, replace the KR46 front fog lamp relay.

- If the test lamp turns ON and OFF

11. Test or replace the appropriate E29 fog lamp.

Front Fog Lamp Indicator Malfunction

1. Ignition ON.
2. Verify the front fog lamp indicator turns ON and OFF when commanding the Instrument Cluster All Indicators Test ON and OFF with a scan tool.

- If the front fog lamp indicator is always OFF or remains ON

Replace the P16 instrument cluster.

- If the front fog lamp indicator turns ON and OFF

3. Replace the K9 body control module.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

- **Front Fog Lamp Replacement (Projection)**
- **Front Fog Lamp Bulb Replacement (Projection)**
- **Relay Replacement (Within an Electrical Center) , Relay Replacement (Attached to Wire Harness)**
- **Fuse Block Replacement**
- **Control Module References** for BCM or Instrument Cluster replacement, programming, and setup

HAZARD LAMPS MALFUNCTION

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Hazard Warning Switch Signal	1	1	1	B3596 00
Hazard Warning Switch LED Backlighting Control	B2652 02	2	2	-
Hazard Warning Switch Ground	-	1	-	-
1. Hazard Lamps Malfunction 2. Hazard Warning Switch Backlighting Malfunction				

Circuit/System Description

The hazard flashers may be activated in any power mode. The hazard warning switch signal circuit is momentarily grounded when the hazard warning switch is pressed. The body control module (BCM) responds to the hazard warning switch signal input by supplying battery voltage to all four turn signal lamps in an ON and OFF duty cycle. When the hazard warning switch is activated, the BCM sends a serial data message to the instrument cluster requesting both turn signal indicators to be cycled ON and OFF.

The instrument panel dimmer switch controls are located on the headlamp switch assembly and are used to increase and decrease the brightness of the interior backlighting components. When the instrument panel dimmer switch is placed in a desired brightness position, the body control module (BCM) receives a signal from the instrument dimmer switch and responds by applying a pulse width modulated (PWM) voltage to the hazard switch LED backlighting control circuit illuminating the LED to the desired level of brightness.

Circuit/System Verification

1. Ignition ON.
2. Verify the scan tool Hazard Lamps Switch parameter changes between Active and Inactive while commanding the hazard lamps ON and OFF with the hazard warning switch.
 - **If the parameter does not change**

Refer to Hazard Warning Switch Malfunction.

- **If the parameter changes**

3. Verify all left and right turn signal lamps turn ON and OFF while commanding the hazard lamps ON and OFF with the hazard warning switch.

- **If all turn signal lamps do not turn ON and OFF**

Refer to **Turn Signal Lamps and/or Indicators Malfunction**

- **If all turn signal lamps turn ON and OFF**

4. Verify the hazard warning switch backlighting turns ON and OFF while commanding the Hazard Lamps Switch Backlight ON and OFF with a scan tool.

- **If the hazard warning switch backlighting does not turn ON and OFF**

Refer to Hazard Warning Switch Backlighting Malfunction.

- **If the hazard warning switch backlighting turns ON and OFF**

5. All OK.

Circuit/System Testing

Hazard Warning Switch Malfunction

1. Ignition OFF, scan tool disconnected, all doors closed, all accessories OFF, disconnect the harness connector at the S26 hazard warning switch. It may take up to 2 minutes for all vehicle systems to power down.
2. Test for less than 5 ohms between the ground circuit terminal 8 and ground.
 - **If 5 ohms or greater**
 1. Ignition OFF.
 2. Test for less than 2 ohms in the ground circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, repair the open/high resistance in the ground connection.
 - **If less than 5 ohms**
3. Ignition ON.
4. Verify the scan tool Hazard Lamps Switch parameter is Inactive.
 - **If not Inactive**
 1. Ignition OFF, disconnect the X2 harness connector at the K9 body control module.
 2. Test for infinite resistance between the signal circuit terminal 7 and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance, replace the K9 body control module.
 - **If Inactive**
5. Install a 3 A fused jumper wire between the signal circuit terminal 7 and ground.

6. Verify the scan tool Hazard Lamps Switch parameter is Active.
 - **If not Active**
 1. Ignition OFF, disconnect the X2 harness connector at the K9 body control module, ignition ON.
 2. Test for less than 1 V between the signal circuit terminal and ground.
 - If 1 V or greater, repair the short to voltage on the circuit.
 - If less than 1 V
 3. Test for less than 2 ohms in the signal circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, replace the K9 body control module.
 - **If Active**
7. Test or replace the S26 hazard warning switch.

Hazard Warning Switch Backlighting Malfunction

1. Ignition OFF, scan tool disconnected, all doors closed, all accessories OFF, disconnect the harness connector at the S26 hazard warning switch. It may take up to 2 minutes for all vehicle systems to power down.
2. Test for less than 5 ohms between the ground circuit terminal 3 and ground.
 - **If 5 ohms or greater**
 1. Ignition OFF.
 2. Test for less than 2 ohms in the ground circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, repair the open/high resistance in the ground connection.
 - **If less than 5 ohms**
3. Connect a test lamp between the control circuit terminal 2 and ground, ignition ON.
4. Verify the test lamp turns ON and OFF when commanding the Hazard Lamps Switch Backlight ON and OFF with a scan tool.
 - **If the test lamp is always OFF**
 1. Ignition OFF, disconnect the X1 harness connector at the K9 body control module.
 2. Test for infinite resistance between the control circuit and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance
 3. Test for less than 2 ohms in the control circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, replace the K9 body control module.
 - **If the test lamp is always ON**
 1. Ignition OFF, disconnect the X1 harness connector at the K9 body control module, ignition ON.
 2. Test for less than 1 V between the control circuit terminal and ground.
 - If 1 V or greater, repair the short to voltage on the circuit.

- If less than 1 V, replace the K9 body control module.
 - **If the test lamp turns ON and OFF**
5. Test or replace the S26 hazard warning switch.

Turn Signal/Multifunction Switch Ground	-	4	-	-
1. Headlamps Malfunction - Low Beam 2. Headlamps Malfunction - High Beam 3. Headlamp Switch Malfunction 4. Turn Signal/Multifunction Switch Malfunction				

Circuit/System Description

The body control module (BCM) monitors two signal circuits from the headlamp switch. With the headlamp switch in the PARK position, the headlamp switch park lamps ON signal circuit is grounded, indicating that the park lamps have been requested. When the headlamp switch is placed in the HEADLAMP position, both the headlamp switch park lamps ON signal circuit and the headlamp switch headlamps ON signal circuit are grounded. The BCM responds to the inputs by illuminating the park lamps and headlamps. When the low beam headlamps are requested, the BCM applies B+ to both low beam headlamp control circuits illuminating the low beam headlamps.

The high beam and flash to pass functions are contained within the turn signal/multifunction switch. The BCM provides the turn signal/multifunction switch with two signal circuits, the high beam signal circuit and the flash to pass signal circuit. When the low beam headlamps are ON and the turn signal/multifunction switch is placed in the high beam position, ground is applied to the BCM through the high beam signal circuit. The BCM responds to the high beam request by applying ground to the high beam relay control circuit which energizes the high beam relay. With the high beam relay energized, the switch contacts close allowing battery voltage to flow through the high beam fuses to the high beam control circuits illuminating the high beam headlamps.

When the turn signal/multifunction switch is momentarily placed in the flash to pass position, ground is applied to the BCM through the flash to pass signal circuit. The BCM responds by applying ground to the high beam relay control circuit which energizes the high beam relay illuminating the high beams for a brief moment or until the flash to pass switch is released.

Circuit/System Verification

1. Ignition ON.
2. Verify the scan tool Headlamps On Switch parameter changes between Active and Inactive while commanding the headlamp ON and OFF with the headlamp switch.
 - **If the parameter does not change**

Refer to Headlamp Switch Malfunction.
 - **If the parameter changes**
3. Verify the scan tool Headlamps Flash Switch parameter changes between Active and Inactive while commanding the flash to pass ON and OFF with the turn signal/multifunction switch.
 - **If the parameter does not change**

Refer to Turn Signal/Multifunction Switch Malfunction.
 - **If the parameter changes**
4. Verify the scan tool High Beam Select Switch parameter changes between Active and Inactive while commanding the high beams ON and OFF with the turn signal/multifunction switch.
 - **If the parameter does not change**

Refer to Turn Signal/Multifunction Switch Malfunction.
 - **If the parameter changes**
5. Verify the left low beam turns ON and OFF when commanding the Left Low Beam/Daytime Running Lamp ON and OFF with a scan tool.
 - **If the left low beam does not turn ON and OFF**

Refer to Headlamps Malfunction - Low Beam.
 - **If the left low beam turns ON and OFF**
6. Verify the right low beam turns ON and OFF when commanding the Right Low Beam/Daytime Running Lamp ON and OFF with a scan tool.
 - **If the right low beam does not turn ON and OFF**

Refer to Headlamps Malfunction - Low Beam.

- **If the right low beam turns ON and OFF**

7. Verify the high beams turn ON and OFF when commanding the High Beams ON and OFF with a scan tool.

- **If the high beams do not turn ON and OFF**

Refer to Headlamps Malfunction - High Beam.

- **If the high beams turn ON and OFF**

8. Verify the high beam indicator on the instrument cluster turns ON and OFF while commanding the All Indicators Test ON and OFF with a scan tool.

- **If the high beam indicator does not turn ON and OFF**

Refer to High Beam Indicator Malfunction.

- **If the high beam indicator turns ON and OFF**

9. All OK.

Circuit/System Testing

Headlamp Switch Malfunction

1. Ignition OFF, scan tool disconnected, all doors closed, all accessories OFF, disconnect the harness connector at the S78 Turn Signal/Multifunction Switch. It may take up to 2 minutes for all vehicle systems to power down.
2. Test for less than 15 ohms between the ground circuit terminal 1 and ground.
 - **If 15 ohms or greater**
 1. Ignition OFF.
 2. Test for less than 2 ohms in the ground circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, repair the open/high resistance in the ground connection.
 - **If less than 15 ohms**
3. Ignition ON.
4. Verify the scan tool Park Lamps Switch parameter is Inactive.
 - **If not Inactive**
 1. Ignition OFF, disconnect the X1 harness connector at the K9 Body Control Module.
 2. Test for infinite resistance between the signal circuit terminal 2 and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance, replace the K9 Body Control Module.
 - **If Inactive**
5. Install a 3 A fused jumper wire between the signal circuit terminal 2 and the ground circuit terminal 1.

6. Verify the scan tool Park Lamps Switch parameter is Active.
 - **If not Active**
 1. Ignition OFF, disconnect the X1 harness connector at the K9 Body Control Module, ignition ON.
 2. Test for less than 1 V between the signal circuit terminal 2 and ground.
 - If 1 V or greater, repair the short to voltage on the circuit.
 - If less than 1 V
 3. Test for less than 2 ohms in the signal circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, replace the K9 Body Control Module.
 - **If Active**
7. Verify the scan tool Headlamps On Switch parameter is Inactive.
 - **If not Inactive**
 1. Ignition OFF, disconnect the X1 harness connector at the K9 Body Control Module.
 2. Test for infinite resistance between the signal circuit terminal 3 and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance, replace the K9 Body Control Module.
 - **If Inactive**
8. Install a 3 A fused jumper wire between the signal circuit terminal 3 and the ground circuit terminal 1.
9. Verify the scan tool Headlamps On Switch parameter is Active.
 - **If not Active**
 1. Ignition OFF, disconnect the X1 harness connector at the K9 Body Control Module, ignition ON.
 2. Test for less than 1 V between the signal circuit terminal 3 and ground.
 - If 1 V or greater, repair the short to voltage on the circuit.
 - If less than 1 V
 3. Test for less than 2 ohms in the signal circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, replace the K9 Body Control Module.
 - **If Active**
10. Test or replace the S78 Turn Signal/Multifunction Switch.

Turn Signal/Multifunction Switch Malfunction

1. Ignition OFF, scan tool disconnected, all doors closed, all accessories OFF, disconnect the harness connector at the S78 Turn Signal/Multifunction Switch. It may take up to 2 minutes for all vehicle systems to power down.
2. Test for less than 15 ohms between the ground circuit terminal 1 and ground.
 - **If 15 ohms or greater**
 1. Ignition OFF.
 2. Test for less than 2 ohms in the ground circuit end to end.

- If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, repair the open/high resistance in the ground connection.
- **If less than 15 ohms**
- 3. Ignition ON.
- 4. Verify the scan tool High Beam Select Switch parameter is Inactive.
 - **If not Inactive**
 1. Ignition OFF, disconnect the X3 harness connector at the K9 Body Control Module.
 2. Test for infinite resistance between the signal circuit terminal 6 and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance, replace the K9 Body Control Module.
 - **If Inactive**
- 5. Install a 3 A fused jumper wire between the signal circuit terminal 6 and the ground circuit terminal 1.
- 6. Verify the scan tool High Beam Select Switch parameter is Active.
 - **If not Active**
 1. Ignition OFF, disconnect the X3 harness connector at the K9 Body Control Module, ignition ON.
 2. Test for less than 1 V between the signal circuit terminal 6 and ground.
 - If 1 V or greater, repair the short to voltage on the circuit.
 - If less than 1 V
 3. Test for less than 2 ohms in the signal circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, replace the K9 Body Control Module.
 - **If Active**
- 7. Verify the scan tool Headlamps Flash Switch parameter is Inactive.
 - **If not Inactive**
 1. Ignition OFF, disconnect the X3 harness connector at the K9 Body Control Module.
 2. Test for infinite resistance between the signal circuit terminal 7 and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance, replace the K9 Body Control Module.
 - **If Inactive**
- 8. Install a 3 A fused jumper wire between the signal circuit terminal 7 and the ground circuit terminal 1.
- 9. Verify the scan tool Headlamps Flash Switch parameter is Active.
 - **If not Active**
 1. Ignition OFF, disconnect the X3 harness connector at the K9 Body Control Module, ignition ON.
 2. Test for less than 1 V between the signal circuit terminal 7 and ground.
 - If 1 V or greater, repair the short to voltage on the circuit.
 - If less than 1 V
 3. Test for less than 2 ohms in the signal circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.

- If less than 2 ohms, replace the K9 Body Control Module.
 - **If Active**
10. Test or replace the S78 Turn Signal/Multifunction Switch.

Headlamps Malfunction - Low Beam

1. Ignition OFF, exterior lamps OFF, disconnect the harness connector at the appropriate E13 Headlamp. It may take up to 2 minutes for all vehicle systems to power down.
2. Test for less than 5 ohms between the appropriate ground circuit terminal listed below and ground.
 - Terminal 1 - with T90
 - Terminal 2 - without T90
 - **If 5 ohms or greater**
 1. Ignition OFF.
 2. Test for less than 2 ohms in the ground circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, repair the open/high resistance in the ground connection.
 - **If less than 5 ohms**
3. Connect a test lamp between the appropriate control circuit terminal listed below and ground, ignition ON.
 - Terminal 1 - without T90
 - Terminal 2 - with T90
4. Verify the test lamp turns ON and OFF when commanding the appropriate Low Beam/Daytime Running Lamp ON and OFF with a scan tool.
 - **If the test lamp is always OFF**
 1. Ignition OFF, disconnect the X4 harness connector at the K9 Body Control Module.
 2. Test for infinite resistance between the control circuit and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance
 3. Test for less than 2 ohms in the control circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, replace the K9 Body Control Module.
 - **If the test lamp is always ON**
 1. Ignition OFF, disconnect the X4 harness connector at the K9 Body Control Module, ignition ON.
 2. Test for less than 1 V between the control circuit terminal and ground.
 - If 1 V or greater, repair the short to voltage on the circuit.
 - If less than 1 V, replace the K9 Body Control Module.
 - **If the test lamp turns ON and OFF**
5. Test or replace the appropriate E4 Headlamp - Low Beam.

Headlamps Malfunction - High Beam

1. Ignition OFF, remove the KR48 Headlamp High Beam Relay, ignition ON.
2. Verify a test lamp illuminates between the B+ circuit terminal 85 and ground.
 - **If the test lamp does not illuminate**

Replace the X50A Fuse Block - Underhood.
 - **If the test lamp illuminates**
3. Verify a test lamp illuminates between the B+ circuit terminal 30 and ground.
 - **If the test lamp does not illuminate**

Replace the X50A Fuse Block - Underhood.
 - **If the test lamp illuminates**
4. Ignition OFF, connect a test lamp between the control circuit terminal 86 and B+, ignition ON.
5. Verify the test lamp turns ON and OFF when commanding the High Beams ON and OFF with a scan tool.
 - **If the test lamp is always OFF**
 1. Ignition OFF, disconnect the X5 harness connector at the K9 Body Control Module, ignition ON.
 2. Test for less than 1 V between the control circuit terminal and ground.
 - If 1 V or greater, repair the short to voltage on the circuit.
 - If less than 1 V
 3. Ignition OFF.
 4. Test for less than 2 ohms in the control circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, replace the K9 Body Control Module.
 - **If the test lamp is always ON**
 1. Ignition OFF, disconnect the X5 harness connector at the K9 Body Control Module.
 2. Test for infinite resistance between the control circuit terminal and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance, replace the K9 Body Control Module.
 - **If the test lamp turns ON and OFF**
 - 6. Ignition OFF, exterior lamps OFF, connect the KR48 Headlamp High Beam Relay.
 - 7. Disconnect the harness connector at the appropriate E13 Headlamp. It may take up to 2 minutes for all vehicle systems to power down.
 - 8. Test for less than 5 ohms between the appropriate ground circuit terminal listed below and ground.
 - Terminal 1 - with T90
 - Terminal 2 - without T90
 - **If 5 ohms or greater**

1. Ignition OFF.
2. Test for less than 2 ohms in the ground circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, repair the open/high resistance in the ground connection.
 - **If less than 5 ohms**
9. Connect a test lamp between the control circuit terminal 3 and ground, ignition ON.
10. Verify the test lamp turns ON and OFF when commanding the High Beams ON and OFF with a scan tool.
 - **If the test lamp is always OFF**
 1. Ignition OFF, disconnect the X1 harness connector at the X50A Fuse Block - Underhood.
 2. Test for infinite resistance between the control circuit and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance
 3. Test for less than 2 ohms in the control circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, replace the KR48 Headlamp High Beam Relay.
 - **If the test lamp is always ON**
 1. Ignition OFF, disconnect the X1 harness connector at the X50A Fuse Block - Underhood, ignition ON.
 2. Test for less than 1 V between the control circuit terminal and ground.
 - If 1 V or greater, repair the short to voltage on the circuit.
 - If less than 1 V, replace the KR48 Headlamp High Beam Relay.
 - **If the test lamp turns ON and OFF**
 - 11. Test or replace the appropriate E4 Headlamp - High Beam.

High Beam Indicator Malfunction

1. Ignition ON.
2. Verify the high beam indicator turns ON and OFF when commanding the Instrument Cluster All Indicators Test ON and OFF with a scan tool.
 - **If the high beam indicator is always OFF or remains ON**

Replace the P16 Instrument Cluster.
 - **If the high beam indicator turns ON and OFF**
3. Replace the K9 Body Control Module.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

- **Headlamp Bulb Replacement**
- **Relay Replacement (Within an Electrical Center)** , **Relay Replacement (Attached to Wire Harness)**
- **Turn Signal Switch Replacement**
- **Control Module References** for BCM or Instrument Cluster replacement, programming, and setup

INTERIOR BACKLIGHTING MALFUNCTION

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

Circuit/System Description

The instrument panel dimmer switch is used to increase and decrease the brightness of the interior backlighting components. The instrument panel dimmer switch provides a voltage signal to the body control module (BCM) that will increase as the brightness of the lights are increased and decrease as the brightness of the lights are decreased. The BCM provides a low reference, signal, and B+ voltage circuits to the instrument panel dimmer switch. When the instrument panel dimmer switch is placed in the desired position, the dimmed voltage setting is applied from the instrument panel dimmer switch through the instrument panel dimmer switch signal circuit to the BCM. The BCM interprets the signal and applies a pulse width modulated (PWM) voltage through the light emitting diode (LED) dimming control circuits illuminating the interior backlighting to the requested level of brightness.

Scan Tool Reference

Control Module References for scan tool information

Circuit/System Verification

1. Ignition ON.
2. Verify the scan tool LED Backlight Dimming Command parameter changes between a high percentage to a low percentage while operating the dimmer switch from high to low.

- **If the parameter does not change**

Refer to Dimmer Switch Malfunction.

- **If the parameter changes**

3. Verify the backlighting components turn ON and OFF while commanding the LED Backlight Dimming ON and OFF with a scan tool.

- **If the backlighting components do not turn ON and OFF**

Refer to Interior Backlighting Malfunction.

- **If the backlighting components turn ON and OFF**

4. Verify the hazard warning switch backlighting turns ON and OFF while commanding the Hazard Lamps Switch Backlight ON and OFF with a scan tool.

- **If the hazard warning switch backlighting does not turn ON and OFF**

Refer to Hazard Warning Switch Backlighting Malfunction.

- **If the hazard warning switch backlighting turns ON and OFF**

5. Verify the amber HVAC recirculation indicator illuminates when turning the recirculation function ON/OFF.

- **If the amber HVAC recirculation indicator does not illuminate**

Refer to HVAC Recirculation Indicator Malfunction.

- **If the amber HVAC recirculation indicator illuminates**

6. All OK.

Circuit/System Testing

Dimmer Switch Malfunction

1. Ignition OFF, disconnect the harness connector at the S36 Instrument Panel Dimmer Switch, ignition ON.
2. Verify a test lamp illuminates between the low reference circuit terminal 2 and B+.

- **If the test lamp does not illuminate**

1. Ignition OFF, disconnect the X1 harness connector at the K9 Body Control Module, ignition ON.
2. Test for less than 1 V between the low reference circuit terminal 2 and ground.
 - If 1 V or greater, repair the short to voltage on the circuit.
 - If less than 1 V
3. Test for less than 2 ohms in the low reference circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, replace the K9 Body Control Module.
 - **If the test lamp illuminates**
3. Test for B+ between the B+ reference circuit terminal 1 and ground.
 - **If less than B+**
 - 1. Ignition OFF, disconnect the X1 harness connector at the K9 Body Control Module.
 - 2. Test for infinite resistance between the B+ reference circuit and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance
 - 3. Test for less than 2 ohms in the B+ reference circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, replace the K9 Body Control Module.
 - **If B+**
4. Verify a test lamp does not illuminate between the B+ reference circuit terminal 1 and ground.
 - **If the test lamp illuminates**
 - 1. Ignition OFF, disconnect the X1 harness connector at the K9 Body Control Module, ignition ON.
 - 2. Test for less than 1 V between the B+ reference circuit terminal 2 and ground.
 - If 1 V or greater, repair the short to voltage on the circuit.
 - If less than 1 V, replace the K9 Body Control Module.
 - **If the test lamp does not illuminate**
5. Park lamps ON, verify a test lamp does not illuminate between the signal circuit terminal 3 and ground.
 - **If the test lamp illuminates**
 - 1. Ignition OFF, disconnect the X2 harness connector at the K9 Body Control Module, ignition ON.
 - 2. Test for less than 1 V between the signal circuit terminal 3 and ground.
 - If 1 V or greater, repair the short to voltage on the circuit.
 - If less than 1 V, replace the K9 Body Control Module.
 - **If the test lamp does not illuminate**
6. Ignition ON, park lamps OFF, test for between 57.4 K ohms and 58 K ohms between the signal circuit terminal 3 and ground.
 - **If not between 57.4 K ohms and 58 K ohms**
 - 1. Ignition OFF, disconnect the X2 harness connector at the K9 Body Control Module.
 - 2. Test for infinite resistance between the signal circuit and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.

- If infinite resistance
- 3. Test for less than 2 ohms in the signal circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, replace the K9 Body Control Module.
- **If between 57.4 K ohms and 58 K ohms**
- 7. Test or replace the S36 Instrument Panel Dimmer Switch.

Interior Backlighting Malfunction

NOTE: Each component with backlighting may need to be disconnected to isolate a short to voltage or short to ground. Use the schematics to identify the following:

- Backlighting components the vehicle is equipped with
- Each component's control and ground circuit terminals
- Component locations on the backlighting control circuit

1. Ignition OFF, all doors closed, all accessories OFF, disconnect the harness connector at the component with inoperative backlighting. It may take up to 2 minutes for all vehicle systems to power down.
2. Test for less than 15 ohms between the appropriate ground circuit terminal listed below and ground.
 - S13D Door Lock Switch - Driver terminal 3
 - S13P Door Lock Switch - Passenger terminal 3
 - S36 Instrument Panel Dimmer Switch - terminal 5
 - S46B Liftgate Unlatch Switch - terminal 6
 - S32D Seat Heating Switch - Driver terminal 5
 - S32P Seat Heating Switch - Passenger terminal 5
 - S70L Steering Wheel Controls Switch - Left terminal 2
 - S70R Steering Wheel Controls Switch - Right terminal 2
 - S75 Traction Control Switch - terminal 3
 - S3 Transmission Shift Lever - terminal 3
 - **If 15 ohms or greater**
 1. Ignition OFF.
 2. Test for less than 2 ohms in the ground circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, repair the open/high resistance in the ground connection.
 - **If less than 15 ohms**
3. Connect a test lamp between the appropriate control circuit terminal listed below and ground.
 - K33 HVAC control module - terminal 6 X1
 - S13D Door Lock Switch - Driver terminal 1

- S13P Door Lock Switch - Passenger terminal 1
 - S36 Instrument Panel Dimmer Switch - terminal 4
 - S46B Liftgate Unlatch Switch - terminal 5
 - S32D Seat Heating Switch - Driver terminal 6
 - S32P Seat Heating Switch - Passenger terminal 6
 - S70L Steering Wheel Controls Switch - Left terminal 1
 - S70R Steering Wheel Controls Switch - Right terminal 1
 - S75 Traction Control Switch - terminal 2
 - S3 Transmission Shift Lever - terminal 8
4. Verify the test lamp turns ON and OFF when commanding the LED Backlight Dimming ON and OFF with a scan tool.
 - **If the test lamp is always OFF**
 1. Ignition OFF, disconnect the X2 harness connector at the K9 Body Control Module.
 2. Test for infinite resistance between the control circuit and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance
 3. Test for less than 2 ohms in the control circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, replace the K9 Body Control Module.
 - **If the test lamp is always ON**
 1. Ignition OFF, disconnect the X2 harness connector at the K9 Body Control Module, ignition ON.
 2. Test for less than 1 V between the control circuit terminal and ground.
 - If 1 V or greater, repair the short to voltage on the circuit.
 - If less than 1 V, replace the K9 Body Control Module.
 - **If the test lamp turns ON and OFF**
 5. Test or replace the component with inoperative backlighting.

Hazard Warning Switch Backlighting Malfunction

1. Ignition OFF, scan tool disconnected, all doors closed, all accessories OFF, disconnect the harness connector at the S26 Hazard Warning Switch. It may take up to 2 minutes for all vehicle systems to power down.
2. Test for less than 5 ohms between the ground circuit terminal 3 and ground.
 - **If 5 ohms or greater**
 1. Ignition OFF.
 2. Test for less than 2 ohms in the ground circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, repair the open/high resistance in the ground connection.
 - **If less than 5 ohms**

3. Connect a test lamp between the control circuit terminal 2 and ground, ignition ON.
4. Verify the test lamp turns ON and OFF when commanding the Hazard Lamps Switch Backlight ON and OFF with a scan tool.
 - **If the test lamp is always OFF**
 1. Ignition OFF, disconnect the X1 harness connector at the K9 Body Control Module.
 2. Test for infinite resistance between the control circuit and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance
 3. Test for less than 2 ohms in the control circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, replace the K9 Body Control Module.
 - **If the test lamp is always ON**
 1. Ignition OFF, disconnect the X1 harness connector at the K9 Body Control Module, ignition ON.
 2. Test for less than 1 V between the control circuit terminal and ground.
 - If 1 V or greater, repair the short to voltage on the circuit.
 - If less than 1 V, replace the K9 Body Control Module.
 - **If the test lamp turns ON and OFF**
5. Test or replace the S26 Hazard Warning Switch.

HVAC Recirculation Indicator Malfunction

1. Ignition OFF, disconnect the X1 harness connector at the K33 HVAC Control Module.
2. Connect a test lamp between the control circuit terminal 10 and ground.
3. Verify the test lamp turns ON and OFF while turning the ignition switch ON and OFF.
 - **If the test lamp is always OFF**
 1. Ignition OFF, disconnect the X1 harness connector at the K9 Body Control Module.
 2. Test for infinite resistance between the control circuit and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance
 3. Test for less than 2 ohms in the control circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, replace the K9 Body Control Module.
 - **If the test lamp is always ON**
 1. Ignition OFF, disconnect the X1 harness connector at the K9 Body Control Module, ignition ON.
 2. Test for less than 1 V between the control circuit terminal and ground.
 - If 1 V or greater, repair the short to voltage on the circuit.
 - If less than 1 V, replace the K9 Body Control Module.
 - **If the test lamp turns ON and OFF**
4. Test or replace the K33 HVAC Control Module.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

- **Hazard Warning Switch Replacement**
- **Transmission Control Replacement**
- **Steering Wheel Control Switch Assembly Replacement**
- **Control Module References** for BCM or HVAC control module replacement, programming, and setup

PARK, LICENSE, AND/OR TAIL LAMPS MALFUNCTION

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

|---|

Circuit/System Description

When the headlamp switch is placed in the HEAD or PARK position, ground is applied to the park lamp switch ON signal circuit to the body control module (BCM). The BCM responds by applying voltage to the park lamps, tail lamps, and license lamps control circuits illuminating the park, tail, and license lamps.

Diagnostic Aids

When testing at the park lamp bulb sockets, make sure all measurements and test lamp connections are in the correct terminal location and do not come in contact with each other during testing.

Scan Tool Reference

Control Module References for scan tool information

Circuit/System Verification

1. Ignition ON.
2. Verify the scan tool Park Lamp Switch parameter changes between Active and Inactive while commanding the park lamps ON and OFF with the headlamp switch.
 - **If the parameter does not change**

Refer to Park Lamp Switch Malfunction.

- **If the parameter changes**

3. Verify the left park lamps turn ON and OFF when commanding the Left Park Lamps ON and OFF with a scan tool.

- **If the left park lamps do not turn ON and OFF**

Refer to Park Lamps Malfunction.

- **If the left park lamps turn ON and OFF**

4. Verify the right park lamps turn ON and OFF when commanding the Right Park Lamps ON and OFF with a scan tool.

- **If the right park lamps do not turn ON and OFF**

Refer to Park Lamps Malfunction.

- **If the right park lamps turn ON and OFF**

5. Verify the license plate lamp turns ON and OFF when commanding the License Plate Lamps ON and OFF with a scan tool.

- **If the license plate lamp does not turn ON and OFF**

Refer to License Plate Lamp Malfunction.

- **If the license plate lamp turns ON and OFF**

6. All OK.

Circuit/System Testing

Park Lamp Switch Malfunction

1. Ignition OFF, all doors closed, all accessories OFF, disconnect the harness connector at the S78 turn signal/multifunction switch. It may take up to 2 minutes for all vehicle systems to power down.
2. Test for less than 15 ohms between the ground circuit terminal 1 and ground.
 - **If 15 ohms or greater**
 1. Ignition OFF.
 2. Test for less than 2 ohms in the ground circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, repair the open/high resistance in the ground connection.
 - **If less than 15 ohms**
3. Ignition ON.
4. Verify the scan tool Park Lamps Switch parameter is Inactive.
 - **If not Inactive**
 1. Ignition OFF, disconnect the X1 harness connector at the K9 body control module.

2. Test for infinite resistance between the signal circuit terminal 2 and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance, replace the K9 body control module.
 - **If Inactive**
5. Install a 3 A fused jumper wire between the signal circuit terminal 2 and the ground circuit terminal 1.
6. Verify the scan tool Park Lamps Switch parameter is Active.
 - **If not Active**
 1. Ignition OFF, disconnect the X1 harness connector at the K9 body control module, ignition ON.
 2. Test for less than 1 V between the signal circuit terminal and ground.
 - If 1 V or greater, repair the short to voltage on the circuit.
 - If less than 1 V
 3. Test for less than 2 ohms in the signal circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, replace the K9 body control module.
 - **If Active**
7. Test or replace the S78 turn signal/multifunction switch.

Park Lamps Malfunction

1. Ignition OFF, exterior lamps OFF, disconnect the harness connector at the appropriate park lamp. It may take up to 2 minutes for all vehicle systems to power down.
2. Test for less than 5 ohms between the appropriate ground circuit terminal listed below and ground.
 - E4N park/turn signal lamp - left socket terminal C
 - E4P park/turn signal lamp - right socket terminal C
 - E5AA tail/stop lamp - left rear socket terminal
 - E5AB tail/stop lamp - right rear socket terminal
 - **If 5 ohms or greater**
 1. Ignition OFF.
 2. Test for less than 2 ohms in the ground circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, repair the open/high resistance in the ground connection.
 - **If less than 5 ohms**
3. Connect a test lamp between the appropriate control circuit terminal listed below and ground, ignition ON.
 - E4N park/turn signal lamp - left socket terminal B
 - E4P park/turn signal lamp - right socket terminal B
 - E5AA tail/stop lamp - left rear socket terminal
 - E5AB tail/stop lamp - right rear socket terminal
4. Verify the test lamp turns ON and OFF when commanding the appropriate Park Lamps ON and OFF with

a scan tool.

- **If the test lamp is always OFF**

1. Ignition OFF, disconnect the X4 harness connector at the K9 body control module.
2. Test for infinite resistance between the control circuit and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance
3. Test for less than 2 ohms in the control circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, replace the K9 body control module.

- **If the test lamp is always ON**

1. Ignition OFF, disconnect the X4 harness connector at the K9 body control module, ignition ON.
2. Test for less than 1 V between the control circuit terminal and ground.
 - If 1 V or greater, repair the short to voltage on the circuit.
 - If less than 1 V, replace the K9 body control module.

- **If the test lamp turns ON and OFF**

5. Test or replace the appropriate park lamp.

License Plate Lamp Malfunction

1. Ignition OFF, exterior lamps OFF, remove the E7 license plate lamp bulb. It may take up to 2 minutes for all vehicle systems to power down.
2. Test for less than 5 ohms between each ground circuit terminal 1 and ground.

- **If 5 ohms or greater**

1. Ignition OFF.
2. Test for less than 2 ohms in the ground circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, repair the open/high resistance in the ground connection.

- **If less than 5 ohms**

3. Connect a test lamp between the control circuit terminal 2 and ground, ignition ON.
4. Verify the test lamp turns ON and OFF when commanding the License Plate Lamps ON and OFF with a scan tool.

- **If the test lamp is always OFF**

1. Ignition OFF, disconnect the X4 harness connector at the K9 body control module.
2. Test for infinite resistance between the control circuit and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance
3. Test for less than 2 ohms in the control circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, replace the K9 body control module.

- **If the test lamp is always ON**
 1. Ignition OFF, disconnect the X4 harness connector at the K9 body control module, ignition ON.
 2. Test for less than 1 V between the control circuit terminal and ground.
 - If 1 V or greater, repair the short to voltage on the circuit.
 - If less than 1 V, replace the K9 body control module.
 - **If the test lamp turns ON and OFF**
- 5. Test or replace the E7 license plate lamp bulb.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

- **Rear License Plate Lamp Replacement**
- **Parking and Turn Signal Lamp Bulb Replacement**
- **Turn Signal Switch Replacement**
- **Control Module References** for BCM replacement, programming, and setup

REAR COMPARTMENT LAMP MALFUNCTION

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Rear Compartment Courtesy Lamp Control	B2570 02	1	1	-
Rear Compartment Courtesy Lamp Ground	-	1	-	-
1. Rear Compartment Lamp Malfunction				

Circuit/System Description

The body control module (BCM) applies battery voltage to the rear compartment courtesy lamp through the rear compartment lamp control circuit. When the BCM receives a rear compartment lid open input from the rear compartment lid latch, the BCM applies battery voltage to the rear compartment lamp control circuit illuminating the rear compartment courtesy lamp. In the event that the rear compartment lamp were to remain illuminated for more than 10 minutes with the ignition switch in the OFF position and no doors opened, the BCM will deactivate the rear compartment lamp control circuit to prevent total battery discharge.

Circuit/System Testing

1. Ignition OFF, exterior lamps OFF, disconnect the harness connector at the E8S rear compartment courtesy lamp. It may take up to 2 minutes for all vehicle systems to power down.
2. Test for less than 5 ohms between the ground circuit terminal 2 and ground.
 - **If 5 ohms or greater**
 1. Ignition OFF.
 2. Test for less than 2 ohms in the ground circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, repair the open/high resistance in the ground connection.
 - **If less than 5 ohms**
3. Connect a test lamp between the control circuit terminal 1 and ground, ignition ON.
4. Verify the test lamp turns ON and OFF when commanding the Cargo Lamp ON and OFF with a scan tool.
 - **If the test lamp is always OFF**
 1. Ignition OFF, disconnect the X7 harness connector at the K9 body control module.
 2. Test for infinite resistance between the control circuit and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.

- If infinite resistance
- 3. Test for less than 2 ohms in the control circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, replace the K9 body control module.
 - **If the test lamp is always ON**
 - 1. Ignition OFF, disconnect the X7 harness connector at the K9 body control module, ignition ON.
 - 2. Test for less than 1 V between the control circuit terminal and ground.
 - If 1 V or greater, repair the short to voltage on the circuit.
 - If less than 1 V, replace the K9 body control module.
 - **If the test lamp turns ON and OFF**
- 5. Test or replace the E8S rear compartment courtesy lamp.

Circuit/System Description

The brake pedal position (BPP) sensor is used to sense the action of the driver application of the brake pedal. The BPP sensor provides an analog voltage signal that will increase as the brake pedal is applied. The body control module (BCM) provides a low reference signal and a 5-volt reference voltage to the BPP sensor. When the variable signal reaches a voltage threshold indicating the brakes have been applied, the BCM will apply battery voltage to the left and right stop lamp control circuits as well as the center high mounted stop lamp (CHMSL) control circuit illuminating the left and right stop lamps and the CHMSL.

Diagnostic Aids

When testing at the stop lamp bulb socket, make sure all measurements and test lamp connections are in the correct terminal location and do not come in contact with each other during testing.

Scan Tool Reference

Control Module References for scan tool information

Circuit/System Verification

1. Ignition ON.
2. Verify the scan tool Brake Lamps Command parameter changes between Active and Inactive while pressing and releasing the brake pedal.
 - **If the parameter does not change**

Refer to Brake Pedal Position Sensor Malfunction.
 - **If the parameter changes**
3. Verify the left brake lamp turns ON and OFF when commanding the Left Brake Lamp ON and OFF with a scan tool.
 - **If the left brake lamp does not turn ON and OFF**

Refer to Stop Lamps Malfunction.
 - **If the left brake lamp turns ON and OFF**
4. Verify the right brake lamp turns ON and OFF when commanding the Right Brake Lamp ON and OFF with a scan tool.
 - **If the right brake lamp does not turn ON and OFF**

Refer to Stop Lamps Malfunction.
 - **If the right brake lamp turns ON and OFF**
5. Verify the center high mounted stop lamp turns ON and OFF when commanding the Center Brake Lamp ON and OFF with a scan tool.
 - **If the center high mounted stop does not turn ON and OFF**

Refer to Center High Mount Stop Lamp Malfunction.
 - **If the center high mounted stop turns ON and OFF**
6. All OK.

Circuit/System Testing

Brake Pedal Position Sensor Malfunction

1. Ignition OFF, disconnect the harness connector at the B22 Brake Pedal Position Sensor, ignition ON.
2. Test for less than 1 V between the appropriate low reference circuit terminal listed below and ground.
 - Terminal A - with MX2
 - Terminal B - without MNG
 - **If 1 V or greater**
 1. Ignition OFF, disconnect the X1 harness connector at the K9 Body Control Module, ignition ON.
 2. Test for less than 1 V between the low reference circuit and ground.

- If 1 V or greater, repair the short to voltage on the circuit.
- If less than 1 V, replace the K9 Body Control Module.
- **If less than 1 V**
- 3. Test or replace the B22 Brake Pedal Position Sensor.

Stop Lamps Malfunction

1. Ignition OFF, exterior lamps OFF, remove the appropriate E5A Tail/Stop Lamp bulb. It may take up to 2 minutes for all vehicle systems to power down.
2. Test for less than 5 ohms between the ground circuit at the socket terminal and ground.
 - **If 5 ohms or greater**
 1. Ignition OFF.
 2. Test for less than 2 ohms in the ground circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, repair the open/high resistance in the ground connection.
 - **If less than 5 ohms**
3. Connect a test lamp between the control circuit at the socket terminal and ground, ignition ON.
4. Verify the test lamp turns ON and OFF when commanding the appropriate Brake Lamp ON and OFF with a scan tool.
 - **If the test lamp is always OFF**
 1. Ignition OFF, disconnect the appropriate harness connector listed below at the K9 Body Control Module.
 - X4 left stop lamp
 - X5 right stop lamp
 2. Test for infinite resistance between the control circuit and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance
 3. Test for less than 2 ohms in the control circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, replace the K9 Body Control Module.
 - **If the test lamp is always ON**
 1. Ignition OFF, disconnect the appropriate harness connector listed below at the K9 Body Control Module, ignition ON.
 - X4 left stop lamp
 - X5 right stop lamp
 1. Test for less than 1 V between the control circuit terminal and ground.
 - If 1 V or greater, repair the short to voltage on the circuit.
 - If less than 1 V, replace the K9 Body Control Module.
 - **If the test lamp turns ON and OFF**

5. Test or replace the appropriate E5A Tail/Stop Lamp.

Center High Mount Stop Lamp Malfunction

1. Ignition OFF, exterior lamps OFF, disconnect the harness connector at the E6 Center High Mounted Stop Lamp. It may take up to 2 minutes for all vehicle systems to power down.
2. Test for less than 5 ohms between the ground circuit terminal 2 and ground.
 - **If 5 ohms or greater**
 1. Ignition OFF.
 2. Test for less than 2 ohms in the ground circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, repair the open/high resistance in the ground connection.
 - **If less than 5 ohms**
3. Connect a test lamp between the control circuit terminal 1 and ground, ignition ON.
4. Verify the test lamp turns ON and OFF when commanding the Center Brake Lamp ON and OFF with a scan tool.
 - **If the test lamp is always OFF**
 1. Ignition OFF, disconnect the X4 harness connector at the K9 Body Control Module.
 2. Test for infinite resistance between the control circuit and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance
 3. Test for less than 2 ohms in the control circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, replace the K9 Body Control Module.
 - **If the test lamp is always ON**
 1. Ignition OFF, disconnect the X4 harness connector at the K9 Body Control Module, ignition ON.
 2. Test for less than 1 V between the control circuit terminal and ground.
 - If 1 V or greater, repair the short to voltage on the circuit.
 - If less than 1 V, replace the K9 Body Control Module.
 - **If the test lamp turns ON and OFF**
5. Test or replace the E6 Center High Mounted Stop Lamp.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

- **High Mount Stop Lamp Replacement**
- **Tail Lamp Bulb Replacement**
- **Brake Pedal Position Sensor Replacement**
- **Brake Pedal Position Sensor Calibration**

- **Control Module References** for BCM replacement, programming, and setup

TURN SIGNAL LAMPS AND/OR INDICATORS MALFUNCTION

Diagnostic Instructions

Turn Signal/Multifunction Switch Ground	-	1	-	-
1. Turn Signal/Multifunction Switch Malfunction				

Circuit/System Description

Ground is applied at all times to the turn signal/multifunction switch. The turn signal lamps may only be activated with the ignition switch in the ON or START positions. When the turn signal/multifunction switch is placed in either the turn left or turn right position, ground is applied to the body control module (BCM) through either the right turn or left turn signal switch signal circuit. The BCM responds to the turn signal switch input by applying a pulsating voltage to the front and rear turn signal lamps through their respective control circuits. When a turn signal request is received by the BCM, a serial data message is sent to the instrument cluster requesting the respective turn signal indicator be pulsed ON and OFF.

Diagnostic Aids

When testing at the turn signal lamp bulb socket, make sure all measurements and test lamp connections are in the correct terminal location and do not come in contact with each other during testing.

Control Module References for scan tool information

Circuit/System Verification

1. Ignition ON.
2. Verify the scan tool Right Turn Signal Switch and Left Turn Signal Switch parameters change between Active and Inactive while cycling the turn signal switch between the right and left positions.

- **If the parameters do not change**

Refer to Turn Signal/Multifunction Switch Malfunction.

- **If the parameters change**

3. Verify the left front turn signal lamps turn ON and OFF while commanding the Left Front Turn Signal Lamp ON and OFF with a scan tool.

- **If the left front turn signal lamps do not turn ON and OFF**

Refer to Turn Signal Lamps Malfunction.

- **If the left front turn signal lamps turn ON and OFF**

4. Verify the right front turn signal lamps turn ON and OFF while commanding the Right Front Turn Signal Lamp ON and OFF with a scan tool.

- **If the right front turn signal lamps do not turn ON and OFF**

Refer to Turn Signal Lamps Malfunction.

- **If the right front turn signal lamps turn ON and OFF**

5. Verify the left rear turn signal lamps turn ON and OFF while commanding the Left Rear Turn Signal Lamp ON and OFF with a scan tool.

- **If the left rear turn signal lamps do not turn ON and OFF**

Refer to Turn Signal Lamps Malfunction.

- **If the left rear turn signal lamps turn ON and OFF**

6. Verify the right rear turn signal lamps turn ON and OFF while commanding the Right Rear Turn Signal Lamp ON and OFF with a scan tool.

- **If the right rear turn signal lamps do not turn ON and OFF**

Refer to Turn Signal Lamps Malfunction.

- **If the right rear turn signal lamps turn ON and OFF**

7. Verify the left and right turn signal indicators turn ON and OFF while commanding the All Indicators Test ON and OFF with a scan tool.

- **If the left or right turn signal indicators do not turn ON and OFF**

Refer to Turn Signal Indicators Malfunction.

- **If the left and right turn signal indicators turn ON and OFF**

8. All OK.

Circuit/System Testing

Turn Signal/Multifunction Switch Malfunction

1. Ignition OFF, scan tool disconnected, all doors closed, all accessories OFF, disconnect the harness connector at the S78 Turn Signal/Multifunction Switch. It may take up to 2 minutes for all vehicle systems to power down.
2. Test for less than 15 ohms between the ground circuit terminal 1 and ground.
 - **If 15 ohms or greater**
 1. Ignition OFF.
 2. Test for less than 2 ohms in the ground circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, repair the open/high resistance in the ground connection.
 - **If less than 15 ohms**
3. Ignition ON.
4. Verify the scan tool Left Turn Signal Switch parameter is Inactive.
 - **If not Inactive**
 1. Ignition OFF, disconnect the X3 harness connector at the K9 Body Control Module.
 2. Test for infinite resistance between the signal circuit terminal 4 and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance, replace the K9 Body Control Module.
 - **If Inactive**
5. Install a 3 A fused jumper wire between the signal circuit terminal 4 and the ground circuit terminal 1.
6. Verify the scan tool Left Turn Signal Switch parameter is Active.
 - **If not Active**
 1. Ignition OFF, disconnect the X3 harness connector at the K9 Body Control Module, ignition ON.
 2. Test for less than 1 V between the signal circuit terminal 4 and ground.
 - If 1 V or greater, repair the short to voltage on the circuit.
 - If less than 1 V
 3. Test for less than 2 ohms in the signal circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, replace the K9 Body Control Module.
 - **If Active**
7. Verify the scan tool Right Turn Signal Switch parameter is Inactive.
 - **If not Inactive**

1. Ignition OFF, disconnect the X3 harness connector at the K9 Body Control Module.
2. Test for infinite resistance between the signal circuit terminal 5 and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance, replace the K9 Body Control Module.
- **If Inactive**
8. Install a 3 A fused jumper wire between the signal circuit terminal 5 and the ground circuit terminal 1.
9. Verify the scan tool Right Turn Signal Switch parameter is Active.
 - **If not Active**
 - 1. Ignition OFF, disconnect the X3 harness connector at the K9 Body Control Module, ignition ON.
 - 2. Test for less than 1 V between the signal circuit terminal 5 and ground.
 - If 1 V or greater, repair the short to voltage on the circuit.
 - If less than 1 V
 - 3. Test for less than 2 ohms in the signal circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, replace the K9 Body Control Module.
 - **If Active**
10. Test or replace the S78 Turn Signal/Multifunction Switch.

Turn Signal Lamps Malfunction

1. Ignition OFF, exterior lamps OFF, remove the appropriate E4 Turn Signal Lamp bulb. It may take up to 2 minutes for all vehicle systems to power down.
2. Test for less than 5 ohms between the appropriate ground circuit at the socket terminal and ground.
 - **If 5 ohms or greater**
 - 1. Ignition OFF.
 - 2. Test for less than 2 ohms in the ground circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, repair the open/high resistance in the ground connection.
 - **If less than 5 ohms**
3. Connect a test lamp between the appropriate control circuit at the socket terminal and ground.
4. Verify the test lamp turns ON and OFF when commanding the appropriate Turn Signal Lamp ON and OFF with a scan tool.
 - **If the test lamp is always OFF**
 - 1. Ignition OFF, disconnect the appropriate harness connector listed below at the K9 Body Control Module.
 - X5 left turn signals
 - X4 right turn signals
 - 2. Test for infinite resistance between the control circuit and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.

- If infinite resistance
- 3. Test for less than 2 ohms in the control circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, replace the K9 Body Control Module.
 - **If the test lamp is always ON**
- 1. Ignition OFF, disconnect the appropriate harness connector listed below at the K9 Body Control Module, ignition ON.
 - X5 left turn signals
 - X4 right turn signals
- 2. Test for less than 1 V between the control circuit terminal and ground.
 - If 1 V or greater, repair the short to voltage on the circuit.
 - If less than 1 V, replace the K9 Body Control Module.
 - **If the test lamp turns ON and OFF**
- 5. Test or replace the appropriate E4 Turn Signal Lamp bulb.

Turn Signal Indicators Malfunction

1. Ignition ON.
2. Verify the left and right turn signal indicators turn ON and OFF while commanding the All Indicators Test ON and OFF with a scan tool.
 - **If the left or right turn signal indicators are always OFF or remain ON**

Replace the P16 Instrument Cluster.

- **If the left and right turn signal indicators turn ON and OFF**
- 3. Replace the K9 Body Control Module.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

- **Parking and Turn Signal Lamp Bulb Replacement**
- **Tail Lamp Bulb Replacement**
- **Turn Signal Switch Replacement**
- **Control Module References** for BCM replacement, programming, and setup

REPAIR INSTRUCTIONS

BRAKE PEDAL POSITION SENSOR CALIBRATION

NOTE: Brake system does not use a brake switch, stoplight switch or brakelight switch. System uses a Brake Pedal Position Sensor to control these functions.

Calibration Criteria

NOTE: Do not apply the brake pedal during the brake pedal position sensor calibration procedure. Any movement of the brake pedal during this procedure will cause the calibration procedure to fail. If this occurs, the brake pedal position sensor calibration must be repeated.

Brake pedal position sensor calibration must be performed after the brake pedal position sensor, body control module (BCM), or engine control module (ECM) have been serviced. The calibration procedure will set the brake pedal position sensor home value. This value is used by the BCM and ECM to determine the action of the driver applying the brake system and to provide this information to the vehicle subsystems via serial data.

Calibration Procedure

1. Apply the parking brake.
2. Ignition ON, engine OFF, place the transmission in the PARK position for automatic transmission or NEUTRAL position for manual transmission.
3. Install a scan tool.
4. Clear all DTCs before proceeding.
5. Navigate to the Configuration/Reset Functions menu of the BCM.
6. Select the Brake Pedal Position Sensor Learn procedure and follow the directions displayed on the screen.
7. Navigate to the Configuration/Reset Functions menu of the ECM.
8. Select the Learn Functions menu.
9. Select the Brake Pedal Position Sensor Learn procedure and follow the directions displayed on the screen.

BRAKE PEDAL POSITION SENSOR REPLACEMENT

NOTE: Brake system does not use a brake switch, stoplight switch or brakelight switch. System uses a Brake Pedal Position Sensor to control these functions.

Removal Procedure

1. Remove the instrument panel lower reinforcement bracket. Refer to **Instrument Panel Lower Reinforcement Bracket Replacement**.

Fig. 12: Intermediate Steering Shaft
Courtesy of GENERAL MOTORS COMPANY

2. Remove the intermediate steering shaft (1). Refer to **Intermediate Steering Shaft Replacement** .
3. Disconnect the brake pedal position sensor electrical connector.

Fig. 13: Brake Pedal Position Sensor Bracket Bolts
Courtesy of GENERAL MOTORS COMPANY

4. Remove the brake pedal position sensor bracket bolts (1).
5. Remove the brake pedal position sensor and bracket assembly.

Fig. 14: Brake Pedal Position Sensor Bolt
Courtesy of GENERAL MOTORS COMPANY

6. Remove the brake pedal position sensor bolt (1).
7. Remove the brake pedal position sensor (2) from the bracket.

Installation Procedure

Fig. 15: Brake Pedal Position Sensor Bolt
Courtesy of GENERAL MOTORS COMPANY

NOTE: **Align the brake pedal position sensor pin to the brake pedal bracket.**

1. Install the brake pedal position sensor bolt (1) through the bracket and to the brake pedal position sensor (2)..

CAUTION: Refer to Fastener Caution .

2. Tighten the brake pedal position sensor bolt to 3 (27 lb in)

Fig. 16: Brake Pedal Position Sensor Bracket Bolts
Courtesy of GENERAL MOTORS COMPANY

3. Install the brake pedal position sensor and bracket assembly to the brake and accelerator pedal assembly.
4. Install the brake pedal position sensor bracket bolts (1) and tighten to 3 (27 lb in).
5. Connect the brake pedal position sensor electrical connector.

Fig. 17: Intermediate Steering Shaft
Courtesy of GENERAL MOTORS COMPANY

6. Install the intermediate steering shaft (1). Refer to **Intermediate Steering Shaft Replacement** .
7. Install the instrument panel lower reinforcement bracket. Refer to **Instrument Panel Lower Reinforcement Bracket Replacement** .
8. Calibrate the brake pedal position sensor. Refer to **Brake Pedal Position Sensor Calibration**.

HAZARD WARNING SWITCH REPLACEMENT

Fig. 18: Hazard Warning Switch
 Courtesy of GENERAL MOTORS COMPANY

Hazard Warning Switch Replacement

Callout	Component Name
Preliminary Procedure	
Remove the instrument panel center molding. Refer to <u>Instrument Panel Center Molding Replacement</u>	
1	Hazard Warning Switch
	Procedure 1. Disconnect the electrical connector. 2. Squeeze tabs on switch to unsnap from housing bracket.

CENTER COURTESY LAMP REPLACEMENT

Fig. 19: Center Courtesy Lamp
 Courtesy of GENERAL MOTORS COMPANY

Center Courtesy Lamp Replacement

Callout	Component Name
Preliminary Procedure Remove the center courtesy lamp lens. Refer to .	
1	Center Courtesy Lamp Fasteners (Qty: 2) CAUTION: Refer to <u>Fastener Caution</u> .
2	Center Courtesy Lamp Procedure Disconnect the electrical connections.

HEADLAMP REPLACEMENT

Fig. 20: Headlamp
 Courtesy of GENERAL MOTORS COMPANY

Headlamp Replacement

Callout	Component Name
Preliminary Procedure Remove the front bumper fascia. Refer to Front Bumper Fascia Replacement .	
1	Headlamp Screw (Qty: 3) CAUTION: Refer to Fastener Caution . Tighten 2.5 N.m (22 lb in)
2	Headlamp Assembly Procedure 1. Pull the headlamp assembly forward far enough to access the electrical connection. 2. Disconnect the headlamp electrical connector from the forward lamp harness connector. 3. Remove the headlamp assembly. 4. Aim the headlamps after installation. Refer to Headlamp Aiming.

HEADLAMP BULB REPLACEMENT

Fig. 21: Headlamp Bulb

Courtesy of GENERAL MOTORS COMPANY

Headlamp Bulb Replacement

Callout	Component Name
1	Headlamp Bulb WARNING: Refer to <u>Halogen Bulb Warning</u> . Procedure 1. Disconnect electrical connector. 2. Rotate the headlamp bulb counterclockwise to remove from the headlamp.

HEADLAMP BRACKET REPLACEMENT

Removal Procedure

Fig. 22: Headlamp Bracket

Courtesy of GENERAL MOTORS COMPANY

1. Remove the headlamp. Refer to **Headlamp Replacement**.
2. There are 2 replacement brackets (1) on each headlamp.

Fig. 23: Screws And Bracket

Courtesy of GENERAL MOTORS COMPANY

3. For bracket, 1 remove the screws (1) and bracket 1 (2).

Fig. 24: Marked Line

Courtesy of GENERAL MOTORS COMPANY

4. For bracket 2, cut the bracket along the marked line (1).

Installation Procedure

Fig. 25: Bracket

Courtesy of GENERAL MOTORS COMPANY

1. For bracket 1, install the bracket (1) with the specified attachments.
2. For bracket 2, install the bracket (2) with the specified attachments.
3. Install the headlamp. Refer to **Headlamp Replacement**.

HEADLAMP AIMING

Visual Aiming Preparation Procedure

NOTE: Some state and local laws specify requirements for headlamp aim. Comply with all of these laws when performing any headlamp aiming operations.

Headlamp aim should be checked:

- When a new headlamp capsule is installed.
- If service or repairs to the front end area have, or may have, disturbed the headlamps or their mounting.

The aiming screen should meet the following criteria:

- The area will consist of a level surface large enough to allow for a vehicle and an additional 7.62 m (25

ft) measured from face of lamps to the front of the aiming screen.

- The screen will be 1.52 m (5 ft) high x 3.66 m (12 ft) wide with a matte white surface well shaded from extraneous light, and properly adjusted to the floor on which the vehicle stands. Provisions should be made to align the aiming screen parallel with the vehicle.
- The screen shall be provided with a fixed vertical centerline, two laterally adjustable vertical tapes, and one vertically adjustable horizontal tape.
- If a regular commercial aiming screen is not available, the screen may consist of a vertical wall having a clear uninterrupted area approximately 1.83 m (6 ft) high and 3.66 m (12 ft) wide. The surface should be finished with a washable non-gloss white paint.

Fig. 26: Headlamp Aiming/Adjusting
Courtesy of GENERAL MOTORS COMPANY

- After the aiming screen has been set up in a permanent location, paint a reference line on the floor directly under the lens of the lamps to indicate the proper location of the headlamps when they are being aimed:
 - Distance between headlamps (1)
 - Center line of screen (2)
 - Adjustable vertical pointer (3)

- Adjustable horizontal tape (4)
- Diagram of light screen (5)
- Vertical center line ahead of right headlamp pointer position (6)
- 7.62 m (25 ft) (7)
- Car axis (8)
- Adjustable vertical pointer
- Horizontal center line of lamps
- Vertical center line ahead of left headlamp

Prior to aiming the headlamps, the following steps must be taken:

1. Remove any snow, ice or mud from the vehicle.
2. The vehicle must have a full tank of gas.
3. Stop all other work on the vehicle.
4. If any service has been performed on the vehicle, make sure that all of the components are back in their original place.
5. The vehicle must be on a level surface.

Fig. 27: View Of Headlamp Aiming Screen & Vehicle Alignment
Courtesy of GENERAL MOTORS COMPANY

6. The vehicle left tires must be aligned with the reference line extending from the screen with the headlamps aligned with the reference line.
7. Do not load any cargo in the vehicle.
8. The vehicle must contain approximately 75 kg (165 lb) on the driver seat.
9. Inflate the tires to the proper pressure.
10. Simulate the vehicle loads if the intended use of the vehicle is for hauling heavy loads or towing a trailer.
11. Rock the vehicle in order to stabilize the suspension.
12. Turn on the headlamps to low beam and observe the left and the top edges of the high intensity zone on the screen. The edges of the high intensity zone should fall within the specifications.

Headlamp Aiming Procedure

1. Open the hood.

Fig. 28: Measuring Distance Between Headlamps Face & Aiming Screen
Courtesy of GENERAL MOTORS COMPANY

2. Measure from the floor to the center of the headlamp bulb. Some headlamps have an aim dot marked on the headlamp lens.
3. At the screen, measure from the floor and place the horizontal tape at the measured distance.
4. Measure from the reference line on the floor to the left headlamp bulb centerline.
5. At the screen, measure from the reference line and place the vertical tape at the measured distance.
6. Measure from the reference line on the floor to the right headlamp bulb centerline.
7. At the screen, measure from the reference line and place the vertical tape at the measured distance.

Fig. 29: Identifying Right Side Low Beam Proper Screen Positioning
Courtesy of GENERAL MOTORS COMPANY

NOTE: DO NOT cover the headlamp. This may cause excessive heat build up.

8. Turn ON the low beam headlamps. Block the light from projecting onto the screen from the passenger side headlamp.

Fig. 30: Vertical Aim Screw

Courtesy of GENERAL MOTORS COMPANY

9. Adjust the vertical aim screw (1) of the headlamps to the specifications required by the state and the local authorities, or as shown in step number 8.
10. Repeat the aiming procedure for the passenger side headlamp while blocking the light from projecting onto the screen from the driver side headlamp.
11. Turn the headlamps OFF.
12. Close the hood.

FRONT FOG LAMP REPLACEMENT (PROJECTION)

Fig. 31: Front Fog Lamp Assembly
 Courtesy of GENERAL MOTORS COMPANY

Front Fog Lamp Replacement (Projection)

Callout	Component Name
Preliminary Procedures	
1. Raise and support the vehicle. Refer to <u>Lifting and Jacking the Vehicle</u> . 2. Remove the front wheelhouse liner. Refer to <u>Front Wheelhouse Liner Replacement</u> . 3. Disconnect fog lamp bulb socket electrical connector.	
1	Front Fog Lamp Screw (Qty: 3)
2	Front Fog Lamp Assembly
	Procedure 1. Remove the lamp assembly from the fog lamp bracket. 2. Aim the fog lamp after installation. Refer to <u>Fog Lamp Aiming</u> .

FRONT FOG LAMP BULB REPLACEMENT (PROJECTION)

Fig. 32: Front Fog Lamp Bulb
 Courtesy of GENERAL MOTORS COMPANY

Front Fog Lamp Bulb Replacement (Projection)

Callout	Component Name
Preliminary Procedures 1. Raise and support the vehicle. Refer to <u>Lifting and Jacking the Vehicle</u> . 2. Remove the front wheelhouse liner. Refer to <u>Front Wheelhouse Liner Replacement</u> . 3. Disconnect fog lamp bulb socket electrical connector.	
1	Front Fog Lamp Projector Bulb WARNING: Refer to <u>Halogen Bulb Warning</u> . Procedure Rotate the bulb socket counterclockwise to remove from the lamp housing.

FRONT FOG LAMP COVER REPLACEMENT

Fig. 33: Front Fog Lamp Cover
 Courtesy of GENERAL MOTORS COMPANY

Front Fog Lamp Cover Replacement

Callout	Component Name
1	Front Fog Lamp Cover Screw CAUTION: Refer to <u>Fastener Caution</u> . Tighten 2 (18 lb in)
2	Front Fog Lamp Cover Procedure 1. Lift the vehicle. 2. Remove the tire and wheel. Refer to <u>Tire and Wheel Removal and Installation</u> . 3. Remove the front wheelhouse liner. Refer to <u>Front Wheelhouse Liner Replacement</u> . 4. Release the cover taps. 5. Remove the front fog lamp cover.

FOG LAMP AIMING

Preparation Procedure

NOTE: Horizontal aim is not adjustable on this vehicle. Vertical aim is done by an adjusting nut located on the rear of the fog lamp. Prior to aiming the fog lamps, perform the following steps:

1. Completely assemble all of the components on the vehicle.
2. Place the vehicle on a level surface.
3. Stop all unnecessary operations or work that could affect the ride height of the vehicle.
4. Close the doors and verify that the luggage compartment is empty.
5. Stabilize the suspension by rocking the vehicle sideways.
6. Ensure that the fuel level is full.
7. Ensure that the tires are inflated to the proper pressure.
8. Ensure that the driver or a similar weight, approximately 75 kg (165 lb), is in the vehicle driver seat.

Aiming Procedure

Fig. 34: Locating Alignment Points On Target Screen
Courtesy of GENERAL MOTORS COMPANY

1. Park the vehicle 7.6 m (25 ft) away from the target screen.
2. Measure from the center of the fog lamp to the ground line. Using this measurement, mark the horizontal centerline (2) of the fog lamp on the target screen directly in front of the vehicle.
3. Turn ON the fog lamps. The top of the fog lamp beam image (4) on the target screen should be 102 mm (4 in) below the center of the fog lamp lens height.

Fig. 35: Fog Lamp Screw

Courtesy of GENERAL MOTORS COMPANY

4. Adjust the fog lamp as required using the adjusting screw (1) above the projector lens on the outside of the front bumper fascia.
5. Turn OFF the fog lamps.

PARKING AND TURN SIGNAL LAMP BULB REPLACEMENT

Fig. 36: Parking and Turn Signal Lamp Bulb
 Courtesy of GENERAL MOTORS COMPANY

Parking and Turn Signal Lamp Bulb Replacement

Callout	Component Name
1	Park/Turn Signal Bulb Socket WARNING: Refer to <u>Halogen Bulb Warning</u> . NOTE: Rotate counterclockwise and remove the socket from the headlamp assembly.
2	Park/Turn Signal Bulb Procedure Pull the bulb straight from the lamp harness socket.

HIGH MOUNT STOP LAMP REPLACEMENT

Fig. 37: High Mount Stop Lamp
 Courtesy of GENERAL MOTORS COMPANY

High Mount Stop Lamp Replacement

Callout	Component Name
1	High Mount Stop Lamp Cover Screw (Qty: 2)
2	High Mount Stop Lamp Cover
3	High Mount Stop Lamp Screw (Qty: 3)
4	High Mount Stop Lamp Assembly
Procedure Disconnect the electrical connector at the high mount stop lamp.	

REAR LICENSE PLATE LAMP REPLACEMENT

Fig. 38: Rear License Plate Lamp
 Courtesy of GENERAL MOTORS COMPANY

Rear License Plate Lamp Replacement

Callout	Component Name
1	Rear License Plate Lamp Screw (Qty: 2) CAUTION: Refer to <u>Fastener Caution</u> . Tighten 2.0 N.m (18 lb in)
2	Rear License Plate Lamp
3	Rear License Plate Lamp Socket

TAIL LAMP REPLACEMENT

Fig. 39: Tail Lamp

Courtesy of GENERAL MOTORS COMPANY

Tail Lamp Replacement

Callout	Component Name
1	Tail Lamp Screw (Qty: 2) CAUTION: Refer to <u>Fastener Caution</u> . Tighten 2.5 N.m (22 lb in)
2	Tail Lamp Assembly Procedure 1. Using a blunt tool, tap gently on the tail lamp studs before attempting to remove the tail lamp assembly from the lamp pocket. 2. Pull the tail lamp assembly rearward. 3. Disconnect the tail lamp bulbs assembly electrical connector.
	Tail Lamp Wiring Harness and Bulb Assembly WARNING:

3

Refer to Halogen Bulb Warning .

TIP: Rotate the bulbs counterclockwise and remove from the tail lamp housing.

TAIL LAMP BULB REPLACEMENT

Fig. 40: Tail Lamp Bulb

Courtesy of GENERAL MOTORS COMPANY

Tail Lamp Bulb Replacement

Callout	Component Name
Preliminary Procedure Remove the tail lamp assembly. Refer to <u>Tail Lamp Replacement</u> .	
1	Tail Lamp Bulb Harness Socket WARNING: Refer to <u>Halogen Bulb Warning</u> . NOTE: Rotate the bulb socket from the tail lamp housing.
2	Tail Lamp Bulb Procedure Pull the bulb straight from the lamp harness socket.

REAR COMPARTMENT COURTESY LAMP REPLACEMENT

Fig. 41: Rear Compartment Courtesy Lamp
Courtesy of GENERAL MOTORS COMPANY

Rear Compartment Courtesy Lamp Replacement

Callout	Component Name
1	Rear Compartment Courtesy Lamp WARNING: Refer to <u>Halogen Bulb Warning</u> .

DESCRIPTION AND OPERATION

EXTERIOR LIGHTING SYSTEMS DESCRIPTION AND OPERATION

Exterior Lamps

The exterior lighting system consist of the following lamps if equipped:

- Backup lamps
- Front fog lamps
- Hazard warning lamps
- Headlamps

- Park, tail and license lamps
- Repeater lamps
- Stop lamps
- Turn signal lamps

Low Beam Headlamps

The body control module (BCM) monitors two signal circuits from the headlamp switch. With the headlamp switch in the PARK position, the headlamp switch park lamps ON signal circuit is grounded, indicating that the park lamps have been requested. When the headlamp switch is placed in the HEADLAMP position, both the headlamp switch park lamps ON signal circuit and the headlamp switch headlamps ON signal circuit are grounded. The BCM responds to the inputs by illuminating the park lamps and headlamps. When the low beam headlamps are requested, the BCM applies B+ to both low beam headlamp control circuits illuminating the low beam headlamps.

The BCM will also command the low beam headlamps ON during daylight conditions when the following conditions are met:

- Headlamp switch in the AUTO position
- Windshield wipers ON
- Vehicle in any gear but PARK - automatic transmission
- Vehicle in motion - manual transmission

When the BCM commands the low beam headlamps ON, the operator will notice the interior backlighting for the instrument cluster and the various other switches dim to the level of brightness selected by the instrument panel dimmer switch.

High Beam Headlamps

When the low beam headlamps are ON and the turn signal/multifunction switch is placed in the high beam position, ground is applied to the BCM through the high beam signal circuit. The BCM responds to the high beam request by applying ground to the high beam relay control circuit which energizes the high beam relay. With the high beam relay energized, the switch contacts close allowing battery voltage to flow through the left and right high beam fuses to the high beam control circuits illuminating the left and right high beam headlamps.

Daytime Running Lamps (DRL)

The daytime running lamps (DRL) will illuminate the right and left low beam headlamps continuously. The DRLs will operate when the following conditions are met:

- The ignition is in the RUN or CRANK position
- The shift lever is out of the PARK position for vehicles equipped with automatic transmissions or the parking brake is released for vehicles with manual transmissions
- The low and high beam headlamps are OFF

With the headlamp switch is in the off position the BCM will command the low beam headlamps ON. The low

beam headlamps are the designated DRL's. Any function or condition that turns on the headlamps will cancel DRL operation.

Flash to Pass (FTP)

When the turn signal/multifunction switch is momentarily placed in the flash to pass (FTP) position, ground is applied from to the turn signal/multifunction switch. The turn signal/multifunction switch applies ground to the body control module (BCM) through the FTP switch signal circuit. The BCM then applies ground to the high beam relay control circuit. This energizes the high beam relay, closing the switch side contacts of the high beam relay, applying battery voltage to the left and right high beam fuses. Battery voltage is applied from the high beam fuses through the high beam control circuit to the high beam headlamp assemblies. This causes the high beam headlamps to illuminate at full brightness momentarily.

Front Fog Lamps

The front fog lamp relay is supplied with battery voltage at all times. The front fog lamp switch signal circuit is grounded momentarily by pressing the front fog lamp switch. The body control module (BCM) energizes the front fog lamp relay by applying ground to the front fog lamp relay control circuit. When the front fog lamp relay is energized, the relay switch contacts close and battery voltage is applied through the front fog lamp fuse to the front fog lamp control circuit which illuminates the front fog lamps.

Hazard Warning Lamps

The hazard warning lamps may be activated in any power mode. The hazard warning switch signal circuit is momentarily grounded when the hazard warning switch is pressed. The body control module (BCM) responds to the hazard warning switch signal input by supplying battery voltage to all four turn signal lamps in an ON and OFF duty cycle. When the hazard warning switch is activated, the BCM sends a serial data message to the instrument cluster requesting both turn signal indicators to be cycled ON and OFF.

The instrument panel dimmer switch controls are used to increase and decrease the brightness of the interior backlighting components. When the instrument panel dimmer switch is placed in a desired brightness position, the body control module (BCM) receives a signal from the instrument panel dimmer switch and responds by applying a pulse width modulated (PWM) voltage to the hazard switch LED backlighting control circuit illuminating the LED to the desired level of brightness.

Park, Tail, and License Lamps

When the headlamp switch is placed in the HEAD or PARK position, ground is applied to the park lamp switch ON signal circuit to the body control module (BCM). The BCM responds by applying voltage to the park lamps, tail lamps, and license lamps control circuits illuminating the park, tail, and license lamps.

Stop Lamps

NOTE: Brake system does not use a brake switch, stoplight switch or brakelight switch. System uses a Brake Pedal Position Sensor to control these functions.

The brake pedal position (BPP) sensor is used to sense the action of the driver application of the brake pedal. The BPP sensor provides an analog voltage signal that will increase as the brake pedal is applied. The body

control module (BCM) provides a low reference signal and a 5-volt reference voltage to the BPP sensor. When the variable signal reaches a voltage threshold indicating the brakes have been applied, the BCM will apply battery voltage to the left and right stop lamp control circuits as well as the center high mounted stop lamp (CHMSL) control circuit illuminating the left and right stop lamps and the CHMSL.

Turn Signal Lamps

Ground is applied at all times to the turn signal/multifunction switch. The turn signal lamps may only be activated with the ignition switch in the ON or START positions. When the turn signal/multifunction switch is placed in either the TURN RIGHT or TURN LEFT position, ground is applied to the body control module (BCM) through either the right turn or left turn signal switch signal circuit. The BCM responds to the turn signal switch input by applying a pulsating voltage to the front and rear turn signal lamps through their respective control circuits. When a turn signal request is received by the BCM, a serial data message is sent to the instrument cluster requesting the respective turn signal indicator be pulsed ON and OFF.

Backup Lamps

Automatic Transmission

With the engine ON and the transmission in the reverse position, the transmission control module (TCM) sends a serial data message to the body control module (BCM). The message indicates that the gear selector is in the reverse position. The BCM applies battery voltage to the backup lamps control circuit illuminating the backup lamps. Once the driver moves the gear selector out of the reverse position, a message is sent by the TCM via serial data requesting the BCM to remove battery voltage from the backup lamps control circuit. The engine must be ON for the backup lamps to operate.

Manual Transmission

The engine control module (ECM) provides a signal circuit to the backup lamp switch which is permanently grounded. With the engine ON and the transmission in the reverse position, the backup lamp switch signal circuit is pulled low and the ECM responds by sending a serial data message to the body control module (BCM). The message indicates that the gear selector is in the reverse position. The BCM applies battery voltage to the backup lamps control circuit illuminating the backup lamps. Once the driver moves the gear selector out of the reverse position, a message is sent by the ECM via serial data requesting the BCM to remove battery voltage from the backup lamps control circuit. The engine must be ON for the backup lamps to operate.

Battery Run Down Protection/Inadvertent Power

To provide battery run down protection, the exterior lamps will be deactivated automatically under certain conditions. The BCM monitors the state of the headlamp switch. If the park or headlamp switch is ON when the ignition switch is placed in either the CRANK or RUN position and then placed in the OFF position, the BCM initiates a 10 min timer. At the end of the 10 min, the BCM will turn off the control power output to the park lamp controls as well as the headlamp relay coils, deactivating the exterior lamps. This feature will be cancelled if any power mode other than OFF becomes active. The BCM will disable battery run down protection if any of the following conditions exist. The park or headlamp switch is placed in the ON to OFF position, and back to the ON position during battery run down protection. The BCM determined that the park or headlamp switch was not active when the ignition was turned OFF.

INTERIOR LIGHTING SYSTEMS DESCRIPTION AND OPERATION

Interior Lamps

The interior lighting consist of two groups. This first group includes lamps that may not be dimmed.

- Dome lamp/reading lamps
- Rear compartment courtesy lamp

Dome Lamp

When any door is opened, the associated door jamb switch closes providing a door open input to the body control module (BCM). The BCM responds by applying battery positive voltage to the dome lamp control circuit illuminating the dome lamp. The dome lamp will turn OFF immediately if the ignition switch is turned to the ON position or approximately 20 seconds after all doors are closed. The dome lamp will normally turn OFF using the theater dimming feature when controlled by the BCM. If the operator inadvertently leaves any interior lamp ON, the BCM will turn all interior lamps OFF after 10 minutes has passed since any switch activation has been detected by the BCM.

Keyless Entry Interior Illumination

When the operator uses the keyless entry transmitter in order to unlock the doors, the BCM receives a door-unlock signal. The BCM must receive inputs from various systems that indicate that the ignition switch is OFF, the courtesy lamp switch is OFF, and all doors are closed before the BCM will activate the interior lamps. The courtesy lamps will remain ON for 20 seconds after the door is closed. The BCM will turn off the courtesy lamps OFF through the theater dimming feature. If the door locks are activated to the LOCK position, or if the ignition switch is turned to either the RUN or CRANK position, the courtesy lamps will turn OFF immediately.

Rear Compartment Courtesy Lamp

The BCM provides battery positive voltage to the rear compartment courtesy lamp. When the rear compartment is opened, the rear compartment latch opens providing a rear compartment open input to the BCM. The BCM responds by applying battery positive voltage to the rear compartment lamp control circuit illuminating the rear compartment lamp.

Reading Lamp

The inadvertent power supply voltage circuit from the BCM provides battery positive voltage the reading lamp. When the reading lamp switch is activated, the switch contacts close providing a path to ground and the reading lamp illuminates. If the operator inadvertently leaves a reading lamp ON, the BCM will turn all interior lamps OFF after 10 minutes has passed since any switch activation has been detected by the BCM.

Battery Rundown Protection/Inadvertent Power

The BCM inadvertent power supply voltage circuit provides battery positive voltage to all of the interior lamps. In the event that any of these lamps were to remain illuminated for a period of more than 10 minutes with the ignition switch in the OFF position, the BCM will deactivate the inadvertent power supply voltage circuit to prevent total battery discharge.

Interior Lamps Dimming

The second group includes lamps which may be dimmed.

- Door lock switch - driver
- Door lock switch - passenger
- Hazard warning switch
- Headlamp switch
- HVAC control head assembly
- Instrument cluster
- Liftgate unlatch switch
- Radio
- Seat heating switch - driver
- Seat heating switch - passenger
- Steering wheel controls switch - left
- Steering wheel controls switch - right
- Transmission shift lever position indicator
- Vehicle stability control switch

When the headlamp switch is placed in the PARK or HEAD position, the park lamp switch signal circuit provides an input to the body control module (BCM). The BCM responds by applying voltage to the park lamps as well as the dimming control circuits illuminating all components with interior backlighting. All LED and incandescent backlighting turns ON at the dimming level indicated by the instrument panel dimmer switch. The instrument panel dimmer switch is a potentiometer type switch used to accomplish dimming controls. The instrument panel dimmer switch contains a battery positive voltage reference circuit, a signal circuit, and a low reference circuit from the BCM. When the instrument panel dimmer switch is held in the decrease brightness position, the BCM receives a low voltage signal via the instrument panel dimmer switch signal circuit. The BCM responds by decreasing the brightness of all interior backlighting by decreasing the voltage supplied to the backlighting components via the dimming control circuits. When the instrument panel dimmer switch is held in the increase brightness position, the BCM receives a high voltage signal via the instrument panel dimmer switch signal circuit. The BCM responds by increasing the brightness of all interior backlighting by increasing the voltage supplied to the backlighting components via the dimming control circuits.

CHANGE TRANS FLUID MESSAGE RESET - PROCEDURE 1

This message will appear on the Driver Information Center (DIC) when transaxle fluid change is due. Change fluid in both the oil pan and side cover.

1. To reset display, turn ignition ON with engine OFF.
2. On the climate control panel, press and hold OFF and REAR DEFOG buttons until TRANS FLUID RESET message appears in DIC (about 5-20 seconds).

CHANGE TRANS FLUID MESSAGE RESET - PROCEDURE 2

The CHANGE TRANS FLUID message will appear on the Driver Information Center (DIC) when transaxle fluid change is due. Percentage of transaxle fluid life remaining may be checked at any time by pressing INFO button several times until TRANS FLUID LIFE message appears.

1. To reset display, turn ignition key ON with engine OFF.
2. Press the INFO button until TRANS FLUID LIFE message appears.
3. Press and hold INFO RESET button until display shows 100 percent TRANS FLUID LIFE. Transaxle fluid life index is now reset.

CHANGE TRANS FLUID MESSAGE RESET - PROCEDURE 3

Resetting With Base Audio System

Press CLR button located to the right of the DIC display to acknowledge the CHANGE TRANS FLUID message. This will clear the message from the display and reset it. To reset transmission fluid life indicator, press up or down arrow on INFO button located to the right of the DIC display to access the DIC menu. Once percentage TRANS FLUID LIFE menu item is highlighted, press and hold CLR button. Percentage will return to 100, and transmission fluid life indicator will be reset. Repeat if percentage does not return to 100.

Resetting With Navigation System

Press multifunction button located to the right of the DIC display, next to the OK prompt to acknowledge the CHANGE TRANS FLUID message. This will clear the message form the display and reset it. To reset transmission fluid life indicator, turn system on by pressing PWR/VOL knob once. PWR/VOL knob is located to the lower left of the DIC display. Press INFO button located to the left of the DIC display to access the VEHICLE INFO menu. Turn TUNE/SEL knob located to the lower right of the DIC display until TRANS FLUID LIFE is highlighted. Press knob once to select it. Once percentage TRANS FLUID LIFE is displayed, press multifunction button next to the RESET prompt in the upper right corner of the display. Percentage will return to 100, and transmission fluid life indicator will be reset. Repeat if percentage does not return to 100.

CHANGE TRANS FLUID MESSAGE RESET - PROCEDURE 4

1. The Driver Information Center (DIC) displays estimated percentage of the remaining useful life of transaxle fluid. When remaining fluid life is 0 percent, the display will show CHANGE TRNS FLUID NOW. After changing transaxle fluid, reset oil life display.
2. To reset the display, turn ignition on with engine off. Press ENG button to select the TRNS FLUID LIFE percentage display. Then, press and hold in RESET for at least 5 seconds.
3. The word RESET will appear. Then, TRNS FLUID 100 will be displayed.

CHECK ENGINE LIGHT

NOTE: To determine the appropriate reset procedure, refer to CHECK ENGINE LIGHT RESET INDEX. Only vehicles listed in this index have a check engine light reset.

CHECK ENGINE LIGHT RESET INDEX

Model & Year	Reset Procedure
--------------	-----------------

Geo Tracker

1989-94

Check Engine Light Reset - Procedure 1

CHECK ENGINE LIGHT RESET - PROCEDURE 1

Federal Emissions

1. CHECK ENGINE light functions as a service reminder indicator and emission system service. CHECK ENGINE light will come on each 50,000 miles (PCV and EGR), each 80,000 miles (oxygen sensor) and each 100,000 miles (charcoal canister) to indicate needed emission system service.
2. After servicing and/or replacing components, reset CHECK ENGINE light by sliding cancel switch to its opposite position. See **CHECK ENGINE LIGHT RESET SWITCH LOCATION (GEO TRACKER)** for switch location.

CHECK ENGINE LIGHT RESET SWITCH LOCATION (GEO TRACKER)

Application	Location
1989-91	Behind Access Panel, Directly Below Steering Column
1992-94	(1) Behind Instrument Panel, Next To Left Speaker
(1) See <u>Fig. 1</u> .

Fig. 1: Check Engine Light Reset Switch Location (1992-94 Geo Tracker - Federal Emissions)
Courtesy of GENERAL MOTORS CORP.

California Emissions

CHECK ENGINE light indicates when it is necessary to have emission system serviced, regardless of mileage. CHECK ENGINE light comes on briefly when starting as a bulb check. If light does not come on or stays on constantly, repair as necessary.

FUEL FILTER LIFE

NOTE: To determine the appropriate reset procedure, refer to Fuel Filter Life Reset Index. Only vehicles listed in this index have a fuel filter life reset.

FUEL FILTER LIFE RESET INDEX

Application	Reset Procedure
Some Models	<u>Fuel Filter Life Reset - Procedure 1</u>

NOTE: ALWAYS reset the FUEL FILTER LIFE system (if equipped) after a fuel filter change.

"FUEL FILTER LIFE" message will appear when a reset is performed either by using the steering wheel controls or performing manual reset procedure.

FUEL FILTER LIFE RESET - PROCEDURE 1

1. On vehicles with steering wheel controls, press and hold the select button for 5 seconds while the FUEL FILTER LIFE message is displayed. This message will appear on the Driver Information Center (DIC) for 10 seconds.
2. On vehicles without steering wheel controls, go to next step.
3. Without pressing the pedals, turn the ignition key to the ON position, engine off. Wait 5 seconds.
4. Completely depress the brake and accelerator pedals simultaneously and hold for 10 seconds. The system is now reset. Turn ignition key OFF.
5. On all vehicles, the next time engine is started, the message will no longer be displayed.

OIL CHANGE REMINDER

NOTE: Most 1981-88 General Motors vehicles do not use a Service Reminder Indicator (SRI).

NOTE: To determine the appropriate reset procedure, refer to Oil Change Reminders Reset Index. Only vehicles listed in this index have an oil change reminder reset.

OIL CHANGE REMINDER RESET - PROCEDURE 1

1. The CHANGE OIL (or CHANGE ENGINE OIL) message is displayed when its time to change engine oil, usually between 3000 and 7500 miles since last oil change.
2. To reset the oil life monitor, turn the ignition switch to RUN position, with engine off. Press the TRIP/OIL RESET button on the instrument panel for 12 seconds. The OIL CHANGE light will start to flash to confirm that system is reset (on some models a chime will also sound). Reset is complete when OIL CHANGE light goes out.

OIL CHANGE REMINDER RESET - PROCEDURE 2

Engine oil life monitor calculates engine oil temperature and RPM. It indicates when the engine oil is nearly worn out. A CHANGE OIL light on the instrument cluster is illuminated when it is time to change the engine oil. To reset CHANGE OIL light:

1. Remove IP fuse block cover (cover can be seen when driver's door is open).
2. Turn ignition ON, engine OFF.
3. Press OIL RESET button and hold for 5 seconds.
4. If Oil Life light does not reset, repeat procedure with ignition OFF.

OIL CHANGE REMINDER RESET - PROCEDURE 3

Engine oil life monitor calculates engine oil temperature and RPM. It indicates when the engine oil is nearly worn out. A CHANGE OIL light on the instrument cluster is illuminated when it is time to change the engine oil.

1. To reset oil life monitor and turn off CHANGE OIL light, turn ignition switch to ON position with engine off.
2. Depress accelerator pedal to wide open throttle 3 times within 5 seconds. This throttle signal will inform the PCM to reset the oil life monitor and turn off the light. If light does not turn off, turn ignition off and repeat procedure.

OIL CHANGE REMINDER RESET - PROCEDURE 4

When the system has calculated that oil life has been diminished, it will indicate that an oil change is necessary. A CHANGE ENGINE OIL SOON message will come on. Change the engine oil as soon as possible within the next 600 miles (1,000 km). It is possible that, if driving under the best conditions, the oil life system may not indicate that an oil change is necessary for over a year. However, the engine oil and filter must be changed at least once a year and at this time the system must be reset.

Reset Procedure

1. Turn the ignition key to RUN with the engine OFF.
2. Press the INFO and RESET buttons on the Driver Information Center (DIC) at the same time to enter the personalization menu.
3. Press the INFO button to scroll through the available personalization menu modes until the DIC display shows OIL-LIFE RESET.
4. Press the INFO and RESET buttons at the same time for one second and release.
5. Press and hold the reset button until the DIC display shows ACKNOWLEDGED. This will tell you the system has been reset.
6. Turn the key to LOCK/OFF.

Alternate Method (Some Models)

1. Turn the ignition key to RUN with the engine off.
2. Fully press the release the accelerator pedal 3 times within 5 seconds. Several beeps sound. This confirms the oil life system has been reset.
3. If the CHANGE/OIL message comes back on when you start the engine, the engine oil life system has not been reset. Repeat the procedure.

OIL CHANGE REMINDER RESET - PROCEDURE 5

Engine oil life monitor calculates engine oil temperature and RPM. It indicates when the oil is nearly worn out. A CHANGE OIL light on left side of instrument cluster is illuminated when it is time to change oil. To reset oil life monitor:

1. Turn ignition on.
2. Depress ENG MET button on trip monitor and release.
3. Within 5 seconds, depress and release ENG MET button again.
4. Within 5 seconds, depress and hold the ENG MET or GAUGES button again. The CHANGE OIL light should flash.
5. Depress and hold the RANGE or GAUGES button until the CHANGE OIL light stops flashing and goes out. When the light goes out, the engine oil life monitor is reset. This should take about 10 seconds.

NOTE: If the light does not reset, turn ignition off and repeat the procedure.

OIL CHANGE REMINDER RESET - PROCEDURE 6

The Driver Information Center (DIC) will display a CHANGE OIL message when an oil change is due. The instrument cluster may also have a CHANGE OIL light. To reset the oil life monitor:

Reset Procedure

1. Turn ignition switch to RUN position, with engine off.
2. Press the TRIP (on some models SELECT or SET/RESET) button, located on the DIC, until the OIL LIFE display appears. Message will display percentage of oil life remaining.

NOTE: On models without DIC buttons, use the TRIP/ODOMETER reset stem.

3. Press and hold SET/RESET button (on some models, the check-symbol button) on DIC for at least 5 seconds. The message will change to indicate that the Oil Life has been reset. On some models, 3 chimes will also sound.
4. Turn ignition off.
5. Turn the key to OFF. If the light or message comes back on when you start your vehicle, the oil life system has not reset. Repeat the procedure.

NOTE: On some models, if oil life system does not reset, try turning ignition OFF after displaying oil life message. Then press and hold reset button.

Alternate Method (Some Models)

1. Turn the ignition key to RUN with the engine off.
2. Fully press the release the accelerator pedal 3 times within 5 seconds. Several beeps sound. This confirms the oil life system has been reset.
3. If the CHANGE/OIL message comes back on when you start the engine, the engine oil life system has not been reset. Repeat the procedure.

OIL CHANGE REMINDER RESET - PROCEDURE 7

When the system has calculated that oil life has been diminished, it indicates that an oil change is necessary. A

CHANGE ENGINE OIL SOON message in the DIC comes on. Reset the system whenever the engine oil is changed so that the system can calculate the next engine oil change. To reset the system:

1. Press the up or down arrow to scroll the DIC to show OIL LIFE.
2. Once the XXX% ENGINE OIL LIFE menu item is highlighted, press and hold the RESET button until the percentage shows 100%

OIL CHANGE REMINDER RESET - PROCEDURE 8

The CHANGE ENGINE OIL message is displayed when its time to change engine oil, usually between 3000 and 7500 miles since last oil change. The oil change interval is not based on mileage, but on engine revolutions and engine operating temperature.

1. There are 2 ways to reset the engine oil life monitor. To reset the engine oil life monitor using the accelerator pedal, go to step 4. To reset the engine oil life monitor using the radio, turn the radio off. Turn ignition to ACC or ON, with the engine off. Press and hold the DISP (on some models, TUNE DISP) button (or knob) on the radio for at least 5 seconds until SETTINGS is displayed.
2. Press the SEEK (on some models, SEEK PTYPE or SEEK PSCAN) up or down arrow to scroll through the main menu. Scroll until OIL LIFE appears on the display. Press the PREV or NEXT button to enter the sub-menu. RESET will be displayed.
3. Press the DISP/TUNE DISP button to reset. A chime will sound to verify the new setting and DONE will be displayed for one second. Once the message indicator has been reset, scroll through the menu until EXIT appears on the display. Press the DISP/TUNE DISP button to exit the program. A chime will sound to verify the exit.
4. To reset the engine oil life monitor using the accelerator pedal, turn ignition on with engine off. Fully depress and release the accelerator pedal slowly 3 times within 5 seconds. If CHANGE ENGINE OIL light flashes, oil life monitor is reset. If the CHANGE ENGINE OIL light comes back on and stays on, oil life monitor has not reset. Repeat reset procedure.

OIL CHANGE REMINDER RESET - PROCEDURE 9

When the system has calculated that oil life has been diminished, it will indicate that an oil change is necessary. A CHANGE message will come on. Change the engine oil as soon as possible within the next 600 miles (1000 km). It is possible that, if driving under the best conditions, the oil life may not indicate that an oil change is necessary for over a year. However, the engine oil and filter must be changed at least once a year and at this time the system must be reset.

To reset the Engine Oil Life System, do the following:

1. Press and hold the TRIP button on the steering wheel while turning on the ignition. Do not start the engine.
2. The instrument panel cluster will prompt to clear the service code.
3. Release the button.
4. Press and hold ENTER Switch on the left side of the steering wheel for approximately one second.
5. Turn off the ignition.

If the CHANGE ENGINE OIL SOON message comes back on when you start the vehicle, the engine oil life system has not reset. Repeat the procedure.

OIL CHANGE REMINDER RESET - PROCEDURE 10

1. Turn ignition ON, with engine off.
2. Press and release reset stem on instrument panel while OIL LIFE message is displayed.
3. Once the alternating OIL LIFE and RESET messages appear, press and hold stem in until several beeps will sound. This confirms that oil life system has been reset. Turn ignition off or full LOCK position. If CHANGE OIL messages comes back after starting engine, repeat reset procedure.

OIL CHANGE REMINDER RESET - PROCEDURE 11

Reset Procedure

If vehicle is equipped with a Driver Information Center (DIC), reset oil life monitor by pressing the Driver Information Center SELECT button for 5 seconds while ENGINE OIL LIFE is displayed.

Alternate Method

To reset the oil life monitor, turn ignition switch to ON or RUN position with engine off. Depress accelerator pedal slowly to wide open throttle 3 times within 5 seconds. If CHANGE ENG OIL light flashes for 5 seconds, oil life monitor is reset. If the CHANGE ENG OIL light does not flash, oil life monitor has not reset. Repeat this step.

OIL CHANGE REMINDER RESET - PROCEDURE 12

1. CHANGE OIL SOON light will come on when engine oil has broken down enough to require changing. After changing oil, reset oil life display.
2. To reset light, turn ignition on. Open glove box to access oil reset button. Press and hold oil reset button in glove box for at least 5 seconds, but not longer than 60 seconds. The CHANGE OIL SOON light will flash 4 times to indicate light has been reset.

OIL CHANGE REMINDER RESET - PROCEDURE 13

GM Oil Life System calculates when to change your engine oil and filter based on vehicle use. Anytime oil is changed, reset the system so it can calculate when the next oil change is required. If a situation occurs where you change your oil prior to a Change Oil Soon message being turned on, reset the system. After changing the engine oil, reset the system.

1. Display OIL LIFE RESET on the DIC.
2. Press and hold ENTER button for at least one second. An ACKNOWLEDGED display message will appear for 3 seconds or until the next button is pressed. This will tell you the system has been reset.
3. Turn key to OFF.
4. If Change Oil Soon message comes back on when you start your vehicle, engine oil life system has not reset. Repeat the procedure.

OIL CHANGE REMINDER RESET - PROCEDURE 14

1. To display this light, press the GAGE INFO or GAGES button on the Driver Information Center (DIC). When oil life index is less than 10 percent, display will show OIL LIFE INDEX CHANGE OIL. After changing oil, reset system.
2. To reset light, display OIL LIFE INDEX. Hold RESET button for more than 5 seconds. After reset, oil life will change to 100 percent.

OIL CHANGE REMINDER RESET - PROCEDURE 15

1. CHANGE OIL SOON light will come on when engine oil has broken down enough to require changing. After changing oil, reset oil life display.
2. To reset light, locate reset button hole under the dash near passenger door. Use a pencil or similar object to push and hold button (inside hole) for 5 seconds. The CHANGE OIL SOON light will flash 4 times to indicate light has been reset.

OIL CHANGE REMINDER RESET - PROCEDURE 16

Vehicles WITHOUT Driver Information Center (DIC) Buttons

1. Turn the ignition to ON/RUN, with the engine off. The vehicle must be in P (Park) to access this display. Press the trip odometer reset stem until OIL LIFE REMAINING displays.
2. Press and hold the trip odometer reset stem until OIL LIFE REMAINING shows "100%." Three chimes sound and the CHANGE ENGINE OIL SOON message goes off.
3. Turn the key to LOCK/OFF. If the CHANGE ENGINE OIL SOON message comes back on when the vehicle is started, the engine oil life system has not been reset. Repeat the procedure.

Vehicles WITH Driver Information Center (DIC) Buttons

1. Turn the ignition to ON/RUN position, with the engine off.
2. Press the VEHICLE INFORMATION BUTTON (i) until OIL LIFE REMAINING displays.
3. Press and hold the SET/RESET button (check-mark symbol) until "100%" is displayed. Three chimes sound (on some models) and the CHANGE ENGINE OIL SOON message goes off.
4. Turn ignition to LOCK/OFF position. If the CHANGE ENGINE OIL SOON message comes back on when engine is started, repeat reset procedure.

OIL CHANGE REMINDER RESET - PROCEDURE 17

Reset Procedure

1. Turn the ignition to ON, with the engine off.
2. Press the MODE button until the Driver Information Center (DIC) reads OIL LIFE LEFT/HOLD SET TO RESET.
3. Press and hold the SET button until 100% is displayed. You will hear three chimes and the CHANGE ENGINE OIL message will go off. Turn the key to OFF.

4. If the CHANGE ENGINE OIL message comes back on when engine is started, the engine oil life system has not reset. Repeat the procedure.

Alternate Method (Some Models)

1. Turn the ignition key to RUN with the engine off.
2. Fully press the release the accelerator pedal 3 times within 5 seconds. Several beeps sound. This confirms the oil life system has been reset.
3. If the CHANGE/OIL message comes back on when you start the engine, the engine oil life system has not been reset. Repeat the procedure.

OIL CHANGE REMINDER RESET - PROCEDURE 18

When the system has calculated that oil life has been diminished, it will indicate that an oil change is necessary. A CHANGE ENGINE OIL message or light will come on. Change the engine oil as soon as possible within the next 600 miles (1 000 km). It is possible that, if driving under the best conditions, the oil life system may not indicate that an oil change is necessary for over a year. However, the engine oil and filter must be changed at least once a year and at this time the system must be reset.

NOTE: **Be careful not to reset the oil life display accidentally at any time other than after the oil is changed. It cannot be reset accurately until the next oil change.**

Vehicles with Driver Information Center (DIC)

1. Turn the ignition to ON/RUN with the engine off.
2. Press the DIC MENU button on the turn signal lever to enter the Vehicle Information Menu. Use the thumbwheel to scroll through the menu items until you reach REMAINING OIL LIFE. See **Fig. 2**.
3. Press the SET/CLR button (on some models, the check-symbol button) while the oil life display is active. After a few seconds, there will be a single chime (on some models) and the oil life will be reset to 100%.
4. Turn the ignition to LOCK/OFF.

The system is reset when the CHANGE OIL message is off and the REMAINING OIL LIFE 100% message is displayed.

NOTE: **If the CHANGE OIL message comes back on or Code 82 DIC message comes on when the vehicle is started, the engine oil life system has not been reset. Repeat the procedure.**

Fig. 2: Identifying DIC Controls (Turn Signal Lever)
Courtesy of GENERAL MOTORS CORP.

Vehicles without DIC (Some Models)

1. With the engine OFF, turn the ignition key to RUN.
2. Fully press and release the accelerator pedal slowly three times within five seconds.
3. Turn the key to OFF, then start the vehicle.

Reset Using Diagnostic Scan Tool (Some Models)

1. Turn on ignition.
2. Connect scan tool.
3. Select Module Diagnosis.
4. Select Engine Control Module.
5. Select Configuration/Reset function.
6. Select Engine Oil System Reset.
7. Push Enter button to run function.
8. Confirm Executed successfully.
9. Turn ignition off and confirm.
10. Turn ignition on and confirm.

OIL CHANGE REMINDER RESET - PROCEDURE 19

1. The Driver Information Center (DIC) will display remaining oil life as a percentage estimate of the useful life of oil.
2. When remaining oil life is 10 percent or less, the system will display CHANGE OIL SOON. When oil life expires, display will show CHANGE ENGINE OIL. After changing oil, reset oil life display.
3. To reset oil life display, press INFORMATION (or INFORMATION SKIP) button to display OIL LIFE LEFT. Press and hold RESET (or RESET NO) button until 100 OIL LIFE LEFT (0.0 OIL LIFE LEFT on some early models) is displayed.

OIL CHANGE REMINDER RESET - PROCEDURE 20

With Base Audio System

Press up or down arrow on the INFO button located to right of Driver Information Center (DIC) display to access DIC menu. Once 100 percent ENGINE OIL LIFE menu item is highlighted, press and hold the CLR button. Percentage will return to 100 and oil life indicator will be reset. Repeat procedure if the percentage does not return to 100.

With Navigation System

Turn the system on by pressing PWR/VOL knob once. PWR/VOL knob is located to lower left of DIC display. Press INFO button located to left of the display to access Vehicle Information menu. Turn TUNE/SEL knob located to lower right of the display until ENGINE OIL LIFE is highlighted. Press TUNE/SEL knob once to select it. When 100 percent Engine Oil Life is displayed, press multifunction button next to reset prompt in upper right corner of the display. Percentage will return to 100 and the oil life indicator will be reset. Repeat procedure if the percentage does not return to 100.

OIL CHANGE REMINDER RESET - PROCEDURE 21

1. Use the SELECT knob to select OIL LIFE on the DIC menu.
2. Press SELECT to start the OIL LIFE reset procedure.
3. The DIC menu will display "Are you sure that you want to reset?" Use SELECT to choose YES to reset oil life or NO to exit and return to the previous menu.
4. If YES is selected, the DIC menu will display RESET OIL LIFE for a short time and then 100% OIL LIFE will be display when OIL LIFE is successfully reset.

OIL CHANGE REMINDER RESET - PROCEDURE 22

With Base Audio System

1. Press the CLR button located to the right of the driver information center (DIC) display to acknowledge the Change Engine Oil message. This will clear the message from the display and reset it.
2. Press the up or down arrow on the INFO button located to the right of the Driver Information Center (DIC) display to access the DIC menu.
3. Once 100% ENGINE OIL LIFE menu item is highlighted, press and hold the CLR button. The percentage will return to 100 and the oil life indicator will be reset. Repeat the steps if the percentage does not return to 100.
4. Turn OFF the key. If the Change Engine Oil message comes back on when you start the vehicle, the engine oil life system has not reset. Repeat the procedure.

Without DIC

1. With the engine OFF, turn the ignition key to RUN.
2. Fully press and release the accelerator pedal slowly three times within five seconds.
3. Turn the key to OFF, then start the vehicle.

With Navigation System

1. Press the multifunction button, next to the OK prompt in the upper right of the display to acknowledge the Change Engine Oil message. This will clear the message from the display and reset it.
2. Turn the system on by pressing the PWR/VOL knob once. The PWR/VOL knob is located to the lower left of the driver information center (DIC) display.
3. Press the INFO button located to the left of the display to access the Vehicle Information menu.
4. Turn the TUNE/SEL knob located to the lower right of the display until Engine Oil Life is highlighted. Press the knob once to select it.
5. Once the 100% Engine Oil Life is displayed, press the multifunction button next to the Reset prompt in the upper right corner of the display. The percentage will return to 100 and the oil life indicator will be reset. Repeat the steps if the percentage does not return to 100.
6. Turn OFF the key. If the Change Engine Oil message comes back on when you start the vehicle, the engine oil life system has not reset. Repeat the procedure.

OIL CHANGE REMINDER RESET - PROCEDURE 23

1. An OIL LIFE INDEX is one of the displays on Driver Information Center (DIC). It will display remaining oil life as a percentage estimate of the useful life of oil.
2. It will show 100 percent when the system is reset. When the oil life is 0 percent, the display will show CHANGE ENGINE OIL. After changing oil, reset oil life display.
3. To reset service reminder on 1989 models, press RANGE button until OIL LIFE INDEX appears on display. Depress and hold in AVG ECON and RANGE buttons for more than 5 seconds or until 100 is displayed. This will reset remaining oil life to 100 percent.
4. On 1990-93 models, press RANGE button until OIL LIFE INDEX appears on DIC display. Depress and hold in AVG SPEED and RANGE buttons for more than 5 seconds or until 100 is displayed. This will reset remaining oil life to 100 percent.

OIL CHANGE REMINDER RESET - PROCEDURE 24

1. An OIL LIFE INDEX is one of 4 displays on Driver Information Center (DIC). It will display remaining oil life as a percentage estimate of the useful life of oil.
2. Display will show 100 percent when the system is reset. When remaining oil life is 10 percent or less, the system will display CHANGE OIL SOON. When the oil life expires, the display will show CHANGE ENGINE OIL. After changing oil, reset oil life display.
3. To reset oil life display, press ENG DATA button until OIL LIFE INDEX appears on DIC display. Depress and hold in ENG DATA and RANGE buttons until 100 is displayed. This will reset remaining oil life to 100 percent.

OIL CHANGE REMINDER RESET - PROCEDURE 25

1. An OIL LIFE INDEX is one of the displays on Driver Information Center (DIC). It will display remaining oil life as a estimated percentage of the useful life of oil.
2. It will show 100 percent when the system is reset. When the oil life is 0 percent, the display will show CHANGE ENGINE OIL. After performing necessary services, reset service reminder.

3. To reset service reminder, turn ignition to on position. Do not start engine. Depress and hold RANGE and FUEL USED buttons until OIL LIFE INDEX appears on DIC display. Depress and hold RANGE and RESET buttons for 5-60 seconds.
4. When CHANGE OIL SOON light flashes 4 times, remaining oil life index is reset to 100 percent. If CHANGE OIL SOON comes on and stays on for 5 seconds, display did not reset. Repeat step 3.

OIL CHANGE REMINDER RESET - PROCEDURE 26

1. Oil change reminder display on the Driver Information Center (DIC) is similar to 1990-91 models, but reset procedures are different. After changing oil, reset oil life display.
2. To reset, press INFORMATION button to display OIL LIFE INDEX. Press and hold STORE/RECALL button until 100 is displayed. This will reset oil life display to 100 percent.

OIL CHANGE REMINDER RESET - PROCEDURE 27

1. The Driver Information Center (DIC) displays estimated percentage of the remaining useful life of engine oil or transaxle fluid. When remaining oil or fluid life is 0 percent, the display will show CHANGE OIL NOW or CHANGE TRNS FLUID NOW. After changing engine oil or transaxle fluid, reset oil life display.
2. To reset the display, turn ignition on with engine off. Press ENG button to select the OIL LIFE or TRNS FLUID LIFE percentage display. Then, press and hold in RESET for at least 5 seconds.
3. The word RESET will appear. Then, OIL LIFE 100 or TRNS FLUID 100 will be displayed.

OIL CHANGE REMINDER RESET - PROCEDURE 28

1. An oil change reminder displays estimated percentage of the remaining useful life of the oil. When engine is started, a tone will sound and approximate distance to next oil change will be displayed.
2. When remaining oil life is 10 percent or less, the system will calculate distance to next oil change. When the oil life is 0 percent, the display will show CHANGE OIL NOW. After changing oil, reset oil life display.
3. To reset the display, press and hold in OIL button to select the oil life display. Then, press and hold in RESET and OIL buttons for at least 5 seconds. This will reset oil life display to 100 percent.

OIL CHANGE REMINDER RESET - PROCEDURE 29

1. To reset the display, press and release the TEST button.
2. Press and release the OIL button.
3. Press and hold the RESET button for at least 7 seconds. This will reset oil life display to 100 percent.

OIL CHANGE REMINDER RESET - PROCEDURE 30

1. To reset the display, press and release RESET button on Driver Information Center (DIC).
2. Press SEL button (with down arrow) to select OIL.
3. Press SEL button (with left and right arrows) to display oil life.

4. Press and hold RESET button for about 5 seconds.
5. A reset message will display, then oil life will display 100 percent.

OIL CHANGE REMINDER RESET - PROCEDURE 31

With Information Center Display

OIL LIFE INDEX is one of 4 engine data displays used on models with Information Center display. It will display remaining oil life as estimated percentage of the useful life of oil. It will show 100 percent when the system is reset. After changing oil, reset oil life display.

1. To reset the display, press ENG DATA button (1989-90) or OPTIONS button (1991-92) until oil life index is displayed.
2. Then, press and hold in ENG DATA and GAGE buttons (1989) or RESET/ENTER button (1990-92) for at least 5 seconds. This will reset remaining oil life to 100 percent.

With Visual Information Center

OIL LIFE is one of the displays used on models with a Visual Information Center (VIC). It will display data regarding previous oil change. A bar graph display shows full when oil is changed. Bar graph will go down as vehicle is driven and oil ages. When bar graph reaches CHANGE OIL mark, oil should be changed. After changing oil, reset oil life display.

1. To reset the display, press INFO hard key and then OIL LIFE soft key to display oil life index.
2. Press RESET soft key.
3. A reset confirmation page will appear and ask if oil has been changed. Press YES soft key to reset bar graph, and update last oil change date and mileage information.

OIL CHANGE REMINDER RESET - PROCEDURE 32

When the system has calculated that oil life has been diminished, it will indicate that an oil change is necessary. A CHANGE ENGINE OIL SOON message will come on. Change the engine oil as soon as possible within the next 600 miles (1000 km). It is possible that, if driving under the best conditions, the oil life system may not indicate that an oil change is necessary for over a year. However, the engine oil and filter must be changed at least once a year and at this time the system must be reset.

To reset the Engine Oil Life System, do the following:

1. With the CHANGE OIL SOON message displayed, press any of the three driver information center (DIC) buttons to clear the CHANGE OIL SOON message.
2. Display OIL LIFE RESET on the DIC.
3. Press and hold the ENTER button for at least one second. An ACKNOWLEDGED display message will appear for three seconds or until the next button is pressed. This will tell you the system has reset.
4. Turn the ignition to OFF.

If the CHANGE ENGINE OIL message comes back on when you start the vehicle the Engine Oil Life System

has not reset. Repeat the procedure.

OIL CHANGE REMINDER RESET - PROCEDURE 33

This vehicle has a computer system that indicates when to change the engine oil and filter. This is based on a combination of factors which include engine revolutions, engine temperature, and miles driven. Based on driving conditions, the mileage at which an oil change is indicated can vary considerably. For the oil life system to work properly, the system must be reset every time the oil is changed. To reset the system:

Reset Procedure

- 1. Using the DIC controls on the right side of the steering wheel, display REMAINING OIL LIFE on the driver information center (DIC).
- 2. Press SEL on the DIC controls and hold SEL down for a few seconds to clear the CHANGE ENGINE OIL SOON message and reset the oil life at 100%.

NOTE: Be careful not to reset the oil life display accidentally at any time other than after the oil is changed. It cannot be reset accurately until the next oil change.

Alternate Method (Some Models)

- 1. Turn the ignition key to RUN with the engine off.
- 2. Fully press the release the accelerator pedal 3 times within 5 seconds. Several beeps sound. This confirms the oil life system has been reset.
- 3. If the CHANGE/OIL message comes back on when you start the engine, the engine oil life system has not been reset. Repeat the procedure.

OXYGEN SENSOR REMINDER FLAG

NOTE: To determine the appropriate reset procedure, refer to OXYGEN SENSOR REMINDER FLAG RESET. Only vehicles listed in this index have an oxygen sensor reminder flag reset.

OXYGEN SENSOR REMINDER FLAG RESET INDEX

Model & Year	Reset Procedure
Some Models	
1980	<u>Oxygen Sensor Reminder Flag - Procedure 1</u>

OXYGEN SENSOR REMINDER FLAG - PROCEDURE 1

- 1. Every 30,000 miles, a reminder flag appears in speedometer face, indicating service of oxygen sensor is necessary. See Fig. 3. Inspect and service oxygen sensor as necessary and reset flag.
- 2. To reset flag, remove instrument panel trim plate. Remove instrument cluster lens. Using pointed tool, apply light downward pressure on notches of flag until it is reset. An alignment mark will appear in left

center of odometer window when flag is fully reset.

Fig. 3: Resetting Reminder Flag
Courtesy of GENERAL MOTORS CORP.

OXYGEN SENSOR WARNING LIGHT

NOTE: To determine the appropriate reset procedure, refer to OXYGEN SENSOR WARNING LIGHT RESET INDEX. Only vehicles listed in this index have an oxygen sensor warning light reset.

OXYGEN SENSOR WARNING LIGHT RESET INDEX

Model & Year	Reset Procedure
Sprint	
1985-86	<u>Oxygen Sensor Warning Light Reset - Procedure 1</u>

OXYGEN SENSOR WARNING LIGHT RESET - PROCEDURE 1

At 30,000 mile intervals, a SENSOR light in dash will start flashing, indicating oxygen sensor needs replacement. To reset mileage counter (after sensor replacement), locate SENSOR light cancel switch on right side of fuse box. Return cancel switch to OFF position. Start engine to ensure light remains off.

SERVICE REMINDER MESSAGE

NOTE: To determine the appropriate reset procedure, refer to Service Reminder Reset

Index. Only vehicles listed in this index have a Service Reminder reset.

SERVICE REMINDER RESET INDEX

Model & Year	Reset Procedure
6000 STE	
1987-89	<u>Service Reminder Message Reset - Procedure 1</u>
Bonneville	
1988-91	<u>Service Reminder Message Reset - Procedure 1</u>
Caprice	
2011	<u>Service Reminder Message Reset - Procedure 2</u>

SERVICE REMINDER MESSAGE RESET - PROCEDURE 1

The SERVICE REMINDER message light is used on models with a Driver Information Center (DIC). After performing necessary services, reset service reminder light.

1. To reset service reminder, push DIC button until desired service item is displayed.
2. Press and hold down the DIC button. With button pressed, the distance display will decrease in increments of 500 miles.
3. Release button when desired distance is displayed on the DIC.

SERVICE REMINDER MESSAGE RESET - PROCEDURE 2

The displayed service reminder is reset using a scan tool or by the following procedure:

1. Turn the ignition to the OFF position.
2. Press and hold the TRIP button.
3. Turn the ignition to the ON position.
4. Release the TRIP button.
5. Once in the Service Reset screen, press and hold the ENTER switch for 3-5 seconds. A confirmation beep will sound upon reset.
6. Turn the ignition to the OFF position.

NOTE: If the service reminder comes back on when you start the vehicle, the Service Reminder Display has not reset. Repeat the procedure.

TIRE PRESSURE MONITOR SYSTEM (TPMS)

NOTE: To determine the appropriate reset procedure, refer to **TPMS RESET INDEX**. Only vehicles listed in this index have a TPMS reset.

(1) This is an Indirect TPM System. A tire sensor activation tool is not required for this procedure.		
(2) A tire sensor activation tool cannot be used for this procedure.		

TPMS RESET - PROCEDURE 1

NOTE: When the wheels have been rotated, or a tire pressure sensor or EGM/LGM has been replaced, retrain tire pressure sensors.

NOTE: The DIC will display the "SERVICE TIRE MONITOR" message if one or more of the tire pressure sensors has malfunctioned or if all of the sensors have not been programmed successfully. If, after the relearn procedure, the warning indicators are still on, there is a problem in the TPM system.

NOTE: If this procedure is performed following replacement and reprogramming of the Liftgate Module (LGM), DIC may display a low tire pressure fault and all tire pressures read 0 psi. If this problem occurs, see appropriate manufacturer service information.

NOTE: The TPM system will cancel the learn mode if more than 2 minutes have passed and no sensors have been learned, or if the system has been in learn mode for more than 5 minutes. If the learn mode is canceled before any sensor has been learned, the EGM/LGM will remember all current sensor IDs and their locations. As soon as the first sensor ID code is learned, all other IDs are erased from the EGM/LGM's memory. On models that display the individual tire pressure on DIC, updated tire pressures will not be displayed until EGM/LGM receives 2 more valid transmissions from each sensor.

NOTE: Before proceeding with the steps below, ensure that no other sensor learn procedure is being performed simultaneously, or that tire pressures are not being adjusted on a TPM equipped vehicle within close proximity.

1. Set the tire pressure of all wheels to pressure specified on the tire and loading information label.
2. Turn ignition ON with engine OFF. Apply parking brake.

NOTE: If Learn Mode cannot be enabled, TPM system is not enabled in EGM/LGM. See appropriate manufacturer service information.

3. To enable Learn Mode, turn headlight switch from OFF to parking lamps 4 times within 4 seconds. A double horn chirp will sound and the low tire pressure indicator will begin to flash to indicate the learn mode has been enabled.
4. Starting with left front tire, hold a tire sensor activation tool against the side wall of the tire, within 3 inches of the valve stem. Activate tool until a horn chirp sounds.
5. After horn chirp has sounded, proceed to the next 3 sensors in the following order: right front, right rear and left rear.
6. After left rear sensor has been learned, turn ignition switch to OFF position to exit Learn Mode.
7. Test drive the vehicle above 25 mph for at least 2 minutes before viewing tire pressures on DIC.

TPMS RESET - PROCEDURE 2

NOTE: If a tire pressure sensor or the Remote Control Door Lock Receiver (RCDLR) is replaced, or if wheels have been rotated, tire pressure sensor must be retrained.

NOTE: When the tire pressure warning light illuminates and warning message appears on DIC, immediately check air pressure of all tires and adjust to the specified pressure. If warning indicators are still on or display shows dashes instead of a value, there is a problem in the TPM system. See appropriate manufacturer service information.

NOTE: Under the following conditions, the TPM system may not function properly:

- If one or more of the tire pressure sensors are missing or inoperable.
- A compact spare tire is used.

NOTE: If a tire pressure sensor or the Remote Control Door Lock Receiver (RCDLR) is replaced, or if wheels have been rotated, tire pressure sensor must be retrained.

NOTE: The relearn procedure must be completed within 15 minutes from when the vehicle is stationary after being driven at 20 mph (32 km/h), or greater, for 10 seconds.

NOTE: The learn mode will cancel if the ignition is cycled to OFF or if more than 2 minutes has elapsed for any sensor that has not been learned. If the learn mode is cancelled before the first sensor is learned, the original sensor IDs will be maintained. If the learn mode is canceled after the first sensor is learned, the following will occur:

- All stored sensor IDs will be invalidated in the RCDLR memory.
- If equipped, the DIC will display dashes instead of tire pressures.
- DTC C0775 will be set.

These conditions will now require the learn procedure to be repeated for the system to function properly.

IMPORTANT: Ensure that no other learn procedure is being performed simultaneously or that tire pressures are not being adjusted on another TPM equipped vehicle within close proximity. Stray signals from other TPM equipped vehicles just driving by can be inadvertently learned. If any random horn chirps are heard from the vehicle while performing the learn procedure, most likely a stray sensor has been learned and the procedure will need to be cancelled and repeated. Under these circumstances, performing the TPM Learn Procedure away from other vehicles would be highly recommended. In the event a particular sensor activation does not cause the horn to chirp, it may be necessary to rotate the wheel valve stem to a different position due to the sensor signal is being blocked by another component.

1. Turn ignition switch to ACC position. Apply parking brake.
2. Set the tire pressure of all wheels to pressure specified on the tire and loading information label.
3. To enable Learn Mode:
 - On vehicles equipped with keyless entry, simultaneously press the keyless entry transmitters lock and unlock buttons until a double horn chirp sounds indicating the Learn Mode has been enabled. On vehicles with DIC, a TIRE LEARN message may be displayed. The left front turn signal will

also be illuminated.

- On vehicles not equipped with keyless entry, press and release the driver information center (DIC) INFO button until the TIRE LEARN message appears on the DIC display. Press and hold the SET/RESET button until a double horn chirp sounds indicating the Learn Mode has been enabled. The left front turn signal will also be illuminated.

4. Ignition ON.
5. Starting with left front tire, hold a tire sensor activation tool against the side wall of the tire, within 3 inches of the valve stem. Activate tool until a horn chirp sounds.
6. After horn chirp has sounded, proceed to the next 3 sensors in the following order: right front, right rear and left rear.
7. After left rear sensor has been learned, turn ignition switch to OFF position to exit Learn Mode.

TPMS RESET - PROCEDURE 3

NOTE: If a tire pressure sensor or the Remote Control Door Lock Receiver (RCDLR) is replaced, or if wheels have been rotated, tire pressure sensor must be relearned.

NOTE: When the tire pressure warning light illuminates and warning message appears on DIC, immediately check air pressure of all tires and adjust to the specified pressure. If warning indicators are still on or display shows dashes instead of a value, there is a problem in the TPM system. See appropriate manufacturer service information.

NOTE: In vehicles without the "UH3" option, each turn signal will illuminate one at a time indicating which location is to be learn.

NOTE: The TPM system will cancel the learn mode if more than 2 minutes have passed and no sensors have been learned, or if the ignition switch is turn to the OFF position. If the learn mode is canceled before the first ID is learned, the RCDLR will remember all previously stored IDs and their locations. As soon as the first sensor ID is learned, all other IDs are erased from the RCDLR's memory. If the learn mode is canceled after the first ID is learned, the RCDLR will store the IDs as invalid and the DIC will display dashes instead of tire pressures.

NOTE: Before proceeding with the registration procedure, ensure that no other sensor learn procedure is being performed simultaneously, or that no tire pressures are being adjusted on another TPM equipped vehicle within close proximity.

1. Set the tire pressure of all wheels to pressure specified on the tire and loading information label.
2. Turn ignition switch to ACC position. Apply parking brake.
3. Simultaneously press the keyless entry transmitter's lock and unlock buttons until a double horn chirp sounds, indicating the Learn Mode has been enabled.

NOTE: The left front turn signal will also illuminate to indicate the learn mode has been enabled.

4. Starting with left front tire, hold a tire sensor activation tool against the side wall of the tire, within 3 inches of the valve stem. Activate tool until a horn chirp sounds.
5. After horn chirp has sounded and the right turn signal has illuminated, proceed to the next 3 sensors in the following order: right front, right rear and left rear.
6. After left rear sensor has been learned, a double horn chirp will sound, indicating all 4 sensor IDs have been learned. Turn ignition switch to OFF position to exit Learn Mode.

TPMS RESET - PROCEDURE 4

NOTE: If the wheels have been rotated, or tire pressure sensor or Remote Control Door Lock Receiver (RCDLR) is replaced, the TPM system needs to relearn tire pressure sensor IDs.

NOTE: When the tire pressure warning light illuminates and warning message appears on DIC, immediately check air pressure of all tires and adjust to the specified pressure. If warning indicators are still on, there is a problem in the TPM system. See appropriate manufacturer service information.

NOTE: The TPM system will cancel Learn Mode if ignition is turned off, if more than 1 or 2 minutes has passed and no sensors have been learned, vehicle battery voltage is less than 8 volts, all 4 sensors have been learned, or if the RCDLR has been in Learn Mode for more than 5 minutes. If Learn Mode is cancelled before any IDs are learned, the RCDLR will remember all previously stored IDs and their locations. As soon as the first sensor ID is learned, all other IDs are erased from the RCDLR's memory.

NOTE: Before proceeding with the registration procedure, ensure that no other sensor learn procedure is being performed simultaneously, or that no tire pressures are being adjusted on another TPM equipped vehicle within close proximity.

1. Set the tire pressure of all wheels to pressure specified on the tire and loading information label.
2. Turn ignition ON with engine OFF.

NOTE: If the TPM Learn Mode cannot be enabled, ensure the TPM option is enabled in the RCDLR. See appropriate manufacturer service information.

3. Simultaneously press the keyless entry transmitter's lock and unlock buttons until a horn chirp sounds, indicating Learn Mode has been enabled.

NOTE: If a horn chirp does not sound after 15 seconds, remove, then re-apply TPM sensor relearn magnet.

4. Starting with left front tire, hold a tire sensor activation tool against the side wall of the tire, within 3 inches of the valve stem. Activate tool until a horn chirp sounds.
5. After the horn chirp sounds, proceed to the next 3 sensors in the following order: right front, right rear, then left rear.
6. After the left rear sensor ID is learned, a double horn chirp will sound, indicating all 4 sensor IDs have been learned. Turn the ignition switch to OFF position to exit Learn Mode.

TPMS RESET - PROCEDURE 5

NOTE: If the wheels have been rotated, or tire pressure sensor or Remote Control Door Lock Receiver (RCDLR) is replaced, the TPM system needs to relearn tire pressure sensor IDs.

NOTE: When the tire pressure warning light illuminates and warning message appears on DIC, immediately check air pressure of all tires and adjust to the specified pressure. If warning indicators are still on, there is a problem in the TPM system. See appropriate manufacturer service information.

NOTE: The TPM system will cancel Learn Mode if ignition is turned off, if more than 1 or 2 minutes has passed and no sensors have been learned, vehicle battery voltage is less than 8 volts, all 4 sensors have been learned, or if the RCDLR has been in Learn Mode for more than 5 minutes. If Learn Mode is cancelled before any IDs are learned, the RCDLR will remember all previously stored IDs and their locations. As soon as the first sensor ID is learned, all other IDs are erased from the RCDLR's memory.

NOTE: Before proceeding with the registration procedure, ensure that no other sensor learn procedure is being performed simultaneously, or that no tire pressures are being adjusted on another TPM equipped vehicle within close proximity.

1. Set the tire pressure of all wheels to pressure specified on the tire and loading information label.
2. Turn ignition ON with engine OFF.
3. Simultaneously press the keyless entry transmitter's lock and unlock buttons until a horn chirp sounds, indicating Learn Mode has been enabled.
4. Starting with left front tire, hold a tire sensor activation tool against the side wall of the tire, within 3 inches of the valve stem. Activate tool until a horn chirp sounds.
5. After the horn chirp sounds, proceed to the next 3 sensors in the following order: right front, right rear, then left rear.
6. After the left rear sensor ID is learned, a double horn chirp will sound, indicating all 4 sensor IDs have been learned. Turn the ignition switch to OFF position to exit Learn Mode.

TPMS RESET - PROCEDURE 6

NOTE: If the wheels have been rotated, or tire pressure sensor or Remote Control Door

Lock Receiver (RCDLR) is replaced, the TPM system needs to relearn tire pressure sensor IDs.

NOTE: When the tire pressure warning light illuminates and warning message appears on DIC, immediately check air pressure of all tires and adjust to the specified pressure. If warning indicators are still on, there is a problem in the TPM system. See appropriate manufacturer service information.

NOTE: The TPM system will cancel Learn Mode if ignition is turned off, if more than 1 or 2 minutes has passed and no sensors have been learned, vehicle battery voltage is less than 8 volts, all 4 sensors have been learned, or if the RCDLR has been in Learn Mode for more than 5 minutes. If Learn Mode is cancelled before any IDs are learned, the RCDLR will remember all previously stored IDs and their locations. As soon as the first sensor ID is learned, all other IDs are erased from the RCDLR's memory.

1. Set the tire pressure of all wheels to pressure specified on the tire and loading information label.
2. Turn ignition ON with engine OFF.
3. Press RESET button on DIC in order to clear any warning messages.
4. Press and release OPTIONS button until display is blank.
5. Press and hold RESET button for 3 seconds.

NOTE: If the DIC does not display "TIRE TRAINING" message, ensure TPM option is enabled in the RCDLR. See appropriate manufacturer service information.

6. Press and release OPTIONS button until "TIRE TRAINING" is displayed.
7. Press and release RESET button. The DIC should display "LEARN L FRONT TIRE", verifying Learn Mode has been enabled.
8. Starting with left front tire, hold a tire sensor activation tool against the side wall of the tire, within 3 inches of the valve stem. Activate tool until a horn chirp sounds.
9. After the horn chirp sounds, proceed to the next 3 sensors in the following order: right front, right rear, then left rear.
10. Turn the ignition switch to OFF position to exit the learn mode.

TPMS RESET - PROCEDURE 7

NOTE: An OEM scan tool or Pressure Increase/Decrease Method is used to perform this procedure.

NOTE: Before proceeding with this process, ensure that no other learn procedure is being performed simultaneously or that tire pressures are not being adjusted on another TPM equipped vehicle within close proximity. Stray signals from

other TPM equipped vehicles just driving by can be inadvertently learned. If any random horn chirps are heard from the vehicle while performing the learn procedure, most likely a stray sensor has been learned and the procedure will need to be cancelled and repeated. Under these circumstances, performing the TPM Learn Procedure away from other vehicles would be highly recommended. In the event a particular sensor activation does not cause the horn to chirp, it may be necessary to rotate the wheel valve stem to a different position due to the sensor signal is being blocked by another component.

1. Ignition ON with engine OFF, apply the parking brake.
2. Using a scan tool, initiate the TPM Learn Mode.
3. Perform the procedure by following the menu selections. A double horn chirp will sound and the IPC tire pressure monitor indicator warning lamp icon will flash indicating Learn Mode is enabled.
4. Starting with the left front tire, active the sensors by one of the following methods:
 - Hold the antenna of the scan tool, aimed upward, against the tire sidewall close to the wheel rim at the valve stem location. Press and release the activate button and wait for a horn chirp. Once the horn chirp has sounded, the sensor information is learned.
 - Increase/decrease the tire pressure for 8-10 seconds then wait for a horn chirp. The horn chirp may occur before or up to 30 seconds after the 8-10 second pressure increase/decrease time period has been reached. Once the horn chirp has sounded, the sensor information has been learned.
5. After the horn chirp has sounded, repeat step 4 for the remaining 3 sensors in the following order: Right front, Right rear, Left rear.
6. After the left rear sensor is learned, a double horn chirp will sound indicating all sensor IDs have been learned and the tire pressure module will exit the Learn mode turning OFF the IPC tire pressure monitor warning indicator lamp icon.
7. Ignition OFF, adjust all tires to the recommended pressures. Refer to the tire placard label.

TPMS RESET - PROCEDURE 8

Automatic Sensor Learn Process

Each TPMS sensor has a unique identification code. The identification code needs to be matched to a new tire/wheel position after rotating the tires or replacing one or more of the TPMS sensors. When a tire is installed, the vehicle must be stationary for about 20 minutes before the system recalculates. The following relearn process takes up to 10 minutes, driving at a minimum speed of 12 mph (19 km/h). A dash (-) or pressure value will display in the DIC. A warning message displays in the DIC if a problem occurs during the relearn process.

TPMS RESET - PROCEDURE 9

NOTE: If a tire pressure sensor or the Remote Control Door Lock Receiver (RCDLR) is replaced, or if wheels have been rotated, tire pressure sensor must be relearned.

NOTE: When the tire pressure warning light illuminates and warning message appears

on DIC, immediately check air pressure of all tires and adjust to the specified pressure. If warning indicators are still on or display shows dashes instead of a value, there is a problem in the TPM system. See appropriate manufacturer service information.

NOTE: The TPM system will cancel the learn mode if more than 2 minutes have passed and no sensors have been learned, or if the ignition switch is turned to the OFF position. If the learn mode is canceled before the first ID is learned, the RCDLR will remember all previously stored IDs and their locations. As soon as the first sensor ID is learned, all other IDs are erased from the RCDLR's memory. If the learn mode is canceled after the first ID is learned, the RCDLR will store the IDs as invalid and the DIC will display dashes instead of tire pressures.

NOTE: Before proceeding with the registration procedure, ensure that no other sensor learn procedure is being performed simultaneously, or that no tire pressures are being adjusted on another TPM equipped vehicle within close proximity.

1. Set the tire pressure of all wheels to pressure specified on the tire and loading information label.
2. Turn ignition switch to RUN position. Apply parking brake.
3. Simultaneously press the keyless entry transmitter's lock and unlock buttons until a double horn chirp sounds, indicating the Learn Mode has been enabled.
4. Starting with left front tire, hold a tire sensor activation tool against the side wall of the tire, within 3 inches of the valve stem. Activate tool until a horn chirp sounds.
5. After horn chirp has sounded and the right turn signal has illuminated, proceed to the next 3 sensors in the following order: right front, right rear and left rear.
6. After left rear sensor has been learned, a double horn chirp will sound, indicating all 4 sensor IDs have been learned. Turn ignition switch to OFF position to exit Learn Mode.

TPMS RESET - PROCEDURE 10

NOTE: If a tire pressure sensor or the Remote Control Door Lock Receiver (RCDLR) is replaced, or if wheels have been rotated, tire pressure sensor must be relearned.

NOTE: When the tire pressure warning light illuminates and warning message appears on DIC, immediately check air pressure of all tires and adjust to the specified pressure. If warning indicators are still on or display shows dashes instead of a value, there is a problem in the TPM system. See appropriate manufacturer service information.

NOTE: The TPM system will cancel the learn mode if more than 2 minutes have passed and no sensors have been learned, or if the ignition switch is turned to the OFF position. If the learn mode is canceled before the first ID is learned, the RCDLR will remember all previously stored IDs and their locations. As soon as the first

sensor ID is learned, all other IDs are erased from the RCDLR's memory. If the learn mode is canceled after the first ID is learned, the RCDLR will store the IDs as invalid and the DIC will display dashes instead of tire pressures.

NOTE: Before proceeding with the registration procedure, ensure that no other sensor learn procedure is being performed simultaneously, or that no tire pressures are being adjusted on another TPM equipped vehicle within close proximity.

1. Set the tire pressure of all wheels to pressure specified on the tire and loading information label.
2. Depending on ignition type:
 - With standard ignition switch, place the switch in the RUN position.
 - With electronic keyless ignition, place the switch in the ACC position.
3. Simultaneously press the keyless entry transmitter's lock and unlock buttons until a double horn chirp sounds, indicating the Learn Mode has been enabled.
4. Starting with left front tire, hold a tire sensor activation tool against the side wall of the tire, within 3 inches of the valve stem. Activate tool until a horn chirp sounds.
5. After horn chirp has sounded and the right turn signal has illuminated, proceed to the next 3 sensors in the following order: right front, right rear and left rear.
6. After left rear sensor has been learned, a double horn chirp will sound, indicating all 4 sensor IDs have been learned. Turn ignition switch to OFF position to exit Learn Mode.

TPMS RESET - PROCEDURE 11

1. Set the tire pressure of all wheels to pressure specified on the tire and loading information label.
2. Set the parking brake.
3. Place the vehicle power mode in ON/RUN/START.
4. Make sure the Tire Pressure info display option is turned on. The info displays on the DIC can be turned on and off through the Settings menu.
5. Use the five-way DIC control on the right side of the steering wheel to scroll to the Tire Pressure screen under the DIC info page.
6. Press and hold the SEL button located in the center of the five-way DIC control. The horn sounds twice to signal the receiver is in relearn mode and the TIRE LEARNING ACTIVE message displays on the DIC screen
7. Start with the driver side front tire. Place a tire sensor activation tool against the tire sidewall, near the valve stem. Then press the button to activate the TPMS sensor. A horn chirp confirms that the sensor identification code has been matched to this tire and wheel position.
8. After horn chirp has sounded, proceed to the next 3 sensors in the following order: right front, right rear and left rear.
9. After left rear sensor has been learned, the horn sounds two times to indicate the sensor identification code has been matched to the driver side rear tire, and the TPMS sensor matching process is no longer active. The TIRE LEARNING ACTIVE message on the DIC display screen goes off.
10. Press STOP to turn the ignition off.

TPMS RESET - PROCEDURE 12

1. Set the tire pressure of all wheels to pressure specified on the tire and loading information label.
2. Set the parking brake.
3. Turn the ignition to ON/RUN with the engine off.
4. Use the MENU button (center console) to select the Vehicle Information Menu in the Driver Information Center (DIC). Use the arrow keys to scroll to the Tire Pressure screen
5. Press the SET/CLR button to begin the sensor matching process. A message requesting acceptance of the process should display.
6. Press the SET/CLR button again to confirm the selection. The horn sounds twice to signal the receiver is in relearn mode and the TIRE LEARNING ACTIVE message displays on the DIC screen.
7. Start with the driver side front tire. Place a tire sensor activation tool against the tire sidewall, near the valve stem. Then press the button to activate the TPMS sensor. A horn chirp confirms that the sensor identification code has been matched to this tire and wheel position.
8. After horn chirp has sounded, proceed to the next 3 sensors in the following order: right front, right rear and left rear.
9. After left rear sensor has been learned, the horn sounds two times to indicate the sensor identification code has been matched to the driver side rear tire, and the TPMS sensor matching process is no longer active. The TIRE LEARNING ACTIVE message on the DIC display screen goes off.
10. Turn the ignition to LOCK/OFF.

TPMS RESET - PROCEDURE 13

LOW TIRE PRESSURE light comes on if air pressure in one tire drops to 12 psi (kPa) less than the other 3 tires, if tires are rotated, if tire(s) are repaired or replaced, if air pressure is adjusted or when vehicle battery is disconnected. Light will stay on until ignition is turned off or RESET button is pressed. Check and adjust air pressure in all 4 tires before resetting system.

1. There are 2 ways to reset the tire inflation monitor. To reset the tire inflation monitor using the exterior or interior lamp controls, go to step 4. To reset tire inflation monitor using the radio, turn the radio off. Turn ignition to ACC or ON, with the engine OFF. Press and hold the TUNE DISP button on the radio for at least 5 seconds until settings is displayed.
2. To scroll through the main menu:
 - On Impala, press the SEEK PTYPE up or down arrow.
 - On Monte Carlo, press the SEEK PSCAN up or down arrow.On all models, scroll until TIRE MON appears on the display. Press the 1 PREV or 2 NEXT button to enter the sub-menu. RESET will be displayed.
3. Press the TUNE DISP button to reset. A chime will sound to verify the new setting and DONE will be displayed for one second. Once the message has been reset, scroll through the menu until EXIT appears on the display. Press the TUNE DISP button to exit the program. A chime will sound to verify the exit.
4. Reset the tire inflation monitor:
 - On Impala, using the interior lighting controls, turn the switch from OFF to ON position 3 times with ignition switch in ON position.

- On Monte Carlo, using the exterior lighting controls, turn the switch from OFF to parking lamps 3 times with ignition switch in ON position.

TPMS RESET - PROCEDURE 14

NOTE: There are 3 different ways to reset the Tire Pressure Monitor (TPM) system. After resetting, the TPM system requires up to 30 minutes of straight line driving in each of the 3 speed ranges to complete the calibration process.

Using Exterior Lamp Switch

1. Adjust all tire pressures to the recommended kPa/psi.
2. Turn ignition ON with engine OFF.
3. Cycle the exterior lamp switch from OFF to parking lamps 3 times within 5 seconds.
4. Use the scan tool in order to clear the TPM DTC.

Using RDS Radio, If Equipped

1. Adjust all tire pressures to the recommended kPa/psi.
2. Turn the ignition to ACC or ON, with the engine OFF.
3. Turn the radio OFF.
4. Press and hold the DISP button until SETTINGS is displayed.
5. Press the SEEK up or down arrows until TIRE MON is displayed.
6. Press the PREV or NEXT button to enter the sub-menu. RESET will be displayed.
7. Press the DISP button, A chime will sound and DONE will be displayed.
8. Scroll until EXIT is displayed.
9. Press the DISP button to exit the TPM reset mode. A chime will sound to verify exit.
10. Use the scan tool in order to clear the TPM DTC.

Using Scan Tool

1. Adjust all tire pressures to the recommended kPa/psi.
2. Install the scan tool.
3. Turn ignition ON with engine OFF.
4. With the scan tool select Special Functions.
5. Select TIM Reset.
6. Press the Reset soft key.
7. Use the scan tool in order to clear the TPM DTC.

TPMS RESET - PROCEDURE 15

CHECK TIRE PRESSURE or TIRE PRESS message will come on if air pressure in one tire is lower than the

other 3 tires, if tires are rotated, if tire(s) are repaired or replaced, or if air pressure is adjusted. Message will stay on until system is recalibrated. Check and adjust air pressure in all 4 tires before recalibrating system.

NOTE: If vehicle is equipped with Systems Monitor, go to step 2.

1. To recalibrate vehicle equipped with Driver Information Center (DIC), turn ignition ON with engine OFF. Using the MODE and SELECT button on DIC, change display until TIRE PRESSURE appears. Press and hold RESET button for 5 seconds. TIRE PRESSURE RESET should now appear on display. If TIRE PRESSURE RESET does not appear on display after 5 seconds, repair system as necessary. Using a scan tool, clear TPM DTC.
2. To recalibrate vehicle equipped with Systems Monitor, turn ignition ON with engine OFF. Press and hold TIRE PRESS RESET button for 5 seconds. TIRE PRESS light on the Systems Monitor should begin to flash. Release the TIRE PRESS RESET button. TIRE PRESS light should go out and system is now reset. If TIRE PRESS light does not begin to flash after 5 seconds, repair system as necessary. Using a scan tool, clear TPM DTC.

TPMS RESET - PROCEDURE 16

CHECK TIRE PRESSURE light comes on if air pressure in one tire drops to 12 psi (kPa) less than the other 3 tires, if tires are rotated, if tire(s) are repaired or replaced, or if air pressure is adjusted. Light will stay on until ignition is turned off or RESET button is pressed. Check and adjust air pressure in all 4 tires before resetting system.

1. To reset tire inflation monitor, turn ignition ON with engine OFF. Press and release the RESET button. RESET button is located inside of driver's side instrument panel fuse block (left end of instrument panel). The CHANGE OIL indicator light will begin to flash.
2. Press and release the RESET button again. The CHANGE OIL indicator light will turn off, and the CHECK TIRE PRESSURE indicator light will begin to flash. While the CHECK TIRE PRESSURE indicator light is flashing, press and hold the RESET button until the chime sounds indicating system is reset. If CHECK TIRE PRESSURE light does not go out, repeat reset procedure. If system still will not reset, repair system as necessary.

TPMS RESET - PROCEDURE 17

NOTE: When a spare tire is mounted, a wheel is replaced or rotated, or tire pressure has been adjusted, TPM system will need to be recalibrated.

NOTE: When the low tire pressure warning messages appear, immediately check air pressure of all tires and adjust to the specified pressure. If warning messages are still displayed, there is a malfunction in the TPM system. See appropriate manufacturer service information.

NOTE: Under the following conditions, the system may not function properly:

- More than one tire is low.

- Only one tire is replaced with a new tire during service.
- Vehicle is moving faster than 65 mph (105 km/h).
- The system is not yet calibrated.
- Tire treadwear is uneven.
- Compact spare tire is installed.
- Tire chains are being used.
- Vehicle is being driven on a rough or frozen road.
- If ABS warning light is on.

CAUTION: DO NOT recalibrate TPM system until all problems are fixed and tire pressure in all 4 tires has been adjusted. If recalibration is done when tire pressures are incorrect, TPM system will not work properly and may not set an alert when a tire pressure is low or high.

NOTE: There are 2 ways to recalibrate the Tire Pressure Monitor (TPM) system:

- *Using DIC Reset Button* (if no scan tool is available)
- *Using Scan Tool* (if an OBD-II compatible scan tool is available).

Using DIC Reset Button

1. Turn ignition switch to OFF position.
2. Ensure all tire pressures are adjusted to the pressure recommended on tire pressure label.
3. Turn ignition ON with engine OFF.
4. Press SELECT right arrow button until "GAGE" is displayed.
5. Press SELECT down arrow button until "TIRE PRESSURE" is displayed.
6. Press and hold RESET button until "TIRE PRESSURE RESET" is displayed.
7. Release RESET button. DIC should display "TIRE PRESSURE NORMAL".
8. After resetting, the TPM system requires up to 30 minutes of straight line driving in each of the following speed ranges to complete calibration process:
 - 15-40 mph (24-64 km/h).
 - 40-70 mph (64-113 km/h).
 - 70-90 mph (113-145 km/h).

NOTE: The EBCM learns tire pressure calibration for each speed range independently. In Monitor Mode 1, EBCM has only partially learned tire pressure calibration for speed range and has limited detection capability for a tire pressure condition. In Monitor Mode 2, EBCM has fully learned tire pressure calibration for speed range and has full detection capability for a tire pressure condition.

NOTE: Learning process does not need to be completed during a single trip.

Using Scan Tool

1. Turn ignition switch to OFF position.
2. Ensure all tire pressures are adjusted to the pressure recommended on tire pressure label.
3. Connect scan tool. Turn ignition ON with engine OFF.
4. Using scan tool, select "SPECIAL FUNCTIONS".
5. Select "TIRE PRESSURE RESET".
6. Press RESET soft key. A "TIRE PRESSURE NORMAL" message should appear on display.
7. If necessary, use scan tool to clear any TPM Diagnostic Trouble Codes (DTCs).
8. After resetting, the TPM system requires up to 30 minutes of straight line driving in each of the following speed ranges to complete calibration process:
 - 15-40 mph (24-64 km/h).
 - 40-70 mph (64-113 km/h).
 - 70-90 mph (113-145 km/h).

NOTE: The EBCM learns tire pressure calibration for each speed range independently. In Monitor Mode 1, EBCM has only partially learned tire pressure calibration for speed range and has limited detection capability for a tire pressure condition. In Monitor Mode 2, EBCM has fully learned tire pressure calibration for speed range and has full detection capability for a tire pressure condition.

NOTE: Learning process does not need to be completed during a single trip.

TPMS RESET - PROCEDURE 18

The Tire Pressure Monitor (TPM) system alerts the driver when a large change in the pressure of one tire exists, while the vehicle is being driven. The TPM system uses the Electronic Brake Control Module (EBCM), ABS wheel speed sensor inputs, class 2 serial data circuit, and the Driver Information Center (DIC) to perform the system functions. The EBCM contains software to calculate relative tire pressure differences. The software requires approximately 30 minutes of straight line driving in 3 different speed ranges to complete the calibration process to have full capability for detecting a tire pressure condition. The speed ranges are 15-40 mph, 40-70 mph and 70-90 mph.

1. LOW TIRE PRESSURE light comes on if air pressure in one tire drops to 12 psi less than the other 3 tires, if tires are rotated, if tire(s) are repaired or replaced, if air pressure is adjusted or if vehicle battery is disconnected. Light will stay on until ignition is turned off or RESET button is pressed. Check and adjust air pressure in all 4 tires before resetting system.
2. To reset tire inflation monitor, turn ignition ON with engine OFF. Press and release the RESET button. RESET button is located inside of driver's side instrument panel fuse block (left end of instrument panel). The CHANGE OIL indicator light will begin to flash.
3. Press and release the RESET button again. The CHANGE OIL indicator light will turn off, and the LOW

TIRE PRESSURE indicator light will begin to flash. While the LOW TIRE PRESSURE indicator light is flashing, press and hold the RESET button until the chime sounds indicating system is reset. If the LOW TIRE PRESSURE indicator light does not go out, repeat reset procedure. If system still will not reset, repair system as necessary.

TPMS RESET - PROCEDURE 19

NOTE: After resetting, the tire pressure monitoring (TPM) system requires 60 minutes or more of driving at a speed of 30 km/h (19 mph) or above to complete the calibration process to have full capability for detecting a tire pressure condition.

1. Adjust all tire pressures to the recommended kPa/psi.
2. Turn ignition ON with engine OFF.
3. Press and hold the tire pressure warning reset switch until the tire pressure warning indicator blinks 3 times at one second intervals.
4. If the tire pressure warning indicator does not blink, repeat the procedure starting at step 2.
5. Drive the vehicle for 60 minutes or more at a speed of 30 km/h (19 mph).
6. Verify the system has initialized. Turn ignition ON with engine OFF and observe the tire pressure warning indicator.
 - System Initialized: light on for 3 seconds.
 - System not initialized: light on for 4 seconds.

TPMS RESET - PROCEDURE 20

NOTE: When a spare tire is mounted, a wheel is replaced or rotated, or tire pressure has been adjusted, TPM system will need to be recalibrated.

CAUTION: DO NOT recalibrate TPM system until all problems are fixed and tire pressure in all 4 tires has been adjusted. If recalibration is done when tire pressures are incorrect, TPM system will not work properly and may not set an alert when a tire pressure is low or high.

NOTE: When the tire pressure warning message appears on DIC, immediately check air pressure of all tires and adjust to the specified pressure. If warning message is still displayed, there is a malfunction in the TPM system. See appropriate manufacturer service information.

NOTE: Under the following conditions, the system may not function properly:

- More than one tire is low.
- Vehicle is moving faster than 65 mph (105 km/h).
- The system is not yet calibrated.

- Tire treadwear is uneven.
- Compact spare tire is installed.
- Tire chains are being used.
- Vehicle is being driven on a rough or frozen road.
- If ABS warning light is on.

NOTE: There are 2 ways to recalibrate the Tire Pressure Monitor (TPM) system:

- *Using DIC Reset Button* (if no scan tool is available)
- *Using Scan Tool* (if an OBD-II compatible scan tool is available).

Using DIC Reset Button

1. Turn ignition switch to OFF position.
2. Ensure all tire pressures are adjusted to the pressure recommended on tire pressure label.
3. Turn ignition ON with engine OFF.
4. Press and hold appropriate button (located on left side of steering column) until "TIRE PRESSURE" message appears on display:
 - 1997-99 models: Press and hold GAGES button
 - 2000-05 models: Press and hold GAGES INFO button
5. Press and hold RESET button for 5 seconds. After 5 seconds, "TIRE PRESSURE RESET" message should appear on display.
6. Release RESET button. A "TIRE PRESSURE NORMAL" message should appear on display.
7. After resetting, the TPM system requires up to 30 minutes of straight line driving in each of the following speed ranges to complete calibration process:
 - 15-40 mph (24-64 km/h).
 - 40-70 mph (64-113 km/h).
 - 70-90 mph (113-145 km/h).

NOTE: The EBCM learns tire pressure calibration for each speed range independently. In Monitor Mode 1, EBCM has only partially learned tire pressure calibration for speed range and has limited detection capability for a tire pressure condition. In Monitor Mode 2, EBCM has fully learned tire pressure calibration for speed range and has full detection capability for a tire pressure condition.

NOTE: Learning process does not need to be completed during a single trip.

Using Scan Tool

1. Turn ignition switch to OFF position.
2. Ensure all tire pressures are adjusted to the pressure recommended on tire pressure label.

3. Connect scan tool. Turn ignition ON with engine OFF.
4. Using scan tool, select SPECIAL FUNCTIONS.
5. Select TIM RESET.
6. Press RESET soft key. A "TIRE PRESSURE NORMAL" message should appear on display.
7. If necessary, use scan tool to clear any TPM Diagnostic Trouble Codes (DTCs).
8. After resetting, the TPM system requires up to 30 minutes of straight line driving in each of the following speed ranges to complete calibration process:
 - 15-40 mph (24-64 km/h).
 - 40-70 mph (64-113 km/h).
 - 70-90 mph (113-145 km/h).

NOTE: The EBCM learns tire pressure calibration for each speed range independently. In Monitor Mode 1, EBCM has only partially learned tire pressure calibration for speed range and has limited detection capability for a tire pressure condition. In Monitor Mode 2, EBCM has fully learned tire pressure calibration for speed range and has full detection capability for a tire pressure condition.

NOTE: Learning process does not need to be completed during a single trip.

TPMS RESET - PROCEDURE 21

Using Reset Button (1999-05 Models)

1. Adjust all tire pressures to the recommended Psi (kPa). See vehicle's Loading Information Label for recommended tire pressure. Turn ignition ON with engine OFF.
2. Press and hold the red RESET button located in the passenger side instrument panel fuse block.
3. The LOW TIRE indicator will flash 3 times, then turn off.
4. Use scan tool to clear the TPM DTC.

Using Scan Tool (2003-05 Models)

1. Adjust all tire pressures to the recommended Psi (kPa). See vehicle's Loading Information Label for recommended tire pressure. Turn ignition ON with engine OFF.
2. Install scan tool. Turn ignition ON with engine OFF.
3. With scan tool, select Special Functions.
4. Select TIM Reset.
5. Press Reset soft key.
6. LOW TIRE indicator will flash 3 times, then turn OFF.
7. Clear the TPM DTC.

TPMS RESET - PROCEDURE 22

NOTE: When a spare tire is mounted, a wheel is replaced or rotated, or tire pressure has been adjusted, TPM system will need to be recalibrated.

CAUTION: DO NOT recalibrate TPM system until all problems are fixed and tire pressure in all 4 tires has been adjusted. If recalibration is done when tire pressures are incorrect, TPM system will not work properly and may not set an alert when a tire pressure is low or high.

1. Turn ignition switch to OFF position.
2. Ensure all tire pressures are adjusted to the pressure recommended on tire pressure label.
3. Turn ignition ON with engine OFF.
4. Press and hold the MODE button until DIC display reads "LOW TIRE PRESSURE HOLD SET TO RESET".
5. Press and hold SET button chime sounds and "TIRE PRESSURE RESET" is displayed and a chime sounds 3 times.
6. Release SET button and DIC will display "TIRE PRESSURE NORMAL".

NOTE: If low tire pressure warning message is still set, TPM system has not reset. Repeat procedure. If it does not work after two tries, refer to appropriate service information.

7. After resetting, the TPM system requires up to 5 miles of driving in each of the following speed ranges to complete the calibration process:
 - 25-40 mph (40-64 km/h).
 - 40-60 mph (65-96 km/h).
 - 60-85 mph (96-136 km/h).

NOTE: Learning process does not need to be completed during a single trip.

TPMS RESET - PROCEDURE 23

1. Check and adjust air pressure in all 4 tires before resetting system. Refer to tire placard located on the inside edge of the driver's door. Turn ignition ON, with engine OFF.
2. Press the MODE button on the Driver Information System until LOW TIRE PRESSURE HOLD SET TO RESET is displayed.
3. Press and hold the SET button until a chime sounds and TIRE PRESSURE RESET is displayed and a chime sounds 3 times.
4. Release the SET button and TIRE PRESSURE NORMAL will be displayed.

TPMS RESET - PROCEDURE 24

NOTE: When a spare tire is mounted, a wheel is replaced or rotated, or tire pressure has been adjusted, TPM system will need to be recalibrated.

CAUTION: DO NOT recalibrate TPM system until all problems are fixed and tire pressure in all 4 tires has been adjusted. If recalibration is done when tire pressures are incorrect, TPM system will not work properly and may not set an alert when a tire pressure is low or high.

1. Turn ignition switch to OFF position.
2. Ensure all tire pressures are adjusted to the pressure recommended on tire pressure label.
3. Turn ignition ON with engine OFF.
4. Press and hold the MODE button until DIC display reads "LOW TIRE PRESSURE HOLD SET TO RESET".
5. Press and hold SET button until a chime sounds and "TIRE PRESSURE RESET" is displayed.
6. System will now sound a chime 3 times, and DIC will display "TIRE PRESSURE NORMAL".

NOTE: If low tire pressure warning message is still set, TPM system has not reset. Repeat procedure.

7. After resetting, the TPM system requires up to 5 miles (8 km) of flat, smooth road, straight line driving in each of the 4 speed ranges (about 10-20 minutes in each range) to complete the calibration process:
 - 19-40 mph (31-65 km/h).
 - 40-59 mph (65-95 km/h).
 - 59-74.5 mph (95-120 km/h).
 - 74.5-90 mph (120-145 km/h).

NOTE: The EBCM learns tire pressure calibration for each speed range independently. In Calibration Mode, EBCM has only partially learned tire pressure calibration for speed range and has limited detection capability for a tire pressure condition. In Detection Mode, EBCM has fully learned tire pressure calibration for speed range and has full detection capability for a tire pressure condition.

NOTE: Learning process does not need to be completed during a single trip.

TPMS RESET - PROCEDURE 25

1. Set the tire pressure of all wheels to pressure specified on the tire and loading information label.
2. Set the parking brake.
3. Turn the ignition to ON/ RUN with the engine OFF or place the vehicle power mode in ON/ RUN/ START. See **Fig. 4**.
4. Use the MENU button to select the VEHICLE INFORMATION MENU in the Driver Information Center (DIC). See **Fig. 5**.
5. Use the thumbwheel (or up and down arrows) to scroll to the TIRE PRESSURE MENU item screen.
6. Press the SET/CLR button to begin the sensor matching process. A message requesting acceptance of the

process should display.

7. Press the SET/CLR button again to confirm the selection. The horn sounds twice to signal the receiver is in relearn mode and the TIRE LEARNING ACTIVE message displays on the DIC screen.
8. Starting with left front tire, hold a tire sensor activation tool against the side wall of the tire, within 3 inches of the valve stem. Activate tool until a horn chirp sounds.
9. After horn chirp has sounded and the right turn signal has illuminated, proceed to the next 3 sensors in the following order: right front, right rear and left rear.
10. After left rear sensor has been learned, a double horn chirp will sound, indicating all 4 sensor IDs have been learned. Turn ignition switch to OFF position to exit Learn Mode.

Ignition Positions

Keyless Access

Pressing the button cycles it through three modes: ACC/ACCESSORY, ON/RUN/START, and Stopping the Engine/OFF.

Key Access

The ignition switch has four different positions.

Fig. 4: Ignition Positions (Key & Keyless)
Courtesy of GENERAL MOTORS CORP.

Fig. 5: Identifying DIC Controls (Turn Signal Lever)

Courtesy of GENERAL MOTORS CORP.

TPMS RESET - PROCEDURE 26

1. Set the tire pressure of all wheels to pressure specified on the tire and loading information label.
2. Set the parking brake.
3. Turn the ignition to ON/RUN with the engine OFF.
4. Up-level Driver Information Center (DIC) Only: Make sure the TIRE PRESSURE INFO page option is turned on. The info pages on the DIC can be turned on and off through the SETTINGS menu.
5. If the vehicle has an up-level DIC, use the DIC controls (arrow buttons) on the right side of the steering wheel to scroll to the TIRE PRESSURE screen under the DIC info page. If the vehicle has a base-level DIC, use the TRIP ODOMETER RESET stem to scroll to the TIRE PRESSURE screen.
6. If the vehicle has an up-level DIC, press and hold the SET/RESET button (check-mark symbol) located in the center of the DIC controls. If the vehicle has a base-level DIC, press and hold the TRIP ODOMETER RESET stem for about five seconds. A message asking if the process should begin should appear. Select YES and press the TRIP ODOMETER RESET stem to confirm the selection.
7. The horn sounds twice to signal the receiver is in relearn mode and the TIRE LEARNING ACTIVE message displays on the DIC screen.
8. Starting with left front tire, hold a tire sensor activation tool against the side wall of the tire, within 3 inches of the valve stem. Activate tool until a horn chirp sounds.
9. After horn chirp has sounded and the right turn signal has illuminated, proceed to the next 3 sensors in the following order: right front, right rear and left rear.
10. After left rear sensor has been learned, a double horn chirp will sound, indicating all 4 sensor IDs have been learned. Turn ignition switch to OFF position to exit Learn Mode.

TPMS RESET - PROCEDURE 27

1. Set the tire pressure of all wheels to pressure specified on the tire and loading information label.
2. Turn ignition switch to ON/RUN position, with engine OFF.
3. Simultaneously press the keyless entry transmitter's lock and unlock buttons until a horn chirp sounds, indicating Learn Mode has been enabled. The TIRE LEARNING ACTIVE message displays on the DIC screen.

NOTE: If the vehicle does not have RKE, press the Driver Information Center (DIC) vehicle information button until the PRESS (check mark symbol) TO RELEARN TIRE POSITIONS message displays. The horn sounds twice to signal the receiver is in relearn mode and TIRE LEARNING ACTIVE message displays on the DIC screen. If the vehicle does not have RKE or DIC buttons, press the trip odometer reset stem on the instrument cluster until the PRESS (check mark symbol) TO RELEARN TIRE POSITIONS message displays. The horn sounds twice to signal the receiver is in relearn mode and TIRE LEARNING ACTIVE message displays on the DIC screen.

4. Starting with left front tire, hold a tire sensor activation tool against the side wall of the tire, within 3 inches of the valve stem. Activate tool until a horn chirp sounds.
5. After horn chirp has sounded and the right turn signal has illuminated, proceed to the next 3 sensors in the following order: right front, right rear and left rear.
6. After left rear sensor has been learned, a double horn chirp will sound, indicating all 4 sensor IDs have been learned. Turn ignition switch to OFF position to exit Learn Mode.

TPMS RESET - PROCEDURE 28

1. Set the tire pressure of all wheels to pressure specified on the tire and loading information label.
2. Set the parking brake.
3. Turn the ignition to ON/ RUN with the engine OFF or place the vehicle power mode in ON/ RUN/ START. See **Fig. 4**.
4. Make sure the Tire Pressure info page option is turned on. The info pages on the Driver Information Center (DIC) can be turned on and off through the Settings menu.
5. Use the DIC controls on the right side of the steering wheel to scroll to the Tire Pressure screen under the DIC info page.
6. Press and hold the SET/RESET button (check mark symbol) located in the center of the DIC controls.
7. The horn sounds twice to signal the receiver is in relearn mode and the TIRE LEARNING ACTIVE message displays on the DIC screen.
8. Starting with left front tire, hold a tire sensor activation tool against the side wall of the tire, within 3 inches of the valve stem. Activate tool until a horn chirp sounds.
9. After horn chirp has sounded and the right turn signal has illuminated, proceed to the next 3 sensors in the following order: right front, right rear and left rear.
10. After left rear sensor has been learned, a double horn chirp will sound, indicating all 4 sensor IDs have been learned. Turn ignition switch to OFF position to exit Learn Mode.

TPMS RESET - PROCEDURE 29

1. Set the tire pressure of all wheels to pressure specified on the tire and loading information label.
2. Set the parking brake.
3. Turn the ignition to ON/RUN with the engine OFF.
4. Press the MENU button once on the Driver Information Center (DIC).
5. Press the up or down arrow button until the Tire Learn screen is displayed.
6. Press and hold the SET/CLR button to begin the sensor matching process.
7. The horn sounds twice to signal the receiver is in relearn mode and the TIRE LEARNING ACTIVE message displays on the DIC screen.
8. Starting with left front tire, hold a tire sensor activation tool against the side wall of the tire, within 3 inches of the valve stem. Activate tool until a horn chirp sounds.
9. After horn chirp has sounded and the right turn signal has illuminated, proceed to the next 3 sensors in the following order: right front, right rear and left rear.
10. After left rear sensor has been learned, a double horn chirp will sound, indicating all 4 sensor IDs have

been learned. Turn ignition switch to OFF position to exit Learn Mode.

TPMS RESET - PROCEDURE 30

1. Set the tire pressure of all wheels to pressure specified on the tire and loading information label.
2. Set the parking brake.
3. Put the vehicle in ON/ RUN and place the vehicle in P (Park).
4. If the Driver Information Center (DIC) display is minimized, press the SELECT knob to maximize it.
5. Use the SELECT knob to scroll to the Tire Pressure display screen.
6. Press and hold the SELECT knob for five seconds to begin the sensor matching process. A message displays confirming to begin the process.
7. Use the SELECT knob to select YES with the highlighted selection, and press the SELECT knob again to confirm the selection.
8. The horn sounds twice to signal the receiver is in relearn mode and the TIRE LEARNING ACTIVE message displays on the DIC screen.
9. Starting with left front tire, hold a tire sensor activation tool against the side wall of the tire, within 3 inches of the valve stem. Activate tool until a horn chirp sounds.
10. After horn chirp has sounded and the right turn signal has illuminated, proceed to the next 3 sensors in the following order: right front, right rear and left rear.
11. After left rear sensor has been learned, a double horn chirp will sound, indicating all 4 sensor IDs have been learned. Turn ignition switch to OFF position to exit Learn Mode.

TPMS RESET - PROCEDURE 31

NOTE: **You have two minutes to match the first tire/wheel position, and five minutes overall to match all four tire/wheel positions. If it takes longer, the matching process stops and must be restarted.**

1. Set the tire pressure of all wheels to pressure specified on the tire and loading information label.
2. Set the parking brake.
3. Turn the ignition to ON/RUN with the engine off.
4. Enter the learn sequence from the TPM Learn screen, located under the Customization Menu in the instrument panel cluster. Press SRCE button until you see Customize Options and then press ENTER (left pointing arrow). Move the thumbwheel up or down to scroll through the available options. Press ENTER to select an item. To exit the current menu, or go back, use the thumbwheel to select BACK (left arrow) at the top of the screen and then press ENTER.
5. Start with the driver side front tire. The driver side front indicator lamp also comes on to indicate that corner's sensor is ready to be learned. Place a tire sensor activation tool against the tire sidewall, near the valve stem. Then press the button to activate the TPMS sensor. A horn chirp confirms that the sensor identification code has been matched to this tire and wheel position
6. After horn chirp has sounded and the right turn signal has illuminated, proceed to the next 3 sensors in the following order: right front, right rear and left rear.
7. After the driver side rear TPMS sensor has been learned the horn chirps two times. The driver side rear

indicator lamp turns off and the TPMS sensor matching process is done. Turn the ignition switch to LOCK/OFF.

DIAGNOSTIC INFORMATION AND PROCEDURES

SYMPTOMS - MIRRORS

NOTE: The following steps must be completed before using the symptom tables.

1. Perform the **Diagnostic System Check - Vehicle** before using the Symptom Tables in order to verify that all of the following are true:
 - There are no DTCs set.
 - The control modules can communicate via the serial data link.
2. Review the system operation in order to familiarize yourself with the system functions. Refer to **Outside Mirror Description and Operation**.

Visual/Physical Inspection

- Inspect for aftermarket devices which could affect the operation of the system. Refer to **Checking**

Aftermarket Accessories .

- Inspect the easily accessible or visible system components for obvious damage or conditions which could cause the symptom.

Intermittent

Faulty electrical connections or wiring may be the cause of intermittent conditions. Refer to **Testing for Intermittent Conditions and Poor Connections .**

Symptom List

Refer to a symptom diagnostic procedure from the following list in order to diagnose the symptom:

- **Heated Mirrors Malfunction**
- **Power Mirror Malfunction**

HEATED MIRRORS MALFUNCTION

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Left Heated Mirror Element Control	2	1	3	-
Driver Outside Rearview Mirror Ground	-	1	-	-
Right Heated Mirror Element Control	2	1	3	-
Passenger Outside Rearview Mirror Ground	-	1	-	-
1. Single Heated Mirror Inoperative 2. Both Heated Mirrors Inoperative 3. Heated Mirrors Always On				

Circuit/System Description

The rear defogger relay supplies voltage to the outside rearview mirror heater elements based on the current state of the rear window defogger. The relay supplies B+ through the driver/passenger mirror heating element control circuit when a request is seen.

Scan Tool Reference

Control Module References for scan tool information.

Circuit/System Verification

1. Engine running.
2. Verify the E18 Rear Defogger Grid turns ON and OFF when commanding the Rear Defogger On and Off with a scan tool.
 - **If the E18 Rear Defogger Grid does not turn ON or OFF**

Refer to **Rear Window Defogger Malfunction** .

- **If the E18 Rear Defogger Grid turns ON and OFF**
3. Verify the E17D Outside Rearview Mirror Glass-Driver and the E17P Outside Rearview Mirror Glass-Passenger become warm when commanding the Rear Defogger On with a scan tool.
 - **If the E17D Outside Rearview Mirror Glass-Driver and the E17P Outside Rearview Mirror Glass-Passenger do not become warm**

Refer to Circuit/System Testing.

- **If the E17D Outside Rearview Mirror Glass-Driver and the E17P Outside Rearview Mirror Glass-Passenger become warm**
4. All OK.

Circuit/System Testing

1. Ignition OFF and all vehicle systems OFF, disconnect the harness connector at the appropriate A9 Outside Rearview Mirror. It may take up to 2 minutes for all vehicle systems to power down.
2. Test for less than 10 ohms between the ground circuit terminal 1 and ground.
 - **If 10 ohms or greater**
 1. Ignition OFF.
 2. Test for less than 2 ohms in the ground circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, repair the open/high resistance in the ground connection.
 - **If less than 10 ohms**
3. Ignition ON, connect a test lamp between the control circuit terminal 2 and the ground circuit terminal 1.
4. Verify the test lamp turns ON and OFF when commanding the Rear Defogger On and Off with a scan tool.
 - **If the test lamp is always OFF**
 1. Ignition OFF, remove the test lamp, disconnect the harness connector at the X50A Fuse Block-Underhood.
 2. Test for infinite resistance between the control circuit and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance
 3. Test for less than 2 ohms in the control circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, replace the X50A Fuse Block-Underhood.
 - **If the test lamp is always ON**
 1. Ignition OFF, remove the test lamp, disconnect the harness connector at the X50A Fuse Block-Underhood, ignition ON.
 2. Test for less than 1 V between the control circuit and ground.
 - If 1 V or greater, repair the short to voltage on the circuit.
 - If less than 1 V, replace the X50A Fuse Block-Underhood
 - **If the test lamp turns ON and OFF**
5. Test or replace the E17 Outside Rearview Mirror Glass.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

Outside Rearview Mirror Glass Replacement

Fuse Block Replacement

POWER MIRROR MALFUNCTION

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.

Passenger Mirror Motor Vertical Control	1	3	3	-
Outside Rearview Mirror Switch Ground	-	1	-	-
1. Both Outside Power Mirrors Inoperative 2. Driver Outside Power Mirror Malfunction 3. Passenger Outside Power Mirror Malfunction				

Circuit/System Description

The outside rearview mirror switch controls the outside rearview mirrors based on the position of the mirror selector switch and which movement position is selected. The outside rearview mirror switch has four positions: up, down, left, and right. B+ is applied to the switch from the power mirror fuse and when a movement position switch is selected, voltage is sent to the commanded mirror via a mirror control circuit. The opposite mirror control circuit acts as a ground circuit for the bi-directional mirror motor. Ground is the applied through the switch.

Description and Operation

Outside Mirror Description and Operation

Electrical Information Reference

- **Circuit Testing**
- **Connector Repairs**
- **Testing for Intermittent Conditions and Poor Connections**
- **Wiring Repairs**

Circuit/System Verification

1. Verify the mirror glass of the A9A Outside Rearview Mirror-Driver and the A9B Outside Rearview Mirror-Passenger move UP, DOWN, LEFT and RIGHT with the S52 Outside Rearview Mirror Switch.
 - **If both outside mirror glasses do not move**

Refer to Circuit/System Testing - Both Outside Rearview Mirrors Inoperative.
 - **If the driver outside mirror glass does not move UP, DOWN, LEFT or RIGHT**

Refer to Circuit/System Testing - Driver Outside Mirror Movement Malfunction.
 - **If the passenger outside mirror glass does not move UP, DOWN, LEFT or RIGHT**

Refer to Circuit/System Testing - Passenger Outside Mirror Movement Malfunction.
 - **If the mirror glass of the A9A Outside Rearview Mirror-Driver and the A9B Outside Rearview Mirror-Passenger move UP, DOWN, LEFT and RIGHT**
2. All OK.

Circuit/System Testing

Both Outside Rearview Mirrors Inoperative

1. Ignition OFF and all vehicle systems OFF, disconnect the harness connector at the S52 Outside Rearview Mirror Switch. It may take up to 2 minutes for all vehicle systems to power down.
2. Test for less than 10 ohms between the ground circuit terminal 8 and ground.
 - **If 10 ohms or greater**
 1. Ignition OFF.
 2. Test for less than 2 ohms in the ground circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, repair the open/high resistance in the ground connection.
 - **If less than 10 ohms**
3. Verify a test lamp illuminates between the B+ circuit terminal 6 and ground.
 - **If the test lamp does not illuminate and the circuit fuse is good**

1. Ignition OFF.
2. Test for less than 2 ohms in the B+ circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, verify the fuse is not open and there is voltage at the fuse.
 - **If the test lamp does not illuminate and the circuit fuse is open**
1. Ignition OFF.
2. Test for infinite resistance between the B+ circuit and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance
3. Test for infinite resistance between each of the control circuit terminals listed below and ground:
 - Control circuit terminal 1
 - Control circuit terminal 3
 - Control circuit terminal 4
 - Control circuit terminal 5
 - Control circuit terminal 7
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance, replace the appropriate M77 Outside Rearview Mirror Motor.
 - **If the test lamp illuminates**
4. Test or replace the S52 Outside Rearview Mirror Switch.

Driver Outside Mirror Movement Malfunction

1. Ignition OFF, disconnect the harness connector at the A9A Outside Rearview Mirror-Driver. Ignition ON
2. Connect a test lamp between the control circuit terminal 6 and control circuit terminal 4.
3. Verify the test lamp turns ON when commanding the UP and DOWN states with the S52 Outside Rearview Mirror Switch.
 - **If the test lamp remains OFF during either of the commands**
1. Ignition OFF, remove the test lamp, disconnect the harness connector at the S52 Outside Rearview Mirror Switch.
2. Test for infinite resistance between each control circuit and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance
3. Test for less than 2 ohms in each control circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, test or replace the S52 Outside Rearview Mirror Switch.
 - **If the test lamp is always ON**
1. Ignition OFF, remove the test lamp, disconnect the harness connector at the S52 Outside Rearview Mirror Switch, ignition ON.
2. Test for less than 1 V between each control circuit and ground.

- If 1 V or greater, repair the short to voltage on the circuit.
 - If less than 1 V, test or replace the S52 Outside Rearview Mirror Switch
- **If the test lamp turns ON during each of the commands**
- 4. Connect a test lamp between the control circuit terminal 6 and control circuit terminal 5.
- 5. Verify the test lamp turns ON when commanding the LEFT and RIGHT states with the S52 Outside Rearview Mirror Switch.
 - **If the test lamp remains OFF during either of the commands**
 1. Ignition OFF, remove the test lamp, disconnect the harness connector at the S52 Outside Rearview Mirror Switch.
 2. Test for infinite resistance between each control circuit and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance
 3. Test for less than 2 ohms in each control circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, test or replace the S52 Outside Rearview Mirror Switch.
 - **If the test lamp is always ON**
 1. Ignition OFF, remove the test lamp, disconnect the harness connector at the S52 Outside Rearview Mirror Switch, ignition ON.
 2. Test for less than 1 V between each control circuit and ground.
 - If 1 V or greater, repair the short to voltage on the circuit.
 - If less than 1 V, test or replace the S52 Outside Rearview Mirror Switch
 - **If the test lamp turns ON during each of the commands**
- 6. Test or replace the M77D Outside Rearview Mirror Motor-Driver.

Passenger Outside Mirror Movement Malfunction

1. Ignition OFF, disconnect the harness connector at the A9B Outside Rearview Mirror-Passenger. Ignition ON
2. Connect a test lamp between the control circuit terminal 6 and control circuit terminal 4.
3. Verify the test lamp turns ON when commanding the UP and DOWN states with the S52 Outside Rearview Mirror Switch.
 - **If the test lamp remains OFF during either of the commands**
 1. Ignition OFF, remove the test lamp, disconnect the harness connector at the S52 Outside Rearview Mirror Switch.
 2. Test for infinite resistance between each control circuit and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance
 3. Test for less than 2 ohms in each control circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, test or replace the S52 Outside Rearview Mirror Switch.

- **If the test lamp is always ON**
 1. Ignition OFF, remove the test lamp, disconnect the harness connector at the S52 Outside Rearview Mirror Switch, ignition ON.
 2. Test for less than 1 V between each control circuit and ground.
 - If 1 V or greater, repair the short to voltage on the circuit.
 - If less than 1 V, test or replace the S52 Outside Rearview Mirror Switch
 - **If the test lamp turns ON during each of the commands**
- 4. Connect a test lamp between the control circuit terminal 6 and control circuit terminal 5.
- 5. Verify the test lamp turns ON when commanding the LEFT and RIGHT states with the S52 Outside Rearview Mirror Switch.
 - **If the test lamp remains OFF during either of the commands**
 1. Ignition OFF, remove the test lamp, disconnect the harness connector at the S52 Outside Rearview Mirror Switch.
 2. Test for infinite resistance between each control circuit and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance
 3. Test for less than 2 ohms in each control circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, test or replace the S52 Outside Rearview Mirror Switch.
 - **If the test lamp is always ON**
 1. Ignition OFF, remove the test lamp, disconnect the harness connector at the S52 Outside Rearview Mirror Switch, ignition ON.
 2. Test for less than 1 V between each control circuit and ground.
 - If 1 V or greater, repair the short to voltage on the circuit.
 - If less than 1 V, test or replace the S52 Outside Rearview Mirror Switch
 - **If the test lamp turns ON during each of the commands**
- 6. Test or replace the M77P Outside Rearview Mirror Motor-Passenger.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

- **Outside Rearview Mirror Remote Control Switch Replacement**
- **Outside Rearview Mirror Motor Replacement**

REPAIR INSTRUCTIONS

OUTSIDE REARVIEW MIRROR REPLACEMENT

Fig. 3: Outside Rearview Mirror
Courtesy of GENERAL MOTORS COMPANY

Outside Rearview Mirror Replacement

Callout	Component Name
1	Front Side Door Upper Front Trim Panel Assembly TIP: Trim panel is secured to door with clips.
2	Front Side Door Trim Bolt Hole Cover
3	Outside Rearview Mirror Mounting Bolt (Qty: 3) CAUTION: Refer to <u>Fastener Caution</u> . Tighten 9 N.m (80 lb in)
4	Outside Rearview Mirror Assembly

OUTSIDE REARVIEW MIRROR HOUSING COVER REPLACEMENT (WITH SIDE TURN SIGNAL LAMP)

Fig. 4: Outside Rearview Mirror Housing Cover (with Side Turn Signal Lamp)
 Courtesy of GENERAL MOTORS COMPANY

Outside Rearview Mirror Housing Cover Replacement (with Side Turn Signal Lamp)

Callout	Component Name
Preliminary Procedures	
Remove the outside rearview mirror inner actuator. Refer to .	
1	Outside Rearview Mirror Housing Screw (Qty: 5) CAUTION: Refer to <u>Fastener Caution</u> . Tighten 2 N.m (18 lb in)
2	Outside Rearview Mirror Housing
3	Outside Rearview Mirror Housing Cover 1. Release the mirror housing cover taps from the mirror housing. 2. After the removal of the mirror housing cover, visually inspect the cover taps for breaking before installation. 3. If the cover taps are broken, replace with new cover. NOTE:

- To access the mirror housing cover taps easily, loosen the mirror housing screws and then move the mirror housing in every direction.
- The mirror housing can not be removed from the outside mirror assembly.

OUTSIDE REARVIEW MIRROR HOUSING COVER REPLACEMENT (WITHOUT SIDE TURN SIGNAL LAMP)

Fig. 5: Outside Rearview Mirror Housing Rear Cover

Outside Rearview Mirror Glass Replacement

Callout	Component Name
WARNING: Refer to <u>Glass and Sheet Metal Handling Warning</u> .	
1	Outside Rearview Mirror Glass Procedure Release the mirror glass backing from the mirror housing by pulling outward. TIP: Disconnect the power wire harness electrical connector.

INSIDE REARVIEW MIRROR REPLACEMENT

Fig. 8: Inside Rearview Mirror
 Courtesy of GENERAL MOTORS COMPANY

Inside Rearview Mirror Replacement

Callout	Component Name
Preliminary Procedure Adjust the mirror to the full upward position.	
1	Inside Rearview Mirror Screw CAUTION: Refer to <u>Fastener Caution</u> . Tighten 1.8 N.m (16 lb in)
2	Inside Rearview Mirror TIP: Slide the mirror in an upward motion in order to remove.

DESCRIPTION AND OPERATION

OUTSIDE MIRROR DESCRIPTION AND OPERATION

Power Mirror System Components

The power mirror system consists of the following components:

- Mirror direction switch - Controls the left, right, up and down movements of the mirrors
- Mirror select switch - Allows the operator to select the mirror to be moved
- Left outside mirror - Contains both the horizontal and vertical mirror motors
- Right outside mirror - Contains both the horizontal and vertical mirror motors
- 10A fuse - Located in the instrument panel (I/P) fuse block and supplies power for the power mirror system

Each of the outside power mirrors contains 2 motors. The up-down motor operates the vertical directions and the left-right motor operates the horizontal directions. Each of the power mirror motors are internally circuit breaker protected.

Power Mirros Without A45 Block Diagram

Fig. 9: Power Mirror System Diagram (Without A45)
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
HW	Hard-Wired
HW	Hard-Wired
S52	S52 Outside Rearview Mirror Switch
A9A	A9A Outside Rearview Mirror - Driver
A9B	A9B Outside Rearview Mirror - Passenger

Power Mirror System Controls

The outside mirror switch incorporates a mirror select switch and a 4 position mirror direction switch.

The mirror select switch allows the driver to select the mirror to be moved by pressing the switch to L position enabling the left outside mirror or pressing the switch to R position enabling the right outside mirror.

The mirror direction switch is a 4 position switch that allows the operator to move the selected mirror up, down, left or right.

Power Mirror System Operation

The outside mirror switch receives power through the battery positive voltage circuit from the 10A fuse in the instrument panel (I/P) fuse block. The outside mirror switch also receives a constant ground.

The 4 positions of the direction switch have multiple switch contacts. When not in use, the directional contacts are isolated from any circuit. Each of the contacts are connected to opposing sides of the appropriate mirror motors through the selector switch. The selector switch interrupts or completes these circuits depending on the position of the selector switch, L or R.

If the mirror select switch is placed in the L position and the up switch is pressed, battery voltage will be supplied to the driver outside mirror vertical motor through the driver mirror motor up control circuit and return to the mirror switch through the driver mirror motor left/down control circuit, then to ground and the mirror will move up. If the down switch is pressed, the driver mirror motor left/down control circuit supplies battery voltage and the driver mirror motor up control circuit completes the path to the mirror switch, then to ground and the mirror will move down.

The remainder of the mirror functions operate in the same manner as described above. Placing the mirror direction switch in opposing positions, left/right or up/down, will reverse the voltage polarity to the mirror motor, utilizing the same circuits and the mirror will move accordingly.

Heated Mirror System Operation

The rear window defogger system controls the operation of the driver and passenger rearview mirror heaters. When the rear window defogger switch is activated, the DEFOG relay in the IP fuse block is energized sending B+ through the defog mirror 15A fuse to the driver and passenger rearview mirror heaters. The mirror heaters are connected to separate ground circuits.

DIAGNOSTIC INFORMATION AND PROCEDURES

SYMPTOMS - OBJECT DETECTION

NOTE: The following steps must be completed before using the symptom tables:

1. Perform the **Diagnostic System Check - Vehicle** before using the Symptom Tables in order to verify that all of the following are true:
 - There are no DTCs set.
 - The control module can communicate via the serial data link.
2. Review the system operation in order to familiarize yourself with the system functions. Refer to **Object Detection Description and Operation**.

Visual/Physical Inspection

- Inspect for aftermarket devices which may affect the operation of the system. Refer to **Checking Aftermarket Accessories** .
- Inspect the easily accessible or visible system components for obvious damage or conditions which may cause the symptom.
- This system can use various sensors that need to be clean in order to function properly. Make sure to check the following sensors for obstructions:
 - Parking assist sensors located in the rear bumper cover

Intermittent

Faulty electrical connections or wiring may be the cause of intermittent conditions. Refer to **Testing for Intermittent Conditions and Poor Connections** .

Symptom List

- **Parking Assist System Malfunction**

PARKING ASSIST SYSTEM MALFUNCTION

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

Circuit/System Description

The Rear Parking Assist Control Module is supplied ignition voltage from the I/P fuse block. When the transmission is in reverse, the system is turned ON, ignition voltage is supplied from the BCM. The Rear Object Sensors are supplied with signal circuits referenced from 8 volts and low reference by the Rear Parking Assist Control Module. The Speaker - Parking Assist is provided with B+ from the Rear Parking Assist Control Module provides a PWM low signal to the speaker to provide an audible alert.

Diagnostic Aids

The park assist system is capable of performing an object detection sensor self test. When the vehicle is shifted into reverse, the system will enter the sensor self test mode and the park assist module will verify inputs from the object detection sensors. The park assist module indicates sensor status using the system alarm. If both sensor signals are being received by the rear park assist, module 1 single short tone will be activated. When one or both sensor signals are not received, the module will respond by activating the alarm with 1 tone repeated for a left sensor fault, and 2 tones repeated for a right sensor fault. If both sensors are faulted, the module will respond by activating the alarm with 3 tones continuously.

Circuit/System Verification

1. Ignition ON.

2. Verify the object alarm sounds 1 short tone when shifting the transmission into reverse.

- **If the object alarm sounds 1 or 2 tones repeated**

Refer to Circuit/System Testing - Rear Object Sensor Malfunction.

- **If the object alarm sounds 3 tones continuously or no tones**

Refer to Circuit/System Testing - Rear Parking Assist Control Module/Speaker Malfunction

- **If the object alarm sounds 1 short tone**

3. All OK.

Circuit/System Testing

Rear Object Sensor Malfunction

1. Ignition OFF and all vehicle systems OFF. It may take up to 2 minutes for all vehicle systems to power down. Disconnect the harness connector at the appropriate B78 Rear Object Sensor.

2. Test for less than 10 ohms between the low reference circuit terminal 2 and ground.

- **If 10 ohms or greater**

1. Ignition OFF, disconnect the harness connector at the K41R Rear Parking Assist Control Module.

2. Test for less than 2 ohms in the low reference circuit end to end.

- If 2 ohms or greater, repair the open/high resistance in the circuit.

- If less than 2 ohms, replace the K41R Rear Parking Assist Control Module.

- **If less than 10 ohms**

3. Ignition ON.

4. Test for 7.5-9.5 V between the 8 V reference circuit terminal 1 and ground.

- **If less than 7.5 V**

1. Ignition OFF, disconnect the harness connector at the K41R Rear Parking Assist Control Module.

2. Test for infinite resistance between the 8 V reference circuit and ground.

- If less than infinite resistance, repair the short to ground on the circuit.

- If infinite resistance

3. Test for less than 2 ohms in the 8 V reference circuit end to end.

- If 2 ohms or greater, repair the open/high resistance in the circuit.

- If less than 2 ohms, replace the K41R Rear Parking Assist Control Module.

- **If greater than 9.5 V**

1. Ignition OFF, disconnect the harness connector at the K41R Rear Parking Assist Control Module, ignition ON.

2. Test for less than 1 V between the 8 V reference circuit and ground.

- If 1 V or greater, repair the short to voltage on the circuit.

- If less than 1 V, replace the K41R Rear Parking Assist Control Module.

- **If between 7.5-9.5 V**

5. Replace the appropriate B78 Rear Object Sensor.

Rear Parking Assist Control Module/Speaker Malfunction

1. Ignition OFF and all vehicle systems OFF. It may take up to 2 minutes for all vehicle systems to power down. Disconnect the harness connector at the K41R Rear Parking Assist Control Module.
2. Test for less than 10 ohms between the ground circuit terminal 9 and ground.
 - **If 10 ohms or greater**
 1. Ignition OFF, disconnect the harness connector at the K41R Rear Parking Assist Control Module.
 2. Test for less than 2 ohms in the low reference circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, replace the K41R Rear Parking Assist Control Module.
 - **If less than 10 ohms**
3. Ignition ON.
4. Verify a test lamp illuminates between the ignition circuit terminal 1 and ground.
 - **If the test lamp does not illuminate and the circuit fuse is good**
 1. Ignition OFF.
 2. Test for less than 2 ohms in the ignition circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, verify the fuse is OK and there is voltage at the fuse.
 - **If the test lamp does not illuminate and the circuit fuse is open**
 1. Ignition OFF.
 2. Test for infinite resistance between the ignition circuit and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance, replace the K41R Rear Parking Assist Control Module.
 - **If the test lamp illuminates**
5. Ignition ON, park brake applied, transmission in REVERSE.
6. Verify a test lamp illuminates between the control circuit terminal 4 and ground.
 - **If the test lamp does not illuminate**
 1. Ignition OFF, disconnect the X7 harness connector at the K9 Body Control Module.
 2. Test for infinite resistance between the control circuit and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance
 3. Test for less than 2 ohms in the control circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, replace the K9 Body Control Module.
 - **If the test lamp illuminates**
7. Ignition OFF, disconnect the harness connector at the P28 Speaker - Parking Assist.

8. Test for less than 10 ohms between the low reference circuit terminal 1 and ground.
 - **If 10 ohms or greater**
 1. Ignition OFF, disconnect the harness connector at the K41R Rear Parking Assist Control Module.
 2. Test for less than 2 ohms in the low reference circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, replace the K41R Rear Parking Assist Control Module.
 - **If less than 10 ohms**
9. Test for 7.5-9.5 V between the 8 V reference circuit terminal 3 and ground.
 - **If less than 7.5 V**
 1. Ignition OFF, disconnect the harness connector at the K41R Rear Parking Assist Control Module.
 2. Test for infinite resistance between the 8 V reference circuit and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance
 3. Test for less than 2 ohms in the 8 V reference circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, replace the K41R Rear Parking Assist Control Module.
 - **If greater than 9.5 V**
 1. Ignition OFF, disconnect the harness connector at the K41R Rear Parking Assist Control Module, ignition ON.
 2. Test for less than 1 V between the 8 V reference circuit and ground.
 - If 1 V or greater, repair the short to voltage on the circuit.
 - If less than 1 V, replace the K41R Rear Parking Assist Control Module.
 - **If between 7.5-9.5 V**
10. Ignition OFF. Place an object less than 0.4m away from the rear bumper. Connect a test lamp between reference voltage terminal 3 and control circuit terminal 2.
11. Verify the test lamp illuminates when the vehicle is started and the transmission is shifted into reverse.
 - **If the test lamp does not illuminate**
 1. Ignition OFF.
 2. Test for less than 2 ohms in the control circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, replace the K41R Rear Parking Assist Control Module.
 - **If the test lamp illuminates**
12. Test or replace the P28 Speaker - Parking Assist.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the diagnostic procedure.

- **Rear Parking Assist Alarm Sensor Replacement**

- **Control Module References** for Rear Parking Assist Control Module replacement, setup and programming.

REAR VISION CAMERA SYSTEM MALFUNCTION

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

Circuit/System Description

When the transmission is placed into REVERSE, a 12 V signal is sent to the rearview camera indicating that camera operation is requested. Ignition voltage and ground are supplied to the rearview camera. The rearview camera sends video information to the radio through a video signal + and a video signal - circuit. A grounded shielding also wraps the video signal circuits to reduce electronic interference which may degrade the video signal and cause a distorted or otherwise degraded image.

Diagnostic Aids

A poor video image can be caused by ice, snow, and mud buildup on the lens of the rearview camera. Also, extreme lighting conditions can affect performance, such as operating in the dark or with bright sunlight shining on the camera. Extreme high or low temperatures can also affect the image quality. An open in the shield of the video signal circuit can also cause a distorted screen.

Scan Tool Reference

Control Module References for scan tool information

Circuit/System Verification

1. Ignition ON.
2. Verify that DTC B2545 is not set.
 - **If the DTC is set**
3. Verify the rearview camera there is no debris on the lens and that the bezel or bezel seal is not damaged.
 - **If debris are found on the lens**

Refer to **DTC B2545** .

- **If the DTC is not set**

Clean the lens. If the lens, bezel, or bezel seal are damaged, replace as necessary.

- **If no debris on the lens**

4. Ignition ON, transmission in REVERSE.
5. Verify the backup lamps are On.
 - **If the backup lamps are not ON**

Refer to **Backup Lamps Malfunction (Automatic Transmission)** , **Backup Lamps Malfunction (Manual Transmission)** .

- **If the backup lamps are ON**

6. Engine running, transmission in REVERSE.
7. Verify a clear rear vision image is displayed on the radio.
 - **If a clear image is not displayed**

Refer to Circuit/System Testing.

- **If a clear image is displayed**

8. All OK.

Circuit/System Testing

NOTE: **Circuit/System Verification must be performed before Circuit/System Testing.**

1. Ignition OFF, disconnect the harness connector at the B87 Rearview Camera.
2. Test for less than 10 ohms between the ground circuit terminal 5 and ground.
 - **If 10 ohms or greater**

Test for less than 2 ohms in the ground circuit end to end.

- If 2 ohms or greater, repair the open/high resistance in the circuit.
- If less than 2 ohms, repair the open/high resistance in the ground connection.
- **If less than 10 ohms**

3. Ignition ON.

4. Verify a test lamp illuminates between the ignition circuit terminal 6 and ground.

- **If the test lamp does not illuminate and the circuit fuse is good**

1. Ignition OFF.

2. Test for less than 2 ohms in the ignition circuit end to end.

- If 2 ohms or greater, repair the open/high resistance in the circuit.

- If less than 2 ohms, verify the fuse is OK and there is voltage at the fuse.

- **If the test lamp does not illuminate and the circuit fuse is open**

1. Ignition OFF.

2. Test for infinite resistance between the ignition circuit and ground.

- If less than infinite resistance, repair the short to ground on the circuit.

- If infinite resistance, test or replace the KR74 Ignition Run Relay.

- **If the test lamp illuminates**

5. Engine running, park brake applied, transmission in REVERSE.

6. Test for greater than 11 V between the control circuit terminal 3 and ground.

- **If less than 11 V**

1. Ignition OFF, disconnect the X7 harness connector at the K9 Body Control Module.

2. Test for infinite resistance between the control circuit and ground.

- If less than infinite resistance, repair the short to ground on the circuit.

- If infinite resistance

3. Test for less than 2 ohms in the control circuit end to end.

- If 2 ohms or greater, repair the open/high resistance in the circuit.

- If less than 2 ohms, replace the K9 Body Control Module.

- **If greater than 11 V**

7. Ignition OFF, disconnect the X4 harness connector at the A11 Radio, ignition ON.

8. Test for less than 1 V between the signal circuit terminal listed below and ground:

- Signal (+) circuit terminal 1 at the B87 Rearview Camera.

- Signal (-) circuit terminal 4 at the B87 Rearview Camera.

- **If 1 V or greater**

Repair the short to voltage on the circuit.

- **If less than 1 V**

9. Test for infinite resistance between the signal circuit terminal listed below and ground:

- Signal (+) circuit terminal 1 at the B87 Rearview Camera.
- Signal (-) circuit terminal 4 at the B87 Rearview Camera.
- **If less than infinite resistance**

Repair the short to ground on the circuit.

- **If infinite resistance**

10. Test for less than 2 ohms in the signal (+) circuit end to end.

- **If 2 ohms or greater**

Repair the open/high resistance in the circuit.

- **If less than 2 ohms**

11. Test for less than 2 ohms in the signal (-) circuit end to end.

- **If 2 ohms or greater**

Test the signal circuit for an open/high resistance.

- **If less than 2 ohms**

12. Replace the B87 Rearview Camera.

13. Engine running, transmission in REVERSE, verify a clear rear vision image is displayed on the A11 Radio.

- **If a clear rear vision image is not displayed on the A11 Radio**

Replace the A11 Radio.

- **If a clear rear vision image displayed on the A11 Radio**

14. All Ok.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

- **Rearview Camera Image Display Module Replacement**
- **Control Module References** for body control module or radio replacement, programming and setup

REPAIR INSTRUCTIONS

REAR OBJECT ALARM CONTROL MODULE REPLACEMENT

Fig. 3: Rear Object Alarm Control Module
 Courtesy of GENERAL MOTORS COMPANY

Rear Object Alarm Control Module Replacement

Callout	Component Name
Preliminary Procedure Remove the rear wheelhouse trim finish. Refer to <u>Rear Wheelhouse Trim Finish Panel Replacement</u> .	
1	Rear Object Alarm Module Bolt CAUTION: Refer to <u>Fastener Caution</u> . Tighten 6 N.m (53 lb in)
2	Rear Object Alarm Module Procedure 1. Loosen the bolts and remove the rear object alarm and module assembly. 2. Disconnect the electrical connector. 3. Remove the module from the bracket.

TIP: The bolt is integral to the sensor assembly, DO NOT remove separately.

REAR OBJECT ALARM REPLACEMENT

Fig. 4: Rear Object Alarm

Courtesy of GENERAL MOTORS COMPANY

Rear Object Alarm Replacement

Callout	Component Name
Preliminary Procedure	
Remove the rear wheelhouse trim finish. Refer to <u>Rear Wheelhouse Trim Finish Panel Replacement</u> .	
1	Rear Object Alarm Nut CAUTION: Refer to <u>Fastener Caution</u> .

	Tighten 4.5 N.m (40 lb in)
2	Rear Object Alarm Procedure 1. Disconnect the electrical connector. 2. Remove the rear object alarm.

REAR PARKING ASSIST ALARM SENSOR REPLACEMENT

Removal Procedure

Fig. 5: Rear Bumper Fascia
Courtesy of GENERAL MOTORS COMPANY

1. Remove the rear bumper fascia. Refer to **Rear Bumper Fascia Replacement** .

2. Disconnect electrical connector from the rear object sensor.
3. Rotate the housing counterclockwise and remove the rear object sensor.

Installation Procedure

Fig. 6: Rear Bumper Fascia

Courtesy of GENERAL MOTORS COMPANY

1. Insert the sensor into the housing and lock the sensor by rotating the housing clockwise.
2. Connect the electrical connector to the rear object sensor.
3. Install the rear bumper fascia. Refer to **Rear Bumper Fascia Replacement** .

REARVIEW CAMERA IMAGE DISPLAY MODULE REPLACEMENT

Fig. 7: Rearview Camera Image Display Module
 Courtesy of GENERAL MOTORS COMPANY

Rearview Camera Image Display Module Replacement

Callout	Component Name
Preliminary Procedure	
Remove the liftgate outside handle. Refer to Liftgate Outside Handle Replacement .	
1	Rearview Camera Image Display Module Procedure 1. Disconnect the electrical connector. 2. Depress the clip fingers and push outward to remove the rearview camera from the applique.

DESCRIPTION AND OPERATION

OBJECT DETECTION DESCRIPTION AND OPERATION

Object Detection Description and Operation (Parking Assist)

The ultrasonic parking assist system is designed to identify and notify the driver of an object in the vehicle's path when reversing. The distance and location of the object is determined by 2 Rear Object Sensors located in the rear bumper. The Rear Parking Assist Control Module will notify the driver using an audible beep signal through an external speaker.

Object Detection Components

The parking assist system is made up of the following components:

- K41R Rear Parking Assist Control Module
- Two Rear Object Sensors

Rear Parking Assist Control Module

The object alarm module provides an 8V reference and a low reference to the Rear Object Sensors. The Rear Parking Assist Control Module receives individual signals from each of the sensors and determines the location and distance of an object based on these inputs. When an object is detected, the Rear Parking Assist Control Module will send a signal to an external speaker to provide an audible alert.

Rear Object Sensors

The Rear Object Sensors are located in the rear bumper of the vehicle. The sensors are used to determine the distance between an object and the bumper. Each sensor emits an ultrasonic frequency which is reflected off any object located in front of or behind the vehicle. These reflections are received by the sensors. The time difference between the emission of the frequency and when the reflection is received is known as sensor ring time, it is used to determine the distance to the object. The sensors report this information to the Rear Parking Assist Control Module.

Parking Assist Operation

When an object is within the measuring range of the sensor, the ultrasonic pulse is reflected and is received by the sending or a neighboring sensor. The sensor converts this signal into a voltage signal and sends this signal to the Rear Parking Assist Control Module. The Rear Parking Assist Control Module evaluates the received sensor signals. As soon as an object is within the measuring range, the Rear Parking Assist Control Module sends a signal to an external speaker in order to give out the acoustic distance signal. The measuring range is between 40-120 cm (15.74-47.24 in). From a distance of 120 cm (15.74 in), the acoustic signal is active. The frequency of the beep sound increases with decreasing distance. From a distance less than 40 cm (15.74 in), the sound becomes continuous.

The parking assist can be activated and deactivated by engaging the reverse gear.

The object alarm module carries out a self test and monitors the sensors for electrical and mechanical faults. Monitored is the power supply of each sensor and the sensor signals, which need to alter when the vehicle moves. If this is not the case, the sensor is acoustically blocked or faulty. Mud, ice and snow may cause obstruction of the function of the sensors. The Rear Parking Assist Control Module will also check whether the correct type of sensor is installed.

ACCESSORIES & EQUIPMENT

Paint and Coatings - Spark

INTRODUCTION

BASECOAT/CLEARCOAT PAINT SYSTEMS

WARNING: Exposure to isocyanates during paint preparation and application processes can cause severe breathing problems. Read and follow all of the instructions from the manufacturers of painting materials, equipment and protective gear.

All paint finish repairs of rigid exterior surfaces must meet GM standards. Refer to the latest revision of the GM Approved Refinish Materials book to identify the paint systems you may use that have been engineered to meet GM standards. The GM Approved Refinish Materials book supplies all approved products, including volatile organic compound (VOC) compliant regulations recommended by the individual manufacturer and detailed procedures for materials used in their paint system.

The latest revision of the GM Approved Refinish Materials booklet is located on the Goodwrench website at www.gmgoodwrench.com.

ANTI-CORROSION TREATMENT AND REPAIR

WARNING: When applying sound deadeners or anti-corrosion materials due care and preventative measures must be exercised to prevent any material from being sprayed into door and quarter panel mechanisms such as door locks, window run channels, window regulators and seat belt retractors, as well as any moving or rotating mechanical or suspension parts on the underbody, particularly the parking brake cable. After material application, be sure that all body drain holes are open. Improper application may increase chance of corrosion damage or limit the operation of moving parts, resulting in personal injury.

Any procedure that disturbs these special treatments, such as panel replacement or collision damage repair operations, may leave the metal unprotected and result in corrosion. Proper recoating of these surfaces with service-type anti-corrosion material is essential.

After repair and/or replacement parts are installed, all accessible bare metal surfaces must be treated with metal conditioner and reprimed. Refer to the GM Approved Refinish Materials book which identifies the paint systems you may use.

The latest revision of the GM Approved Refinish Materials booklet is located on the Goodwrench website at www.gmgoodwrench.com.

Anti-corrosion compounds are light-bodied materials designed to penetrate between metal-to-metal surfaces, such as pinch-weld joints, hem flanges and integral panel attaching points where metal surfaces are difficult to

coat with conventional undercoating materials and are inaccessible for painting. The materials that are suitable for interior and exterior are listed in the chart below. Conventional undercoating is recommended in order to coat large areas, such as replacement door and quarter outer panels, floor pan sections, lids, hoods, fenders, etc. During undercoating operations, care should be taken to prevent the material from being sprayed into door and quarter panel hardware mechanisms, such as door locks, window run channels, window regulators and seat belt retractors. On the underbody, the material should not be applied to any moving or rotating part, energy absorbing bumper components or shock absorbers. After undercoating, ensure that all body drain holes are open.

Interior Protectant

The following products are available from GM Dealer Equipment. For technical information, call 187-Permatex (1-877-376-2839):

Permatex Part Number	Description
310-JDI-UCA1	Permatex Canister and Wand Assembly
310-81881	Permatex Amber Rust Proofing (24 oz) (Qty of 12)
310-81882	Permatex Amber Rust Proofing (1 gal)

Exterior Protectants

The following product is available from *ECP, Inc. Contact them at 1-800-323-3521 or www.ecpinc.net.

Part Number	Description
178660	Nox Rust X-121B (12 cans per case)

The following products are available from your local *3M® distributor or call 1-800-521-8180, ext. 779-5165.

3M® Part Number	Description
08804	Water-Based Undercoat
08801	No Clean-Up Applicator Gun
05917	Weld-Thru Coating
08891	Rust Fighter-I

The following product is available from *Transtar Autobody Technologies. Contact the company at 1-800-824-2843 or www.tat-co.com.

Part Number	Description
4353	Weld-Through Primer

*We believe these sources and their products to be reliable. There may be additional manufacturers of such material. General Motors does not endorse, indicate any preference for or assume any responsibility for the products from these firms or for any such items which may be available from other sources.

These sealers are intended to prevent water and dust from entering the vehicle and also are anti-corrosion

barriers. Sealers are applied to such areas as rear compartment lid hem flanges, wheelhouse, quarter outer, floor, cowl, roof and various other panel to panel attaching points. The originally sealed joints are obvious and any damage to these sealed locations should be corrected by resealing. Attaching points of new replacement panels should be resealed. Replacement lids and doors will also require sealing in the hem flange areas.

Flanged joints, overlap joints and seams should be sealed using a quality sealer of medium-bodied consistency. The sealer used must retain its flexible characteristics after curing and be paintable.

Open joints which require bridging of the sealer in order to close a gap should be sealed using a heavy-bodied caulking material. Follow the label directions for the material selected.

Color application may be required in order to restore repaired areas such as hood, fenders, doors, quarters, lid, roof, engine compartment, underbody and inner panels to original appearance. When this is necessary, conventional refinishing preparation, undercoat buildup and color application techniques should be followed.

Deadener materials, spray-on type, are used on various metal panels in order to provide corrosion resistance and joint sealing. They control the general noise level inside the passenger area of the vehicle. When deadeners are disturbed because of damage, are removed during repair operations or a new replacement panel is installed, the deadener material must be replaced by a service equivalent material. The application pattern and location of deadener materials can be determined by observing the original production installation.

Cleaning of the interior and underbody panel surfaces is necessary when original galvanized or other anti-corrosion materials have been burned off during welding or heating operations. Removal of the residue from burning will require additional care in such areas as interior surfaces of box-type construction and when configurations of the metal panels limit access to interior surfaces.

REPAIR INSTRUCTIONS

CLEARCOAT REPAIR WITHOUT REPAINTING

1. Thoroughly wash the repair area with Liquid Wash and Wax GM P/N 1052870 or the equivalent.
2. Environmental damage may be corrected. Refer to **Environmental Fallout (Acid Rain)** or **Rail Dust Damage Repair**.

NOTE: Follow all of the instructions from the manufacturer of the polishing material.

3. Use a paint gauge before, during and after sanding and/or polishing, to avoid removing too much clearcoat. Refer to **Paint Gauges**.

ENVIRONMENTAL FALLOUT (ACID RAIN)

CAUTION: Refer to **Clearcoat/Ultraviolet Screeners Caution** .

NOTE: Always refer to the manufacturer's packaged instructions for the detailed

procedures of materials used for compounding and/or polishing.

Since the severity of the condition varies from area to area, proper diagnosis of the contamination extent is critical to the success of the repairs. Perform the diagnosis under high intensity fluorescent lighting on the horizontal surfaces (hood, roof panel, rear compartment lid), after the surfaces have been properly cleaned by washing the vehicle with GM Wash and Wax GM P/N 1237841 (Canadian P/N 10953203) or equivalent.

There are 3 basic types of acid rain damage:

Surface Level Contamination

May be repaired by simply washing the vehicle, cleaning the surface with a silicone wax and grease remover, neutralizing acidic residue and finesse polishing. Refer to Surface Level Contamination Repair.

Clearcoat Etching

Slight etching is still noticeable after the above washing and finesse polishing procedure. Refer to Slight Clearcoat Damage - Wet Sanding, Finesse Polishing.

Basecoat Etching

Severe etching beyond the clearcoat into the basecoat in the affected areas will require refinishing. Refer to **Basecoat/Clearcoat Paint Systems**.

Surface Level Contamination Repair

1. Thoroughly wash and dry the contaminated area with GM Wash and Wax GM P/N 1237841 (Canadian P/N 10953203) or equivalent.
2. Clean the affected area with silicone, wax and grease remover.
3. Remove and neutralize acidic residue by cleaning the contaminated areas with a mixture of baking soda and water (1 tablespoon of baking soda per 1 liter or 1 quart of water). Rinse thoroughly and dry the panel completely.
4. Apply finesse-type polish with a foam panel. If damage has been repaired, remove any swirl marks with a dual action orbital polisher and foam pad.
5. If some damage remains, refer to Slight Clearcoat Damage - Wet Sanding, Finesse Polishing.

Slight Clearcoat Damage - Wet Sanding, Finesse Polishing

1. Select a small contaminated test area.
2. Film thickness should be taken prior to the sanding and polishing. Refer to **Paint Gauges**.
3. Wet sand and finesse polish the contaminated test area. If during the polishing you suspect or observe that etching has penetrated into the basecoat, too much clearcoat has been removed during sanding or base color is transferred to the polishing pad during polishing, then the affected areas will require refinishing. Refer to **Basecoat/Clearcoat Paint Systems**.

PAINT GAUGES

Paint thickness gauges measure the total thickness of the vehicle finish. It is important to accurately measure the thickness of the finish on each vehicle as the thickness of the finish will vary on each vehicle. Use a paint gauge before the sanding process in order to accurately measure how much finish there is to remove before, during and after the sanding process. Paint gauges range from magnetic pull type to sophisticated electronic types and are available from a variety of sources. The older magnetic type gauges, at best have a 5 percent accuracy range and are not sensitive enough to detect removal of 0.02 mm 0.5 mil (0.0005 in) clearcoat. The newer type magnetic gauges have improved accuracy ranges. Most gauges are confined to checking either ferrous metal, steel, non-ferrous metal or aluminum panel. At this time, there are no viable gauges for reading film thickness on composite (SCM doors, RIM fenders) panels. The more sophisticated electronic paint thickness gauges (ETG) digital type gauges are able to read film thickness on both ferrous and non-ferrous metal panel. Digital ETG gauges may have an accuracy range of 1 percent and include thickness standards for recalibration. The following paint thickness gauges are available. Call 1-800-GM-TOOLS for information:

Paint Thickness Gauges

- 147-5437-ETG Standard model
- 147-5437-ETG-P Standard model with print option
- 147-5437-N-ETG-N Non-ferrous model for aluminum panels
- 147-5437-NP-ETG-NP Non-ferrous model with print option
- 147-54437-SD-ETG Steel and aluminum gauge

CLEARCOAT THICKNESS

The clearcoat on the vehicle is typically 0.059-0.078 mm (1.5-2 mils [0.0015-0.0020 in]) thick. The clearcoat contains ultraviolet screeners. Removing more than 0.5 mils (0.019 in) of the clearcoat may result in early paint failure.

RAIL DUST DAMAGE REPAIR

WARNING: Refer to Eye Protection Warning .

NOTE: If rail dust has penetrated into the basecoat, the panel requires refinishing. Ensure all the rail dust has been removed prior to refinishing or the rust spots will return.

Rail dust damage comes from the tiny iron particles produced from the friction between the train wheels and the track. It can also be deposited on vehicles if stored near any operation producing iron dust (i.e., steel ore yards). This dust can either lay on top of or embed into the paint surface. It is usually diagnosed as bumps in the paint surface or rust colored spots in the paint.

1. Move the vehicle to a cool shaded area and ensure the vehicle surfaces are cool during the removal process.
2. Thoroughly wash the repair area with Liquid Wash and Wax GM P/N 1052870 or equivalent.
3. Wipe the area dry.

4. Clean the affected area with silicone, wax and grease remover.
5. Perform the removal process according to the manufacturer's directions of the type of repair material used (Gel Type Oxalic Acid or Clay Type Non-Acid Based). If, upon inspection, some particles are still present, the process may be repeated. If the damage has been repaired, complete the repair to the entire panel.
6. Polish the entire panel after the removal process. If small pits remain in the clearcoat after all of the damage has been repaired, refer to **Clearcoat Repair without Repainting**.

BRAKES

Park Brake - Spark

SPECIFICATIONS

FASTENER TIGHTENING SPECIFICATIONS

Fastener Tightening Specifications

Application	Specification	
	Metric	English
Park Brake Cable Mounting Clamp to Floor Panel Cross Bar Retaining Nut	22 N.m	16 lb ft
Park Brake Cable Mounting Clamp to Rear Axle Bracket Retaining Nut	9 N.m	80 lb in
Park Brake Cable Mounting Clamp to Rear Side Rail Retaining Nut	22 N.m	16 lb ft

DIAGNOSTIC INFORMATION AND PROCEDURES

SYMPTOMS - PARK BRAKE

NOTE: Review the system operation in order to familiarize yourself with the system functions. Refer to Park Brake System Description and Operation

Visual/Physical Inspection

- Inspect for aftermarket devices which could affect the operation of the park brake system.
- Inspect the easily accessible or visible system components for obvious damage or conditions which could cause the symptom.

Symptom List

Refer to a symptom diagnostic procedure from the following list in order to diagnose the symptom:

- Park Brake Will Not Hold or Release
- Park Brake System Diagnosis

PARK BRAKE WILL NOT HOLD OR RELEASE

Park Brake Will Not Hold or Release

Step	Action	Yes	No

1	Were you sent here from a Park Brake Symptom table?	Go to Step 2	Go to Symptoms - Park Brake
2	Inspect the park brake system for proper operation. Refer to <u>Park Brake System Diagnosis</u> . Did you find and correct a condition?	Go to Step 6	Go to Step 3
3	Inspect the drum brake system for proper operation. Refer to <u>Drum Brake System Diagnosis</u> . Did you find and correct a condition?	Go to Step 6	Go to Step 4
4	Inspect the disc brake system for proper operation. Refer to <u>Disc Brake System Diagnosis</u> . Did you find and correct a condition?	Go to Step 6	Go to Step 5
5	Inspect the hydraulic brake system for proper operation. Refer to <u>Hydraulic Brake System Diagnosis</u> . Did you find and correct a condition?	Go to Step 6	Go to Symptoms - Park Brake
6	Road test the vehicle in order to confirm correct operation. Refer to <u>Brake System Vehicle Road Test</u> . Is the condition still present?	Go to Step 2	System OK

PARK BRAKE SYSTEM DIAGNOSIS

Park Brake System Diagnosis

Step	Action	Yes	No
DEFINITION: This diagnostic table is designed to diagnose ONLY the components of the PARK brake system in order to determine if the PARK brake system is operating properly. You will be directed by the appropriate Symptom table to go to other brake system diagnostic tables as appropriate.			
1	Were you sent here from a Hydraulic Brake Symptom table?	Go to Step 4	Go to Step 2
2	Were you sent here from a Park Brake Symptom table?	Go to Step 4	Go to Step 3
3	Is the symptom related to the ability of the park brake system to hold and/or release?	Go to Symptoms - Park Brake	Go to Symptoms - Hydraulic Brakes
4	1. Raise and support the vehicle with the rear axle supported by jack stands. Refer to <u>Lifting and Jacking the Vehicle</u> . 2. Shift the transmission into NEUTRAL. 3. With the park brake RELEASED, attempt to rotate the rear wheels to check the rear brakes for a significant amount of drag.		
	Do the rear brakes have a substantial amount of drag?	Go to Step 11	Go to Step 5
5	1. With the transmission still in NEUTRAL, apply the park brake. 2. Attempt to rotate the rear wheels to check the rear brakes for a significant amount of drag.		

	Do the rear brakes have a significant amount of drag?	Go to Step 6	Go to Step 7
6	1. Release the park brake. 2. Rotate the rear wheels to check the rear brakes for a significant reduction in the amount of drag. Did the rear brakes exhibit a significant reduction in the amount of drag?	Go to Step 20	Go to Step 11
7	1. Remove the brake drums. Refer to <u>Brake Drum Replacement</u>. 2. Visually check the park brake cable connections and the cables that are accessible on the UNDERSIDE of the vehicle for disconnections and/or damage. Were any or the park brake cables disconnected and/or damaged?	Go to Step 8	Go to Step 9
8	Reconnect or replace the park brake cables as necessary. Refer to <u>Parking Brake Cable Replacement</u>. Did you complete the repair and/or replacement?	Go to Step 9	-
9	Check the adjustment of the park brake. Refer to <u>Parking Brake Adjustment</u>. Was the park brake adjusted properly?	Go to Step 11	Go to Step 10
10	Adjust the park brake. Refer to <u>Parking Brake Adjustment</u>. Were you able to attain adjustment of the park brake?	Go to Step 16	Go to Step 11
11	CAUTION: Do not depress the brake pedal with the brake rotors and/or the brake drums removed or with the brake calipers repositioned away from the brake rotors or damage to the brake system may result. 1. Remove the brake drums. Refer to <u>Brake Drum Replacement</u>. 2. Inspect the park brake hardware for loose, damaged, broken or missing components. Refer to <u>Park Brake Hardware Inspection</u>. 3. Check the drum brake adjusters for a seized condition. Do the park brake hardware and/or the drum brake adjusters require replacement?	Go to Step 12	Go to Step 13
12	1. Replace park brake hardware components as necessary. Refer to <u>Brake Shoe Replacement</u>. 2. Replace the drum brake adjusting hardware as necessary. Refer to <u>Drum Brake Adjusting Hardware Replacement</u>.		-

	Did you complete the replacement?	Go to Step 13	
13	Have an assistant apply and release the park brake, while you observe the park brake cables for free movement. Do the park brake cables move freely?	Go to Step 14	Go to Step 17
14	Check the adjustment of the park brake. Refer to <u>Parking Brake Adjustment</u> . Was the park brake adjusted properly?	Go to Step 16	Go to Step 15
15	Adjust the park brake. Refer to <u>Parking Brake Adjustment</u> . Were you able to attain adjustment of the park brake?	Go to Step 16	Go to Step 25
16	1. With the transmission still in NEUTRAL, apply the park brake. 2. Attempt to rotate the rear wheels to check the rear brakes for a significant amount of drag. 3. Release the park brake. 4. Rotate the rear wheels to check the rear brakes for a significant reduction of drag. Does the park brake apply and release properly?	Go to Step 27	Return to Symptom Table
17	1. Remove the brake drums. Refer to <u>Brake Drum Replacement</u>. 2. Disconnect the park brake cable connections that are accessible on the UNDERSIDE of the vehicle one at a time and check each cable for free movement. Did any of the park brake cables accessible on the underside of the vehicle require replacement?	Go to Step 18	Go to Step 19
18	Replace any of the park brake cables that do not have free movement - not releasing properly. Refer to <u>Parking Brake Cable Replacement</u> . Did you complete the replacement?	Go to Step 23	-
19	Replace the park brake lever assembly - not releasing properly. Refer to <u>Parking Brake Lever Replacement</u> . Did you complete the replacement?	Go to Step 24	-
20	Check the adjustment of the park brake. Refer to <u>Parking Brake Adjustment</u> . Was the park brake adjusted properly?	Go to Step 27	Go to Step 21
21	Adjust the park brake. Refer to <u>Parking Brake Adjustment</u> . Were you able to attain adjustment of the park brake system?	Go to Step 26	Go to Step 22
	1. Remove the brake drums. Refer to <u>Brake Drum Replacement</u>. 2. Check the drum brake adjuster for a seized condition.		

22	3. Replace the drum brake adjusting hardware as necessary. Refer to <u>Drum Brake Adjusting Hardware Replacement</u> . Did you find and correct a condition?	Go to Step 23	Go to Step 25
23	Adjust the park brake. Refer to <u>Parking Brake Adjustment</u>. Were you able to attain adjustment of the park brake system?	Go to Step 26	Go to Step 25
24	Adjust the park brake. Refer to <u>Parking Brake Adjustment</u>. Were you able to attain adjustment of the park brake system?	Go to Step 26	Return to Symptom Table
25	1. Replace the component that is used to adjust the park brake system. Refer to <u>Parking Brake Lever Replacement</u>. 2. Adjust the park brake. Refer to <u>Parking Brake Adjustment</u>. Did you complete the replacement and adjustment?	Go to Step 26	Return to Symptom Table
26	1. With the transmission in NEUTRAL, apply the park brake. 2. Attempt to rotate the rear wheels to check the rear brakes for a significant amount of drag. 3. Release the park brake. 4. Rotate the rear wheels to check the rear brakes for a significant reduction of drag. Did the park brake apply and release properly?	Go to Step 27	Return to Symptom Table
27	Install or connect any components that were removed or disconnected during diagnosis. Did you complete the operation?	Park Brake System OK Return to Symptom Table	-

PARK BRAKE HARDWARE INSPECTION

Fig. 1: Park Brake Lever And Pivot Pin
Courtesy of GENERAL MOTORS COMPANY

WARNING: Refer to Brake Dust Warning .

1. Visually inspect the park brake lever (1) and the lever pivot pin (2) for the following conditions:
 - The lever being bent or broken at any point - particularly at the cable attachment
 - A seized or binding condition at lever pivot pin
 - A broken lever pivot pin

NOTE: **The brake shoe and park brake lever are not serviced separately. If either component requires replacement, they must be replaced as an assembly.**

2. If any of the conditions listed were found, the park brake lever and brake shoe assembly requires replacement.

REPAIR INSTRUCTIONS

PARKING BRAKE LEVER REPLACEMENT

Removal Procedure

1. Remove the front floor console. Refer to **Front Floor Console Replacement** .
2. Ensure that the park brake lever is in the fully released position.

Fig. 2: Front Park Brake Cable Adjusting Nut
Courtesy of GENERAL MOTORS COMPANY

3. Release the tension from the park brake cables.

Using ONLY HAND TOOL, loosen the adjusting nut (1) completely to the end of the front cable threaded rod.

4. Raise and support the vehicle. Refer to **Lifting and Jacking the Vehicle** .

Fig. 3: Left And Right Parking Brake Cables And Cable Equalizer
Courtesy of GENERAL MOTORS COMPANY

5. Disconnect the left and right parking brake cables (1) from the cable equalizer (2).

Fig. 4: Electrical Connector

Courtesy of GENERAL MOTORS COMPANY

6. Lower the vehicle.
7. Disconnect the electrical connector (1) from the park brake indicator switch.

Fig. 5: Park Brake Lever Mounting Nuts
Courtesy of GENERAL MOTORS COMPANY

8. Remove the park brake lever mounting nuts (1).
9. Disconnect the parking brake cable grommet from the floor panel and remove the park brake lever assembly (2) from the vehicle.

Installation Procedure

Fig. 6: Park Brake Lever Mounting Nuts
Courtesy of GENERAL MOTORS COMPANY

1. Install the park brake lever assembly (2) to the vehicle and install the parking brake cable grommet to the floor panel.

CAUTION: Refer to Fastener Caution .

2. Install the park brake lever assembly mounting nuts (1) and tighten to 22 N.m (16 lb ft).

Fig. 7: Electrical Connector

Courtesy of GENERAL MOTORS COMPANY

3. Connect the electrical connector (1) to the park brake indicator switch.
4. Raise and support the vehicle. Refer to **Lifting and Jacking the Vehicle** .

Fig. 8: Left And Right Parking Brake Cables And Cable Equalizer
Courtesy of GENERAL MOTORS COMPANY

5. Install the left and right parking brake cables (1) to the cable equalizer (2).
6. Lower the vehicle.
7. Adjust the park brake cable tension. Refer to **Parking Brake Adjustment**.
8. Install the front floor console. Refer to **Front Floor Console Replacement** .

PARKING BRAKE INDICATOR SWITCH REPLACEMENT

Removal Procedure

1. Remove the front floor console. Refer to **Front Floor Console Replacement** .

Fig. 9: Electrical Connector

Courtesy of GENERAL MOTORS COMPANY

2. Disconnect the electrical connector (1) from the parking brake indicator switch.

Fig. 10: Parking Brake Indicator Switch
Courtesy of GENERAL MOTORS COMPANY

3. Remove the parking brake indicator switch screw (3).
4. Remove the parking brake indicator switch (2) from the park brake lever assembly (1).

Installation Procedure

Fig. 11: Parking Brake Indicator Switch
Courtesy of GENERAL MOTORS COMPANY

1. Install the parking brake indicator switch (2) to the park brake lever assembly (1).

CAUTION: Refer to Fastener Caution .

2. Install the parking brake indicator switch screw (3) and tighten to 1.5 N.m (13 lb in).

Fig. 12: Electrical Connector

Courtesy of GENERAL MOTORS COMPANY

3. Connect the electrical connector (1) to the parking brake indicator switch.
4. Install the front floor console. Refer to **Front Floor Console Replacement** .
5. Check the operation of the parking brake indicator switch.

PARKING BRAKE CABLE REPLACEMENT

Removal Procedure

WARNING: Refer to **Brake Dust Warning** .

1. Ensure that the park brake is in the fully released position.
2. Release the park brake lever boot from the floor console by applying light pressure inward on the sides of the boot retainer and pull the boot back.

Fig. 13: Front Park Brake Cable Adjusting Nut
Courtesy of GENERAL MOTORS COMPANY

3. With the park brake lever in the released position, loosen the adjusting nut (1) enough to completely relieve tension on the front cable.
4. Raise and support the vehicle. Refer to **Lifting and Jacking the Vehicle** .
5. Remove the wheel and tire assembly. Refer to **Tire and Wheel Removal and Installation** .
6. Remove the brake drum. Refer to **Brake Drum Replacement** .

Fig. 14: Rear Park Brake Cable Retaining Clip
Courtesy of GENERAL MOTORS COMPANY

7. Remove the rear park brake cable retaining clip (1) from the drum brake backing plate.
8. Using a flat-bladed screwdriver, disconnect the park brake cable from the park brake lever of the drum brake shoe.

Fig. 15: Park Brake Cable Mounting Clamp Nut
Courtesy of GENERAL MOTORS COMPANY

9. Remove the park brake cable mounting clamp nut (1) and remove the park brake cable mounting clamp (2) from the rear axle bracket.

Fig. 16: Park Brake Cable Mounting Clamp Nut
Courtesy of GENERAL MOTORS COMPANY

10. Remove the park brake cable mounting clamp nut (1) and remove the park brake cable mounting clamp (2) from the rear side rail.

Fig. 17: Park Brake Cable Mounting Clamp Nut
Courtesy of GENERAL MOTORS COMPANY

11. Remove the park brake cable mounting clamp nut (1) and remove the park brake cable mounting clamp (2) from the floor panel cross bar.

Fig. 18: Left And Right Parking Brake Cables And Cable Equalizer
Courtesy of GENERAL MOTORS COMPANY

12. Detach the park brake cable (1) from the bracket on the floor panel.
13. Separate the park brake cable (1) from the park brake cable equalizer (2) and remove the park brake cable from the vehicle.

Installation Procedure

1. Using a flat-bladed screwdriver, connect the park brake cable from the park brake lever of the drum brake shoe.

Fig. 19: Rear Park Brake Cable Retaining Clip
Courtesy of GENERAL MOTORS COMPANY

2. Install the rear park brake cable retaining clip (1) to the drum brake backing plate.

Fig. 20: Left And Right Parking Brake Cables And Cable Equalizer
Courtesy of GENERAL MOTORS COMPANY

3. Connect the park brake cable (1) to the park brake cable equalizer (2) and install the park brake cable (1) to the mounting bracket on the floor panel.

Fig. 21: Park Brake Cable Mounting Clamp Nut
Courtesy of GENERAL MOTORS COMPANY

4. Install the park brake cable mounting clamp (2) to the floor panel cross bar.

CAUTION: Refer to Fastener Caution .

5. Install the park brake cable mounting clamp nut (1) and tighten to 22 N.m (16 lb ft).

Fig. 22: Park Brake Cable Mounting Clamp Nut
Courtesy of GENERAL MOTORS COMPANY

6. Install the park brake cable mounting clamp (2) to the rear side rail.
7. Install the park brake cable mounting clamp nut (1) and tighten to 22 N.m (16 lb ft).

Fig. 23: Park Brake Cable Mounting Clamp Nut
Courtesy of GENERAL MOTORS COMPANY

8. Install the park brake cable mounting clamp (2) to the rear axle bracket.
9. Install the park brake cable mounting clamp nut (1) and tighten to 9 N.m (80 lb in).
10. Install the brake drum. Refer to **Brake Drum Replacement**.
11. Install the wheel and tire assembly. Refer to **Tire and Wheel Removal and Installation**.
12. Adjust the park brake cable tension. Refer to **Parking Brake Adjustment**.

PARKING BRAKE ADJUSTMENT

WARNING: Refer to **Brake Dust Warning**.

NOTE: Use **ONLY HAND TOOLS** whenever tightening or loosening the adjusting nut.

1. Apply and fully release the park brake several times. Verify that the park brake lever releases completely.
2. Turn ON the ignition. Verify the red BRAKE warning lamp is not illuminated.
3. If the red BRAKE warning lamp is illuminated, verify the following:

- The park brake lever is in the fully released position and against the stop.
 - There is no slack in the park brake cables.
4. If the red BRAKE warning lamp remained illuminated and there were no other visible causes, refer to **Symptoms - Hydraulic Brakes** .
 5. Turn OFF the ignition.
 6. Release the park brake lever boot from the floor console by applying light pressure inward on the sides of the boot retainer and pull the boot back.

Fig. 24: Front Park Brake Cable Adjusting Nut
Courtesy of GENERAL MOTORS COMPANY

7. With the park brake lever in the released position, loosen the adjusting nut (1) enough to completely relieve tension on the front cable.

CAUTION: Refer to Vehicle Lifting and Jacking Caution .

8. Raise and support the vehicle. Raise the vehicle just enough to allow rear tire and wheel assembly removal and rear drum adjustment.
9. Remove the rear tire and wheel assemblies. Refer to **Tire and Wheel Removal and Installation** .

10. Adjust the rear drum brakes. Refer to **Drum Brake Adjustment** .
11. Ensure there is no brake shoe drag after adjustment by rotating the brake drums. If drag exists, re-center the brake shoes and perform the brake shoe adjustment again.
12. Raise the park brake lever 6 detent positions.

Fig. 25: Installing Park Brake Cable Adjusting Nut Until Projection Amount (A)
Courtesy of GENERAL MOTORS COMPANY

CAUTION: Refer to **Fastener Caution** .

13. Install the park brake cable adjusting nut until the projection amount (A) of the adjusting rod reaches 21 mm from the adjusting nut.
14. Attempt to rotate the rear brake drums. There should be no rotation forward or rearward.
15. Fully release the park brake lever.
16. Verify the park brake is released by rotating the rear brake drums. The drums should rotate freely and exhibit no brake shoe drag.
17. If the drums do not rotate freely, repeat the park brake cable adjustment procedure.
18. Raise the park brake lever 3 detent positions and attempt to rotate the rear brake drums:
 - One of the brake drums should not rotate forward or rearward.

- The other brake drum should not rotate forward or rearward or should require substantial effort to rotate.
19. Raise the park brake lever one additional detent position and attempt to rotate the rear brake drums.
 20. Verify that the left and right brake drums cannot be rotated.
 21. Install the rear tire and wheel assemblies. Refer to **Tire and Wheel Removal and Installation** .
 22. Lower the vehicle.
 23. Position the park brake lever boot to the floor console and press the boot retainer into place to secure.
 24. Release the park brake lever.

DESCRIPTION AND OPERATION

PARK BRAKE SYSTEM DESCRIPTION AND OPERATION

System Component Description

The park brake system consists of the following:

Park Brake Lever Assembly

Receives, multiplies and transfers park brake system apply input force from driver to park brake cable system. Releases applied park brake system when lever release button is depressed and lever is returned to the at-rest position.

Park Brake Cables

Transfers input force received from park brake lever, through park brake cable equalizer, to park brake apply levers.

Park Brake Cable Equalizer

Evenly distributes input force to both the left and right park brake units. Threaded front park brake cable adjuster is also used to remove slack in park brake cables.

Park Brake Apply Lever

Multiplies and transfers input force to park brake actuator/adjuster.

Drum Brake Actuator/Adjuster

Uses multiplied input force from park brake apply lever to expand drum brake shoes toward the friction surface of the brake drum. Threaded drum brake actuators/adjusters are also used to control clearance between the drum brake shoes and the friction surface of the brake drum.

System Operation

Park brake apply input force is received by the park brake lever assembly being applied. The input force is multiplied by the lever assembly, transferred and evenly distributed, through the park brake cables and the park brake cable equalizer, to the left and right park brake apply levers. The park brake apply levers multiply and transfer the apply input force to the drum brake actuators/adjusters which expand the drum brake shoes toward the friction surface of the brake drum in order to prevent the rotation of the rear tire and wheel assemblies. The park brake lever assembly releases an applied park brake system when it is released and returned to the at-rest position.

ACCESSORIES & EQUIPMENT

Plastic Panel Information and Repair - Spark

REPAIR INSTRUCTIONS

GENERAL PLASTIC REPAIR

WARNING: In order to reduce the risk of personal injury when exposed to toxic fumes while grinding, cutting or applying repair material on any type of sheet molded compound or RIM rigid plastic, observe the following guidelines:

- Work in a properly ventilated area
- Apply protective cream to any exposed skin
- Remove any mixture that comes into contact with skin
- Wash skin with cold water to remove glass and resin dust
- Use a sander with a vacuum attachment
- Follow the repair material manufacturer's instructions

Also, always wear the following:

- An approved respirator or air supplied respirator
- Eye protection
- Rubber gloves
- Earplugs
- Protective clothing

The following procedures should be followed when repairing all types of thermoset plastic:

- Follow the manufacturer's application and curing recommendations.
- Do not intermix systems. Use the supplies and the repair materials from the same manufacturer.
- Clean the inner and outer surfaces of the repair area with a soap impregnated scouring pad in order to remove any dirt or mold release agent.
- Clean the area with a wax and grease remover, using only enough of the remover to dampen a cloth. Allow the panel to dry thoroughly.
- Remove the surface finish from the area to be repaired. Adhesives are designed to adhere to the plastic substrate, not the finish.
- Prime a metal surface before applying the repair material.
- Inspect the rear side of the work area before making repairs in order to avoid possible damage to wires, motors, etc.

DESCRIPTION AND OPERATION

HOW TO IDENTIFY PLASTIC PARTS

Fig. 1: Identifying SAE Code

Courtesy of GENERAL MOTORS COMPANY

Plastic parts can be identified by the SAE code, which is usually found on the rear of the part, and/or by the characteristics of the plastic. Knowing the type of plastic aids in selecting the proper repair materials and in selecting the proper repair procedure.

Look for the SAE code stamped into the part.

Code Found

Match the code to those in the plastic identification chart to determine whether the plastic is thermoplastic or thermoset plastic and whether the plastic is rigid or flexible. Refer to **Plastic Identification and Refinishing Systems**.

No Code Found

WARNING: Do NOT use a plastic burn test to distinguish the type of plastic. The burn test produces vapors which are harmful.

Perform one or both of the following tests to determine if the part is thermoplastic polyolefin or thermoset non-polyolefin.

Float Test

1. Cut a shaving of plastic from the back of the part.

The shaving should be free of mold release agents and paint.

2. Place the shaving in a container of water.
 - Thermoplastic polyolefin floats
 - Thermoset non-polyolefin sinks

Abrasion Test

- Sand a spot near the damaged area with Grade 36 Roloc Disc.
- Thermoplastic polyolefin material melts or frays when sanded.
- Thermoset non-polyolefin material sands cleanly.

Thermoplastic and thermoset plastics can be either rigid or flexible. Thermoplastic plastic parts are best repaired with a hot iron plastic material-feed welder, but are usually replaced. Thermoset plastic can be repaired with epoxy or other more rigid 2 package repair material.

For general repair instructions, refer to **General Plastic Repair**.

PLASTIC IDENTIFICATION AND REFINISHING SYSTEMS

Plastic Identification and Refinishing Systems

Identifying Symbol - Old Symbol in ()s	Chemical Composition or Plastic Family Name	Typical Area(s) Where Part is Used	Examples of Common/ Trade Names	Type of Plastic
ABS	Acrylonitrile/ Butadiene-Styrene	Armrest Support, Console, IPC, Steering Column Bracket/ Jacket, Trim Molding	ABS, Absafil, Magnum, Cyclolac, Dyel, Kralastic, Lustran	Thermoplastic
ABS + PC	Acrylonitrile / Butadiene-Styrene + Polycarbonate	Instrument Panel, IPC	Bayblend, Cycloloy, KHA, Pulse	Rigid
ABS/PVC	ABS/Vinyl (Soft)	Head Rest Cover, Instrument Panel Pad, Trim Molding/ Panel	ABS Vinyl	Flexible, Vinyl

EPDM	Ethylene Propylene Diene Monomer	Body Panel, Bumper Impact Strip	EPDM, Nordel	Rigid
EVA (EVAC)	Ethylene / Vinyl Acetate	Head Rest Cover, Misc Soft Trim	Elvax, Microthane	Flexible
PA	Polyamide	Headlamp Bezels, Quarter Panel Extensions, Exterior Finish Trim Panels	Nylon, Capron, Zytel, Rilsan, Minion, Vydine, Welland	Rigid
PA, PAG, PAGG	Polyamide	Exterior Finish Trim Panel, Headlamp Bezel, Quarter Panel Extension	Capron, Minlon, Nylon, Rilsan, Vydine, Wellamid, Zytel	Rigid, Thermoset

Circuit/System Description

The body control module (BCM) powers the reversible liftgate and door latch assemblies by providing battery positive voltage and ground to the appropriate lock and unlock control circuits of the liftgate and door latch assemblies. The lock and unlock control circuits of the liftgate, rear doors and passenger door latch assemblies are all connected together. When the door latch assemblies are not active, all actuator lock and unlock control circuits are supplied a floating voltage used by the BCM to perform diagnostic functions on the circuits.

Transitioning of the lock actuators to the lock or unlocked position depends upon which control circuits receive voltage and which control circuits receive ground.

Conditions for Running the DTC

Ignition ON

Conditions for Setting the DTC

B3125 01, B3130 01, B3135 01

The BCM detects a short to battery on a door latch control circuit

B3125 02, B3130 02 and B3135 02

- A short to ground or an open/high resistance in the BCM B+ circuit.
- The BCM detects a short to ground on a door latch control circuit.

B3125 04, B3130 04, B3135 04

The BCM detects an open/high resistance on a door latch control circuit

Action Taken When the DTC Sets

The BCM will disable the lock and unlock functions of the door latches.

Conditions for Clearing the DTC

- This DTC will be current for as long as the fault is present.
- When the fault is no longer present, the DTC will be a history DTC.
- A history DTC will clear after 50 ignition cycles.

Scan Tool Reference

Control Module References for scan tool information

Circuit/System Verification

1. Ignition ON.
2. Verify all vehicle doors and liftgate lock and unlock when commanding the All Doors Lock/Unlock with a scan tool.
 - **If only the driver door does not lock and unlock**

Refer to Circuit/System Testing - Driver Door Lock Malfunction.
 - **If one or more passenger doors or the liftgate does not lock and unlock**

Refer to Circuit/System Testing - Passenger Door Lock Malfunction.
 - **If the liftgate and all doors do not lock and unlock**

Refer to Circuit/System Testing - All Door Lock Inoperative.
 - **If all doors lock and unlock**
3. All OK.

Circuit/System Testing

Driver Door Lock Malfunction

1. Ignition OFF, disconnect the X6 harness connector at the K9 Body Control Module, ignition ON.
2. Test for less than 1 V between the control circuit terminal 1 and ground.
 - **If 1 V or greater**
 1. Ignition OFF, disconnect the harness connector at the A23D Door Latch Assembly - Driver, ignition ON.
 2. Test for less than 1 V between the control circuit and ground.
 - If 1 V or greater, repair the short to voltage on the circuit.

- **If less than 1 V**

3. Ignition OFF, connect the X6 harness connector at the K9 Body Control Module. Disconnect the harness connector at the A23D Door Latch Assembly-Driver, ignition ON.

NOTE: Leaving the DMM connected between a control circuit and ground for greater than 20 s may cause the K9 Body Control Module to interpret the test as a system fault and will cause the voltage on the control circuit to drop to 0 V. If the voltage drops to 0 V, operate the door locks using the door lock switch to restore the voltage for testing.

4. Test for greater than 3 V between the control circuit terminals listed below and ground:
 - Control circuit terminal A
 - Control circuit terminal B
 - **If 3 V or less**
 1. Ignition OFF, disconnect the X6 harness connector at the K9 Body Control Module.
 2. Test for infinite resistance between the control circuit and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance
 3. Test for less than 2 ohms in the control circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance on the circuit.
 - If less than 2 ohms, replace the K9 Body Control Module.
 - **If greater than 3 V**

NOTE: When using the MIN MAX function, autorange on the DMM may not function properly. To ensure accurate test results, turn off autorange and manually set the DMM range to 000.0 V.

5. Install a DMM between the control circuit terminal A and control circuit terminal B Set the DMM to capture DC voltage using the MIN MAX function. Turn off autorange and manually set the DMM range to 00.00 V.
6. Lock and unlock the vehicle doors using the S13D Door Lock Switch-Driver.
7. Verify the MAX voltage captured by the DMM is greater than 10 V.
 - **If 10 V or less**

Replace the K9 Body Control Module.

- **If greater than 10 V**

8. Test or replace the A23D Door Latch Assembly-Driver.

Passenger Door Lock Malfunction

1. Ignition OFF, disconnect the X6 harness connector at the K9 Body Control Module, ignition ON.

2. Test for less than 1 V between the control circuit terminal 2 and ground.
 - **If 1 V or greater**
 1. Ignition OFF, disconnect the harness connector at the A23P Door Latch Assembly - Passenger, A23LR Door Latch Assembly - Left Rear, A23RR Door Latch Assembly - Right Rear and M14B Door Lock Actuator-Liftgate, ignition ON.
 2. Test for less than 1 V between the control circuit and ground.
 - If 1 V or greater, repair the short to voltage on the circuit.
 - **If less than 1 V**
3. Ignition OFF, connect the X6 harness connector at the K9 Body Control Module. Disconnect the harness connector at the appropriate M14B Door Lock Actuator-Liftgate or the A23P Door Latch Assembly-Passenger or A23 Door Latch Assembly-Rear.

NOTE: Leaving the DMM connected between a control circuit and ground for greater than 20 s may cause the K9 Body Control Module to interpret the test as a system fault and will cause the voltage on the control circuit to drop to 0 V. If the voltage drops to 0 V, operate the door locks using the door lock switch to restore the voltage for testing.

4. Test for greater than 3 V between the control circuit terminal listed below and ground:
 - A23P Door Latch Assembly-Passenger - control circuit terminal A
 - A23P Door Latch Assembly-Passenger - control circuit terminal B
 - A23RR Door Latch Assembly-Right Rear - control circuit terminal A
 - A23RR Door Latch Assembly-Right Rear - control circuit terminal B
 - A23LR Door Latch Assembly-Left Rear - control circuit terminal A
 - A23LR Door Latch Assembly-Left Rear - control circuit terminal B
 - M14B Door Lock Actuator-Liftgate - control circuit terminal 1
 - M14B Door Lock Actuator-Liftgate - control circuit terminal 2
 - **If 3 V or less**
 1. Ignition OFF, disconnect the X6 harness connector at the K9 Body Control Module.
 2. Test for infinite resistance between the control circuit and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance
 3. Test for less than 2 ohms in the control circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance on the circuit.
 - If less than 2 ohms, replace the K9 Body Control Module.
 - **If greater than 3 V**

NOTE: When using the MIN MAX function, autorange on the DMM may not function properly. To ensure accurate test results, turn off autorange and manually set the DMM range to 000.0 V.

5. Install a DMM between the control circuits listed below. Set the DMM to capture DC voltage using the MIN MAX function. Turn off autorange and manually set the DMM range to 00.00 V.
 - A23P Door Latch Assembly-Passenger - control circuit terminal A and control circuit terminal B
 - A23RR Door Latch Assembly-Right Rear - control circuit terminal A and control circuit terminal B
 - A23LR Door Latch Assembly-Left Rear - control circuit terminal A and control circuit terminal B
 - M14B Door Lock Actuator-Liftgate - control circuit terminal 1 and control circuit terminal 2
6. Lock and unlock the vehicle doors using the door lock switch.
7. Verify the MAX voltage captured by the DMM is greater than 10 V.
 - **If 10 V or less**

Replace the K9 Body Control Module.

- **If greater than 10 V**
8. Test or replace the A23 Door Latch Assembly or M14B Door Lock Actuator-Liftgate.

All Door Locks Inoperative

1. Ignition OFF, disconnect the X2 harness connector at the K9 Body Control Module, ignition ON.
2. Verify a test lamp illuminates between the B+ circuit terminal 4 and ground.
 - **If the test lamp does not illuminate and the circuit fuse is good**
 1. Ignition OFF.
 2. Test for less than 2 ohms in the B+ circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, verify the fuse is not open and there is voltage at the fuse.
 - **If the test lamp does not illuminate and the circuit fuse is open**
3. Ignition OFF.
4. Test for infinite resistance between the B+ circuit and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance
5. Disconnect the harness connector at each of the A23 Door Latch Assemblies and the M14B Door Lock Actuator-Liftgate.
6. Test for infinite resistance between each control circuit and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance, replace the appropriate A23 Door Latch Assembly or M14B Door Lock Actuator-Liftgate.
- **If the test lamp illuminates**
3. Ignition OFF, connect the X2 harness connector at the K9 Body Control Module. Disconnect the X6 harness connector at the K9 Body Control Module, ignition ON.
4. Test for less than 1 V between the control circuit terminals listed below and ground:
 - Control circuit terminal 1 X6

- Control circuit terminal 2 X6
- Control circuit terminal 4 X6
- **If 1 V or greater**
- 1. Ignition OFF, disconnect the harness connector at the A23D Door Latch Assembly - Driver, A23P Door Latch Assembly - Passenger, A23LR Door Latch Assembly - Left Rear, A23RR Door Latch Assembly - Right Rear and M14B Door Lock Actuator-Liftgate, ignition ON.
- 2. Test for less than 1 V between the control circuit and ground.
 - If 1 V or greater, repair the short to voltage on the circuit.
- **If less than 1 V**
- 5. Test for infinite resistance between the control circuit terminals listed below and ground:
 - Control circuit terminal 1 X6
 - Control circuit terminal 2 X6
 - Control circuit terminal 4 X6
 - **If less than infinite resistance**
 - 1. Ignition OFF, disconnect the harness connector at the A23D Door Latch Assembly - Driver, A23P Door Latch Assembly - Passenger, A23LR Door Latch Assembly - Left Rear, A23RR Door Latch Assembly - Right Rear and M14B Door Lock Actuator-Liftgate.
 - 2. Test for less than infinite resistance between the control circuit and ground.
 - If 1 V or greater, repair the short to ground on the circuit.
 - **If infinite resistance**
- 6. Test for less than 10 ohms between the control circuit terminal 1 and the control circuit terminal 4.
 - **If 10 ohms or greater**
 - 1. Ignition OFF, disconnect the harness connector at the A23D Door Latch Assembly - Driver.
 - 2. Test for less than 2 ohms between the K9 Body Control Module control circuit terminal 4 and the A23D Door Latch Assembly - Driver control circuit terminal A.
 - If 2 ohms or greater, repair the open/high resistance on the circuit.
 - **If less than 10 ohms**
- 7. Test or replace the K9 Body Control Module.

Component Testing

1. Ignition OFF, disconnect the harness connector at the appropriate A23 Door Latch Assembly.
2. Install a 25 A fused jumper wire between one of the control terminals and 12 V. Momentarily install a jumper wire between the other control terminal and ground. Reverse the jumper wires at least two times, the A23 Door Latch Assembly should perform the LOCK and UNLOCK function.
 - **If the actuator does not perform the LOCK and UNLOCK function**
 - Replace the A23 Door Latch Assembly.
 - **If the actuator performs the LOCK and UNLOCK function**
3. All OK

Repair Instructions

Circuit/System Verification

1. Ignition ON.
2. Verify the scan tool Door Lock Switch parameter changes from Inactive to Lock and Unlock when cycling the S46B Liftgate Unlatch Switch between LOCK and UNLOCK.

- **If the parameter does not change**

Refer to **Trunk/Liftgate Lock Malfunction.**

- **If the parameter changes**

3. Verify the M14B Door Lock Actuator-Liftgate will LOCK and UNLOCK when commanding the All Doors Lock/Unlock with a scan tool.

- **If the M14B Door Lock Actuator-Liftgate LOCK or UNLOCK functions do not work**

Refer to Circuit/System Testing.

- **If the M14B Door Lock Actuator-Liftgate LOCK and UNLOCK function works**

4. All OK.

Circuit/System Testing

1. Ignition OFF, disconnect the X2 harness connector at the K9 Body Control Module, ignition ON.
2. Verify a test lamp illuminates between the B+ circuit terminal 4 and ground.
 - **If the test lamp does not illuminate and the circuit fuse is good**
 1. Ignition OFF.
 2. Test for less than 2 ohms in the B+ circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.

- If less than 2 ohms, verify the fuse is not open and there is voltage at the fuse.
- **If the test lamp does not illuminate and the circuit fuse is open**
- 1. Ignition OFF.
- 2. Test for infinite resistance between the B+ circuit and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance
- 3. Disconnect the harness connector at the M14B Door Lock Actuator-Liftgate.
- 4. Test for infinite resistance between each control circuit and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance, replace the M14B Door Lock Actuator-Liftgate.
- **If the test lamp illuminates**
- 3. Ignition OFF, disconnect the harness connector at the M14B Door Lock Actuator-Liftgate.
- 4. Connect a test lamp between the control circuit terminal 1 and control circuit terminal 2, ignition ON.
- 5. Verify the test lamp turns ON and OFF when commanding the Lock and Unlock states with a scan tool.
 - **If the test lamp is always OFF**
 - 1. Ignition OFF, remove the test lamp, disconnect the X6 harness connector at the K9 Body Control Module.
 - 2. Test for infinite resistance between each control circuit and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance
 - 3. Test for less than 2 ohms in each control circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, replace the K9 Body Control Module.
 - **If the test lamp is always ON**
 - 1. Ignition OFF, remove the test lamp, disconnect the harness connector at the K9 Body Control Module, Ignition ON.
 - 2. Test for less than 1 V between the control circuit and ground.
 - If 1 V or greater, repair the short to voltage on the circuit.
 - If less than 1 V, replace the K9 Body Control Module.
 - **If the test lamp turns ON and OFF**
- 6. Test or replace the M14B Door Lock Actuator-Liftgate.

Component Testing

1. Ignition OFF, disconnect the harness connector at the M14B Door Lock Actuator-Liftgate.
2. Install a 25 A fused jumper wire between one of the control terminals and 12 V. Momentarily install a jumper wire between the other control terminal and ground. Reverse the jumper wires at least two times, the M14B Door Lock Actuator-Liftgate should perform the LOCK and UNLOCK function.
 - **If the actuator does not perform the LOCK and UNLOCK function**

Replace the M14B Door Lock Actuator-Liftgate.

- If the actuator performs the LOCK and UNLOCK function

3. All OK

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

|--|

Circuit/System Description

The body control module (BCM) supplies a 12 V signal to each of the door lock and door unlock signal circuits. When the door lock switches are in the open position, the voltage level in the signal circuit will be near 12 V. When any door lock switch is pressed to the lock or unlock position, the voltage level in the appropriate signal circuit will drop to 0 V and the BCM will detect the voltage drop and command the door latches to perform the requested lock or unlock command.

Conditions for Running the DTC

The system voltage is 9-16 V.

Conditions for Setting the DTC

B3140 00

The BCM detects short to ground in the lock signal circuit for greater than 60 seconds.

B3150 00

The BCM detects a short to ground in the lock signal circuit for greater than 60 seconds.

Action Taken When the DTC Sets

B3140 00

The BCM will ignore the unlock signal and the doors will not unlock when using the passenger or driver door unlock switch.

B3150 00

The BCM will ignore the lock signal and the doors will not lock when using the passenger or driver door lock switch.

Conditions for Clearing the DTC

- The DTC will be current for as long as the fault is present.
- When the fault is no longer present, the DTC will be a history DTC.
- A history DTC will clear after 50 ignition cycles.

- **If the parameter changes**

3. Verify the scan tool Door Lock Switch parameter changes from Inactive to Lock and Unlock when pushing the appropriate switch on the S13P Door Lock Switch-Passenger.

- **If the parameter is always Inactive**

Refer to Circuit/System Testing - Door Lock Switch Inoperative.

- **If the parameter changes between Inactive and Lock only**

Refer to Circuit/System Testing - Door Lock Switch Malfunction.

- **If the parameter changes between Inactive and Unlock only**

Refer to Circuit/System Testing - Door Lock Switch Malfunction.

- **If the parameter is always Lock**

Refer to Circuit/System Testing - Lock/Unlock Signal Circuit Test.

- **If the parameter is always Unlock**

Refer to Circuit/System Testing - Lock/Unlock Signal Circuit Test.

- **If the parameter changes**

4. All OK.

Circuit/System Testing

Door Lock Switch Inoperative

1. Ignition OFF and all vehicle systems OFF, disconnect the harness connector at the appropriate S13 Door Lock Switch. It may take up to 2 minutes for all vehicle systems to power down.
2. Test for less than 10 ohms between the ground circuit terminal 3 and ground.
 - **If 10 ohms or greater**
 1. Ignition OFF.
 2. Test for less than 2 ohms in the ground circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, repair the open/high resistance in the ground connection.
 - **If less than 10 ohms**
3. Test or replace the S13 Door Lock Switch.

Door Lock Switch Malfunction

1. Ignition OFF, disconnect the harness connector at the appropriate S13 Door Lock Switch. Ignition ON
2. Install a 3 A fused jumper wire between the signal circuit terminal 2 and the ground circuit terminal 3.
3. Verify the scan tool Door Lock Switch parameter is Unlock.
 - **If not Unlock**
 1. Ignition OFF, remove the 3 A fused jumper wire, disconnect the harness connector at the K9 Body Control Module, ignition ON.
 2. Test for less than 1 V between the signal circuit and ground.
 - If 1 V or greater, repair the short to voltage on the circuit.
 - If less than 1 V
 3. Test for less than 2 ohms in the signal circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, replace the K9 Body Control Module.
 - **If Unlock**
4. Install a 3 A fused jumper wire between the signal circuit terminal 4 and the ground circuit terminal 3.
5. Verify the scan tool Door Lock Switch parameter is Lock.
 - **If not Lock**
 1. Ignition OFF, remove the 3 A fused jumper wire, disconnect the harness connector at the K9 Body Control Module, ignition ON.
 2. Test for less than 1 V between the signal circuit and ground.
 - If 1 V or greater, repair the short to voltage on the circuit.
 - If less than 1 V
 3. Test for less than 2 ohms in the signal circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, replace the K9 Body Control Module.
 - **If Lock**
6. Test or replace the S13 Door Lock Switch.

Lock/Unlock Signal Circuit Test

1. Ignition OFF, disconnect the harness connector at the S13D Door Lock Switch-Driver.
2. Disconnect the harness connector at the S13P Door Lock Switch-Passenger.
3. Verify the scan tool Door Lock Switch parameter is Inactive.
 - **If Lock**
 1. Ignition OFF, disconnect the X6 harness connector at the K9 Body Control Module.
 2. Test for infinite resistance between the signal circuit terminal 15 and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance, replace the K9 Body Control Module

- **If Unlock**

1. Ignition OFF, disconnect the X7 harness connector at the K9 Body Control Module.
2. Test for infinite resistance between the signal circuit terminal 14 and ground.

- If less than infinite resistance, repair the short to ground on the circuit.

- If infinite resistance, replace the K9 Body Control Module

- **If Inactive**

4. Connect the harness connector at the S13P Door Lock Switch-Passenger.
5. Verify the scan tool Door Lock Switch parameter changes from Inactive to Lock and Unlock when pushing the appropriate switch on the S13P Door Lock Switch-Passenger.

- **If Lock**

Test or replace the S13P Door Lock Switch-Passenger.

- **If Unlock**

Test or replace the S13P Door Lock Switch-Passenger.

- **If the parameter changes**

6. Connect the harness connector at the S13D Door Lock Switch-Driver.
7. Verify the scan tool Door Lock Switch parameter changes from Inactive to Lock and Unlock when pushing the appropriate switch on the S13D Door Lock Switch-Driver.

- **If Lock**

Test or replace the S13D Door Lock Switch-Driver.

- **If Unlock**

Test or replace the S13D Door Lock Switch-Driver.

- **If the parameter changes**

8. All OK.

Component Testing

1. Ignition OFF, disconnect the harness connector at the appropriate S13 Door Lock Switch.
2. Test for infinite resistance between the signal terminal 2 and the ground terminal 3 with the switch in the open position.

- **If less than infinite resistance**

Replace the S13 Door Lock Switch.

- **If infinite resistance**

3. Test for infinite resistance between the signal terminal 4 and the ground terminal 3 with the switch in the

open position.

- **If less than infinite resistance**

Replace the S13 Door Lock Switch.

- **If infinite resistance**

4. Test for less than 2 ohms between the signal terminal 4 and the ground terminal 3 with the switch in the Lock position.

- **If 2 ohms or greater**

Replace the S13 Door Lock Switch.

- **If less than 2 ohms**

5. Test for less than 2 ohms between the signal terminal 2 and the ground terminal 3 with the switch in the Unlock position.

- **If 2 ohms or greater**

Replace the S13 Door Lock Switch.

- **If less than 2 ohms**

6. All OK

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

Control Module References BCM replacement, programming and setup

DTC B3140 OR B3150: DRIVER DOOR LOCK/UNLOCK SWITCH (WITHOUT AU3)

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

DTC Descriptors

DTC B3140 00

Driver Door Unlock Switch Circuit

DTC B3150 00

Left Front Door Lock Switch Circuit

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Lock Signal	B3150 00	1	1	-
Unlock Signal	B3140 00	2	2	-
Ground	-	3	-	-
1. Liftgate Lock Switch Lock Function Inoperative 2. Liftgate Lock Switch Unlock Function Inoperative 3. Liftgate Lock Switch Lock and Unlock Functions Inoperative				

Circuit/System Description

When the vehicle is equipped with out power door locks, it will be provided with a Liftgate Unlatch Switch to lock or unlock the liftgate. The Body Control Module monitors the voltage level of the liftgate lock and liftgate unlock signal circuits. When the Liftgate Unlatch Switch is in the open position, the voltage level in the signal circuit will be near 12 V. When the Liftgate Unlatch Switch is pressed to the lock or unlock position the voltage will drop to 0V and the Body Control Module will detect the voltage drop in the appropriate circuit and will lock or unlock the liftgate.

Conditions for Running the DTC

The system voltage is 9-16 V.

Conditions for Setting the DTC

B3140 00

The Body Control Module detects short to ground in the unlock signal circuit for greater than 60 seconds.

B3150 00

The Body Control Module detects a short to ground in the lock signal circuit for greater than 60 seconds.

Action Taken When the DTC Sets

B3140 00

The Body Control Module will ignore the unlock signal and the liftgate will not unlock when using the Liftgate Unlatch Switch.

B3150 00

The Body Control Module will ignore the lock signal and the liftgate will not lock when using the Liftgate Unlatch Switch.

Conditions for Clearing the DTC

- The DTC will be current for as long as the fault is present.
- When the fault is no longer present, the DTC will be a history DTC.
- A history DTC will clear after 50 ignition cycles.

Circuit/System Verification

1. Ignition ON.
2. Verify the scan tool Door Lock Switch parameter changes from Inactive to Lock and Unlock when pushing the appropriate switch on the S46B Liftgate Unlatch Switch.
 - **If the parameter does not change**

Refer to Circuit/System Testing.
 - **If the parameter changes**
3. All OK.

Circuit/System Testing

1. Ignition OFF and all vehicle systems OFF, disconnect the harness connector at the S46B Liftgate Unlatch Switch. It may take up to 2 minutes for all vehicle systems to power down.

2. Test for less than 10 ohms between the ground circuit terminal 4 and ground.
 - **If 10 ohms or greater**
 1. Ignition OFF.
 2. Test for less than 2 ohms in the ground circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, repair the open/high resistance in the ground connection.
 - **If less than 10 ohms**
3. Ignition ON.
4. Verify the scan tool Door Lock Switch parameter is Inactive.
 - **If not Inactive**
 1. Ignition OFF, disconnect the harness connector at the K9 Body Control Module.
 2. Test for infinite resistance between the signal circuit terminal listed below and ground:
 - Signal circuit terminal 2
 - Signal circuit terminal 3
 3. If less than infinite resistance, repair the short to ground on the circuit.
 4. If infinite resistance, replace the K9 Body Control Module.
 - **If Inactive**
5. Install a 3 A fused jumper wire between the signal circuit terminal 3 and the ground circuit terminal 4.
6. Verify the scan tool Door Lock Switch parameter is Unlock.
 - **If not Unlock**
 1. Ignition OFF, remove the 3 A fused jumper wire, disconnect the harness connector at the K9 Body Control Module, ignition ON.
 2. Test for less than 1 V between the signal circuit terminal 3 and ground.
 - If 1 V or greater, repair the short to voltage on the circuit.
 - If less than 1 V
 3. Test for less than 2 ohms in the signal circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, replace the K9 Body Control Module.
 - **If Unlock**
7. Install a 3 A fused jumper wire between the signal circuit terminal 2 and the ground circuit terminal 4.
8. Verify the scan tool Door Lock Switch parameter is Lock.
 - **If not Lock**
 1. Ignition OFF, remove the 3 A fused jumper wire, disconnect the harness connector at the K9 Body Control Module, ignition ON.
 2. Test for less than 1 V between the signal circuit terminal 2 and ground.
 - If 1 V or greater, repair the short to voltage on the circuit.
 - If less than 1 V
 3. Test for less than 2 ohms in the signal circuit end to end.

- If 2 ohms or greater, repair the open/high resistance in the circuit.
- If less than 2 ohms, replace the K9 Body Control Module.

- **If Lock**

9. Test or replace the S46B Liftgate Unlatch Switch.

Component Testing

1. Ignition OFF, disconnect the harness connector at the S46B Liftgate Unlatch Switch.
2. Test for infinite resistance between the signal terminal 2 and the ground terminal 4 with the switch in the open position.

- **If less than infinite resistance**

Replace the S46B Liftgate Unlatch Switch.

- **If infinite resistance**

3. Test for infinite resistance between the signal terminal 3 and the ground terminal 4 with the switch in the open position.

- **If less than infinite resistance**

Replace the S46B Liftgate Unlatch Switch.

- **If infinite resistance**

4. Test for less than 2 ohms between the signal terminal 2 and the ground terminal 4 with the switch in the Lock position.

- **If 2 ohms or greater**

Replace the S46B Liftgate Unlatch Switch.

- **If less than 2 ohms**

5. Test for less than 2 ohms between the signal terminal 3 and the ground terminal 4 with the switch in the Unlock position.

- **If 2 ohms or greater**

Replace the S46B Liftgate Unlatch Switch.

- **If less than 2 ohms**

6. All OK

Repair Instructions

SYMPTOMS - VEHICLE ACCESS

Important Preliminary Checks Before Starting

1. Perform the **Diagnostic System Check - Vehicle** before using the Symptom Tables in order to verify that all of the following are true:
 - There are no DTCs set.
 - The control modules can communicate via the serial data link.
2. Review the following description and operations below in order to familiarize yourself with the system functions:
 - **Power Door Locks Description and Operation**
 - **Rear Hatch/Gate Description and Operation**
 - **Door Ajar Indicator Description and Operation**

Visual/Physical Inspection

- Inspect for aftermarket devices which could affect the operation of the system. Refer to **Checking Aftermarket Accessories** .
- Inspect the easily accessible or visible system components for obvious damage or conditions which could cause the symptom.

Intermittent

Faulty electrical connections or wiring may be the cause of intermittent conditions. Refer to **Testing for Intermittent Conditions and Poor Connections** .

Symptom List

Refer to a symptom diagnostic procedure from the following list in order to diagnose the symptom:

- **Power Door Locks Malfunction**
- **Door Ajar Indicator Malfunction**
- **Trunk/Liftgate Lock Malfunction**
- **Power Door Lock Key Cylinder Switches Malfunction**

DOOR AJAR INDICATOR MALFUNCTION

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Driver Door Ajar Switch Signal	1	2	1	-
Left Rear Door Ajar Switch Signal	1	2	1	-
Liftgate Latch Ajar Switch Signal	1	2	1	-
Liftgate Latch Ground	-	2	-	-
Passenger Door Ajar Switch Signal	1	2	1	-
Right Rear Door Ajar Switch Signal	1	2	1	-
1. Ajar Indicator Always Illuminated 2. Ajar Indicator Inoperative When Door or Liftgate Is Open				

Circuit/System Description

The Body Control Module provides a 12 V signal to each of the door ajar switch signal circuits and to the liftgate ajar switch signal circuit. When a door or liftgate is opened, the normally open contacts of the ajar switch closes. With the ajar switch closed, ground is provided to the ajar switch signal circuit. The Body Control Module interprets this and communicates via serial data with the instrument panel cluster which will display the door ajar icon.

Circuit/System Verification

1. Ignition ON.
2. Verify the scan tool Driver Door Ajar Switch parameter changes between Inactive and Active when opening and closing the driver door.
 - **If the parameter does not change**

Refer to Circuit/System Testing - Door Ajar Switch.
 - **If the parameter changes**
3. Verify the scan tool Passenger Door Ajar Switch parameter changes between Inactive and Active when opening and closing the passenger door.
 - **If the parameter does not change**

Refer to Circuit/System Testing - Door Ajar Switch.
 - **If the parameter changes**
4. Verify the scan tool Left Rear Door Ajar Switch parameter changes between Inactive and Active when opening and closing the left rear door.
 - **If the parameter does not change**

Refer to Circuit/System Testing - Door Ajar Switch.
 - **If the parameter changes**
5. Verify the scan tool Right Rear Door Ajar Switch parameter changes between Inactive and Active when opening and closing the right rear door.
 - **If the parameter does not change**

Refer to Circuit/System Testing - Door Ajar Switch.
 - **If the parameter changes**
6. Verify the scan tool Rear Closure Ajar Switch parameter changes between Inactive and Active when opening and closing the liftgate.
 - **If the parameter does not change**

Refer to Circuit/System Testing - Liftgate Ajar Switch.
 - **If the parameter changes**
7. All OK.

Circuit/System Testing

Door Ajar Switch

1. Ignition OFF, disconnect the harness connector at the appropriate B28 Door Ajar Switch. Ignition ON
2. Verify the appropriate scan tool Door Ajar Switch parameter is Inactive.
 - **If not Inactive**
 1. Ignition OFF, disconnect the harness connector at the K9 Body Control Module.
 2. Test for infinite resistance between the signal circuit terminal 1 and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance, replace the K9 Body Control Module.
 - **If Inactive**
3. Install a 3 A fused jumper wire between the signal circuit terminal 1 and ground.
4. Verify the scan tool Door Ajar Switch parameter is Active.
 - **If not Active**
 1. Ignition OFF, remove the 3 A fused jumper wire, disconnect the harness connector at the K9 Body Control Module, ignition ON.
 2. Test for less than 1 V between the signal circuit and ground.
 - If 1 V or greater, repair the short to voltage on the circuit.
 - If less than 1 V
 3. Test for less than 2 ohms in the signal circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, replace the K9 Body Control Module.
 - **If Active**
5. Test or replace the B28 Door Ajar Switch.

Liftgate Ajar Switch

1. Ignition OFF and all vehicle systems OFF, disconnect the harness connector at the A23C Liftgate Latch Assembly. It may take up to 2 minutes for all vehicle systems to power down.
2. Test for less than 10 ohms between the ground circuit terminal A and ground.
 - **If 10 ohms or greater**
 1. Ignition OFF.
 2. Test for less than 2 ohms in the ground circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, repair the open/high resistance in the ground connection.
 - **If less than 10 ohms**
3. Ignition ON.
4. Verify the scan tool Rear Closure Ajar Switch parameter is Inactive.
 - **If not Inactive**
 1. Ignition OFF, disconnect the harness connector at the K9 Body Control Module.
 2. Test for infinite resistance between the signal circuit terminal B and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.

- If infinite resistance, replace the K9 Body Control Module.
- **If Inactive**
- 5. Install a 3 A fused jumper wire between the signal circuit terminal A and the ground circuit terminal B.
- 6. Verify the scan tool Rear Closure Ajar Switch parameter is Active.
 - **If not Active**
 1. Ignition OFF, remove the 3 A fused jumper wire, disconnect the harness connector at the K9 Body Control Module, ignition ON.
 2. Test for less than 1 V between the signal circuit and ground.
 - If 1 V or greater, repair the short to voltage on the circuit.
 - If less than 1 V
 3. Test for less than 2 ohms in the signal circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, replace the K9 Body Control Module.
 - **If Active**
- 7. Test or replace the A23C Liftgate Latch Assembly.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

- **Liftgate Latch Replacement**

POWER DOOR LOCK KEY CYLINDER SWITCHES MALFUNCTION

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Lock Signal	2	2	2	-
Unlock Signal	1	1	1	-
Ground	-	3	-	-
1. Key Cylinder Lock Function Inoperative 2. Key Cylinder Unlock Function Inoperative 3. Key Cylinder Switch Inoperative				

Circuit/System Description

The body control module (BCM) monitors the voltage level of the key switch lock and unlock signal circuits. When the key is inserted into the driver door key cylinder and turned to the Lock or Unlock position, a switch within the key cylinder closes causing the voltage to drop within the key switch unlock signal circuit. The BCM will detect the drop in voltage will command the driver door to unlock or for all doors to lock.

Circuit/System Verification

1. Verify the A23 Door Latch Assemblies LOCK when inserting the key into the driver door lock key cylinder and turning the key to the lock position.
 - **If the A23 door latch assemblies do not LOCK**

Refer to Circuit/System Testing.

- **If the A23 Door Latch Assemblies LOCK**
2. All OK.

Circuit/System Testing

1. Ignition OFF and all vehicle systems OFF, disconnect the harness connector at the A23D Door Latch Assembly-Driver. It may take up to 2 minutes for all vehicle systems to power down.
2. Test for less than 10 ohms between the ground circuit terminal listed below and ground:
 - Ground circuit terminal B - left hand drive
 - Ground circuit terminal C - right hand drive

- **If 10 ohms or greater**
- 1. Ignition OFF.
- 2. Test for less than 2 ohms in the ground circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, repair the open/high resistance in the ground connection.
- **If less than 10 ohms**
- 3. Ignition ON.
- 4. Test for greater than 10 V between the signal circuit terminals listed below and ground:
 - Signal circuit terminal D - right hand drive
 - Signal circuit terminal B - right hand drive
 - Signal circuit terminal A - left hand drive
 - Signal circuit terminal C - left hand drive
- **If 10 V or less**
- 1. Ignition OFF, disconnect the harness connector at the K9 Body Control Module.
- 2. Test for infinite resistance between the signal circuit and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
- 3. Test for less than 2 ohms in the signal circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, replace the K9 Body Control Module.
- **If greater than 10 V**
- 5. Test or replace the A23D Door Latch Assembly-Driver.

Component Testing

1. Ignition OFF, disconnect the harness connector at the A23D Door Latch Assembly-Driver.
2. Test for infinite resistance between the terminals listed below with the switch in the open position:
 - Signal terminal D and ground terminal C - right hand drive
 - Signal terminal B and ground terminal C - right hand drive
 - Signal terminal A and ground terminal B - left hand drive
 - Signal terminal C and ground terminal B - left hand drive
- **If less than infinite resistance**
- Replace the A23D Door Latch Assembly-Driver.
- **If infinite resistance**
3. Test for less than 2 ohms between the terminal listed below with the switch in the Lock position:
 - Signal terminal B and ground terminal C - right hand drive
 - Signal terminal C and ground terminal B - left hand drive
- **If 2 ohms or greater**

Replace the A23D Door Latch Assembly-Driver.

- **If less than 2 ohms**

4. Test for less than 2 ohms between the terminals listed below with the switch in the Unlock position:

- Signal terminal D and ground terminal C - right hand drive
- Signal terminal A and ground terminal B - left hand drive

- **If 2 ohms or greater**

Replace the A23D Door Latch Assembly-Driver.

- **If less than 2 ohms**

5. All OK

Passenger Door Lock Switch Lock Function Inoperative 5. Passenger Door Lock Switch Unlock Function Inoperative 6. Passenger Door Lock Switch Inoperative				

Circuit/System Description

The body control module (BCM) supplies a 12 V signal to each of the door lock and door unlock signal circuits. When the door lock switches are in the open position, the voltage level in the signal circuit will be near 12 V. When any door lock switch is pressed to the lock or unlock position, the voltage level in the appropriate signal circuit will drop to 0 V and the BCM will detect the voltage drop and command the door latches to perform the requested lock or unlock command.

The body control module (BCM) powers the reversible door latch assemblies by providing battery positive voltage and ground to the appropriate lock and unlock control circuits of the door latch assemblies. The lock and unlock control circuits of the rear doors and passenger door latch assemblies are all connected together. When the door latch assemblies are not active, all actuator lock and unlock control circuits are supplied a floating voltage door driver by the BCM. Transitioning of the lock actuators to the lock or unlocked position depends upon which control circuits receive voltage and which control circuits receive ground.

Circuit/System Verification

1. Ignition ON.
2. Verify the scan tool Door Lock Switch parameter changes from Inactive to Lock and Unlock when pushing the appropriate switch on the S13D Door Lock Switch-Driver.
 - **If the parameter is always Inactive**

Refer to Circuit/System Testing - Door Lock Switch Inoperative.
 - **If the parameter changes between Inactive and Lock only**

Refer to Circuit/System Testing - Door Lock Switch Malfunction.
 - **If the parameter changes between Inactive and Unlock only**

Refer to Circuit/System Testing - Door Lock Switch Malfunction.
 - **If the parameter is always Lock or always Unlock**

Refer to Circuit/System Testing - Lock/Unlock Signal Circuit Test.
 - **If the parameter changes**
3. Verify the scan tool Door Lock Switch parameter changes from Inactive to Lock and Unlock when pushing the appropriate switch on the S13P Door Lock Switch-Passenger.
 - **If the parameter is always Inactive**

Refer to Circuit/System Testing - Door Lock Switch Inoperative.
 - **If the parameter changes between Inactive and Lock only**

Refer to Circuit/System Testing - Door Lock Switch Malfunction.
 - **If the parameter changes between Inactive and Unlock only**

Refer to Circuit/System Testing - Door Lock Switch Malfunction.

- **If the parameter is always Lock or always Unlock**

Refer to Circuit/System Testing - Lock/Unlock Signal Circuit Test.

- **If the parameter changes**

4. Verify all vehicle doors LOCK and UNLOCK when commanding the All Doors Lock/Unlock with a scan tool.

- **If only the driver door LOCK or UNLOCK functions do not work**

Refer to Circuit/System Testing - Driver Door Lock Malfunction.

- **If one or more, but not all, passenger door LOCK or UNLOCK functions do not work**

Refer to Circuit/System Testing - Passenger Door Lock Malfunction.

- **If all door LOCK and UNLOCK functions do not work**

Refer to Circuit/System Testing - All Door Lock Inoperative.

- **If the LOCK and UNLOCK function for all doors works**

5. All OK.

Circuit/System Testing

Door Lock Switch Inoperative

1. Ignition OFF and all vehicle systems OFF, disconnect the harness connector at the appropriate S13 Door Lock Switch. It may take up to 2 minutes for all vehicle systems to power down.
2. Test for less than 10 ohms between the ground circuit terminal 3 and ground.
 - **If 10 ohms or greater**
 1. Ignition OFF.
 2. Test for less than 2 ohms in the ground circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, repair the open/high resistance in the ground connection.
 - **If less than 10 ohms**
3. Test or replace the S13 Door Lock Switch.

Door Lock Switch Malfunction

1. Ignition OFF, disconnect the harness connector at the appropriate S13 Door Lock Switch. Ignition ON
2. Install a 3 A fused jumper wire between the signal circuit terminal 2 and the ground circuit terminal 3.
3. Verify the scan tool Door Lock Switch parameter is Unlock.

- **If not Unlock**

1. Ignition OFF, remove the 3 A fused jumper wire, disconnect the harness connector at the K9 Body Control Module, ignition ON.
2. Test for less than 1 V between the signal circuit and ground.
 - If 1 V or greater, repair the short to voltage on the circuit.
 - If less than 1 V
3. Test for less than 2 ohms in the signal circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, replace the K9 Body Control Module.

- **If Unlock**

4. Install a 3 A fused jumper wire between the signal circuit terminal 4 and the ground circuit terminal 3.
5. Verify the scan tool Door Lock Switch parameter is Lock.

- **If not Lock**

1. Ignition OFF, remove the 3 A fused jumper wire, disconnect the harness connector at the K9 Body Control Module, ignition ON.
2. Test for less than 1 V between the signal circuit and ground.
 - If 1 V or greater, repair the short to voltage on the circuit.
 - If less than 1 V
3. Test for less than 2 ohms in the signal circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, replace the K9 Body Control Module.

- **If Lock**

6. Test or replace the S13 Door Lock Switch.

Lock/Unlock Signal Circuit Test

1. Ignition OFF, disconnect the harness connector at the S13D Door Lock Switch-Driver.
2. Disconnect the harness connector at the S13P Door Lock Switch-Passenger. Ignition ON
3. Verify the scan tool Door Lock Switch parameter is Inactive.

- **If Lock**

1. Ignition OFF, disconnect the X6 harness connector at the K9 Body Control Module.
2. Test for infinite resistance between the K9 Body Control Module signal circuit terminal 15 and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance, replace the K9 Body Control Module

- **If Unlock**

3. Ignition OFF, disconnect the X7 harness connector at the K9 Body Control Module.
4. Test for infinite resistance between the K9 Body Control Module signal circuit terminal 14 and ground.

- If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance, replace the K9 Body Control Module
 - **If Inactive**
4. Connect the harness connector at the S13P Door Lock Switch-Passenger.
 5. Verify the scan tool Door Lock Switch parameter changes from Inactive to Lock and Unlock when pushing the appropriate switch on the S13P Door Lock Switch-Passenger.
 - **If the parameter does not change**

Test or replace the S13P Door Lock Switch-Passenger.

- **If the parameter changes**
6. Connect the harness connector at the S13D Door Lock Switch-Driver.
 7. Verify the scan tool Door Lock Switch parameter changes from Inactive to Lock and Unlock when pushing the appropriate switch on the S13D Door Lock Switch-Driver.
 - **If the parameter does not change**

Test or replace the S13D Door Lock Switch-Driver.

- **If the parameter changes**
8. All OK.

Driver Door Lock Malfunction

1. Ignition OFF, disconnect the X2 harness connector at the A23D Door Latch Assembly-Driver. Ignition ON.

NOTE: Leaving the DMM connected between a control circuit and ground for greater than 20 seconds will cause the K9 Body Control Module to interpret the test as a system fault and will cause the voltage on the control circuit to drop to 0 V. If the voltage drops to 0 V, operate the door locks using the driver door lock switch to restore the voltage for testing.

2. Test for greater than 7 V between the control circuit terminal A and ground.
 - **If 7 V or less**
 1. Ignition OFF, disconnect the X6 harness connector at the K9 Body Control Module.
 2. Test for infinite resistance between the control circuit and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance
 3. Test for less than 2 ohms in the control circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance on the circuit.
 - If less than 2 ohms, replace the K9 Body Control Module.
- **If greater than 7 V**

NOTE: Leaving the DMM connected between a control circuit and ground for greater than 20 seconds will cause the K9 Body Control Module to interpret the test as a system fault and will cause the voltage on the control circuit to drop to 0 V. If the voltage drops to 0 V, operate the door locks using the driver door lock switch to restore the voltage for testing.

3. Test for greater than 7 V between the control circuit terminal B and ground.
 - **If 7 V or less**
 1. Ignition OFF, disconnect the X6 harness connector at the K9 Body Control Module.
 2. Test for infinite resistance between the control circuit and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance
 3. Test for less than 2 ohms in the control circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance on the circuit.
 - If less than 2 ohms, replace the K9 Body Control Module.
 - **If greater than 7 V**
4. Test or replace the A23D Door Latch Assembly-Driver.

Passenger Door Lock Malfunction

1. Ignition OFF, disconnect the harness connector at the appropriate passenger or rear A23 Door Latch Assembly. Ignition ON.

NOTE: Leaving the DMM connected between a control circuit and ground for greater than 20 seconds will cause the K9 Body Control Module to interpret the test as a system fault and will cause the voltage on the control circuit to drop to 0 V. If the voltage drops to 0 V, operate the door locks using the driver door lock switch to restore the voltage for testing.

2. Test for greater than 7 V between the control circuit terminal listed below and ground:
 - Control circuit terminal A
 - Control circuit terminal B
 - **If 7 V or less**
 1. Ignition OFF, disconnect the X6 harness connector at the K9 Body Control Module.
 2. Test for infinite resistance between the control circuit and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance
 3. Test for less than 2 ohms in the control circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance on the circuit.
 - If less than 2 ohms, replace the K9 Body Control Module.
 - **If greater than 7 V**

3. Test or replace the A23 Door Latch Assembly.

All Door Locks Inoperative

1. Ignition OFF, disconnect the X2 harness connector at the K9 Body Control Module, ignition ON.
2. Verify a test lamp illuminates between the B+ circuit terminal 4 and ground.
 - **If the test lamp does not illuminate and the circuit fuse is good**
 - 1. Ignition OFF.
 - 2. Test for less than 2 ohms in the B+ circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, verify the fuse is not open and there is voltage at the fuse.
 - **If the test lamp does not illuminate and the circuit fuse is open**
 - 3. Ignition OFF.
 - 4. Test for infinite resistance between the B+ circuit and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance
 - 5. Disconnect the harness connector at each of the A23 Door Latch Assemblies.
 - 6. Test for infinite resistance between each control circuit and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance, replace the appropriate A23 Door Latch Assembly.
 - **If the test lamp illuminates**
3. Ignition OFF, connect the X2 harness connector at the K9 Body Control Module. Disconnect the X2 harness connector at the A23D Door Latch Assembly-Driver, ignition ON.

NOTE: Leaving the DMM connected between a control circuit and ground for greater than 20 seconds will cause the K9 Body Control Module to interpret the test as a system fault and will cause the voltage on the control circuit to drop to 0 V. If the voltage drops to 0 V, operate the door locks using the driver door lock switch to restore the voltage for testing.

4. Test for greater than 7 V between the control circuit terminal A and ground.
 - **If 7 V or less**
 - 1. Ignition OFF, disconnect the X6 harness connector at the K9 Body Control Module.
 - 2. Test for infinite resistance between the control circuit terminal listed below and ground:
 - Control circuit terminal 1 X6
 - Control circuit terminal 2 X6
 - Control circuit terminal 4 X6
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance, replace the K9 Body Control Module.
 - **If greater than 7 V**

5. Replace the K9 Body Control Module.

Component Testing

Door Lock Switch

1. Ignition OFF, disconnect the harness connector at the appropriate S13 Door Lock Switch.
2. Test for infinite resistance between the signal terminal 2 and the ground terminal 3 with the switch in the open position.
 - **If less than infinite resistance**

Replace the S13 Door Lock Switch.
 - **If infinite resistance**
3. Test for infinite resistance between the signal terminal 4 and the ground terminal 3 with the switch in the open position.
 - **If less than infinite resistance**

Replace the S13 Door Lock Switch.
 - **If infinite resistance**
4. Test for less than 2 ohms between the signal terminal 4 and the ground terminal 3 with the switch in the Lock position.
 - **If 2 ohms or greater**

Replace the S13 Door Lock Switch.
 - **If less than 2 ohms**
5. Test for less than 2 ohms between the signal terminal 2 and the ground terminal 4 with the switch in the Unlock position.
 - **If 2 ohms or greater**

Replace the S13 Door Lock Switch.
 - **If less than 2 ohms**
6. All OK

Door Latch Assembly

1. Ignition OFF, disconnect the harness connector at the appropriate A23 Door Latch Assembly.
2. Install a 25 A fused jumper wire between one of the control terminals and 12 V. Momentarily install a jumper wire between the other control terminal and ground. Reverse the jumper wires at least two times, the A23 Door Latch Assembly should perform the LOCK and UNLOCK function.
 - **If the actuator does not perform the LOCK and UNLOCK function**

Replace the A23 Door Latch Assembly.

- If the actuator performs the LOCK and UNLOCK function

3. All OK

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

- **Front Side Door Lock Replacement**
- **Rear Side Door Lock Replacement**
- **Control Module References** for BCM replacement, programming and setup

TRUNK/LIFTGATE LOCK MALFUNCTION

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

1. Liftgate Lock Switch Lock Function Inoperative 2. Liftgate Lock Switch Unlock Function Inoperative 3. Liftgate Lock Switch Lock and Unlock Functions Inoperative				

Circuit/System Description

When the vehicle does not have power door locks, it will be provided with a liftgate unlatch switch to lock or unlock the liftgate. The body control module (BCM) monitors the voltage level of the liftgate lock and liftgate

unlock signal circuits. When the liftgate unlatch switch is in the open position, the voltage level in the signal circuit will be near 0 V. When the liftgate unlatch switch is pressed to the lock or unlock position, a signal will be sent to the BCM requesting a lock or unlock. command. When the liftgate door lock actuator is not active, both lock and unlock control circuits are supplied a floating voltage used by the BCM to perform diagnostic functions on the circuits. Transitioning of the liftgate door lock actuator to the lock or unlocked position depends upon which control circuits receive voltage and which control circuits receive ground

Circuit/System Verification

1. Ignition ON.
2. Verify the scan tool Door Lock Switch parameter changes from Inactive to Lock and Unlock when cycling the S46B Liftgate Unlatch Switch between LOCK and UNLOCK.
 - **If the parameter does not change**

Refer to Circuit/System Testing - Liftgate Unlatch Switch Malfunction

- **If the parameter changes**
3. Verify the M14B Door Lock Actuator-Liftgate will LOCK and UNLOCK when commanding the All Doors Lock/Unlock with a scan tool.

- **If the M14B Door Lock Actuator-Liftgate LOCK or UNLOCK functions do not work**

Refer to Circuit/System Testing - Liftgate Lock Actuator Malfunction.

- **If the M14B Door Lock Actuator-Liftgate LOCK and UNLOCK function works**

4. All OK.

Circuit/System Testing

Liftgate Unlatch Switch Malfunction

1. Ignition OFF and all vehicle systems OFF, disconnect the harness connector at the S46B Liftgate Unlatch Switch. It may take up to 2 minutes for all vehicle systems to power down.
2. Test for less than 10 ohms between the ground circuit terminal 4 and ground.
 - **If 10 ohms or greater**
 1. Ignition OFF.
 2. Test for less than 2 ohms in the ground circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, repair the open/high resistance in the ground connection.
 - **If less than 10 ohms**
3. Ignition ON.
4. Verify the scan tool Door Lock Switch parameter is Inactive.
 - **If not Inactive**
 1. Ignition OFF, disconnect the harness connector at the K9 body control module.
 2. Test for infinite resistance between the signal circuit terminal 2 and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 3. Test for infinite resistance between the signal circuit terminal 3 and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance, replace the K9 Body Control Module.
 - **If Inactive**
5. Install a 3 A fused jumper wire between the signal circuit terminal 3 and the ground circuit terminal 4.
6. Verify the scan tool Door Lock Switch parameter is Unlock.
 - **If not Unlock**
 1. Ignition OFF, remove the 3 A fused jumper wire, disconnect the harness connector at the K9 Body Control Module, ignition ON.
 2. Test for less than 1 V between the signal circuit terminal 3 and ground.
 - If 1 V or greater, repair the short to voltage on the circuit.
 - If less than 1 V
 3. Test for less than 2 ohms in the signal circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.

- If less than 2 ohms, replace the K9 Body Control Module.
- **If Unlock**
- 7. Install a 3 A fused jumper wire between the signal circuit terminal 2 and the ground circuit terminal 4.
- 8. Verify the scan tool Door Lock Switch parameter is Lock.
 - **If not Lock**
 1. Ignition OFF, remove the 3 A fused jumper wire, disconnect the harness connector at the K9 body control module, ignition ON.
 2. Test for less than 1 V between the signal circuit terminal 2 and ground.
 - If 1 V or greater, repair the short to voltage on the circuit.
 - If less than 1 V
 3. Test for less than 2 ohms in the signal circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, replace the K9 Body Control Module.
 - **If Lock**
- 9. Test or replace the S46B Liftgate Unlatch Switch.

Liftgate Lock Actuator Malfunction

1. Ignition OFF, disconnect the X2 harness connector at the K9 Body Control Module, ignition ON.
2. Verify a test lamp illuminates between the B+ circuit terminal 4 and ground.
 - **If the test lamp does not illuminate and the circuit fuse is good**
 1. Ignition OFF.
 2. Test for less than 2 ohms in the B+ circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, verify the fuse is not open and there is voltage at the fuse.
 - **If the test lamp does not illuminate and the circuit fuse is open**
 1. Ignition OFF.
 2. Test for infinite resistance between the B+ circuit and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance
 3. Disconnect the harness connector at the M14B Door Lock Actuator-Liftgate.
 4. Test for infinite resistance between each control circuit and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance, replace the M14B Door Lock Actuator-Liftgate.
 - **If the test lamp illuminates**
3. Ignition OFF, disconnect the harness connector at the M14B Door Lock Actuator-Liftgate.
4. Connect a test lamp between the control circuit terminal 1 and control circuit terminal 2, ignition ON.
5. Verify the test lamp turns ON and OFF when commanding the Lock and Unlock states with a scan tool.
 - **If the test lamp is always OFF**

1. Ignition OFF, remove the test lamp, disconnect the X6 harness connector at the K9 Body Control Module.
2. Test for infinite resistance between each control circuit and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance
3. Test for less than 2 ohms in each control circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, replace the K9 Body Control Module.

- **If the test lamp is always ON**

1. Ignition OFF, remove the test lamp, disconnect the harness connector at the K9 Body Control Module, Ignition ON.
2. Test for less than 1 V between the control circuit and ground.
 - If 1 V or greater, repair the short to voltage on the circuit.
 - If less than 1 V, replace the K9 Body Control Module.

- **If the test lamp turns ON and OFF**

6. Test or replace the M14B Door Lock Actuator-Liftgate.

Component Testing

Liftgate Unlatch Switch

1. Ignition OFF, disconnect the harness connector at the S46B Liftgate Unlatch Switch.
2. Test for infinite resistance between the signal terminal 2 and the ground terminal 4 with the switch in the open position.

- **If less than infinite resistance**

Replace the S46B Liftgate Unlatch Switch.

- **If infinite resistance**

3. Test for infinite resistance between the signal terminal 3 and the ground terminal 4 with the switch in the open position.

- **If less than infinite resistance**

Replace the S46B Liftgate Unlatch Switch.

- **If infinite resistance**

4. Test for less than 2 ohms between the signal terminal 2 and the ground terminal 4 with the switch in the Lock position.

- **If 2 ohms or greater**

Replace the S46B Liftgate Unlatch Switch.

- **If less than 2 ohms**

5. Test for less than 2 ohms between the signal terminal 3 and the ground terminal 4 with the switch in the Unlock position.

- **If 2 ohms or greater**

Replace the S46B Liftgate Unlatch Switch.

- **If less than 2 ohms**

6. All OK

Liftgate Lock Actuator

1. Ignition OFF, disconnect the harness connector at the M14B Door Lock Actuator-Liftgate.
2. Install a 25 A fused jumper wire between one of the control terminals and 12 V. Momentarily install a jumper wire between the other control terminal and ground. Reverse the jumper wires at least two times, the M14B Door Lock Actuator-Liftgate should perform the LOCK and UNLOCK function.

- **If the actuator does not perform the LOCK and UNLOCK function**

Replace the M14B Door Lock Actuator-Liftgate.

- **If the actuator performs the LOCK and UNLOCK function**

3. All OK

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

- **Instrument Panel Multifunction Switch Replacement**
- **Liftgate Lock Actuator Replacement**
- **Control Module References** for BCM replacement, programming and setup

REPAIR INSTRUCTIONS

LIFTGATE LOCK ACTUATOR REPLACEMENT

Fig. 4: Liftgate Lock Actuator
 Courtesy of GENERAL MOTORS COMPANY

Liftgate Lock Actuator Replacement

Callout	Component Name
Preliminary Procedure Remove the liftgate trim panel. Refer to <u>Liftgate Trim Panel Replacement</u> .	
1	Liftgate Lock Actuator Nut (Qty: 2) CAUTION: Refer to <u>Fastener Caution</u> .
2	Liftgate Lock Actuator Rubber Bush (Qty: 2)
3	Liftgate Lock Actuator Plastic Bush (Qty: 2)
4	Liftgate Lock Actuator Procedure 1. Disconnect the liftgate lock actuator electrical connector. 2. Release the liftgate lock actuator rod from the latch.

FUEL TANK FILLER DOOR LATCH RELEASE CABLE REPLACEMENT

Fig. 5: Fuel Tank Filler Door Latch Release Cable
 Courtesy of GENERAL MOTORS COMPANY

Fuel Tank Filler Door Latch Release Cable Replacement

Callout	Component Name
Preliminary Procedures 1. Remove the front side door sill trim plate. Refer to <u>Front Side Door Sill Trim Plate Replacement</u> . 2. Remove the center pillar lower trim panel. Refer to <u>Center Pillar Lower Trim Panel Replacement</u> . 3. Remove the rear side door sill trim plate. Refer to <u>Rear Side Door Sill Trim Plate Replacement</u> . 4. Remove the rear wheelhouse trim finish panel. Refer to <u>Rear Wheelhouse Trim Finish Panel Replacement</u> .	
1	Fuel Tank Filler Door Latch Release Cable Lever Bolt (Qty: 2) CAUTION: Refer to <u>Fastener Caution</u> . Tighten 8 N.m (71 lb in)
2	Fuel Tank Filler Door Latch TIP: Remove the rear wheelhouse trim finish panel to access the fuel tank filler door latch.

FRONT SIDE DOOR LOCK CYLINDER REPLACEMENT

Removal Procedure

1. Remove the front side door trim panel. Refer to Front Side Door Trim Panel Replacement .
2. Remove the water deflector.
3. Remove the front side door lock cylinder rod.

Fig. 6: Front Side Door Lock Rod Holder
Courtesy of GENERAL MOTORS COMPANY

4. Remove the front side door lock rod holder (1).

Fig. 7: Front Side Door Lock Cylinder Bolt
Courtesy of GENERAL MOTORS COMPANY

5. Remove the front side door lock cylinder bolt (2).

Fig. 8: Front Side Door Lock Cylinder
Courtesy of GENERAL MOTORS COMPANY

6. Remove the front side door lock cylinder (3).

Installation Procedure

NOTE: If you are installing a new lock cylinder, refer to Key and Lock Cylinder Coding .

1. Install the front side door lock cylinder.

Fig. 9: Front Side Door Lock Cylinder Bolt
Courtesy of GENERAL MOTORS COMPANY

2. Install the front side door lock cylinder bolt (2) and tighten to 4.5 N.m (40 lb in).
3. Install the front side door lock rod holder.

LIFTGATE LOCK CYLINDER REPLACEMENT

Fig. 10: Liftgate Lock Cylinder
 Courtesy of GENERAL MOTORS COMPANY

Liftgate Lock Cylinder Replacement

Callout	Component Name
Preliminary Procedures 1. Remove the liftgate trim panel. Refer to <u>Liftgate Trim Panel Replacement</u> . 2. Remove the liftgate lock cylinder rod.	
1	Liftgate Lock Cylinder Nut (Qty: 2) CAUTION: Refer to <u>Fastener Caution</u> . Tighten 5 N.m (44 lb in)
2	Liftgate Lock Cylinder Assembly TIP: If you are installing a new lock cylinder, refer to <u>Key and Lock Cylinder Coding</u> .

FRONT SIDE DOOR INSIDE HANDLE REPLACEMENT

Fig. 11: Front Side Door Inside Handle
 Courtesy of GENERAL MOTORS COMPANY

Front Side Door Inside Handle Replacement

Callout	Component Name
Preliminary Procedures 1. Remove the front side door trim panel. Refer to <u>Front Side Door Trim Panel Replacement</u> . 2. Remove the water deflector. 3. Remove the front side door inside handle rod.	
1	Front Side Door Inside Handle Screw (Qty: 1) CAUTION: Refer to <u>Fastener Caution</u> . Tighten 1.5 N.m (13 lb in)
2	Front Side Door Inside Handle

FRONT SIDE DOOR OUTSIDE HANDLE REPLACEMENT

Fig. 12: Front Side Door Outside Handle
 Courtesy of GENERAL MOTORS COMPANY

Front Side Door Outside Handle Replacement

Callout	Component Name
Preliminary Procedures 1. Remove the front side door trim panel. Refer to <u>Front Side Door Trim Panel Replacement</u> . 2. Remove the water deflector. 3. Remove the front side door lock cylinder. Refer to <u>Front Side Door Lock Cylinder Replacement</u>.	
1	Front Side Door Outside Handle Bolt (Qty: 1) CAUTION: Refer to <u>Fastener Caution</u> . Tighten 4.5 N.m (40 lb in)
2	Front Side Door Outside Handle

LIFTGATE OUTSIDE HANDLE REPLACEMENT

Fig. 13: Liftgate Outside Handle
 Courtesy of GENERAL MOTORS COMPANY

Liftgate Outside Handle Replacement

Callout	Component Name
Preliminary Procedures 1. Remove the liftgate trim panel. Refer to <u>Liftgate Trim Panel Replacement</u> . 2. Remove the liftgate lock cylinder. Refer to <u>Liftgate Lock Cylinder Replacement</u>.	
1	Liftgate Outside Handle Nut (Qty: 5) CAUTION: Refer to <u>Fastener Caution</u> . Tighten 5 N.m (44 lb in)
2	Liftgate Outside Handle Procedure Disconnect the license plate lamp electrical connector. Refer to <u>Rear License Plate Lamp Replacement</u> .

LIFTGATE LATCH REPLACEMENT

Fig. 14: Liftgate Latch

Courtesy of GENERAL MOTORS COMPANY

Liftgate Latch Replacement

Callout	Component Name
Preliminary Procedures 1. Remove the liftgate trim panel. Refer to <u>Liftgate Trim Panel Replacement</u> . 2. Remove the liftgate lock cylinder rod. 3. Remove the liftgate outside handle rod.	
1	Liftgate Latch Bolt (Qty: 2) CAUTION: Refer to <u>Fastener Caution</u> . Tighten 12 N.m (106 lb in)
2	Liftgate Latch Assembly

REAR SIDE DOOR OUTSIDE HANDLE REPLACEMENT

Fig. 15: Rear Side Door Outside Handle
 Courtesy of GENERAL MOTORS COMPANY

Rear Side Door Outside Handle Replacement

Callout	Component Name
Preliminary Procedure Remove the rear side door upper rear trim panel. Refer to <u>Rear Side Door Upper Rear Trim Panel Replacement</u> .	
1	Rear Side Door Outside Handle Bolt (Qty: 2) CAUTION: Refer to <u>Fastener Caution</u> . Tighten 4.5 N.m (40 lb in)
2	Rear Side Door Outside Handle Procedure 1. Remove the rear side door outside handle clip (Qty: 2). 2. Remove the rear side door outside handle rod.

FRONT SIDE DOOR LOCK REPLACEMENT

Fig. 16: Front Side Door Lock
 Courtesy of GENERAL MOTORS COMPANY

Front Side Door Lock Replacement

Callout	Component Name
Preliminary Procedures 1. Remove the front side door trim. Refer to Front Side Door Trim Panel Replacement . 2. Remove the water deflector. 3. Disconnect the front side door outside handle rod, inside handle rod and lock rod.	
1	Front Side Door Lock Screw (Qty: 3) CAUTION: Refer to Fastener Caution . Tighten 8.5 N.m (75 lb in)
2	Front Side Door Lock Assembly Procedure Disconnect the door lock electrical connector.

REAR SIDE DOOR LOCK REPLACEMENT

Fig. 17: Rear Side Door Lock
 Courtesy of GENERAL MOTORS COMPANY

Rear Side Door Lock Replacement

Callout	Component Name
Preliminary Procedures 1. Remove the rear side door trim panel. Refer to Rear Side Door Trim Panel Replacement . 2. Remove the rear side door water deflector. 3. Disconnect the rear side door outside handle rod, inside handle rod and lock rod.	
1	Rear Side Door Lock Screw (Qty: 3) CAUTION: Refer to Fastener Caution . Tighten 8.5 N.m (75 lb in)
2	Rear Side Door Lock Assembly Procedure Disconnect the door lock electrical connector.

DOOR LOCK STRIKER ADJUSTMENT

Fore/Aft Adjustment

Fig. 18: Door Lock Striker

Courtesy of GENERAL MOTORS COMPANY

CAUTION: When replacing the door lock striker, only use the manufactures replacement part. Do not use a replacement part of a lesser quality or a substitute design. The use of a lesser quality part could lead to an improperly operating door retention system.

1. The door must be properly aligned.

Fig. 19: Door Lock Striker

Courtesy of GENERAL MOTORS COMPANY

2. Close the door until the lock fork contacts the striker.
3. Stand next to the door opening and move the door slowly in and out, just touching the striker each time.

Fig. 20: Lock Fork And Striker

Courtesy of GENERAL MOTORS COMPANY

4. The alignment of the lock fork and the striker can be easily seen. The lock fork should be perpendicular to and fall near the middle of the striker. The lock fork should fall near the middle of the striker between the upper/lower center pillar and the end of the striker.

Fig. 21: Striker Screws And Spacer
Courtesy of GENERAL MOTORS COMPANY

5. If a fore or aft adjustment is required, use the following steps:
 1. Remove the striker screws.
 2. Remove the spacer in order to move the striker toward the rear of the vehicle.
 3. Add a 2 mm (0.08 in) spacer in order to move the striker toward the front of the vehicle.
 4. Install the striker screws.
6. Perform the up/down or the in/out adjustment.

Up/Down or In/Out Adjustment

An adjustment of the striker in the up and down or in and out directions may be necessary for a number of reasons:

- Vehicle frame damage as the result of a collision
- Installation of new door weather-stripping
- Customer complaints of excessive windnoise
- Difficulty in opening or closing the door

Fig. 22: Door Lock Striker

Courtesy of GENERAL MOTORS COMPANY

In order to adjust the door striker in an up and down or in and out direction, perform the following procedure:

1. The door must be properly aligned.
2. Loosen the striker screws.

CAUTION: In order to oblong the striker mounting hole to assist in further striker adjustment, use a die grinder with a flat-headed grinding bit. This type of bit will help to prevent damage to the tapered floating cage plate. The striker and the tapered floating cage plate are important attaching parts that could affect operation of the door closing and latching systems.

3. The floating cage plate can be moved slightly using the ends of the striker screws. Move the floating cage plate to the desired position.
4. If proper adjustment requires that the floating cage plate be moved more than is possible, use an electric hand drill and a 9.5 mm (0.375 in) rotary file with a flat head in order to enlarge the body opening in the direction required.
5. Tighten the striker screws to the correct position.

FRONT SIDE DOOR LOCK STRIKER REPLACEMENT

Fig. 23: Front Side Door Lock Striker
Courtesy of GENERAL MOTORS COMPANY

Front Side Door Lock Striker Replacement

Callout	Component Name
1	Front Side Door Lock Striker Screw (Qty: 2) CAUTION: Refer to <u>Fastener Caution</u> . Tighten 25 N.m (18 lb ft)
2	Front Side Door Lock Striker TIP: When the striker bolts have been removed, the striker anchor plate could slip down in the door pillar or quarter panel and the trim will need to be removed to gain access.

LIFTGATE LOCK STRIKER REPLACEMENT

Fig. 24: Liftgate Lock Striker
 Courtesy of GENERAL MOTORS COMPANY

Liftgate Lock Striker Replacement

Callout	Component Name
Preliminary Procedure Open the liftgate.	
1	Liftgate Lock Striker Screw (Qty: 2) CAUTION: Refer to <u>Fastener Caution</u> . Tighten 20 N.m (15 lb ft)
2	Liftgate Lock Striker Procedure Disconnect the lock cable.

DESCRIPTION AND OPERATION

DOOR AJAR INDICATOR DESCRIPTION AND OPERATION

Door Ajar Indicator System Components

The door ajar indicator system consists of the following components:

- The body control module (BCM)
- The instrument cluster
- The driver door ajar switch
- The passenger door ajar switch
- The left rear door ajar switch
- The right rear door ajar switch
- The liftgate ajar switch

B28RR	B28RR Door Ajar Switch - Right Rear
B28LR	B28LR Door Ajar Switch - Left Rear
B69	B69 Liftgate Ajar Switch

Driver and Passenger Door Ajar Operation

The body control module (BCM) provides a 12V signal to each door ajar switch and the liftgate ajar switch via the ajar switch signal circuit. The door ajar switches are normally open when the door is fully closed. When a door or liftgate is opened, the ajar switch contacts close providing a path to ground. The driver information center displays door ajar icon when the BCM detects that one of the doors or liftgate are open. The instrument cluster receives a serial data message from the BCM indicating the door ajar status.

FUEL FILL DOOR DESCRIPTION AND OPERATION

The fuel filler door attaches to the fuel tank pocket on the right side of the vehicle.

POWER DOOR LOCKS DESCRIPTION AND OPERATION

Door Lock System Components

The power door lock system consists of the following components:

- Driver door lock switch
- Passenger door lock switch
- Body control module (BCM)
- Driver door latch
- Passenger door latch
- Left rear door latch
- Right rear door latch

A23LR	A23LR Door Latch Assembly - Left Rear

A23P	A23P Door Latch Assembly - Passenger
A23D	A23D Door Latch Assembly - Driver

Door Lock Switch Operation

The body control module supplies a 12 V signal to each of the door lock and door unlock signal circuits. When the door lock switches are in the open position, the voltage level in the signal circuit will be near 12 V. When any door lock switch is pressed to the lock or unlock position, the voltage level in the appropriate signal circuit will drop to 0 V and the BCM will detect the voltage drop and command the door latches to perform the requested lock or unlock command.

Door Lock and Unlock Operation

The body control module powers the reversible door latch assemblies by providing battery positive voltage and ground to the appropriate lock and unlock control circuits of the door latch assemblies. The lock and unlock control circuits of the rear doors and passenger door latch assemblies are all connected together. When the door latch assemblies are not active, all actuator lock and unlock control circuits are supplied a floating voltage door driver by the BCM. Transitioning of the lock actuators to the lock or unlocked position depends upon which control circuits receive voltage and which control circuits receive ground.

The following three circuits are used to operate the lock:

- Driver door only unlock
- All passenger doors unlock
- All doors lock

REAR HATCH/GATE DESCRIPTION AND OPERATION

Liftgate

The liftgate may be operated by one of the following methods:

- Inserting the key into the liftgate lock.
- Operating the power door lock switches.
- Operating the rear hatch lock switch.
- Using the keyless entry fob.

Functional Operation

The liftgate operates in the same manner as the power door locks. If the vehicle is equipped with power door locks, the lock and unlock circuits for the liftgate are shared with the passenger lock/unlock control circuits. If the vehicle is not equipped with power door locks, the liftgate will have it's own lock/unlock switch and will have it's own lock and unlock control circuits commanded by the BCM.

DIAGNOSTIC INFORMATION AND PROCEDURES

SYMPTOMS - POWER OUTLETS

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

Visual/Physical Inspection

- Inspect for aftermarket devices which can affect the operation of the power outlets. Refer to **Checking Aftermarket Accessories**
- Inspect the accessible system components or the visible system components for obvious damage or for obvious conditions which can cause the symptom.

Intermittent

Electrical connections or wiring may be the cause of intermittent conditions. Refer to **Testing for Intermittent Conditions and Poor Connections**

Symptom List

Refer to **Power Outlet Receptacle Malfunction** in order to diagnose the system.

POWER OUTLET RECEPTACLE MALFUNCTION

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Ignition	1	1	-	-
Ground	-	1	1	-
1. Accessory Power Receptacle Malfunction				

Circuit/System Description

The vehicle is fitted with a 12 V accessory power receptacle. The accessory power outlets are controlled by an ignition operated relay. The accessory power receptacle is operational when the ignition is turned to either the On or the Accessories positions.

Diagnostic Aids

It may be helpful to discuss with the customer the usage of any device that may have drawn too much current and caused an open fuse.

COMPONENT CONNECTOR END VIEWS - INDEX

Description and Operation

Power Outlets Description and Operation

Electrical Information Reference

- **Circuit Testing**
- **Connector Repairs**
- **Testing for Intermittent Conditions and Poor Connections**
- **Wiring Repairs**

Circuit/System Verification

1. Ignition ON, connect an appropriate device to the X80 Accessory Power Receptacle.
2. Verify the device is powered by the X80 Accessory Power Receptacle.
 - **If the device is not powered**

Refer to Circuit/System Testing

- **If the device is powered**
3. All OK.

Circuit/System Testing

1. Ignition OFF, disconnect the harness connector at the appropriate X80 Accessory Power Receptacle. It may take up to 2 min for all vehicle systems to power down.
2. Test for less than 10 ohms between the ground circuit terminal C and ground.
 - **If greater than 10 ohms**
 1. Ignition OFF.
 2. Test for less than 2 ohms in the ground circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, repair the open/high resistance in the ground connection.
 - **If less than 10 ohms**
3. Ignition ON.
4. Verify that a test lamp illuminates between the control circuit terminal A and ground.
 - **If the test lamp does not illuminate and the circuit fuse is good**
 1. Ignition OFF.

2. Test for less than 2 ohms in the control circuit end to end.
 - If greater than 2 ohms, repair the open/high resistance in the circuit.
 - If less than 2 ohms, verify the fuse is not open and there is voltage at the fuse. Refer to **Retained Accessory Power Malfunction** .
 - **If the test lamp does not illuminate and the circuit fuse is open**
1. Ignition OFF.
2. Test for infinite resistance between the control circuit terminal A and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance, replace the appropriate X80 Accessory Power Receptacle.
 - **If the test lamp illuminates**
5. Test or replace the X80 Accessory Power Receptacle.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

Accessory Power Receptacle Replacement.

DESCRIPTION AND OPERATION

POWER OUTLETS DESCRIPTION AND OPERATION

System Description

The vehicle is fitted with either a cigarette lighter or with 12 V accessory power outlets. The power outlet is operational when the ignition is turned to either the On or the Accessories positions. The cigarette lighter is operational whenever the ignition is in the On position. To operate the cigarette lighter, press in the lighter knob. When the element is hot, the lighter automatically pops out and is ready for use.

DIAGNOSTIC INFORMATION AND PROCEDURES

DIAGNOSTIC CODE INDEX

DIAGNOSTIC CODE INDEX

DTC	Description
<u>DTC C0176</u>	DTC C0176 54 Control Module Temperature Sensor High Temperature
<u>DTC C0460</u>	DTC C0460 00 Steering Wheel Angle Sensor Malfunction DTC C0460 4B Steering Wheel Angle Sensor Calibration Not Learned
<u>DTC C0475</u>	DTC C0475 00 Electric Steering Motor Circuit Malfunction

DTC C0176: CONTROL MODULE TEMPERATURE SENSOR

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.

- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

DTC Descriptor

DTC C0176 54

Control Module Temperature Sensor High Temperature

Circuit/System Description

The power steering control module monitors the temperature of the power steering system. The power steering control module uses voltage, current levels and input from an internal temperature sensor to calculate an estimated system temperature. If the power steering control module detects a high system temperature event is occurring, the amount of assist is decreased to reduce system temperature, in effort to prevent thermal damage to the power steering components.

Conditions for Running the DTC

- Ignition ON, engine running.
- Power steering system voltage is 9-16 V.
- Repetitive steering input applied.

Conditions for Setting the DTC

The power steering control module detects a high system temperature.

Action Taken When the DTC Sets

- DTC C0176 54 is stored in memory.
- Steering assist is reduced.

Conditions for Clearing the DTC

A current DTC will clear on the next malfunction-free ignition cycle.

Diagnostic Aids

- DTC C0176 54 does not indicate that a malfunction has occurred. Rather that the power steering control module had to limit current to the power steering motor to avoid thermal damage to the power steering system components. Discuss with the customer about driving conditions when the steering assist was reduced.
- Ensure that no steering components down stream of the power steering column assembly, such as ball joints, tie rod ends, universal joints, or the steering gear assembly, are mechanically binding.

Scan Tool Reference

Control Module References for scan tool information.

Circuit/System Verification

1. Verify that the DTC sets outside of the conditions for running and setting. Since most occurrences of this DTC are caused by excessive driver inputs, review with the customer the conditions under which the DTC set.
 - **If the DTC did not set outside of the conditions for running and setting**
1. Ignition ON.
2. Operate the vehicle within the conditions that the customer experienced, avoiding excessive inputs, and verify the DTC does not reset.
 - If the DTC is set
1. Verify that no steering components down stream of the power steering column assembly are mechanically binding. Refer to
 - If steering components are mechanically binding, replace the mechanically binding steering components.
 - If no steering components are mechanically binding, replace the steering column assembly.
- If the DTC is not set
3. All OK.
 - **If the DTC set outside of the conditions for running and setting**
2. All OK. The power steering is operating as designed.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

- **Steering Column Replacement (Electric Power Steering)**
- **Control Module References** for Power Steering Control Module replacement, programming and setup.

DTC C0460: STEERING WHEEL ANGLE SENSOR

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

DTC Descriptor

DTC C0460 00

Steering Wheel Angle Sensor Malfunction

DTC C0460 4B

Steering Wheel Angle Sensor Calibration Not Learned

Circuit/System Description

The power steering control module contains the steering wheel angle sensor. The steering wheel angle sensor identifies the position and direction of the steering wheel rotation. The steering wheel angle signal is sending a serial data to the GMLAN high speed bus.

Conditions for Running the DTC

- Ignition ON, engine running.
- Power steering system voltage is 9-16 V.

Conditions for Setting the DTC

DTC C0460 00

- Steering angle signal is not valid.
- Steering angle signal line is open.
- Steering angle signal cycle time is out of range.
- Steering angle signal duty cycle is out of range.

DTC C0460 4B

Steering sensor zero position is not set.

Action Taken When the DTC Sets

- DTC C0460 is stored in memory.
- No steering assist.

Conditions for Clearing the DTC

A current DTC will clear on the next malfunction-free ignition cycle.

DTC C0475: ELECTRIC STEERING MOTOR

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

DTC Descriptors

DTC C0475 00

Electric Steering Motor Circuit Malfunction

Circuit/System Description

The power steering control module continuously monitors the voltage and current levels being commanded to the 3-phase steering motor. The power steering control module compares the desired and actual current levels to detect malfunctions in the internal power steering motor circuits.

Conditions for Running the DTC

Ignition ON.

Conditions for Setting the DTC

The power steering control module detects a short to ground, short to voltage, or an open/high resistance on any of the internal power steering motor circuits.

Action Taken When the DTC Sets

- The DTC is stored in memory.
- No steering assist.

Conditions for Clearing the DTC

A history DTC will clear after 40 consecutive malfunction-free ignition cycles.

3. All OK.

Repair Instructions

Perform the Diagnostic Repair Verification after completing the repair.

- Steering Column Replacement (Electric Power Steering)
- Control Module References for Power Steering Control Module replacement, programming and setup.

SYMPTOMS - POWER STEERING SYSTEM (ELECTRIC POWER STEERING)

NOTE: Review the system description and operation in order to familiarize yourself with the system functions. Refer to Power Steering System Description and Operation (Electric Power Steering).

Visual/Physical Inspection

- Inspect for aftermarket devices which could affect the operation of the power steering system.
- Inspect the easily accessible or visible system components for obvious damage or conditions which could cause the symptom.

Symptoms List

Refer to a symptom diagnostic procedure from the following list in order to diagnose the symptom:

- Increase in Effort While Turning Steering Wheel (Electronic Power Steering)
- Poor Return of Steering Wheel (Electronic Power Steering)
- Steering Wheel Surges/Jerks While Turning (Electric Power Steering)
- Rattle, Clunk, or Shudder Noise from the Power Steering System
- Whine or Growl Noise from the Power Steering System (Electric Power Steering)

RATTLE, CLUNK, OR SHUDDER NOISE FROM THE POWER STEERING SYSTEM

Rattle, Clunk, or Shudder Noise from the Power Steering System

Step	Action	Yes	No
1	Did you review the Power Steering System Symptoms and perform the necessary inspections?	Go to Step 2	Go to <u>Symptoms - Power Steering System (Electric Power Steering)</u>
2	Verify that a rattle, clunk or shudder noise is present. Is a rattle, clunk or shudder noise present?	Go to Step 3	System OK
3	Inspect the power steering gear for the proper installation. Refer to <u>Steering Gear Replacement (Electric Power Steering)</u> . Is the power steering gear installation incorrect?	Go to Step 6	Go to Step 4
4	Inspect the intermediate shaft. Is the intermediate shaft worn?	Go to Step 8	Go to Step 5
5	Inspect the suspension. Is the suspension worn?	Go to Step 7	Go to <u>Noise Diagnosis - Front Suspension</u>
6	Install the power steering gear correctly. Refer to <u>Steering Gear Replacement (Electric Power Steering)</u> . Did you complete the repair?	Go to Step 9	-

7	Replace the worn suspension components. Did you complete the repair?	Go to Step 9	-
8	Replace the intermediate shaft. Refer to <u>Intermediate Steering Shaft Replacement</u> . Did you complete the repair?	Go to Step 9	-
9	Operate the system in order to verify the repair. Did you correct the condition?	System OK	Go to Step 3

WHINE OR GROWL NOISE FROM THE POWER STEERING SYSTEM (ELECTRIC POWER STEERING)

Whine or Growl Noise from the Power Steering System (Electric Power Steering)

Step	Action	Yes	No
1	Did you review the Power Steering System Symptoms and perform the necessary inspections?	Go to Step 2	Go to <u>Symptoms - Power Steering System (Electric Power Steering)</u> .
2	Verify that a whine or a growl noise is present. Is a whine or a growl noise present?	Go to Step 3	System OK
3	Inspect the power steering gear for the proper installation. Refer to <u>Steering Gear Replacement (Electric Power Steering)</u> . Is the power steering gear installation incorrect?	Go to Step 6	Go to Step 4
4	Inspect the intermediate shaft. Is the intermediate shaft worn?	Go to Step 8	Go to Step 5
5	Inspect the suspension. Is the suspension worn?	Go to Step 7	Go to <u>Noise Diagnosis - Front Suspension</u> .
6	Install the power steering gear correctly. Refer to <u>Steering Gear Replacement (Electric Power Steering)</u> . Did you complete the repair?	Go to Step 9	-
7	Replace the worn suspension components. Did you complete the repair?	Go to Step 9	-
8	Replace the intermediate shaft. Refer to <u>Intermediate Steering Shaft Replacement</u> . Did you complete the repair?	Go to Step 9	-
9	Operate the system in order to verify the repair. Did you correct the condition?	System OK	Go to Step 3

INCREASE IN EFFORT WHILE TURNING STEERING WHEEL (ELECTRONIC POWER STEERING)

Increase in Effort While Turning Steering Wheel (Electronic Power Steering)

Step	Action	Yes	No
	Did you review the Power Steering System		Go to <u>Power</u>

1	Description and Operation and perform the necessary inspections?	Go to Step 2	<u>Steering System Description and Operation (Electric Power Steering)</u>
2	Verify that there is an increase in effort while turning is present. Does the system operate normally?	System OK	Go to Step 3
3	Check for the following conditions: • Incorrect tire inflation - Refer to <u>Vehicle Certification, Tire Placard, Anti-Theft, and Service Parts ID Label</u> . • Improper tire size Did you find and correct the condition?	Go to Step 10	Go to Step 4
4	1. Raise and support the vehicle. Refer to <u>Lifting and Jacking the Vehicle</u> . 2. Check for a binding or worn steering linkage outer tie rod. Is the tie rod binding or worn?	Go to Step 7	Go to Step 5
5	Check for a worn or binding intermediate steering shaft. Is the intermediate steering shaft worn or binding?	Go to Step 8	Go to Step 6
6	Check for a worn or binding steering gear. Is the steering gear worn or binding?	Go to Step 9	System OK
7	Replace the steering linkage outer tie rod. Refer to <u>Steering Linkage Outer Tie Rod Replacement</u> . Did you complete the repair?	Go to Step 10	-
8	Replace the intermediate steering shaft. Refer to <u>Intermediate Steering Shaft Replacement</u> . Did you complete the repair?	Go to Step 10	-
9	Replace the steering gear. Refer to <u>Steering Gear Replacement (Electric Power Steering)</u> . Did you complete the repair?	Go to Step 10	-
10	Operate the system in order to verify the repair. Did you correct the condition?	System OK	Go to Step 3

POOR RETURN OF STEERING WHEEL (ELECTRONIC POWER STEERING)

Poor Return of Steering Wheel (Electronic Power Steering)

Step	Action	Yes	No
DEFINITION: After completing a turn, extra steering input is required for the steering wheel to return to center.			

1	Did you review the General Description and perform the necessary inspections?	Go to Step 2	Go to <u>Power Steering System Description and Operation (Electric Power Steering)</u>
2	Verify that poor return of the steering wheel is present. Does the system operate normally?	System OK	Go to Step 3
3	1. Raise and support the vehicle. Refer to <u>Lifting and Jacking the Vehicle</u> . 2. Lubricate the tie rod ends and ball joints, if applicable. 3. Inspect the suspension system for worn or damaged components. 4. Repair as necessary. Did you find and correct the condition?	Go to Step 12	Go to Step 4
4	1. Rotate the steering wheel ONE revolution in both directions. 2. Rotate the steering wheel back to the original position. Was the steering wheel abnormally difficult to rotate in either direction?	Go to Step 5	Go to Step 10
5	NOTE: Position the wheels straight ahead. Do NOT rotate the steering wheel more than one complete revolution from center. 1. Disconnect the intermediate shaft from the steering column. 2. Note the position of the steering wheel and rotate the steering wheel ONE revolution in both directions. 3. Rotate the steering wheel back to the original position. Was the steering wheel abnormally difficult to rotate in either direction?	Go to Step 11	Go to Step 6
6	Inspect the intermediate shaft for stiff or loose joints. Repair or replace as necessary. Refer to <u>Intermediate Steering Shaft Replacement</u> . Did you find and complete the repair?	Go to Step 12	Go to Step 7
	1. Remove the front tire and wheel assemblies.		

7	Refer to <u>Tire and Wheel Removal and Installation</u> . 2. Disconnect both outer tie rod ends from the steering knuckles. 3. Use your hands in order to move the tie rod end studs. 4. If abnormally difficult to move, replace the tie rod end. Refer to <u>Steering Linkage Outer Tie Rod Replacement</u>.		
	Did you find and complete the repair?	Go to Step 12	Go to Step 8
8	1. Use your hands to rotate the steering knuckle inboard and outboard in order to inspect for a binding strut bearings, ball joints, or axle. 2. Repair or replace any abnormally stiff or loose components.		
	Did you find and complete the repair?	Go to Step 12	Go to Step 9
9	Inspect for binding in the steering gear. If a binding is present repair or replace the steering gear. Refer to <u>Steering Gear Replacement (Electric Power Steering)</u>.		
	Did you find and complete the repair?	Go to Step 12	Go to Step 10
10	Inspect the wheel alignment and adjust as necessary. Refer to <u>Wheel Alignment Measurement</u> .		
	Did you find and complete the repair?	Go to Step 12	-
11	Inspect the steering column for a binding. If a binding is present, repair or replace the steering column as necessary. Refer to <u>Steering Column Replacement (Electric Power Steering)</u> .		
	Did you find and complete the repair?	Go to Step 12	-
12	Operate the system in order to verify the repair.		
	Did you correct the condition?	System OK	-

STEERING WHEEL SURGES/JERKS WHILE TURNING (ELECTRIC POWER STEERING)

Steering Wheel Surges/Jerks While Turning (Electric Power Steering)

Step	Action	Yes	No
1	Did you perform the Diagnostic Starting Point - Power Steering System?	Go to Step 2	Go to <u>Symptoms - Power Steering System (Electric Power Steering)</u>
2	Verify that the steering wheel surges/jerks while turning. Does the system operate normally?	System OK	Go to Step 3

3	Check for worn or binding front suspension components. Did you find and correct the condition?	Go to Step 14	Go to Step 4
4	1. Raise and support the vehicle. Refer to <u>Lifting and Jacking the Vehicle</u> . 2. Check for a binding or worn rack and pinion outer tie rod end. Is the rack and pinion outer tie rod end binding or worn?	Go to Step 10	Go to Step 5
5	Check for a worn or binding intermediate steering shaft. Is the intermediate steering shaft worn or binding?	Go to Step 11	Go to Step 6
6	Check for a worn or binding steering gear. Is the steering gear worn or binding?	Go to Step 12	Go to Step 7
7	Check for a worn or binding steering column. Is the steering column worn or binding?	Go to Step 13	Go to Step 8
8	Check for excessive heat in the electric power steering (EPS) motor. Does the EPS motor appear to be overheated?	Go to Step 9	Go to Step 13
9	NOTE: Do not perform excessive parking lot maneuvers during testing, that can cause the EPS motor to heat up. Allow the EPS motor to cool and retest the system. Did you correct the condition?	Go to Step 14	Go to Step 13
10	Replace the steering linkage outer tie rod end. Refer to <u>Steering Linkage Outer Tie Rod Replacement</u> . Did you complete the repair?	Go to Step 14	-
11	Replace the intermediate steering shaft. Refer to <u>Intermediate Steering Shaft Replacement</u> . Did you complete the repair?	Go to Step 14	-
12	Replace the steering gear. Refer to <u>Steering Gear Replacement (Electric Power Steering)</u> . Did you complete the repair?	Go to Step 14	-
13	Replace the steering column. Refer to <u>Steering Column Replacement (Electric Power Steering)</u> . Did you complete the repair?	Go to Step 14	-
14	Operate the system in order to verify the repair. Did you correct the condition?	System OK	Go to Step 3

REPAIR INSTRUCTIONS

STEERING LINKAGE OUTER TIE ROD REPLACEMENT

Fig. 2: Steering Linkage Outer Tie Rod And Nuts
 Courtesy of GENERAL MOTORS COMPANY

Steering Linkage Outer Tie Rod Replacement

Callout	Component Name
Preliminary Procedure Remove the tire and wheel assembly. Refer to <u>Tire and Wheel Removal and Installation</u> .	
1	Steering Linkage Tie Rod Nut CAUTION: Refer to <u>Fastener Caution</u> . Tighten 50 N.m (37 lb ft)
2	Steering Linkage Inner Tie Rod Nut Tighten 75 N.m (55 lb ft)
	Steering Linkage Outer Tie Rod Procedure 1. Use CH-161-B puller to separate the steering linkage outer tie rod from the steering knuckle.

3

2. Inspect the steering linkage inner tie rod for bent or damaged threads.
3. Clean the tapered surface of the steering knuckle.
4. Lubricate the steering linkage inner tie rod threads with chassis lubricant.
5. Adjust the front toe. Refer to **Wheel Alignment - Steering Wheel Angle and/or Front Toe Adjustment** .

Special Tools

CH-161-B Puller

For equivalent regional tools, refer to **Special Tools**.

STEERING GEAR BOOT REPLACEMENT

Special Tools

CH-804 Drive Axle Seal Clamp Pliers

For equivalent regional tools, refer to **Special Tools**.

Removal Procedure

Fig. 3: Steering Linkage Inner Tie Rod Nut

Courtesy of GENERAL MOTORS COMPANY

1. Remove the steering linkage outer tie rod. Refer to Steering Linkage Outer Tie Rod Replacement.
2. Remove the steering linkage inner tie rod nut (1).
3. Remove the steering gear outer boot clamp (2).

Fig. 4: Steering Gear Inner Boot Clamp

Courtesy of GENERAL MOTORS COMPANY

4. Loosen the steering gear inner boot clamp (1).

Fig. 5: Steering Gear Boot

Courtesy of GENERAL MOTORS COMPANY

NOTE: After removing the boot, inspect the steering linkage inner tie rod for evidence of corrosion or contamination. If none is evident, continue with the repair. If corrosion or contamination is evident, replace the inner tie rod.

5. Remove the steering gear boot (1).
6. Remove the steering gear inner boot clamp (2).

Installation Procedure

Fig. 6: Steering Gear Boot

Courtesy of GENERAL MOTORS COMPANY

1. Install a new clamp (2) loosely on the inner part of the steering gear boot.
2. Apply grease from the service kit to the indicated locations.

NOTE: **The steering gear boot must seat in the appropriate groove on the steering gear.**

3. Install the steering gear boot (1) over the steering linkage inner tie rod and onto the steering gear.

Fig. 7: Steering Gear Inner Boot Clamp
Courtesy of GENERAL MOTORS COMPANY

4. Using **CH-804** pliers crimp the inner steering gear boot clamp (1).

Fig. 8: Steering Linkage Inner Tie Rod Nut
Courtesy of GENERAL MOTORS COMPANY

5. Install the steering gear outer boot clamp (2).
6. Install the steering linkage inner tie rod nut (1).
7. Install the steering linkage outer tie rod. Refer to **Steering Linkage Outer Tie Rod Replacement**.

POWER STEERING CONTROL MODULE REPLACEMENT

Removal Procedure

1. Remove the steering column lower trim cover. Refer to **Steering Column Lower Trim Cover Replacement**.
2. Remove the inflatable restraint instrument panel lower module replacement of driver side, if equipped. Refer to **Instrument Panel Lower Airbag Replacement - Driver Side**.
3. Remove the steering column opening filler. Refer to **Steering Column Opening Filler Replacement**.
4. Remove the instrument panel lower reinforcement bracket. Refer to **Instrument Panel Lower Reinforcement Bracket Replacement**.
5. Disconnect the electric power steering module connectors.

Fig. 9: Electric Power Steering Module Bracket Bolts
Courtesy of GENERAL MOTORS COMPANY

6. Remove the electric power steering module bracket bolts (1).
7. Remove the electric power steering module and bracket assembly from the vehicle.

Fig. 10: Electric Power Steering Module And Bracket Bolts
Courtesy of GENERAL MOTORS COMPANY

8. Remove the electric power steering module to bracket bolts (1).
9. Remove the electric power steering module (2) from the electric power steering module bracket (3).

Installation Procedure

Fig. 11: Electric Power Steering Module And Bracket Bolts
Courtesy of GENERAL MOTORS COMPANY

1. Install the electric power steering module (2) to the electric power steering module bracket (3).
2. Install the electric power steering module to bracket bolts (1) and tighten to 3 (27 lb in).
3. Install the electric power steering module and bracket assembly to the vehicle.

Fig. 12: Electric Power Steering Module Bracket Bolts
Courtesy of GENERAL MOTORS COMPANY

4. Install the electric power steering module bracket bolts (1) and tighten to 18 (13 lb ft).
5. Connect the electric power steering module connectors.
6. Install the instrument panel lower reinforcement bracket. Refer to **Instrument Panel Lower Reinforcement Bracket Replacement** .
7. Install the steering column opening filler. Refer to **Steering Column Opening Filler Replacement**
8. Install the inflatable restraint instrument panel lower module replacement of driver side, if equipped. Refer to **Instrument Panel Lower Airbag Replacement - Driver Side** .
9. Install the steering column lower trim cover. Refer to **Steering Column Lower Trim Cover Replacement** .
10. If a new electric power steering control module is installed, program the electric power steering control module. Refer to **Power Steering Control Module Programming and Setup** .

STEERING GEAR REPLACEMENT (ELECTRIC POWER STEERING)

Removal Procedure

CAUTION: With wheels of the vehicle facing straight ahead, secure the steering wheel utilizing steering column anti-rotation pin, steering column

lock, or a strap to prevent rotation. Locking of the steering column will prevent damage and a possible malfunction of the SIR system. The steering wheel must be secured in position before disconnecting the following components:

- The steering column
- The intermediate shaft(s)
- The steering gear

After disconnecting these components, do not rotate the steering wheel or move the front tires and wheels. Failure to follow this procedure may cause the SIR coil assembly to become un-centered and cause possible damage to the SIR coil. If you think the SIR coil has become un-centered, refer to your specific SIR coil's centering procedure to re-center SIR Coil.

1. Turn the steering wheel to the straight ahead position and lock it in place.
2. Remove the front tire/wheel assemblies. Refer to **Tire and Wheel Removal and Installation** .

Fig. 13: Intermediate Steering Shaft Lower Bolt
Courtesy of GENERAL MOTORS COMPANY

3. Remove the intermediate steering shaft lower bolt (1) and disconnect the intermediate steering shaft from the steering gear assembly. Refer to **Intermediate Steering Shaft Replacement** .
4. Separate both of the steering linkage outer tie rod ends. Refer to **Steering Linkage Outer Tie Rod Replacement**.
5. Remove both of the upper stabilizer shaft link nuts and separate the left and right stabilizer shaft link from the strut. Refer to **Stabilizer Shaft Link Replacement**
6. Remove the transmission rear mount. Refer to **Transmission Rear Mount Replacement (MX2, MFM)** .
7. Using a suitable support, lower the drivetrain and front suspension frame to replace the power steering gear. Refer to **Drivetrain and Front Suspension Frame Replacement (with EN-49802)** , **Drivetrain and Front Suspension Frame Replacement (with CH-49289)** .

Fig. 14: Steering Gear
Courtesy of GENERAL MOTORS COMPANY

8. Remove the steering gear bolts (1).
9. Remove the steering gear (2) from the drivetrain and front suspension frame.

Installation Procedure

Fig. 15: Steering Gear

Courtesy of GENERAL MOTORS COMPANY

1. Install the steering gear (2) from the drivetrain and front suspension frame.

CAUTION: Refer to Fastener Caution .

2. Install the steering gear bolts (1) and tighten to 110 (81 lb ft).
3. Install the drivetrain and front suspension frame to the vehicle. Refer to **Drivetrain and Front Suspension Frame Replacement (with EN-49802)** , **Drivetrain and Front Suspension Frame Replacement (with CH-49289)** .
4. Install the transmission rear mount. Refer to **Transmission Rear Mount Replacement (MX2, MFM)** .
5. Install the left and right stabilizer shaft link to the strut. Refer to **Stabilizer Shaft Link Replacement** .
6. Install both of the steering linkage outer tie rod ends. Refer to **Steering Linkage Outer Tie Rod Replacement**.

Fig. 16: Intermediate Steering Shaft Lower Bolt
Courtesy of GENERAL MOTORS COMPANY

7. Install the lower intermediate steering shaft to the steering gear and install the intermediate steering shaft lower bolt (1). Refer to **Intermediate Steering Shaft Replacement** .
8. Install the front tire/wheel assemblies. Refer to **Tire and Wheel Removal and Installation** .
9. Adjust the front toe. Refer to **Wheel Alignment - Steering Wheel Angle and/or Front Toe Adjustment** .

DESCRIPTION AND OPERATION

POWER STEERING SYSTEM DESCRIPTION AND OPERATION (ELECTRIC POWER STEERING)

The electric power steering system reduces the amount of effort needed to steer the vehicle. The system uses the body control module, power steering control module, torque sensor, discrete battery voltage supply circuit, electric power steering motor, serial data bus, and the instrument panel cluster message center to perform the system functions. Any electric power steering components diagnosed to be malfunctioning requires replacement of the steering column assembly, also known as the electric power steering assembly.

Torque Sensor

The power steering control module uses a torque sensor as it's main input for determining the amount of steering assist. The steering column has an input shaft, from the steering wheel to the torque sensor, and an output shaft, from the torque sensor to the steering shaft coupler. The input and output shafts are separated by a torsion bar, where the torque sensor is located. The sensor consists of a compensation coil, detecting coil and 3 detecting rings. These detecting rings have toothed edges that face each other. Detecting ring 1 is fixed to the output shaft, detecting rings 2 and 3 are fixed top the input shaft. The detecting coil is positioned around the toothed edges of detecting rings 1 and 2. As torque is applied to the steering column shaft the alignment of the teeth between detecting rings 1 and 2 changes, which causes the detecting coil signal voltage to change. The power steering control module recognizes this change in signal voltage as steering column shaft torque. The compensation coil is used to compensate for changes in electrical circuit impedance due to circuit temperature changes from the electrical current and voltage levels as well as ambient temperatures for accurate torque detection.

EPS Motor

The electric power steering motor is a 12-volt brushed DC reversible motor. The motor assists steering through a worm shaft and reduction gear located in the steering column housing.

Power Steering Control Module

The power steering control module uses a combination of torque sensor inputs, vehicle speed, calculated system temperature and the steering calibration to determine the amount of steering assist. When the steering wheel is turned, the power steering control module uses signal voltage from the torque sensor to detect the amount of torque being applied to the steering column shaft and the amount of current to command to the electric power steering motor. The power steering control module receives serial data from the engine control module to determine vehicle speed. At low speeds more assist is provided for easy turning during parking maneuvers. At high speeds, less assist is provided for improved road feel and directional stability. In this mode the power steering control module will limit the amount of current commanded to the electric power steering motor which reduces steering assist levels. The power steering control module also chooses which steering calibration to use when the ignition is turned ON, based on the production map number stored in the body control module. The power steering control module contains all 8 of the steering calibrations which are different in relation to the vehicles RPOs. The power steering control module has the ability to detect malfunctions within the electric power steering system. Any malfunction detected will cause the instrument panel cluster message center to display a warning message.

REPAIR INSTRUCTIONS

BODY CONTROL MODULE PROGRAMMING AND SETUP

NOTE:

- **DO NOT** program a control module unless directed to by a service procedure or a service bulletin. If the control module is not properly configured with the correct calibration software, the control module will not control all of the vehicle features properly.
- Ensure the programming tool is equipped with the latest software and is securely connected to the data link connector. If there is an interruption during programming, programming failure or control module damage may occur.
- Stable battery voltage is critical during programming. Any fluctuation, spiking, over voltage or loss of voltage will interrupt programming. When required install the EL-49642 SPS Programming Support Tool to maintain system voltage. If not available, connect a fully charged 12 V jumper or booster pack disconnected from the AC voltage supply. **DO NOT** connect a battery charger.
- Turn OFF or disable systems that may put a load on the vehicles battery such as; interior lights, exterior lights (including daytime running lights), HVAC, radio, etc.
- During the programming procedure, follow the SPS prompts for the correct ignition switch position.
- Clear DTCs after programming is complete. Clearing powertrain DTCs will set the Inspection/Maintenance (I/M) system status indicators to NO.

Reference Information

Special Tools

- **EL-49642** SPS Programming Support Tool
- **EL-46079** Tire Pressure Monitor Diagnostic Tool

For equivalent regional tools, refer to **Special Tools**.

Replace and Program Control Module

To program a replacement K9 Body Control Module (BCM), perform the following procedure:

1. Install **EL-49642** SPS programming support tool.

NOTE:

Make sure the vehicle ignition switch state is in appropriate position for the following step.

- For Key Ignition System, begin with the ignition in the RUN position.

- **For Push Button Start System, begin with the vehicle in vehicle OFF power mode. The Service Programming System will power mode the vehicle.**

2. Access the Service Programming System (SPS) and follow the on-screen instructions.
3. On the SPS Supported Controllers screen, select K9 Body Control Module - Programming and follow the on-screen instructions.
4. Perform the following for the appropriate ignition type prior to proceeding with the next step:
 - Key Ignition System: Key in the ignition and any additional keys must be away from the vehicle at least 3 m.
 - Push Button Start System: Keyless entry transmitter must be in the programming pocket. Refer to the owner manual for the exact pocket location. All additional transmitters must be away from the vehicle at least 3 m.

NOTE: The following programming step may take between 10-12 min and progress will appear to have stopped during this process. This is a normal security timer response and a restart should not be performed. If the DTC B389A set immediately after programming a replacement BCM, the Immobilizer Learn procedure was not properly completed. The Immobilizer Learn procedure needs to be performed again.

5. On the SPS Supported Controllers screen, select IMMO Immobilizer Learn - Setup. On the next screen, select Body Control Module IMMO Learn with Existing Transponder or Remote Key and follow the on-screen instructions. When Immobilizer Learn is complete, press the Unlock button on the keyless entry transmitter to allow the keyless entry transmitter to exit the Immobilizer Learn mode.

NOTE: When performing the Tire Pressure Monitor Sensor Learn during BCM setup, the EL-46079 tire pressure monitor diagnostic tool must be used to activate each tire pressure sensor for vehicles with UJM.

- **For Key Ignition System, begin with the ignition in the RUN position.**
- **For Push Button Start System, begin with the vehicle in vehicle ON power mode.**

6. On the SPS Supported Controllers screen, select K9 Body Control Module - Setup (or K9 Body Control Module - Configuration & Setup) and follow the on-screen instructions.
7. Check the driver information center display for additional messages regarding further calibration instructions. If there are no additional driver information center instructions present, programming is complete.
8. At the end of programming, choose the "Clear DTCs" function on the SPS screen.
9. If ABS, Traction Control and/or Stabilitrak indicators are ON and DTC C0161 is set in the K17 Electronic Brake Control Module after performing BCM programming and setup, do the following:
 1. Disconnect the scan tool from the X84 Data Link Connector.
 2. Ignition OFF, all access doors closed, all vehicle systems OFF, and all keys at least 3 m (9.8 ft)

away from the vehicle. It may take up to 2 min to power down.

3. Ignition ON, verify DTC C0161 is in history. If not, repeat the above step to make sure the vehicle is in sleep mode.
4. Use the scan tool to clear the DTCs.

Reprogram Control Module

To program an existing K9 Body Control Module, perform the following procedure:

1. Install **EL-49642** SPS programming support tool.

NOTE: **Make sure the vehicle ignition switch state is in appropriate position for the following step.**

- **For Key Ignition System, begin with the ignition in the RUN position.**
- **For Push Button Start System, begin with the vehicle in vehicle ON power mode.**

2. Access the Service Programming System (SPS) and follow the on-screen instructions.
3. On the SPS Supported Controllers screen, select K9 Body Control Module - Programming and follow the on-screen instructions.

NOTE: **When performing the Tire Pressure Monitor Sensor Learn during BCM setup, the EL-46079 tire pressure monitor diagnostic tool must be used to activate each tire pressure sensor for vehicles with UJM.**

4. On the SPS Supported Controllers screen, select K9 Body Control Module - Setup (or K9 Body Control Module - Configuration & Setup) and follow the on-screen instructions.
5. Check the driver information center display for additional messages regarding further calibration instructions. If there are no additional driver information center instructions present, programming is complete.
6. At the end of programming, choose the "Clear DTCs" function on the SPS screen.
7. If ABS, Traction Control and/or Stabilitrak indicators are ON and DTC C0161 is set in the K17 Electronic Brake Control Module after performing BCM programming and setup, do the following:
 1. Disconnect the scan tool from the X84 Data Link Connector.
 2. Ignition OFF, all access doors closed, all vehicle systems OFF, and all keys at least 3 m (9.8 ft) away from the vehicle. It may take up to 2 min to power down.
 3. Ignition ON, verify DTC C0161 is in history. If not, repeat the above step to make sure the vehicle is in sleep mode.
 4. Use the scan tool to clear the DTCs.

Unsuccessful Programming Recovery

In the event of an interrupted or unsuccessful programming event, perform the following steps:

1. Ignition ON. Ensure the control module, DLC and programming tool connections are secure and the SPS software is up to date.
2. Verify the control module can be reprogrammed.
 - **If the control module cannot be reprogrammed**
 1. Ignition OFF for one minute, ignition ON.
 2. Verify the control module can be reprogrammed.
 - If the control module cannot be reprogrammed, replace the control module.
 - If the control module can be reprogrammed.
 3. All OK.
 - **If the control module can be reprogrammed**
3. All OK.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

Control Module References for Control Module replacement, programming and setup

CONTROL SOLENOID VALVE AND TRANSMISSION CONTROL MODULE ASSEMBLY PROGRAMMING AND SETUP (CVT)

The following service procedures require either a programming or a setup event be performed for a complete repair.

NOTE: **If replacing both the transmission control module and the transmission assembly, replace the transmission first and then the transmission control module.**

Transmission Control Module (TCM) Replacement

If the TCM is replaced, the following procedures must be performed:

1. TCM Reprogramming. Refer to **Service Programming System (SPS)**.
2. The Transmission Adaptive Pressure Reset - Refer to **Transmission Adaptive Pressure Reset** .

Transmission Control Module (TCM) Reprogramming

NOTE: **Use a scan tool to view and record the Transmission Control Module - End Model Part Number in the original TCM prior to starting the TCM reprogramming procedure.**

1. If the TCM needs to be reprogrammed, refer to **Service Programming System (SPS)**.
2. Perform the Transmission Adaptive Pressure Reset. Refer to **Transmission Adaptive Pressure Reset** .

NOTE: After programming, perform the following to avoid future misdiagnosis:

1. Turn the ignition OFF for 30 seconds.
2. Turn the ignition ON with the engine OFF.
3. Use the scan tool in order to retrieve history DTCs from all modules.
4. Clear all history DTCs.

Transmission Replacement

NOTE: The Read Only Memory (ROM) is part of the control solenoid valve assembly which is part of the transmission assembly, and is not serviced separately.

Perform the Transmission Adaptive Pressure Reset. Refer to Transmission Adaptive Pressure Reset .

ELECTRONIC BRAKE CONTROL MODULE PROGRAMMING AND SETUP

- NOTE:**
- DO NOT program a control module unless directed to by a service procedure or a service bulletin. If the ECU is not properly configured with the correct calibration software, the ECU will not control all of the vehicle features properly.
 - Ensure the programming tool is equipped with the latest software and is securely connected to the data link connector. If there is an interruption during programming, programming failure or ECU damage may occur.
 - Stable battery voltage is critical during programming. Any fluctuation, spiking, over voltage or loss of voltage will interrupt programming. Install the EL-49642 SPS Programming Support Tool to maintain system voltage. If not available, connect a fully charged 12 V jumper or booster pack disconnected from the AC voltage supply. DO NOT connect a battery charger.
 - Turn OFF or disable systems that may put a load on the vehicles battery such as; interior lights, exterior lights (including daytime running lights), HVAC, radio, etc.
 - During the programming procedure, follow the SPS prompts for the correct ignition switch position.
 - Clear DTCs after programming is complete. Clearing powertrain DTCs will set the Inspection/Maintenance (I/M) system status indicators to NO.

Special Tools

EL-49642 SPS Programming Support Tool

For equivalent regional tools, refer to Special Tools.

Replace and Program EBCM or Reprogram EBCM

To program a replacement or an existing EBCM, perform the following procedure:

1. Install **EL-49642** SPS programming support tool.
2. Access the Service Programming System (SPS) and follow the on-screen instructions.
3. On the SPS Supported Controllers screen, select Electronic Brake Control Module-Programming and follow the on-screen instructions.
4. On the SPS Supported Controllers screen, select Electronic Brake Control Module-Setup and follow the on-screen instructions.
5. On the SPS Supported Controllers screen, select Electronic Brake Control Module-Configuration and follow the on-screen instructions.
6. At the end of programming, choose the "Clear All DTCs" function on the SPS screen.

Unsuccessful Programming Recovery

In the event of an interrupted or unsuccessful programming event, perform the following steps:

1. DO NOT turn the Ignition OFF. Ensure that all ECU, DLC and programming tool connections are secure and the TIS terminal operating software is up to date.
2. Attempt to reprogram the ECU.
3. If the ECU can still not be programmed, turn the Ignition OFF for at least one minute.
4. Turn the Ignition ON, and attempt to reprogram the ECU. The ECU should program.
 - If the ECU still cannot be programmed, replace the ECU.

K20 ENGINE CONTROL MODULE: PROGRAMMING AND SETUP (LC5)

Before Programming The Engine Control Module

The following service procedures require either a programming or a setup event performed for a complete repair.

NOTE: **DO NOT program a control module unless you are directed by a service procedure or you are directed by a service bulletin. Programming a control module at any other time will not permanently correct a customers concern.**

The following criteria must be met before performing the programming or learning procedure:

- Vehicle system voltage
- There is no charging system concern. All charging system concerns must be repaired before programming a control module.
- Battery voltage is between 12-16 V. The battery must be charged before programming the control module if the battery voltage is low.
- A battery charger is NOT connected to the vehicle battery. Incorrect system voltage or voltage fluctuations from a battery charger may cause programming failure or control module damage.
- Turn OFF or disable any of the following systems that may put a load on the vehicle battery:

- Twilight sentinel
- Interior lights
- Daytime running lights
- HVAC systems
- Engine cooling fans, etc.
- The ignition switch is in the proper position. The scan tool prompts you to turn ON the ignition, with the engine OFF. DO NOT change the position of the ignition switch during the programming procedure, unless instructed to do so.
- All of the following tool connections are secure:
 - The connection at the data link connector (DLC)
 - The voltage supply circuits

DO NOT disturb the tool harnesses while programming. If an interruption occurs during the programming procedure, programming failure or control module damage may occur.

ECM Replacement

If the engine control module (ECM) is replaced, the following procedures must be performed:

1. Connect a scan tool to the vehicle and access SPS. Refer to **Service Programming System (SPS)**.

NOTE: **The Prepare Control Module for Removal function can only be performed when communication with the old control module is still possible.**

2. Before removing the old control module, perform the SPS function Prepare Control Module for Removal.
3. Replace the ECM.
4. Perform the SPS function Engine Control Module - Programming and follow the on-screen instructions.
5. Perform the SPS Function Immobilizer Learn. Refer to **Immobilizer System Component Programming**.
6. Clear DTCs after completing the programming procedure.
7. Start and idle engine.
8. Perform the throttle/idle learn. Refer to **Q38 Throttle Body: Throttle/Idle Learn**
9. Perform the crankshaft position system learn. Refer to **Crankshaft Position System Variation Learn**

ECM Reprogramming

If the engine control module (ECM) needs to be reprogrammed, the following procedures must be performed:

1. Connect a scan tool to the vehicle and access SPS. Refer to **Service Programming System (SPS)**.
2. Perform the SPS function Engine Control Module - Programming and follow the on-screen instructions.

Setup for Component Replacement

If any of the following components are replaced or repaired, perform the idle learn procedure. Refer to **Q38 Throttle Body: Throttle/Idle Learn** .

- The throttle body assembly is replaced.
- The throttle body is cleaned.
- The engine control module (ECM) is replaced.
- The idle air control valve (IAC) is replaced.

FX3 only- If any of the following components are replaced or repaired, perform the crankshaft position system variation learn procedure.

Refer to **Crankshaft Position System Variation Learn**

- The engine assembly is replaced
- The engine control module (ECM) is replaced
- The crankshaft is replaced
- The crankshaft position sensor is replaced
- Any engine repairs which disturb the crankshaft to crankshaft position sensor relationship.

K20 ENGINE CONTROL MODULE: PROGRAMMING AND SETUP (LL0)

Special Tools

EL-49642 SPS Programming Support Tool

For equivalent regional tools, refer to **Special Tools**.

NOTE:

- **DO NOT** program a control module unless directed to by a service procedure or a service bulletin. If the control module is not properly configured with the correct calibration software, the control module will not control all of the vehicle features properly.
- Ensure the programming tool is equipped with the latest software and is securely connected to the data link connector. If there is an interruption during programming, programming failure or control module damage may occur.
- Stable battery voltage is critical during programming. Any fluctuation, spiking, over voltage or loss of voltage will interrupt programming. When required install the EL-49642 SPS Programming Support Tool to maintain system voltage. If not available, connect a fully charged 12 V jumper or booster pack disconnected from the AC voltage supply. **DO NOT** connect a battery charger.
- Turn OFF or disable systems that may put a load on the vehicles battery such as; interior lights, exterior lights (including daytime running lights), HVAC, radio, etc.

- During the programming procedure, follow the SPS prompts for the correct ignition switch position.
- Clear DTCs after programming is complete. Clearing powertrain DTCs will set the Inspection/Maintenance (I/M) system status indicators to NO.
- Note the engine oil life remaining percentage.

Replace and Program Control Module

To program a replacement K20 Engine Control Module (ECM), perform the following procedure:

1. Install **EL-49642** SPS programming support tool.
2. Access the Service Programming System (SPS) and follow the on-screen instructions.
3. Before removing the old control module, perform the SPS function Prepare Control Module for Removal, if available.

NOTE: The Prepare Control Module for Removal function can only be performed when communication with the old control module is still possible.

4. Replace the ECM.
5. Perform the SPS function K20 Engine Control Module - Programming and follow the on-screen instructions.
6. Clear the DTCs after completing the Programming procedure.
7. Perform the SPS function Immobilizer Learn and follow the on-screen instructions. Refer to **Immobilizer System Component Programming**.
8. Perform the SPS function K20 Engine Control Module - Configuration & Setup and follow the on-screen instructions.
9. Clear DTCs after completing the Configuration & Setup procedure.

Reprogram Control Module

To reprogram an existing K20 Engine Control Module, perform the following procedure:

1. Install **EL-49642** SPS programming support tool.
2. Access the Service Programming System (SPS) and follow the on-screen instructions.
3. Clear DTCs after completing the Programming procedure.

NOTE: If vehicle fails to start during Configuration and Setup, perform the SPS Function Immobilizer Learn and follow the on-screen instructions.

4. Perform the SPS function Engine Control Module - Configuration & Setup and follow the on-screen instructions, if available.
5. Clear DTCs after completing the Configuration & Setup procedure.

Unsuccessful Programming Recovery

In the event of an interrupted or unsuccessful programming event, perform the following:

1. Ignition ON. Ensure the control module, DLC, and programming tool connections are secure and the SPS software is up to date.
2. Verify the control module can be reprogrammed.
 - **If the control module cannot be reprogrammed**
 1. Ignition OFF for one minute, ignition ON.
 2. Verify the control module can be reprogrammed.
 - If the control module cannot be reprogrammed, replace the K20 Engine Control Module.
 - **If the control module can be reprogrammed**
3. All OK.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

Control Module References for ECM replacement, programming and setup.

HVAC SYSTEM CONTROL MODULE PROGRAMMING AND SETUP

This device requires no programming or setup.

IMMOBILIZER CONTROL MODULE PROGRAMMING AND SETUP

Replace and Program ECU or Reprogram ECU

This ECU does not require SPS programming or any setup procedures.

INFLATABLE RESTRAINT SENSING AND DIAGNOSTIC MODULE PROGRAMMING AND SETUP

The inflatable restraint sensing and diagnostic module (SDM) must be programmed with the proper calibration software. The module stores and utilizes this information however if it is not properly configured with the correct calibration software, the SDM will not control all of the vehicle features properly.

Ensure that the following conditions exist in order to prepare for SDM programming:

1. The battery is fully charged.
2. The MDI data link connectors are secure.
3. The scan tool is loaded with the most current software version.
4. All disconnected modules and devices are reconnected securely.
5. This entire procedure has been reviewed before proceeding.

Do not reprogram the SDM unless directed by a service procedure or a service bulletin.

NOTE:

- The air bag indicator light may remain ON after the body control module (BCM), or SDM is replaced, and during the programming procedure for the BCM until after the procedure is completed. When installing a new SDM, there may be several DTCs set prior to programming. Once programmed, these DTCs should be in history and can be cleared.
- Failure to complete the following Setup procedure may cause DTC B1001 to be set in the SDM.

The following service procedures require either a programming or a setup event performed for a complete repair:

Sensing and Diagnostic Module Replacement and/or Programming

If the inflatable restraint sensing and diagnostic module needs to be replaced and/or reprogrammed, the following procedures must be performed:

1. Access SPS. Refer to **Service Programming System (SPS)**.
2. Perform the SPS function Inflatable Restraint Sensing and Diagnostic Module Programming and follow the on-screen instructions.
3. Perform the SPS function Inflatable Restraint Sensing and Diagnostic Module Setup and follow the on-screen instructions.
4. Clear DTCs after completing the programming procedure.

If the control module fails to program, proceed as follows:

1. Ensure the DLC and Accessory Power Module connections are good.
2. Inspect the Techline equipment for the latest software version.
3. Attempt to program the SDM. If the SDM still cannot be programmed properly, replace the SDM.

INSTRUMENT CLUSTER PROGRAMMING AND SETUP

Special Tools

EL-49642 SPS Programming Support Tool

For equivalent regional tools, refer to **Special Tools**.

NOTE:

- **DO NOT** program a control module unless directed to by a service procedure or a service bulletin. If the ECU is not properly configured with the correct calibration software, the ECU will not control all of the vehicle features properly.
- Ensure the programming tool is equipped with the latest software and is

securely connected to the data link connector. If there is an interruption during programming, programming failure or ECU damage may occur.

- **Stable battery voltage is critical during programming.** Any fluctuation, spiking, over voltage or loss of voltage will interrupt programming. Install the EL-49642 SPS programming support tool to maintain system voltage. If not available, connect a fully charged 12 V jumper or booster pack disconnected from the AC voltage supply. **DO NOT** connect a battery charger.
- **Turn OFF or disable systems that may put a load on the vehicles battery** such as; interior lights, exterior lights (including daytime running lights), HVAC, radio, etc.
- **During the programming procedure, follow the SPS prompts for the correct ignition switch position.**
- **Clear DTCs after programming is complete.** Clearing powertrain DTCs will set the Inspection/Maintenance (I/M) system status indicators to NO.

Replace and Program ECU or Reprogram ECU

To program a replacement or an existing ECU, perform the following procedure:

1. Install **EL-49642** SPS programming support tool.
2. Access the Service Programming System (SPS) and follow the on-screen instructions.
3. On the SPS Supported Controllers screen, select Instrument Cluster - Programming and follow the on-screen instructions.
4. On the SPS Supported Controllers screen, select Instrument Cluster - Setup and follow the on-screen instructions.
5. On the SPS Supported Controllers screen, select Instrument Cluster - Configuration and follow the on-screen instructions.
6. At the end of programming, choose the "Clear All DTCs" function on the SPS screen.

Unsuccessful Programming Recovery

In the event of an interrupted or unsuccessful programming event, perform the following steps:

1. **DO NOT** turn the ignition OFF. Ensure that all ECU, DLC and programming tool connections are secure and the TIS terminal operating software is up to date.
2. Attempt to reprogram the ECU.
3. If the ECU can still not be programmed, turn the ignition OFF for at least one minute.
4. Turn the ignition ON and attempt to reprogram the ECU. The ECU should program.
 - If the ECU still cannot be programmed, replace the ECU.

OBJECT ALARM MODULE PROGRAMMING AND SETUP

The K41R Rear Parking Assist Control Module requires no programming or setup.

PASSENGER PRESENCE SYSTEM PROGRAMMING AND SETUP

When the passenger presence system is replaced or serviced, perform the rezeroing procedure for the passenger presence system. Refer to **Passenger Presence System Rezeroing** for the rezeroing procedure.

POWER STEERING CONTROL MODULE PROGRAMMING AND SETUP

NOTE:

- **DO NOT** program a control module unless directed to by a service procedure or a service bulletin. If the control module is not properly configured with the correct calibration software, the control module will not control all of the vehicle features properly.
- Ensure the programming tool is equipped with the latest software and is securely connected to the data link connector. If there is an interruption during programming, programming failure or control module damage may occur.
- Stable battery voltage is critical during programming. Any fluctuation, spiking, over voltage or loss of voltage will interrupt programming. When required install the EL-49642 SPS Programming Support Tool to maintain system voltage. If not available, connect a fully charged 12 V jumper or booster pack disconnected from the AC voltage supply. **DO NOT** connect a battery charger.
- Turn OFF or disable systems that may put a load on the vehicles battery such as; interior lights, exterior lights (including daytime running lights), HVAC, radio, etc.
- During the programming procedure, follow the SPS prompts for the correct ignition switch position.
- Clear DTCs after programming is complete. Clearing powertrain DTCs will set the Inspection/Maintenance (I/M) system status indicators to NO.

Diagnostic Aids

The internal steering wheel angle sensor does not require a centering often. Centering of the internal steering wheel angle sensor might be required after certain service procedures are performed. Some of these procedures are as follows:

- Power Steering Control module replacement
- Steering column replacement
- Collision or other physical damage to steering or suspension components

Certain steering symptoms can be corrected by performing the steering wheel angle sensor centering procedures such as:

- Poor, or uneven return to center
- Poor, or uneven on center feel

Reference Information

Special Tools

EL-49642 SPS Programming Support Tool

For equivalent regional tools, refer to **Special Tools**.

Replace and Program Control Module or Reprogram Control Module

This control module does not require SPS programming or any setup procedures.

This control module does not require SPS programming but does require the following setup procedures after a new control module is installed:

To program a replacement or an existing control module, perform the following procedure:

1. Install **EL-49642** SPS Programming Support Tool.
2. Using the steering wheel, align and center the front wheels forward.
3. Apply the parking brake, and set the transmission in Park if equipped with an automatic transmission.
4. Turn ON the ignition, with the engine OFF.
5. Access the Service Programming System (SPS) and follow the on-screen instructions.
6. On the SPS Supported Controllers screen, select Power Steering Control Module - Programming and follow the on-screen instructions.
7. Using a scan tool, select Power Steering Control Module and perform the Configuration/Reset Functions, Steering Wheel Angle Sensor Centering procedure and follow the on-screen instructions.
8. Clear all DTCs after completing the programming and setup procedures.
9. Turn OFF the ignition.

Unsuccessful Programming Recovery

In the event of an interrupted or unsuccessful programming event, perform the following steps:

1. Ignition ON. Ensure the control module, DLC and programming tool connections are secure and the SPS software is up to date.
2. Verify the control module can be reprogrammed.
 - **If the control module cannot be reprogrammed**
 1. Ignition OFF for one minute, ignition ON.
 2. Verify the control module can be reprogrammed.
 - If the control module cannot be reprogrammed, replace the control module.
 - If the control module can be reprogrammed.
 - 3. All OK.
 - **If the control module can be reprogrammed**

3. All OK.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

Control Module References for Control Module replacement, programming and setup.

RADIO PROGRAMMING AND SETUP (2GB, UM7)

NOTE:

- **DO NOT** program a control module unless directed to by a service procedure or a service bulletin. If the ECU is not properly configured with the correct calibration software, the ECU will not control all of the vehicle features properly.
- Ensure the programming tool is equipped with the latest software and is securely connected to the data link connector. If there is an interruption during programming, programming failure or ECU damage may occur.
- Stable battery voltage is critical during programming. Any fluctuation, spiking, over voltage or loss of voltage will interrupt programming. Install the EL-49642 SPS Programming Support Tool to maintain system voltage. If not available, connect a fully charged 12 V jumper or booster pack disconnected from the AC voltage supply. **DO NOT** connect a battery charger.
- Turn OFF or disable systems that may put a load on the vehicles battery such as; interior lights, exterior lights (including daytime running lights), HVAC, radio, etc.
- During the programming procedure, follow the SPS prompts for the correct ignition switch position.
- Clear DTCs after programming is complete. Clearing powertrain DTCs will set the Inspection/Maintenance (I/M) system status indicators to NO.

Diagnostic Aids

- During radio programming you may be required to select multiple calibrations dependant upon vehicle equipment. Have the vehicle build/RPO information available during the following procedure to ensure the correct calibrations are selected.
- The XM satellite radio (if equipped) is integrated into the radio. If XM was activated in the previous radio, the replacement radio will require no additional activation steps. Customer subscription information is transferred to the replacement radio when a replacement radio is ordered.

Reference Information

Special Tools

EL-49642 SPS Programming Support Tool

For equivalent regional tools, refer to **Special Tools**.

Replace and Program Control Module or Reprogram Control Module

To program a replacement or an existing ECU, perform the following procedure:

1. Install **EL-49642** SPS Programming Support Tool.
2. Access the Service Programming System (SPS) and follow the on-screen instructions.
3. On the SPS Supported Controllers screen, select A11 Radio - Programming and follow the on-screen instructions.
4. At the end of programming, choose the "Clear All DTCs" function on the SPS screen.

Unsuccessful Programming Recovery

In the event of an interrupted or unsuccessful programming event, perform the following steps:

1. Ignition ON. Ensure the control module, DLC and programming tool connections are secure and the SPS software is up to date.
2. Verify the control module can be reprogrammed.
 - **If the control module cannot be reprogrammed**
 1. Ignition OFF for one minute, ignition ON.
 2. Verify the control module can be reprogrammed.
 - If the control module cannot be reprogrammed, replace the control module.
 - If the control module can be reprogrammed.
 3. All OK.
 - **If the control module can be reprogrammed**
3. All OK.

RADIO PROGRAMMING AND SETUP (UF7, UH7)

NOTE:

- **DO NOT** program a control module unless directed to by a service procedure or a service bulletin. If the ECU is not properly configured with the correct calibration software, the ECU will not control all of the vehicle features properly.
- Ensure the programming tool is equipped with the latest software and is securely connected to the data link connector. If there is an interruption during programming, programming failure or ECU damage may occur.
- Stable battery voltage is critical during programming. Any fluctuation, spiking, over voltage or loss of voltage will interrupt programming. Install the EL-49642 SPS programming support tool to maintain system voltage. If not available, connect a fully charged 12 V jumper or booster pack disconnected from the AC voltage supply. **DO NOT** connect a battery charger.

- **Turn OFF or disable systems that may put a load on the vehicles battery such as; interior lights, exterior lights (including daytime running lights), HVAC, radio, etc.**
- **During the programming procedure, follow the SPS prompts for the correct ignition switch position.**
- **Clear DTCs after programming is complete. Clearing powertrain DTCs will set the Inspection/Maintenance (I/M) system status indicators to NO.**

Diagnostic Aids

- If programming of the control module is being performed at the direction of a bulletin or PI, follow the instructions provided in that document.
- During audio system programming you may be required to select multiple calibrations dependent upon vehicle equipment. Have the vehicle build/RPO information available during the following procedure to ensure the correct calibrations are selected.
- Dependant upon vehicle equipment, the current software level of the module, or the release of updates, USB programming may not be required when replacing/reprogramming the control module. If USB files for the application are not available via SPS, or have not been received from General Motors in another manner of distribution, the USB update process will not need to be performed.
- The length of time for the USB programming to complete will vary depending on the number and size of the files in the update.
- All data will be erased from the USB device BEFORE the calibration is downloaded onto the device. To ensure important information is NOT erased, always verify that NO information is stored on the device BEFORE beginning the calibration download. If required, transfer important files to another storage device BEFORE beginning the calibration download.
- The XM satellite radio (if equipped) is integrated into the radio. If XM was activated in the previous radio, the replacement radio will require no additional activation steps. Customer subscription information is transferred to the replacement radio when a replacement radio is ordered.

Reference Information

Special Tools

- **EL-49642** SPS Programming Support Tool
- USB 2.0 flash drive with a minimum capacity of 4 GB.

For equivalent regional tools, refer to **Special Tools**.

Replace and Program Control Module or Reprogram Control Module

To program a replacement or an existing control module, perform the following procedure:

1. Install the **EL-49642** SPS Programming Support Tool.
2. Access the Service Programming System (SPS) and follow the on-screen instructions.
3. On the SPS Supported Controllers screen, select A11 Radio - Programming, and follow the on-screen

instructions.

4. When programming is complete, access the Service Programming System (SPS) and follow the on-screen instructions.
5. Connect a USB drive to the computer.

NOTE: **If using a pre-configured USB drive supplied by General Motors, proceed to step 8.**

6. On the SPS Supported Controllers screen, select A11 Radio - USB File Transfer, and follow the on-screen instructions.

NOTE:

- **If there are no files available for USB transfer via SPS, proceed to step 12.**
- **All existing files on the USB drive will be erased when the new files are copied.**

7. Upon completion of the file transfer, remove the USB drive from the computer.
8. Ignition ON, radio ON.
9. Connect the USB drive to the USB port in the vehicle.
10. Using the radio controls, select the following: Config>Radio Settings>Software Versions Menu>Update Radio Software. Follow the infotainment display on-screen instructions and select Update when prompted. Programming will take several minutes.
11. When programming is complete, remove the USB device from the vehicle USB port.
12. At the end of programming, choose the "Clear DTCs" function on the SPS screen.

Unsuccessful Programming Recovery

In the event of an interrupted or unsuccessful programming event, perform the following steps:

1. Ignition ON. Ensure the control module, DLC and programming tool connections are secure and the SPS software is up to date.
2. Verify the control module can be reprogrammed.
 - **If the control module cannot be reprogrammed**
 1. Ignition OFF for one minute, ignition ON.
 2. Verify the control module can be reprogrammed.
 - If the control module cannot be reprogrammed, replace the control module.
 - If the control module can be reprogrammed.
 3. All OK.
 - **If the control module can be reprogrammed**
3. All OK.

REMOTE CONTROL DOOR LOCK RECEIVER PROGRAMMING AND SETUP

Diagnostic Aids

The remote control door lock receiver only functions as an antenna, receiving the signals sent by the keyless entry transmitter and forwarding them to the body control module (BCM). The keyless entry software is contained wholly within the BCM.

Replace and Program ECU or Reprogram ECU

This ECU does not require SPS programming or any setup procedures.

SERVICE PROGRAMMING SYSTEM (SPS)

Special Tools

EL-49642 SPS Programming Support Tool

For equivalent regional tools, refer to **Special Tools**.

For step-by-step control module programming instructions, please refer to the techline information system (TIS) terminal.

Review the information below to ensure proper programming protocol.

NOTE:

- **DO NOT program a control module unless you are directed by a service procedure or you are directed by a General Motors service bulletin. Programming a control module at any other time will not permanently correct a customers concern.**
- **It is essential that the TIS terminal, MDI, and/or Scan Tool, is equipped with the latest software before performing service programming.**
- **Stable battery voltage is critical during programming. Any fluctuation, spiking, over voltage or loss of voltage will interrupt programming. When required, install the EL-49642 SPS Programming Support Tool to maintain system voltage. If not available, connect a fully charged 12V jumper or booster pack disconnected from the AC voltage supply. DO NOT connect a battery charger.**
- **Some modules will require additional programming/setup events to be performed before or after programming.**
- **Some vehicles may require the use of a CANDi or MDI module for programming.**
- **Review the appropriate service information for these procedures.**
- **DTCs may set during programming. Clear DTCs after programming is complete.**
- **Clearing powertrain DTCs will set the Inspection/Maintenance (I/M) system status indicators to NO.**

Ensure the following conditions are met before programming a control module:

- Vehicle system voltage:
 - There is not a charging system concern. All charging system concerns must be repaired before programming a control module.
 - Battery voltage is greater than 12 volts but less than 16 volts. The battery must be fully charged before programming the control module.
 - Turn OFF or disable any system that may put a load on the vehicles battery, such as the following components:
 - Interior lights
 - Exterior lights including daytime running lights (DRL)-Applying the parking brake, on most vehicles, disables the DRL system
 - Heating, ventilation, and air conditioning (HVAC) systems
 - Engine cooling fans
 - Radio, etc.
- The ignition switch must be in the proper position. SPS prompts you to turn ON the ignition, with the engine OFF. DO NOT change the position of the ignition switch during the programming procedure, unless instructed to do so.
- Make certain all tool connections are secure, including the following components and circuits:
 - Scan Tool
 - The RS-232 communication cable port
 - The connection at the data link connector (DLC)
 - The voltage supply circuits
 - MDI
 - The USB, Ethernet or Wireless communication port
 - The connection at the data link connector (DLC)
- DO NOT disturb the tool harnesses while programming. If an interruption occurs during the programming procedure, programming failure or control module damage may occur.

In the event of an interrupted or unsuccessful programming event, perform the following steps:

1. DO NOT turn the ignition OFF. Ensure that all control module and DLC connections are secure and the TIS terminal operating software is up to date.
2. Attempt to reprogram the control module.
3. If the control module can still not be programmed, turn the ignition OFF for at least one minute.
4. Turn the ignition ON and attempt to reprogram the control module. The control module should program.
 - If the control module still cannot be programmed, replace the control module.

After successfully programming the control module, ensure that all post programming procedures are performed; refer to **Control Module References** for the appropriate control module Programming and Setup document for any required procedures.

TELEMATICS COMMUNICATION INTERFACE CONTROL MODULE PROGRAMMING AND SETUP

Special Tools

EL-49642 SPS Programming Support Tool

For equivalent regional tools, refer to Special Tools.

Each of the following service procedures require programming or setup procedures to be performed on the telematics communication interface control module.

Communication Interface Module Replacement

NOTE:

- It is critical to use the service replacement telematics communication interface control module only in the vehicle for which it was ordered.
- Failure to perform the following procedures will result in a red LED, DTC(s) being set, and limited or incomplete OnStar® services.
- An OnStar® button press to the OnStar® call center is not required to complete the procedure.
- It may take up to 24 hours for OnStar® service to become fully activated after performing the procedures.
- Perform the following procedure only once. Repeat attempts of the procedure may result in a delay of the activation process.
- To fully activate an OnStar® module, both the setup and activation request procedures must be completed on all vehicles with and without an active OnStar® subscription to insure the unit has been setup properly for the vehicle it has been installed into and also to update the OnStar® with the correct unit information.
- To initialize the Turn-by-Turn feature, the vehicle must first be driven in open sky condition at speeds greater than 10 mph (16 kph) or more for a minimum of 5 miles (8 km), and perform at least 2 left and 2 right 90 degree turns coming to complete stops prior to each turn.
- On vehicles up fitted with TTY capabilities, it is necessary to perform a power cycle of the OnStar® Interface Module (OTIM), and toggle the TTY mode after completing the telematics communication interface control module installation and setup procedures.

1. Install EL-49642 SPS programming support tool.
2. Access the Service Programming System (SPS) and follow the on-screen instructions.
3. On the SPS Supported Controllers screen, select ONSU Onstar® Module Setup and Service Activation and follow the on-screen instructions.
4. At the end of programming, choose the "Clear All DTCs" function on the SPS screen.
5. The default language for the new telematics communication interface control module is English. To

change to an alternate language, access the scan tool.

6. Inform the customer that it may take up to 24 hours for the OnStar® service to become fully activated.

REPAIR INSTRUCTIONS

REAR WHEEL BEARING AND HUB REPLACEMENT

Special Tools

DT-50186 Wheel Hub Holding Tool

For equivalent regional tools, refer to **Special Tools**.

Removal Procedure

1. Raise and support the vehicle. Refer to **Lifting and Jacking the Vehicle** .
2. Remove the tire and wheel assembly. Refer to **Tire and Wheel Removal and Installation** .
3. Remove the brake drum. Refer to **Brake Drum Replacement** .
4. Remove the rear wheel speed sensor, if equipped with ABS. Refer to **Rear Wheel Speed Sensor Replacement** .

Fig. 1: Wheel Bearing/Hub And Spindle Assembly And Rear Axle Retaining Nuts
Courtesy of GENERAL MOTORS COMPANY

5. Remove the wheel bearing/hub and spindle assembly to rear axle retaining nuts (1).

Fig. 2: Wheel Bearing/Hub And Spindle Assembly
Courtesy of GENERAL MOTORS COMPANY

6. Remove the wheel bearing/hub and spindle assembly (1) from the rear axle assembly and the brake backing plate.

Fig. 3: Wheel Bearing Cap And Wheel Hub/Bearing Assembly
Courtesy of GENERAL MOTORS COMPANY

7. Install the wheel bearing/hub and spindle assembly to the vise.
8. Remove the wheel bearing cap (1).
9. Using the **DT-50186** holding tool, remove the wheel hub spindle nut (2).
10. Remove the wheel hub/bearing assembly (3) from the wheel hub spindle (4).
11. Remove the wheel hub spindle (4) from the vise.

Installation Procedure

Fig. 4: Wheel Bearing Cap And Wheel Hub/Bearing Assembly
Courtesy of GENERAL MOTORS COMPANY

1. Install the wheel hub spindle (4) to the vise.
2. Install the wheel hub/bearing assembly (3) to the wheel hub spindle (4).

CAUTION: Refer to Fastener Caution .

3. Using the **DT-50186** holding tool, install the wheel hub spindle nut (2) and tighten to 190 N.m (140 lb ft).
4. Install the wheel bearing cap (1) to the wheel hub/bearing and spindle assembly.

Fig. 5: Wheel Bearing/Hub And Spindle Assembly
Courtesy of GENERAL MOTORS COMPANY

5. Install the wheel bearing/hub and spindle assembly (1) to the brake backing plate and the rear axle assembly.

Fig. 6: Wheel Bearing/Hub And Spindle Assembly And Rear Axle Retaining Nuts
Courtesy of GENERAL MOTORS COMPANY

6. Install the wheel bearing/hub and spindle assembly to rear axle retaining nuts (1). Tighten the nuts evenly, in a cross-pattern to 80 N.m (59 lb ft).
7. Install the rear wheel speed sensor, if equipped with ABS. Refer to **Rear Wheel Speed Sensor Replacement** .
8. Install the brake drum. Refer to **Brake Drum Replacement** .
9. Install the tire and wheel assembly. Refer to **Tire and Wheel Removal and Installation** .
10. Lower the vehicle.

SHOCK ABSORBER REPLACEMENT

Removal Procedure

1. Apply the park brake completely.
2. Raise and support the vehicle. Refer to **Lifting and Jacking the Vehicle** .
3. Support the rear tire with a hydraulic jack stand.

Fig. 7: Shock Absorber Strut To Rear Axle Retaining Bolt
Courtesy of GENERAL MOTORS COMPANY

4. Remove the shock absorber strut to rear axle retaining bolt (1).
5. Remove the jack stand.
6. Lower the vehicle.
7. Remove the rear wheelhouse trim finish panel. Refer to **Rear Wheelhouse Trim Finish Panel Replacement** .

Fig. 8: Upper Mounting Plate And Upper Mount Assembly
Courtesy of GENERAL MOTORS COMPANY

8. Remove the strut upper cap (1) from the shock absorber strut.
9. Remove the strut nut (2) from the shock absorber strut.
10. Remove the upper mounting plate (3), the upper mount assembly (4) and the washer (5) from the shock absorber strut.
11. Remove the shock absorber strut assembly from the vehicle.

Fig. 9: Lower Mount Assembly And Washer
Courtesy of GENERAL MOTORS COMPANY

12. Remove the lower mount assembly (1), the washer (2), the jounce bumper (3), and the dust shield (4) from the strut (5).

Installation Procedure

Fig. 10: Lower Mount Assembly And Washer
Courtesy of GENERAL MOTORS COMPANY

1. Install the lower mount assembly (1), the washer (2), the jounce bumper (3), and the dust shield (4) to the strut (5).
2. Position the shock absorber strut assembly to the vehicle.

Fig. 11: Upper Mounting Plate And Upper Mount Assembly
Courtesy of GENERAL MOTORS COMPANY

3. Install the upper mounting plate (3), the upper mount assembly (4) and the washer (5) to the shock absorber strut.

CAUTION: Refer to Fastener Caution .

4. Install the strut upper mounting nut (2) to the shock absorber strut and tighten to 20 (15 lb ft).
5. Install the strut upper cap (1) to the shock absorber strut.
6. Install the rear wheelhouse trim finish panel. Refer to **Rear Wheelhouse Trim Finish Panel Replacement** .
7. Raise and support the vehicle. Refer to **Lifting and Jacking the Vehicle** .
8. Support the rear tire with the hydraulic jack stand.

Fig. 12: Shock Absorber Strut To Rear Axle Retaining Bolt
Courtesy of GENERAL MOTORS COMPANY

9. Install the shock absorber strut to rear axle retaining bolt (1) and tighten it by hand.
10. Raise the rear axle to the rear suspension height specification by measuring the vertical distance between the center of wheel and bottom edge of the wheelhouse. Refer to **Trim Height Specifications** .
11. Tighten the shock absorber strut to rear axle retaining bolt (1) and tighten to 60 (44 lb ft).
12. Remove the hydraulic jack stand.
13. Lower the vehicle.

REAR SPRING REPLACEMENT

Removal Procedure

1. Apply the park brake completely.
2. Raise and support the vehicle. Refer to **Lifting and Jacking the Vehicle** .
3. Support the tire to be replaced with a hydraulic jack stand.
4. Remove the shock absorber strut to rear axle retaining bolt. Refer to **Shock Absorber Replacement**.
5. Lower the hydraulic jack stand.

NOTE: The opposite strut to rear axle retaining bolt must be removed so that the

rear axle can turn down easily.

KEEP supporting the tire with the hydraulic jack stand to prevent the rear brake hose and rear wheel speed sensor harness from being damaged.

6. Support the opposite tire with the hydraulic jack stand.
7. Remove the opposite strut to rear axle retaining bolt. Refer to **Shock Absorber Replacement**.
8. Using the hydraulic jack stand, slowly lower the rear axle until the tension is not applied to the rear brake hose and rear wheel speed sensor harness.

Fig. 13: Spring

Courtesy of GENERAL MOTORS COMPANY

9. With the hydraulic jack stand supported, remove the spring (1) from the vehicle.

Fig. 14: Spring Upper Insulator

Courtesy of GENERAL MOTORS COMPANY

10. Remove the spring upper insulator (1) from the upper spring seat on the underbody rear side rail.

Fig. 15: Spring Lower Insulator
Courtesy of GENERAL MOTORS COMPANY

11. Remove the spring lower insulator (1) from the lower spring seat on the rear axle.

Installation Procedure

Fig. 16: Spring Lower Insulator

Courtesy of GENERAL MOTORS COMPANY

1. Install the spring lower insulator (1) to the lower spring seat on the rear axle.

Fig. 17: Spring Upper Insulator

Courtesy of GENERAL MOTORS COMPANY

2. Install the spring upper insulator (1) to the upper spring seat on the underbody rear side rail.

Fig. 18: Spring

Courtesy of GENERAL MOTORS COMPANY

3. Install the spring (1) to the vehicle, making sure the lower coil is seated into the lower spring seat.
4. Raise the hydraulic jack stand in order to compress the rear spring.
5. Install the shock absorber strut to rear axle retaining bolt. Refer to **Shock Absorber Replacement**.
6. Raise the hydraulic jack stand in order to compress the opposite rear spring.
7. Install the opposite shock absorber strut to rear axle retaining bolt. Refer to **Shock Absorber Replacement**.
8. Remove the hydraulic jack stand.
9. Lower the vehicle.

REAR AXLE REPLACEMENT

Special Tools

EN-50187 Rear Axle Supporter

For equivalent regional tools, refer to **Special Tools**.

Removal Procedure

1. Release the park brake lever boot from the floor console and loosen the adjusting nut enough to completely relieve tension on the parking brake cable.
2. Raise and support the vehicle. Refer to **Lifting and Jacking the Vehicle** .
3. Remove the rear tire and wheel assemblies. Refer to **Tire and Wheel Removal and Installation** .
4. Disconnect the parking brake cables from the equalizer and remove three parking brake cable clamps for both of the cables. Refer to **Parking Brake Cable Replacement** .
5. Remove both of the rear wheel speed sensors, if equipped with ABS. Refer to **Rear Wheel Speed Sensor Replacement** .
6. Disconnect the rear wheel cylinder pipes from the rear brake hose. Refer to **Rear Brake Hose Replacement** .

Fig. 19: Rear Axle Retaining Nuts And Backing Plates As An Assembly
Courtesy of GENERAL MOTORS COMPANY

7. Remove the wheel bearing/hub and spindle assembly to rear axle retaining nuts (1) from both sides.
8. Remove the wheel bearing/hubs, the brakes and backing plates as an assembly (2) from the rear axle.

Fig. 20: Hydraulic Jack Stand And DT-50187
Courtesy of GENERAL MOTORS COMPANY

9. Install the **DT-50187** supporter to a hydraulic jack stand and support the rear axle with the two rear adapters of the **DT-50187** supporter.
10. Remove both of the shock absorber strut to rear axle retaining bolts from the rear axle. Refer to **Shock Absorber Replacement**.
11. Lower the hydraulic jack stand and remove the rear springs from the both sides.

Fig. 21: Hydraulic Jack Stand And DT-50187
Courtesy of GENERAL MOTORS COMPANY

12. Position the hydraulic jack stand with the **DT-50187** supporter to the rear axle and support it with all adapters of the **DT-50187** supporter.

Fig. 22: Body Retaining Bolts

Courtesy of GENERAL MOTORS COMPANY

13. Remove the rear axle to body retaining bolts (1).
14. Slowly lower the hydraulic jack stand to remove the rear axle from the vehicle.
15. Remove the rear coil spring lower insulators from the axle.
16. Remove the rear axle from the hydraulic jack stand with the **DT-50187** supporter.

Installation Procedure

1. Place the rear axle on the hydraulic jack stand with **DT-50187** supporter.
2. Install the rear coil spring lower insulators to the rear axle.

Fig. 23: Body Retaining Bolts

Courtesy of GENERAL MOTORS COMPANY

3. Using the hydraulic jack stand, raise the rear axle to the correct position.
4. Hand tighten all rear axle to body retaining bolts (1).

Fig. 24: View Of DT-20187

Courtesy of GENERAL MOTORS COMPANY

NOTE: The rear axle to body retaining bolts must be tightened with the axle at the correct suspension height.

5. Using the two rear adapters of the **DT-50187** supporter and the hydraulic jack stand, raise the rear axle to the proper suspension height specification (B: 357.2 mm, 14.06 in) by measuring the vertical distance between the center of wheel and bottom edge of the wheelhouse.

CAUTION: Refer to Fastener Caution .

6. Tighten completely the axle to body retaining bolts to 170 N.m (125 lb ft).
7. Lower the hydraulic jack stand.
8. Install the rear springs.

Fig. 25: Hydraulic Jack Stand And DT-50187
Courtesy of GENERAL MOTORS COMPANY

9. Support the rear axle with the two rear adapters of the **DT-50187** supporter, and install the shock absorber strut to rear axle retaining bolts to the rear axle. Refer to **Shock Absorber Replacement**.

Fig. 26: Rear Axle Retaining Nuts And Backing Plates As An Assembly
Courtesy of GENERAL MOTORS COMPANY

10. Lower the hydraulic jack stand and remove the **DT-50187** supporter.
11. Install the wheel bearing/hubs, the brakes and backing plates as an assembly to the rear axle.
12. Install the wheel bearing/hub and spindle assembly to rear axle retaining nuts (1) to both sides.
13. Install the rear wheel cylinder pipes to the rear brake hose. Refer to **Rear Brake Hose Replacement** .
14. Install both of the rear wheel speed sensors, if equipped with ABS. Refer to **Rear Wheel Speed Sensor Replacement** .
15. Connect the parking brake cables to the equalizer and install three parking brake cable clamps for both of the cables. Refer to **Parking Brake Cable Replacement** .
16. Adjust the park brake cable tension. Refer to **Parking Brake Adjustment** .
17. Install park brake lever boot.
18. Bleed the hydraulic brake system. Refer to **Hydraulic Brake System Bleeding (Manual)** , **Hydraulic Brake System Bleeding (Pressure)** .
19. Install the rear tire and wheel assemblies. Refer to **Tire and Wheel Removal and Installation** .
20. Verify the rear wheel alignment. Refer to **Wheel Alignment Specifications** .
21. Lower the vehicle.

WHEEL STUD REPLACEMENT

Special Tools

CH-43631 Ball Joint Remover

For equivalent regional tools, refer to Special Tools.

Removal Procedure

1. Raise and support the vehicle. Refer to Lifting and Jacking the Vehicle .
2. Remove the tire and wheel assembly. Refer to Tire and Wheel Removal and Installation .
3. Remove the brake drum. Refer to Brake Drum Replacement .
4. Remove the wheel bearing/hub. Refer to Rear Wheel Bearing and Hub Replacement.

Fig. 27: Wheel Nut And Wheel Stud
Courtesy of GENERAL MOTORS COMPANY

5. Install a wheel nut (2) flush with the end of the wheel stud (3).
6. Using the **CH-43631** remover (1), remove the wheel stud (3) from the wheel hub (4).

Installation Procedure

Fig. 28: Washers And Wheel Nut

Courtesy of GENERAL MOTORS COMPANY

1. Install the NEW wheel stud into the wheel bearing/hub (2).
2. Add enough washers (3) in order to draw the stud into the hub.
3. Install and tighten the wheel nut (1) until the head of the wheel stud is fully seated against the back of the bearing hub flange (2).
4. Install the wheel nut (1) and the washers (3).
5. Install the wheel bearing/hub. Refer to **Rear Wheel Bearing and Hub Replacement**.
6. Install the brake drum. Refer to **Brake Drum Replacement** .
7. Install the tire and wheel assembly. Refer to **Tire and Wheel Removal and Installation** .
8. Lower the vehicle.

DESCRIPTION AND OPERATION

REAR SUSPENSION DESCRIPTION AND OPERATION

This vehicle has a semi-independent twist-beam rear suspension system consisting of the following components:

- An axle with integral trailing arms

- A V-shaped twisting cross beam
- Two coil springs
- Two standard shock absorbers

Axle Assembly

The axle assembly attaches to the underbody through a rubber bushing and bracket located at the front of each integral trailing arm. The brackets are bolted to the underbody side rails. The axle structure itself maintains the geometrical relationship of the wheels relative to the centerline of the body.

Rear camber and tow are not adjustable. Replace any damaged suspension components as necessary.

Coil Spring

The coil springs support the weight of the vehicle in the rear. Rubber insulators isolate the coil spring at the upper and lower spring seat.

Shock Absorber

The shock absorbers are connected to the rear axle and the vehicle underbody. The shock absorbers are non-adjustable and non-refillable. Service of the shocks requires replacement of the shock assembly.

Wheel Bearing/Hub Assembly

A single hub and bearing assembly is bolted to both ends of the rear axle assembly. The hub and bearing assembly is a sealed unit that eliminates the need for wheel bearing adjustment or periodic maintenance.

Although the rear suspension components are lubricated for life and require no routine lubrication, they should be inspected periodically for damage and wear.

Circuit/System Description

The inflatable restraint seat belt buckle switch is within the seat belt buckle and provides an input to the inflatable restraint sensing and diagnostic module (SDM). The inflatable restraint sensing and diagnostic module supplies a low reference circuit and a seat belt buckle signal circuit to determine a buckled or unbuckled condition. The inflatable restraint sensing and diagnostic module monitors the seat belt buckle circuits and if a fault is detected a DTC will be set.

Conditions for Running the DTC

Ignition voltage is between 9-16 V.

Conditions for Setting the DTC

B0072 01 or B0073 01

The seat belt buckle circuit is shorted to voltage.

B0072 02 or B0073 02

The seat belt buckle circuit is shorted to ground.

B0072 04 or B0073 03

The seat belt buckle circuit is open.

B0072 05 or B0073 05

The seat belt buckle circuit is shorted to voltage or open.

B0072 06 or B0073 06

The seat belt buckle circuit is shorted to ground or open.

B0072 08 or B0073 08

The seat belt buckle signal is invalid.

B0072 0B or B0073 0B

The seat belt buckle signal is above threshold.

B0072 0C or B0073 0C

The seat belt buckle signal is below threshold.

Action Taken When the DTC Sets

The inflatable restraint sensing and diagnostic module will store a DTC and illuminate the air bag indicator in the instrument cluster.

Conditions for Clearing the DTC

The condition for setting the DTC no longer exists.

Scan Tool Reference

Control Module References for scan tool information

Circuit/System Verification

1. Ignition ON.
2. Verify the appropriate scan tool Seat Belt Status parameter changes between Buckled and Unbuckled when the seat belt is buckled and unbuckled.
 - **If the parameter does not change**

Refer to Circuit/System Testing.

- **If the parameter changes**
3. All OK.

Circuit/System Testing

NOTE: When removing connectors inspect for damage or corrosion. Damage or corrosion in the following requires repair or replacement of the affected component/connector.

- **B153D Seat Belt Buckle-Driver**
- **B153P Seat Belt Buckle-Passenger**
- **K36 Inflatable Restraint Sensing and Diagnostic Module**

1. Ignition OFF, disconnect the harness connector at the appropriate B153 Seat Belt Buckle. It may take up to 2 min for all vehicle systems to power down.
2. Test for less than 5 ohms between the low reference circuit terminal 1 and ground.
 - **If 5 ohms or greater**
 1. Ignition OFF, disconnect the harness connector at the K36 Inflatable Restraint Sensing and

Diagnostic Module.

2. Test for less than 2 ohms in the low reference circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, replace the K36 Inflatable Restraint Sensing and Diagnostic Module.
 - **If less than 5 ohms**
3. Ignition ON.
4. Verify the appropriate scan tool Seat Belt Status parameter is Buckled.
 - **If not Buckled**
 1. Ignition OFF, disconnect the harness connector at the K36 Inflatable Restraint Sensing and Diagnostic Module.
 2. Test for infinite resistance between the signal circuit terminal 2 and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance, replace the K36 Inflatable Restraint Sensing and Diagnostic Module.
 - **If Buckled**
5. Install a 3 A fused jumper wire between the signal circuit terminal 2 and the low reference circuit terminal 1.
6. Verify the appropriate scan tool Seat Belt Status parameter is Unbuckled.
 - **If not Unbuckled**
 1. Ignition OFF, disconnect the harness connector at the K36 Inflatable Restraint Sensing and Diagnostic Module, ignition ON.
 2. Test for less than 1 V between the signal circuit and ground.
 - If 1 V or greater, repair the short to voltage on the circuit.
 - If less than 1 V
 3. Test for less than 2 ohms in the signal circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, replace the K36 Inflatable Restraint Sensing and Diagnostic Module.
 - **If Unbuckled**
7. Test or replace the B153 Seat Belt Buckle.

Component Testing

1. Ignition OFF, disconnect the harness connector at the B153 Seat Belt Buckle.
2. Test for infinite resistance between the signal terminal 2 and the low reference terminal 1.
 - **If less than infinite resistance**

Replace the B153 Seat Belt Buckle.
 - **If infinite resistance**
3. Insert the seat belt into the buckle.
4. Test for less than 5 ohms between the signal terminal 2 and the low reference terminal 1.

- If 5 ohms or greater

Replace the B153 Seat Belt Buckle.

- If less than 5 ohms

5. All OK.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

- **Front Seat Belt Buckle Replacement**
- **SIR/SRS Wiring Repairs**
- **Control Module References** for inflatable restraint sensing and diagnostic module replacement, programming and setup.

DTC B0082: SEAT BELT REMINDER SENSOR

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

DTC Descriptors

DTC B0082 01

DTC B0082 04

Seat Belt Reminder Sensor Open Circuit

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Seat Belt Reminder Sensor Signal	B0082 02	B0082 04	B0082 01	-
Seat Belt Reminder Sensor Low	-	B0082 04	-	-

Reference				
-----------	--	--	--	--

Circuit/System Description

The seat belt reminder sensor is within the passenger seat cushion and provides an input to the Inflatable Restraint Sensing and Diagnostic Module (SDM). The Inflatable Restraint Sensing and Diagnostic Module supplies a low reference circuit and a seat belt reminder sensor signal circuit to determine seated or unseated condition of passenger seat.

Conditions for Running the DTC

Ignition voltage is between 9-16 V.

Conditions for Setting the DTC

B0082 01

The Inflatable Restraint Sensing and Diagnostic Module detects a short to voltage in the seat belt reminder sensor signal circuit.

B0082 02

The Inflatable Restraint Sensing and Diagnostic Module detects a short to ground in the seat belt reminder sensor signal circuit

B0082 04

The Inflatable Restraint Sensing and Diagnostic Module detects an open/high resistance in the seat belt reminder sensor signal circuit or the seat belt reminder sensor ground circuit

Action Taken When the DTC Sets

The SIR System is disabled and no deployments are allowed.

Conditions for Clearing the DTC

- The DTC will be current for as long as the fault is present
- When the fault is no longer present, the DTC will be a history DTC
- A history DTC will clear after 50 ignition cycles

Scan Tool Reference

Control Module References for scan tool information

Circuit/System Verification

1. Ignition ON.
2. Verify, with the passenger seat unoccupied, the scan tool Passenger Seat Occupancy Status parameter is Empty Seat.
 - **If not Empty Seat**

Refer to Circuit/System Testing
 - **If Empty Seat**
3. Verify, with the passenger seat occupied, the scan tool Passenger Seat Occupancy Status parameter is Occupied.
 - **If not Occupied**

Refer to Circuit/System Testing
 - **If Occupied**
4. All OK.

Circuit/System Testing

1. Ignition OFF. Disconnect the harness connector at the B60 Passenger Presence Sensor, wait 120 seconds.
2. Test for less than 30 ohms between the low reference circuit terminal 2 and ground.
 - **If 30 ohms or greater**
 1. Ignition OFF, disconnect the X2 harness connector at the K36 Inflatable Restraint Sensing and Diagnostic Module.
 2. Test for less than 2 ohms in the low reference circuit end to end.

- If 2 ohms or greater, repair the open/high resistance in the circuit.
- If less than 2 ohms, replace the K36 Inflatable Restraint Sensing and Diagnostic Module.
- **If less than 30 ohms**
- 3. Ignition ON.
- 4. Test for 4.75-5.25 V between the signal circuit terminal 1 and ground.
 - **If less than 4.75 V**
 1. Disconnect the X2 harness connector at the K36 Inflatable Restraint Sensing and Diagnostic Module.
 2. Test for infinite resistance between the signal circuit and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 3. Test for less than 2 ohms in the signal circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, replace the K36 Inflatable Restraint Sensing and Diagnostic Module.
 - **If greater than 5.25 V**
 1. Ignition OFF. Disconnect the X2 harness connector at the K36 Inflatable Restraint Sensing and Diagnostic Module. Ignition ON.
 2. Test for less than 1 V between the signal circuit and ground.
 - If 1 V or greater, repair the short to voltage on the circuit.
 - If less than 1 V, replace the K36 Inflatable Restraint Sensing and Diagnostic Module.
 - **If between 4.75-5.25 V**
- 5. Replace the B60 Passenger Presence Sensor.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

- **Front Seat Cushion Cover and Pad Replacement** for Passenger Presence Sensor replacement
- **Control Module References** for Inflatable Restraint Sensing and Diagnostic Module control module replacement, programming and setup

SYMPTOMS - SEAT BELTS

NOTE: Review the seat belt system description and operation in order to familiarize yourself with the system and how it functions. Refer to **Seat Belt System Description and Operation**.

Visual/Physical Inspection

- Inspect for aftermarket devices which could affect the operation of the seat belt system. Refer to **Checking Aftermarket Accessories**.
- Inspect the easily accessible or visible system components for obvious damage or conditions which could cause the symptom.

Intermittent

Faulty electrical connections or wiring may be the cause of intermittent conditions. Refer to **Testing for Intermittent Conditions and Poor Connections** .

Symptom List

Refer to the following symptom diagnostic procedure in order to diagnose the symptom:

- **Seat Belt Indicator Malfunction - Driver**
- **Seat Belt Indicator Malfunction - Passenger**

SEAT BELT DOES NOT RETRACT

1. Grab the seat belt webbing and slowly and firmly extract 15-25 mm (5/8-1 in) of webbing from the seat belt.
2. Release the seat belt and allow the webbing to slowly retract back into the retractor.
3. Check to see if the seat belt is released. If the seat belt is not released, repeat steps 1 and 2, two times more.
4. If the retractor does not release after repeating the steps, replace with a new retractor.

SEAT BELT INDICATOR MALFUNCTION - DRIVER

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Driver Seat Belt Switch Signal	1	2	2	-
Driver Seat Belt Switch Low Reference	-	2	-	-
1. Indicator will remain ON with seat belt buckled. 2. Indicator will illuminate only for the bulb check.				

Circuit/System Description

The driver seat belt switch is a 2-wire switch wired to the inflatable restraint sensing and diagnostic module (SDM) using a signal circuit and a low reference circuit. When the seat belt is unbuckled the switch is closed and when the seat belt is buckled the switch is open. The inflatable restraint sensing and diagnostic module sends the status of the driver seat belt via serial data to the instrument cluster. After receiving the message, the instrument cluster controls the illumination of the driver seat belt indicator.

Circuit/System Verification

1. Verify the driver seat belt indicator turns ON and OFF when commanding the instrument cluster all indicators ON and OFF with a scan tool.
 - **If the driver seat belt indicator does not turn ON and OFF as commanded .**

Replace the P16 Instrument Cluster.
 - **If the driver seat belt indicator does turn ON and OFF as commanded**
2. Verify the scan tool Diver Seat Belt Switch parameter changes between Buckled and Unbuckled when buckling and unbuckling the driver seat belt.
 - **If the parameter does not change**

Refer to Circuit/System Testing.
 - **If the parameter changes**
3. All OK.

Circuit/System Testing

NOTE: When removing connectors inspect for damage or corrosion. Damage or corrosion in the following requires repair or replacement of the affected component/connector.

- **B153D Seat Belt Buckle-Driver**
- **Seat belt switch harness connector**
- **K36 Inflatable Restraint Sensing and Diagnostic Module**
- **Inflatable Restraint Sensing and Diagnostic Module wiring harness connector**

1. Ignition OFF and all vehicle systems OFF, disconnect the harness connector at the B153D Seat Belt Buckle-Driver. It may take up to 2 min for all vehicle systems to power down.
2. Test for less than 5 ohms between the low reference circuit terminal 1 and ground.
 - **If 5 ohms or greater**
 1. Disconnect the X2 harness connector at the K36 Inflatable Restraint Sensing and Diagnostic Module.
 2. Test for less than 2 ohms in each low reference circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, replace the K36 Inflatable Restraint Sensing and Diagnostic Module.
 - **If less than 5 ohms**
3. Ignition ON.
4. Verify the scan tool Driver Seat Belt Status parameter is Buckled.
 - **If not Buckled**
 1. Ignition OFF, disconnect the X2 harness connector at the K36 Inflatable Restraint Sensing and Diagnostic Module.
 2. Test for infinite resistance between the seat belt switch signal circuit terminal 2 and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance, replace the K36 Inflatable Restraint Sensing and Diagnostic Module.
 - **If Buckled**
5. Install a 3 A fused jumper wire between the signal circuit terminal 2 and the low reference circuit terminal 1.
6. Verify the scan tool Driver Seat Belt Status parameter is Unbuckled.
 - **If Unbuckled**
 1. Ignition OFF, disconnect the X2 harness connector at the K36 Inflatable Restraint Sensing and Diagnostic Module, ignition ON.
 2. Test for less than 1 V between the signal circuit and ground.
 - If 1 V or greater, repair the short to voltage on the circuit.
 - If less than 1 V
 3. Test for less than 2 ohms in each circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.

- If less than 2 ohms, replace the K36 Inflatable Restraint Sensing and Diagnostic Module.

- **If Unbuckled**

7. Test or replace the B153D Seat Belt Buckle-Driver.

Component Testing

1. Ignition OFF, disconnect the harness connector at the B153D Seat Belt Buckle-Driver, buckle the driver seat belt.
2. Test for infinite resistance between the signal circuit terminal 2 and the low reference terminal 1.

- **If not infinite resistance**

Replace the B153D Seat Belt Buckle-Driver.

- **If infinite resistance**

3. Unbuckle the driver seat belt.
4. Test for less than 1 ohms between the signal circuit terminal 2 and the low reference terminal 1.

- **If 1 ohms or greater**

Replace the B153D Seat Belt Buckle-Driver.

- **If less than 1 ohms**

5. All OK.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

- **Front Seat Belt Buckle Replacement**
- **Control Module References** for inflatable restraint sensing and diagnostic module or instrument cluster replacement, programming and setup

SEAT BELT INDICATOR MALFUNCTION - PASSENGER

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Passenger Seat Belt Buckle	1	2	2	-

Signal				
Passenger Seat Belt Buckle Low Reference	-	2	-	-
Passenger Seat Belt Indicator Control	3	3	4	-
1. Indicator will remain ON with Seat Belt Buckled. 2. Indicator will illuminate only for the bulb check. 3. Indicator will not illuminate. 4. Indicator always ON.				

Circuit/System Description

When an individual is sitting in the passenger seat the passenger presence sensor detects the individual. A signal to the Inflatable Restraint Sensing and Diagnostic Module indicates a person is in the passenger seat. The Inflatable Restraint Sensing and Diagnostic Module will turn the passenger seat belt indicator on. The passenger Seat Belt Buckle is a 2-wire switch wired to the Inflatable Restraint Sensing and Diagnostic Module (SDM) using a signal circuit and a low reference circuit. When the seat belt is unbuckled the switch is closed and when the seat belt is buckled the switch is open. The Inflatable Restraint Sensing and Diagnostic Module controls the passenger seat belt indicator via a hard wire to the Info Display Module.

Diagnostic Aids

Objects on the passenger seat can cause the passenger seat belt reminder to be commanded on. Depending on the sensing technology used, a conductive object (computers, MP3 players, cell phones, diagnostic scan tool, wires, a hand, etc.) placed on the passenger seat may cause the Passenger Presence Detection Module to command the passenger air bag indicator ON and/or command the passenger seat belt indicator ON. The fasten seat belt chime will also sound.

Circuit/System Verification

1. Ignition ON.
2. Verify the passenger seat belt indicator turns ON and OFF when performing the Passenger Seat Belt Reminder Indicator On/Off Control Function with a scan tool.
 - **If the passenger seat belt indicator does not turn ON and OFF**

Refer to Seat Belt Indicator Malfunction in Circuit/System Testing.

- **If the passenger seat belt indicator turns ON and OFF**
3. Verify the scan tool Passenger Seat Belt Status parameter changes between Buckled and Unbuckled when buckling and unbuckling the seat belt.
 - **If the parameter does not change between Buckled and Unbuckled when buckling and unbuckling the seat belt**

Refer to Seat Belt Switch Malfunction in Circuit/System Testing.

- **If the parameter changes between Buckled and Unbuckled when buckling and unbuckling the seat belt**
4. All OK.

Circuit/System Testing

Seat Belt Buckle Malfunction

NOTE: When removing connectors inspect for damage or corrosion. Damage or corrosion in the following requires repair or replacement of the affected component/connector.

- **B153 Seat Belt Buckle**
- **Seat Belt Buckle harness connector**
- **K36 Inflatable Restraint Sensing and Diagnostic Module**
- **Inflatable Restraint Sensing and Diagnostic Module harness connector**

1. Ignition OFF and all vehicle systems OFF, disconnect the harness connector at the B153P Seat Belt Buckle-Passenger. It may take up to 2 minutes for all vehicle systems to power down.
2. Test for less than 5 ohms between the low reference circuit terminal 2 (AY0) or 1 (AYF) and ground.

- **If 5 ohms or greater**
 1. Disconnect the harness connector at the K36 Inflatable Restraint Sensing and Diagnostic Module.
 2. Test for less than 2 ohms in the low reference circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, replace the K36 Inflatable Restraint Sensing and Diagnostic Module.
 - **If less than 5 ohms**
- 3. Ignition ON.
- 4. Verify the scan tool Passenger Seat Belt Status parameter is Buckled.
 - **If not Buckled**
 1. Disconnect the harness connector at the K36 Inflatable Restraint Sensing and Diagnostic Module.
 2. Test for infinite resistance between the Seat Belt Buckle signal circuit terminal 1 (AY0) or 2 (AYF) and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If less than 2 ohms, replace the K36 Inflatable Restraint Sensing and Diagnostic Module.
 - **If Buckled**
- 5. Install a 3 A fused jumper wire between the signal circuit terminal 1 (AY0) or 2 (AYF) and the low reference circuit terminal 2 (AY0) or 1 (AYF).
- 6. Verify the scan tool Passenger Seat Belt Status parameter is Unbuckled.
 - **If not Unbuckled**
 1. Disconnect the harness connector at the K36 Inflatable Restraint Sensing and Diagnostic Module, ignition ON.
 2. Test for less than 1 V between the signal circuit and ground.
 - If 1 V or greater, repair the short to voltage on the circuit.
 3. Test for less than 2 ohms in each circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, replace the K36 Inflatable Restraint Sensing and Diagnostic Module.
 - **If Unbuckled**
- 7. Test or replace the B153P Seat Belt Buckle-Passenger.

Seat Belt Indicator Malfunction

1. Ignition OFF, disconnect the harness connector at the P17 Info Display Module. It may take up to 2 minutes for all vehicle systems to power down.
2. Test for less than 10 ohms between the ground circuit terminal 7 and ground.
 - **If 10 ohms or greater**
 1. Ignition OFF.
 2. Test for less than 2 ohms in the ground circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, repair the open/high resistance in the ground connection.

- **If less than 10 ohms**
- 3. Connect a test lamp between the control circuit terminal 11 and ground, ignition ON.
- 4. Verify with a scan tool, command the Passenger Seat Belt Reminder Indicator ON and OFF, the test lamp should turn ON and OFF while changing between the commanded states.
 - **If the test lamp is always ON**
 1. Ignition OFF, disconnect the harness connector at the K36 Inflatable Restraint Sensing and Diagnostic Module, ignition ON.
 2. Test for less than 1 V between the control circuit and ground.
 - If 1V or greater, repair the short to voltage on the circuit.
 - If less than 1V, replace the K36 Inflatable Restraint Sensing and Diagnostic Module.
 - **If the test lamp is always OFF**
 1. Ignition OFF, disconnect the harness connector at the K36 Inflatable Restraint Sensing and Diagnostic Module.
 2. Test for infinite resistance between the control circuit terminal 4 and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 3. Test for less than 2 ohms in the control circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, replace the K36 Inflatable Restraint Sensing and Diagnostic Module.
 - **If test lamp turns ON and OFF**
- 5. Replace the P17 Info Display Module.

Component Testing

1. Ignition OFF, disconnect the harness connector at the B153P Seat Belt Buckle-Passenger, buckle the passenger seat belt.
2. Test for infinite resistance between the signal circuit terminal 1 (AY0) or 2 (AYF) and the low reference terminal 2 (AY0) or 1 (AYF).
 - **If not infinite resistance**

Replace the B153P Seat Belt Buckle-Passenger.
 - **If infinite resistance**
3. Unbuckle the passenger seat belt.
4. Test for less than 1 ohms between the signal circuit terminal 1 (AY0) or 2 (AYF) and the low reference terminal 2 (AY0) or 1 (AYF).
 - **If 1 ohms or greater**

Replace the B153P Seat Belt Buckle-Passenger.
 - **If less than 1 ohms**
5. All OK.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair

- **Front Seat Belt Buckle Replacement**
- **Information Center Telltale Assembly Replacement** for Info Display Module replacement
- **Control Module References** for Inflatable Restraint Sensing and Diagnostic Module or Instrument Cluster replacement, programming and setup

REPAIR INSTRUCTIONS

REPAIRS AND INSPECTIONS REQUIRED AFTER A COLLISION

WARNING: Restraint systems can be damaged in a collision. To help avoid injury and ensure that all parts in need of replacement are replaced:

- Replace any seat belt system that was in use during the collision serious enough to deploy any automatic restraint device such as air bags and seat belt pretensioners. This not only includes seat belt systems in use by people of adult size, but seat belt systems used to secure child restraints, infant carriers and booster seats, including LATCH system and top tether anchorages.
- Replace any seat belt system that has torn, worn or damaged components. This not only includes adult seat belt systems, but built-in child restraints and LATCH system components, if any.
- Replace any seat belt system if you observe the words "REPLACE" or "CAUTION" or if a yellow tag is visible. Do not replace a seat belt if only the child seat caution label is visible.
- Replace any seat belt system if you are doubtful about its condition. This not only includes adult seat belt systems, but built-in child restraints, LATCH system components and any restraint system used to secure infant carriers, child restraints and booster seats.

Do NOT replace single seat belt system components in vehicles that have been in a collision as described above. Always replace the entire seat belt system with the buckle, guide and retractor assembly, which includes the latch and webbing material.

After a minor collision where no automatic restraint device was deployed, seat belt system replacement may not be necessary, unless some of the parts are torn, worn or damaged.

FRONT SEAT BELT BUCKLE REPLACEMENT

Fig. 4: Front Seat Belt Buckle
 Courtesy of GENERAL MOTORS COMPANY

Front Seat Belt Buckle Replacement

Callout	Component Name
Preliminary Procedure	
Remove the front seat. Refer to <u>Driver or Passenger Seat Removal and Installation</u> .	
1	Front Seat Belt Buckle Bolt CAUTION: Refer to <u>Fastener Caution</u> . Tighten 40 N.m (30 lb ft)
2	Front Seat Belt Buckle Assembly

REAR SEAT BELT BUCKLE REPLACEMENT

Fig. 5: Front Seat Belt Buckle
 Courtesy of GENERAL MOTORS COMPANY

Rear Seat Belt Buckle Replacement

Callout	Component Name
Preliminary Procedure Remove the rear seat cushion. Refer to <u>Rear Seat Cushion Removal and Installation</u> .	
1	Rear Seat Belt Buckle Bolt CAUTION: Refer to <u>Fastener Caution</u> . Tighten 40 N.m (30 lb ft)
2	Rear Seat Belt Buckle Assembly

REAR SEAT CENTER BELT REPLACEMENT

Fig. 6: Rear Seat Center Belt
 Courtesy of GENERAL MOTORS COMPANY

Rear Seat Center Belt Replacement

Callout	Component Name
Preliminary Procedure Remove the rear seat cushion. Refer to <u>Rear Seat Cushion Removal and Installation</u> .	
1	Rear Seat Center Belt Nut CAUTION: Refer to <u>Fastener Caution</u> . Tighten 40 N.m (30 lb ft)
2	Rear Seat Center Belt Assembly

SHOULDER BELT REPLACEMENT - REAR

Fig. 7: Rear Seat Belt Assembly
 Courtesy of GENERAL MOTORS COMPANY

Shoulder Belt Replacement - Rear

Callout	Component Name
Preliminary Procedures 1. Remove the rear wheelhouse trim finish. Refer to <u>Rear Wheelhouse Trim Finish Panel Replacement</u> . 2. Remove the quarter window garnish molding. Refer to <u>Quarter Window Garnish Molding Replacement</u> .	
1	Rear Seat Belt Anchor Bolt CAUTION: Refer to <u>Fastener Caution</u> . Tighten 40 N.m (30 lb ft)
2	Rear Seat Belt Retractor Bolt Tighten 40 N.m (30 lb ft)
3	Rear Seat Belt Assembly

FRONT SEAT BELT GUIDE ADJUSTER REPLACEMENT

Fig. 8: Front Seat Belt Guide Adjuster
Courtesy of GENERAL MOTORS COMPANY

Front Seat Belt Guide Adjuster Replacement

Callout	Component Name
Preliminary Procedure Remover center pillar upper trim panel. Refer to Center Pillar Upper Trim Panel Replacement .	
1	Front Seat Shoulder Belt Guide Adjuster Bolt (Qty: 2) CAUTION: Refer to <u>Fastener Caution</u> . Tighten 40 N.m (30 lb ft)
2	Front Seat Shoulder Belt Guide Adjuster Assembly

Restraint System

NOTE: If the vehicle has been in a collision, refer to **Repairs and Inspections Required After a Collision**

The vehicle has front and rear seat belts that are the primary means of occupant restraint. Seat belts help to keep the occupants inside the passenger compartment and to gradually reduce the impact forces during the following events:

- Frontal impact type crashes
- Rear impact type crashes
- Side impact type crashes
- Roll-over type crashes

All seat belt retractors have emergency locks. The retractors remain unlocked during normal operation and under normal driving conditions. The retractors remain unlocked during normal conditions in order to allow free movement of the upper body of each occupant. A pendulum locks the seat belt webbing into position. The pendulum causes a locking bar to engage a cog on the spool of the retractor mechanism when the following conditions occur:

- A rapid extraction of the seat belt webbing from the retractor
- An abrupt change in vehicle speed
- An abrupt change in vehicle direction
- Operation of the vehicle on a steep upgrade
- Operation of the vehicle on a downgrade

The seat belts have an automatic locking (cinch) feature. The cinch feature is activated when the seat belt webbing is completely extended from the retractor. The cinch feature prevents the webbing from extending beyond the position from which it is allowed to retract. Use of the cinch feature is recommended for securing a child seat. The cinch feature may be cancelled by allowing the webbing to wind back completely into the retractor. After the cinch feature is cancelled, the webbing is unlocked. After the cinch feature is cancelled, the webbing will extend from the retractor. This vehicle is also equipped with a supplemental inflatable restraint (SIR) system. Refer to **Supplemental Inflatable Restraint System Description and Operation**

Front Seat Belt System

The front seat belt system includes a driver and passenger seat belt retractor pretensioner. Both front seat belt pretensioners includes a seat belt switch in the seat buckle which controls a reminder lamp and a tone alarm.

NOTE: The front passenger seat is equipped with a passenger presence sensor, which detects an occupant. If the passenger presence sensor detects an empty front

passenger seat, then the passenger fasten safety belt indicator will be disabled.

- When the driver seat belt is buckled and the ignition switch is turned ON, the following events will occur:
 - The tone alarm will not operate.
 - The reminder lamp will not operate.
- When the passenger seat belt is buckled with an occupant sitting in the passenger front seat, then the ignition switch is turned ON, the following events will occur:
 - The tone alarm will not operate.
 - The reminder lamp, which is located within the Instrument Panel Multifunction Switch, will not be turned ON.
- When the driver seat belt is not buckled and the ignition switch is in the ON position, the following events will occur:
 - The tone alarm will operate for 4-8 seconds and then go OFF.
 - The fasten safety belt indicator will turn ON for 20 seconds, until the driver seat belt is buckled.
- When the passenger seat belt is not buckled with an occupant sitting in the passenger front seat, then the ignition switch is turned ON, the following events will occur:
 - The tone alarm will operate for 4-8 seconds and then go OFF.
 - The reminder lamp, which is located within the Instrument Panel Multifunction Switch, will be turned ON.

Rear Seat Belt System

The Rear Seat Belt System includes the following components:

- The rear seat belt retractor is located at the wheelhouse panel and attached to the floor panel by the rear seat shoulder belt retractor bracket.
- The rear seat belt buckles and the center seat belt buckle are attached to each seat.

Child Seat Restraint System

WARNING: A child in a rear-facing child restraint can be seriously injured if the right-front passengers air bag inflates. This is because the back of a rear-facing child restraint would be very close to the inflating air bag. NEVER use a rear-facing child restraint in this vehicle. If a forward-facing child restraint is suitable for your child, ALWAYS move the front passenger seat as far back as it will go and then install the child restraint. Be sure the child restraint position does not conflict with any additional requirements provided by the manufacturer. For more information, refer to the vehicle owners manual and the instruction that came with the child restraint.

A child in a rear-facing child restraint can be seriously injured if the right-front passengers air bag inflates. This is because the back of a rear-facing child restraint would be very close to the inflating air bag. NEVER use a rear-facing child restraint in this vehicle. If a forward-facing child restraint is suitable for your child, ALWAYS move the front passenger seat as far back as it will go and then install the child restraint. Be sure the child

restraint position does not conflict with any additional requirements provided by the manufacturer. For more information, refer to the vehicle owners manual and the instruction that came with the child restraint.

The child seat may only be used in a forward facing seating location. The child seat should be installed and secured according to the manufacturer's directions. If the child seat has a top strap, the seat will need to be anchored. Passengers should not be allowed to sit at locations where the seat belts are being used to secure the child seat.

All vehicles are equipped with a dual-mode type retractor with emergency and automatic locking features. The automatic locking feature is for restraint of a child seat. The child seat can be secured by pulling the seat belt all the way out to lock it. Then tighten the seat belt around the child seat.

If a child seat is to be used in the second seat position, a special dealer-installed anchor must be used in order to anchor the child seat top strap. This only applies to the seats designed with the top strap provision and for the vehicles sold in Canada. In order to ensure the correct top strap angle, the child seat is only to be used at the seating position for which the top strap anchor is installed.

Fasten Safety Belt Indicators

There are two fasten safety belt indicators for this vehicle. The driver fasten safety belt reminder is displayed in the instrument cluster and the passenger fasten safety belt reminder is displayed in the Instrument Panel Multifunction Switch. The fasten safety belt indicator may only be ON during RUN. The fasten safety belt indicator illuminates under the following conditions:

- During the bulb check
- The inflatable restraint sensing and diagnostic module (SDM) sends the status of the driver seat belt to the instrument cluster via serial data. The passenger seat belt status is sent to the Instrument Panel Multifunction Switch via a hard wire. If any of the seat belts are unfastened, the instrument cluster will send a message requesting a chime sound to be turned ON after a bulb check.

REPAIR INSTRUCTIONS

DRIVER OR PASSENGER SEAT REMOVAL AND INSTALLATION

Fig. 1: Seat Assembly

Courtesy of GENERAL MOTORS COMPANY

Driver or Passenger Seat Removal and Installation

Callout	Component Name
1	Front Seat Mounting Bolt (Qty: 2) CAUTION: Refer to <u>Fastener Caution</u> . TIP: Adjust the seat forward or rearward to access the nuts. Tighten 45 N.m (33 lb ft)
2	Seat Assembly Procedure Disconnect the electrical connectors.

DRIVER OR PASSENGER SEAT ADJUSTER HANDLE KNOB REPLACEMENT

Fig. 2: Front Seat Adjuster Handle Knob

Courtesy of GENERAL MOTORS COMPANY

Driver or Passenger Seat Adjuster Handle Knob Replacement

Callout	Component Name
---------	----------------

1	Front Seat Adjuster Handle Knob Clamp TIP: Use a proper tool to release adjuster handle knob clamp.
2	Front Seat Adjuster Handle Knob

FRONT SEAT ARMREST REPLACEMENT

Fig. 3: Front Seat Armrest Assembly
 Courtesy of GENERAL MOTORS COMPANY

Front Seat Armrest Replacement

Callout	Component Name
1	Front Seat Armrest Cover
2	Front Seat Armrest Cover Zipper Procedure Open the zipper to access the front seat armrest mounting bolt.
3	Front Seat Armrest Mounting Bolt (Qty: 1) CAUTION: Refer to <u>Fastener Caution</u> . Tighten 45 N.m (33 lb ft)
4	Front Seat Armrest Assembly

DRIVER OR PASSENGER SEAT HEAD RESTRAINT REPLACEMENT

Fig. 4: Front Seat Head Restraint

Courtesy of GENERAL MOTORS COMPANY

Driver or Passenger Seat Head Restraint Replacement

Callout	Component Name
1	Front Seat Head Restraint Procedure 1. Raise the headrest to the full upward position. 2. Depress the flush button on the head restraint guide. 3. Remove the head restraint by pulling up on the restraint.

DRIVER OR PASSENGER SEAT HEAD RESTRAINT GUIDE REPLACEMENT

Fig. 5: Driver or Passenger Seat Head Restraint Guide
 Courtesy of GENERAL MOTORS COMPANY

Driver or Passenger Seat Head Restraint Guide Replacement

Callout	Component Name
Preliminary Procedures	
1. Remove the hog rings at the rear part of the front seat back. Refer to <u>Driver or Passenger Seat Back Cushion Cover Replacement</u> .	
2. Remove the front seat back cushion cover and pad to access the head restraint guide.	
1	Front Seat Back Cushion Pad
2	Front Seat Head Restraint Guide

FRONT SEAT CUSHION COVER REPLACEMENT

Fig. 6: Front Seat Cushion Cover
 Courtesy of GENERAL MOTORS COMPANY

Front Seat Cushion Cover Replacement

Callout	Component Name
Preliminary Procedure Remove the front seat back cushion frame. Refer to <u>Driver or Passenger Seat Back Cushion Frame Replacement</u> .	
1	Front Seat Cushion Cover Procedure Remove the hog rings and retainers securing the seat cushion cover.

FRONT SEAT CUSHION OUTER TRIM PANEL REPLACEMENT

Fig. 7: Front Seat Cushion Outer Trim Panel
 Courtesy of GENERAL MOTORS COMPANY

Front Seat Cushion Outer Trim Panel Replacement

Callout	Component Name
Preliminary Procedure 1. Remove the front seat recliner handle. Refer to <u>Front Seat Back Recliner Handle Replacement</u>. 2. Remove the front seat adjuster handle knob. Refer to <u>Driver or Passenger Seat Adjuster Handle Knob Replacement</u>.	
1	Front Seat Outer Cover Screw (Qty: 2) CAUTION: Refer to <u>Fastener Caution</u> . Tighten 2.5Y (22 lb in)
2	Front Seat Outer Cover

FRONT SEAT CUSHION INNER TRIM PANEL REPLACEMENT

Fig. 8: Front Seat Cushion Inner Trim Panel
 Courtesy of GENERAL MOTORS COMPANY

Front Seat Cushion Inner Trim Panel Replacement

Callout	Component Name
1	Front Seat Inner Cover Screw (Qty: 2) CAUTION: Refer to <u>Fastener Caution</u> . TIP: Adjust the seat forward or rearward to access the nuts. Tighten 2.5Y (22 lb in)
2	Front Seat Inner Cover

FRONT SEAT CUSHION COVER AND PAD REPLACEMENT

Fig. 9: Front Seat Cushion Cover and Pad
 Courtesy of GENERAL MOTORS COMPANY

Front Seat Cushion Cover and Pad Replacement

Callout	Component Name
Preliminary Procedure Remove the front seat. Refer to <u>Driver or Passenger Seat Removal and Installation.</u>	
1	Front Seat Cushion Nut (Qty: 4) CAUTION: Refer to <u>Fastener Caution</u> . Tighten 30.5 (22.5 lb ft)
2	Front Seat Cushion Cover and Pad WARNING: Replace the passenger presence system as a complete assembly to prevent possible injury to the occupant. The bladder, the pressure sensor, the seat cushion, and the control module are assembled and calibrated as a unit. Using only some of the components in the service kit will cause the passenger presence system to operate improperly. Procedure 1. Disconnect the electrical connectors that attach to the seat cushion, if equipped.

2. Remove the seat cushion cover and pad from the seat cushion frame as an assembly.
3. Disengage the j-channel retainers from the seat cushion frame.
4. Remove the hog rings.
5. Pull the cover away from the pad to disengage the hog rings.
6. If working on the passenger seat, re-zero the inflatable restraint passenger presence system whenever the seat cushion or any component of the passenger presence system is removed. Refer to **Passenger Presence System Rezeroing** .

DRIVER OR PASSENGER SEAT CUSHION PAD REPLACEMENT

Fig. 10: Driver or Passenger Seat Cushion Pad
 Courtesy of GENERAL MOTORS COMPANY

Driver or Passenger Seat Cushion Pad Replacement

Callout	Component Name
Preliminary Procedure Remove the front seat cushion cover. Refer to <u>Front Seat Cushion Cover Replacement</u> .	
1	Front Seat Cushion Pad Procedure If necessary, remove the seat cushion heating mat. Refer to <u>Driver or Passenger Seat Cushion Heater Replacement</u> .

DRIVER OR PASSENGER SEAT BACK CUSHION COVER REPLACEMENT

Fig. 11: Driver or Passenger Seat Back Cushion Cover
 Courtesy of GENERAL MOTORS COMPANY

Driver or Passenger Seat Back Cushion Cover Replacement

Callout	Component Name
Preliminary Procedure	
Remove the front seat armrest. Refer to Front Seat Armrest Replacement .	
1	Front Seat Back Cushion Cover Hog Ring (Qty: 13) TIP: Begin at the rear part of the front seat back cushion cover, release the hog rings.
2	Front Seat Back Cushion Cover

FRONT SEAT BACK PAD REPLACEMENT

Fig. 12: Front Seat Back Pad
 Courtesy of GENERAL MOTORS COMPANY

Front Seat Back Pad Replacement

Callout	Component Name
Preliminary Procedures	
1. Remove the front seat back cushion cover. Refer to <u>Driver or Passenger Seat Back Cushion Cover Replacement.</u> 2. Remove the front seat back cushion frame. Refer to <u>Driver or Passenger Seat Back Cushion Frame Replacement.</u> 3. Remove the inflatable restraint side impact module as needed. Refer to <u>Front Seat Outboard Seat Back Airbag Replacement .</u>	
1	Front Seat Back Cushion Frame
2	Front Seat Back Cushion Pad Procedure 1. Remove the front seat back cushion frame, then remove the cushion pad. 2. If necessary, remove the front seat back cushion heating mat. Refer to <u>Driver or Passenger Seat Back Cushion Heater Replacement .</u>

DRIVER OR PASSENGER SEAT BACK CUSHION FRAME REPLACEMENT

Fig. 13: Driver or Passenger Seat Back Cushion Frame
 Courtesy of GENERAL MOTORS COMPANY

Driver or Passenger Seat Back Cushion Frame Replacement

Callout	Component Name
Preliminary Procedures 1. Remove the front seat. Refer to <u>Driver or Passenger Seat Removal and Installation</u>. 2. Remove the front seat inner trim panel. Refer to <u>Front Seat Cushion Inner Trim Panel Replacement</u>. 3. Remove the front seat outer trim panel. Refer to <u>Front Seat Cushion Outer Trim Panel Replacement</u>.	
1	Front Seat Back Cushion Frame Bolt (Qty: 4) CAUTION: Refer to <u>Fastener Caution</u> . Tighten 45 N.m (33 lb ft)
2	Front Seat Back Cushion Frame Procedure

1. Disconnect electrical connectors as needed.
2. Remove the inflatable restraint side impact module. Refer to **Front Seat Outboard Seat Back Airbag Replacement** .
3. If replacing with a new front seat back frame, transfer components as necessary.

FRONT SEAT BACK RECLINER HANDLE REPLACEMENT

Fig. 14: Front Seat Back Recliner Handle
Courtesy of GENERAL MOTORS COMPANY

Front Seat Back Recliner Handle Replacement

Callout	Component Name
1	Front Seat Recliner Handle Cover Procedure Pull the handle cover away from the seat to remove.
2	Front Seat Recliner Handle Procedure Pull the handle away from the seat to remove.

REAR SEAT HEAD RESTRAINT REPLACEMENT

Fig. 15: Rear Seat Head Restraint
Courtesy of GENERAL MOTORS COMPANY

Rear Seat Head Restraint Replacement

Callout	Component Name
1	Rear Seat Head Restraint Flush Button Procedure Push the flush button and remove the head restraint.
2	Rear Seat Head Restraint

REAR SEAT HEAD RESTRAINT GUIDE REPLACEMENT

Fig. 16: Rear Seat Head Restraint Guide
 Courtesy of GENERAL MOTORS COMPANY

Rear Seat Head Restraint Guide Replacement

Callout	Component Name
Preliminary Procedure	
Remove rear seat back cushion pad. Refer to <u>Rear Seat Back Cushion Pad Replacement.</u>	
1	Rear Seat Head Restraint Guide Procedure Unclip the rear seat head restraint guide.

REAR SEAT BACK BOLSTER REPLACEMENT

Fig. 17: Rear Seat Back Bolster
 Courtesy of GENERAL MOTORS COMPANY

Rear Seat Back Bolster Replacement

Callout	Component Name
1	Rear Seat Back Cushion Bolster WARNING: Refer to <u>SIR Warning</u> . WARNING: Do not repair or replace the seat stitching or seams in the seat back trim cover with an internal mounted seat side airbag module. Replace the complete seat back trim cover from the OEM. Non-OEM seat stitching may cause improper airbag deployment which could result in personal injury. Procedure 1. Disable the SIR system. Refer to <u>SIR Disabling and Enabling</u> . 2. Fold rear seat back cushion down. 3. Pull the lower seat back cushion bolster forward. NOTE: Use a flat-bladed screwdriver to aid in releasing the retainer from the bolster retaining bar.

4. Pull the seat back cushion bolster up.
5. Disconnect the electrical connector.
6. Remove rear seat back cushion bolster.
7. Remove the rear seat side inflatable module. Refer to **Rear Seat Outboard Seat Back Airbag Replacement** .

REAR SEAT CUSHION HINGE PIVOT REPLACEMENT

Fig. 18: NO CONTENT
Courtesy of GENERAL MOTORS COMPANY

Rear Seat Cushion Hinge Pivot Replacement

Callout	Component Name
Preliminary Procedure	
Remove the rear seat. Refer to <u>Rear Seat Cushion Removal and Installation</u> .	
1	Rear Seat Cushion Hinge Pivot Bolt (Qty: 2) CAUTION: Refer to <u>Fastener Caution</u> . Tighten 30.5 (22.5 lb ft)
2	Rear Seat Cushion Hinge Pivot

REAR SEAT CUSHION REMOVAL AND INSTALLATION

Fig. 19: Rear Seat Cushion
Courtesy of GENERAL MOTORS COMPANY

Rear Seat Cushion Removal and Installation

Callout	Component Name
1	Rear Seat Cushion Procedure Pull up on the front of the seat cushion to disengage the retainers.
2	Rear Seat Cushion Hinge Wire Procedure Reverse the rear seat cushion to disengage the rear seat cushion hinge wire.

REAR SEAT BACK CUSHION LATCH REPLACEMENT

Fig. 20: Rear Seat Back Cushion Latch
 Courtesy of GENERAL MOTORS COMPANY

Rear Seat Back Cushion Latch Replacement

Callout	Component Name
Preliminary Procedure	
Remove rear seat back cushion pad. Refer to <u>Rear Seat Back Cushion Pad Replacement</u> .	
1	Rear Seat Back Cushion Latch Bolt (Qty: 2) CAUTION: Refer to <u>Fastener Caution</u> . Tighten 11 N.m (97 lb in)
2	Rear Seat Back Cushion Latch

REAR SEAT BACK CUSHION REMOVAL AND INSTALLATION

Fig. 21: Rear Seat Back Cushion

Courtesy of GENERAL MOTORS COMPANY

Rear Seat Back Cushion Removal and Installation

Callout	Component Name
Preliminary Procedure	
Remove the rear seat cushion. Refer to <u>Rear Seat Cushion Removal and Installation.</u>	
1	Rear Seat Back Cushion Bolt (Qty: 2) CAUTION: Refer to <u>Fastener Caution</u> . Tighten 24 N.m (18 lb ft)
2	Rear Seat Back Cushion Nut (Qty: 1) Tighten 24 N.m (18 lb ft)
3	Rear Seat Back Cushion

REAR SEAT BACK CUSHION PAD REPLACEMENT

Fig. 22: Rear Seat Back Cushion

Courtesy of GENERAL MOTORS COMPANY

Rear Seat Back Cushion Pad Replacement

Callout	Component Name
Preliminary Procedure	
Remove the rear seat back cushion cover. Refer to <u>Rear Seat Back Cover Replacement</u> .	
1	Rear Seat Back Cushion Pad

REAR SEAT BACK COVER REPLACEMENT

Fig. 23: Rear Seat Back Cover

Courtesy of GENERAL MOTORS COMPANY

Rear Seat Back Cover Replacement

Callout	Component Name
Preliminary Procedure	
Remove the rear seat back cushion. Refer to <u>Rear Seat Cushion Removal and Installation</u> .	
1	Rear Seat Back Cushion Cover Hog Ring (Qty: 16) TIP: Begin at the rear part of the rear seat, release the hog rings.
2	Rear Seat Back Cushion Cover Zipper TIP: Open the zipper to remove the cushion cover.
3	Rear Seat Back Cushion Cover

REAR SEAT BACK CUSHION LATCH RELEASE HANDLE REPLACEMENT

Rear Seat Back Cushion Latch Release Handle Replacement

Callout	Component Name
1	Rear Seat Back Cushion Latch Release Handle
	Procedure Turn the release handle clockwise for removal.

DESCRIPTION AND OPERATION

MANUAL SEATS DESCRIPTION

NOTE: Do not attempt to change the designed seat position by altering the designed seat adjuster-to-floor pan anchor provisions or the seat adjuster-to-seat frame anchor provisions. Changing the seat position could affect the performance of the seat system.

This vehicle is equipped with low-backed front seats with separate head restraints and a three-passenger folding rear seat. Split folding rear seat is optional. Seat cushions and seatbacks have formed foam pads, which fit the contours of the full-panel seatback frame assembly and the designed contour of the seat cushion frame. There are no front seat forward or rearward relocation provisions provided at either the seat adjuster-to-seat frame or the seat adjuster-to-floor pan anchor attachments.

DIAGNOSTIC INFORMATION AND PROCEDURES

SYMPTOMS - SEAT HEATING AND COOLING

IMPORTANT: Review the system description in order to familiarize yourself with the system functions. Refer to Heated Seats Description and Operation

Visual/Physical Inspection

- Inspect for aftermarket devices which could affect the operation of the heated seat system. Refer to

Checking Aftermarket Accessories

- Inspect the easily accessible or visible system components for obvious damage or conditions which could cause the symptom.

Intermittent

Faulty electrical connections or wiring may be the cause of intermittent conditions. Refer to **Testing for Intermittent Conditions and Poor Connections** .

Symptom List

Refer to **Front Heated Seat Malfunction** in order to diagnose the symptom.

FRONT HEATED SEAT MALFUNCTION

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Ignition Voltage	1	1	-	-
Heated Seat Element Control	1	1	3	-
Heated Seat Element Ground	-	1	-	-
Heated Seat Switch Ground	-	2	-	-
1. Heated seat is inoperative 2. Heated seat indicator is inoperative 3. Heated seat is always ON				

Circuit/System Description

With the ignition ON, ignition voltage is applied to the driver and passenger seat heating switches through a 15 A fuse located in the instrument panel fuse block. Ground for the seat heating element is supplied from the heating element ground circuit and ground connection G302. Ground is supplied to both the driver and passenger the heated seat switches through the switch ground circuit and the ground connection at G202. This ground circuit is used only for the purpose of illuminating heated seat ON indicator. When a seat heating switch is pressed, ignition voltage is applied through the switch contacts and the control circuit activating the seat heating element.

COMPONENT CONNECTOR END VIEWS - INDEX

Description and Operation

Heated Seats Description and Operation

Electrical Information Reference

- **Circuit Testing**
- **Connector Repairs**
- **Testing for Intermittent Conditions and Poor Connections**
- **Wiring Repairs**

Circuit/System Verification

1. Ignition ON.
2. Verify the appropriate heated seat turns ON and OFF when cycling the S32 Seat Heating Switch ON and OFF.
 - **If the heated seat does not turn ON or OFF**
3. Verify the seat heating switch indicator turns ON and OFF when cycling the S32 Seat Heating Switch ON and OFF.
 - **If the indicator does not turn ON or OFF**

Refer to Circuit/System Testing - Heated Seat Circuit Test

- **If the heated seat turns ON and OFF**

Refer to Circuit/System Testing - Heated Seat Switch Indicator Circuit Test

Circuit/System Testing

Heated Seat Circuit Test

1. Ignition OFF, disconnect the harness connector at the appropriate S32 Seat Heating Switch, ignition ON.
2. Verify a test lamp illuminates between the ignition circuit terminal 2 and ground.
 - **If the test lamp does not illuminate and the circuit fuse is good**
1. Ignition OFF.
2. Test for less than 2 ohms in the ignition circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, refer to **Power Mode Mismatch** .

- **If the test lamp does not illuminate and the circuit fuse is open**

1. Ignition OFF.
2. Test for infinite resistance between the ignition circuit and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance

NOTE: The fuse feeds both the driver and passenger seat heating elements. Test both the driver and passenger seat heating element control circuits.

3. Test for greater than 10 ohms between the control circuit terminal 3 and ground
 - If 10 ohms or less, disconnect the E14 Seat Cushion Heating Element and verify the short is in the circuit or the component.
 - If greater than 10 ohms, replace the S32 Seat Heating Switch.

- **If the test lamp illuminates**

3. Ignition OFF, connect the harness connector at the S32 Seat Heating Switch and disconnect the harness connector at the E14 Seat Cushion Heating Element.
4. Test for less than 10 ohms between the ground circuit terminal 2 and ground.

- **If 10 ohms or greater**

1. Ignition OFF.
2. Test for less than 2 ohms in the ground circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, repair the open/high resistance in the ground connection.

- **If less than 10 ohms**

5. Install a test lamp between the control circuit terminal 1 and ground, ignition ON.
6. Verify the test lamp turns ON and OFF when commanding heated seat ON and OFF using the S32 Seat Heating Switch.

- **If the test lamp remains OFF**

1. Ignition OFF, disconnect the harness connector at the S32 Seat Heating Switch.
2. Test for infinite resistance between the control circuit and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance
3. Test for less than 2 ohms in the control circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, test or replace the S32 Seat Heating Switch.

- **If the test lamp remains ON**

1. Ignition OFF, disconnect the harness connector at the S32 Seat Heating Switch, ignition ON.
2. Test for less than 1 V between the control circuit and ground.
 - If 1 V or greater, repair the short to voltage on the circuit.

- If less than 1 V, test or replace the S32 Seat Heating Switch.
 - **If the test lamp turns ON and OFF**
7. Test or replace the E14 Seat Cushion Heating Element.

Heated Seat Switch Indicator Circuit Test

1. Ignition OFF and all vehicle systems OFF, disconnect the harness connector at the appropriate S32 Seat Heating Switch. It may take up to 2 minutes for all vehicle systems to power down.
2. Test for less than 10 ohms between the ground circuit terminal 1 and ground.
 - **If 10 ohms or greater**
 1. Ignition OFF.
 2. Test for less than 2 ohms in the ground circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, repair the open/high resistance in the ground connection.
 - **If less than 10 ohms**
3. Test or replace the S32 Seat Heating Switch.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

- **Driver or Passenger Seat Back Cushion Heater Replacement**
- **Driver or Passenger Seat Cushion Heater Replacement**

REPAIR INSTRUCTIONS

DRIVER OR PASSENGER SEAT BACK CUSHION HEATER REPLACEMENT

Fig. 2: Driver or Passenger Seat Back Cushion Heater Mat
 Courtesy of GENERAL MOTORS COMPANY

Driver or Passenger Seat Back Cushion Heater Replacement

Callout	Component Name
Preliminary Procedures	
1. Remove the front seat back cushion cover. Refer to <u>Driver or Passenger Seat Back Cushion Cover Replacement</u> .	
2. Disconnect the electric harness connector.	
1	Front Seat Back Cushion Heating Mat

DRIVER OR PASSENGER SEAT CUSHION HEATER REPLACEMENT

Fig. 3: Driver or Passenger Seat Cushion Heater
 Courtesy of GENERAL MOTORS COMPANY

Driver or Passenger Seat Cushion Heater Replacement

Callout	Component Name
WARNING: Refer to <u>SIR Warning</u> .	
Preliminary Procedures	
1. Remove the driver or passenger seat. Refer to <u>Driver or Passenger Seat Removal and Installation</u> . 2. Remove the front seat cushion cover and pad. Refer to <u>Front Seat Cushion Cover and Pad Replacement</u> .	
1	Front Seat Cushion Cover Procedure Separate the seat cushion from the seat cushion pad by pulling the cover away from the pad.
2	Front Seat Cushion Heater WARNING: Replace the passenger presence system as a complete assembly to prevent possible injury to the occupant. All the components in the service kit are assembled and calibrated as a unit. Using only some of the components in the service kit will cause the passenger presence system to operate improperly.
	Front Seat Cushion Pad

NOTE:

The seat belt presence sensor and heat mat, if equipped, are integral parts of the seat cushion pad.

DESCRIPTION AND OPERATION

HEATED SEATS DESCRIPTION AND OPERATION

The heated seat system consists of the following components:

- Heated seat switch
- Seat cushion heating element

Heated Seat Operation

With the ignition ON, ignition voltage is applied to the driver and passenger heated seat switches through 15 A fuse located in the instrument panel fuse block. Ground for the seat heater element is supplied from the heater element ground circuit and ground connection G302. Ground is supplied to both the driver and passenger the heated seat switches through the switch ground circuit and the ground connection at G202. This ground circuit is used only for the purpose of illuminating heated seat ON indicator. When a heated seat switch is pressed, ignition voltage is applied through the switch contacts and the control circuit activating the seat cushion heater element.

Diagnostic Fault Information

Electrical DTCs

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
12 V Reference	B1529 03, B1405 03	1	B1529 07	B1529 07
Signal	1	1	B3622 07	-
1. Steering Wheel Controls Inoperative				

Circuit/System Description

The body control module (BCM) monitors the 12V reference circuit to make sure that the voltage stays within the proper range. Damage to components and/or incorrect operation can occur when the voltage is out of range.

Conditions for Running the DTC

- Battery voltage is between 9-16 V.
- The ignition is ON.

Conditions for Setting the DTC

The BCM detects voltage out of range on the 12V reference circuit.

Conditions for Clearing the DTC

- The condition responsible for setting the DTC no longer exists.
- A history DTC will clear once 100 consecutive malfunction free ignition cycles have occurred.

Circuit/System Verification

1. Engine running, accessories OFF, measure and record the battery voltage at the battery terminals.
2. Verify the voltage measured at the battery terminals is between 12.6-15.0 V.
 - **If not between 12.6-15.0 V**

Refer to **Charging System Test** .

- **If between 12.6-15.0 V**

3. Refer to Circuit/System Testing.

Circuit/System Testing

1. Ignition OFF and all vehicle systems OFF, disconnect the harness connector at the S70R Steering Wheel

Controls Switch - Right, ignition ON.

2. Test for B+ between the 12V reference circuit terminal 1 and ground.
 - **If less than B+**
 1. Ignition OFF, disconnect the harness connector at the K9 Body Control Module.
 2. Test for infinite resistance between the 12V reference circuit and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance
 3. Test for less than 2 ohms in the 12V reference circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, replace the K9 Body Control Module.
 - **If B+**
3. Test for B+ between the 12V reference circuit terminal 1 and signal circuit terminal 2.
 - **If less than B+**
 1. Ignition OFF, disconnect the harness connector at the K9 Body Control Module.
 2. Test for less than 1 V between the signal circuit and ground.
 - If 1 V or greater, repair the short to voltage on the circuit.
 - If less than 1 V
 3. Test for less than 2 ohms in the signal circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms replace the K9 body control module.
 - **If B+**
4. Ignition OFF, disconnect the X3 harness connector at the K9 Body Control Module.
5. Test for infinite resistance between the S70R Steering Wheel Controls Switch - Right signal circuit terminal 2 and ground.
 - **If less than infinite resistance**

Repair the short to ground on the circuit.
 - **If infinite resistance**
6. Test or replace the S70R Steering Wheel Controls Switch - Right.

Component Testing

1. Ignition OFF, disconnect the harness connector at the S70R Steering Wheel Controls Switch - Right.
2. Test the resistance between the signal terminal 2 and the 12V reference circuit terminal 1 while pressing the appropriate steering wheel controls switch button listed below:
 - **If not the specified value**

Replace the S70R Steering Wheel Controls Switch - Right.
 - **If the specified value**

3. All OK

Function Switch	Minimum Resistance Value	Maximum Resistance Value
Hang Up-Mute	5.0 kohms	5.5 kohms
Telephone Switch	3.6 kohms	4 kohms
Arrow Down	2.2 kohms	2.6 kohms
Arrow Up	1.7 kohms	2 kohms
Volume Down	1.4 kohms	1.6 kohms
Volume Up	1.1 kohms	1.3 kohms
No Switch Pressed	Infinite	Infinite

Diagnostic Fault Information

Electrical DTCs

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
12 V Reference	B1529 03, B1405 03	1	B1529 07	B1529 07
Signal	1	1	B3622 07	-
1. Steering Wheel Controls Inoperative				

Circuit/System Description

The body control module (BCM) supplies voltage to the steering wheel control switches and monitors the return signal. Each switch state is associated to a set resistance value and when pressed, a specific voltage drop occurs across the resistor unique to the switch. The BCM identifies the switch selection and activates the feature.

Conditions for Running the DTC

- The system voltage is between 9-16 V.
- The ignition is ON.

Conditions for Setting the DTC

B1529 03

- The BCM detects a short to ground in the 12 V reference circuit.
- The above condition is present for greater than 30 seconds.

B1529 07

- The BCM detects a short to voltage in the 12 V reference circuit.
- The above condition is present for greater than 30 seconds.

Action Taken When the DTC Sets

The BCM will ignore switch inputs.

Conditions for Clearing the DTC

- The condition responsible for setting the DTC no longer exists.
- A history DTC will clear once 100 consecutive malfunction free ignition cycles have occurred.

DTC B3622: STEERING WHEEL CONTROLS

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

DTC Descriptor

DTC B3622 07

Steering Wheel Controls Signal Circuit High Voltage

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
12 V Reference	B1529 03, B1405 03	1	B1529 07	B1529 07
Signal	1	1	B3622 07	-
1. Steering Wheel Controls Inoperative				

Circuit/System Description

The body control module (BCM) monitors the steering wheel control signal circuit voltage. If the voltage level is too high, damage may result in the system. When a high voltage condition is detected, the BCM will ignore the switch command.

Conditions for Running the DTC

- Battery voltage is between 9-16 V.
- The ignition is ON.

Conditions for Setting the DTC

The BCM detects a short to voltage in the steering wheel control switch signal circuit.

Action Taken When the DTC Sets

The BCM will ignore switch inputs.

Conditions for Clearing the DTC

- The condition responsible for setting the DTC no longer exists.
- A history DTC will clear once 100 consecutive malfunction free ignition cycles have occurred.

SYMPTOMS - SECONDARY AND CONFIGURABLE CUSTOMER CONTROLS

NOTE: **The following steps must be completed before using the symptom tables.**

1. Perform the **Diagnostic System Check - Vehicle** before using the symptom tables in order to verify that all of the following are true:
 - There are no DTCs set.
 - The control modules can communicate via the serial data link.
2. Review the system description and operation in order to familiarize yourself with the system functions. Refer to **Steering Wheel Controls Description and Operation**.

Visual/Physical Inspection

- Inspect for aftermarket devices which could affect the operation of the steering wheel controls. Refer to

Checking Aftermarket Accessories .

- Inspect the easily accessible or visible system components, for obvious damage or conditions, which could cause the symptom.

Intermittent

Faulty electrical connections or wiring may be the cause of intermittent conditions. Refer to **Testing for Intermittent Conditions and Poor Connections .**

Symptom List

Refer to a symptom diagnostic procedure from the following list in order to diagnose the symptom:

Refer to **Steering Wheel Controls Malfunction** in order to diagnose the symptom.

STEERING WHEEL CONTROLS MALFUNCTION

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

K9	K9 Body Control Module
A11	A11 Radio

The steering wheel control switches duplicate the function of the primary controls of the associated component, through a network of momentary contact switches and a series of resistors. The body control module (BCM) supplies voltage to the switches and monitors the return signal. When a switch is pressed, a specific voltage drops across the resistor unique to that switch. The BCM identifies the switch selected and sends a serial data message to the component controlled by the switch, activating the feature.

This section is intended to diagnose the circuits between the BCM and the steering wheel control switches. If the primary control for the device is inoperative, refer to the appropriate section for the component the steering wheel control switch is used for.

DTC	Description
<u>DTC B270A</u>	DTC B270A 01 Park Lock Solenoid Actuator Control Circuit Short to Voltage DTC B270A 02 Park Lock Solenoid Actuator Control Circuit Short to Ground

DTC B270A: PARK LOCK SOLENOID ACTUATOR

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

DTC Descriptors

DTC B270A 01

Park Lock Solenoid Actuator Control Circuit Short to Voltage

DTC B270A 02

Park Lock Solenoid Actuator Control Circuit Short to Ground

DTC B270A 04

Park Lock Solenoid Actuator Control Circuit Open

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Control	B270A 02	B270A 04	B270A 01	-
Ground	-	B270A 04	-	-

Circuit/System Description

The body control module (BCM) controls the transmission shift lock control solenoid actuator by providing a battery positive voltage to the solenoid when the brake pedal is applied. The BCM monitors the voltage and current flow of the control circuit.

Conditions for Running the DTC

- The ignition switch is in the ON position.
- The brake pedal is applied.
- The transmission is in the PARK position.
- The DTC runs continuously once the above conditions are met.

Conditions for Setting the DTC

B270A 01

The body control module detects a short to voltage in the transmission shift lock control solenoid actuator control circuit for 1 s.

B270A 02

The body control module detects a short to ground in the transmission shift lock control solenoid actuator control circuit for 1 s.

B270A 04

The body control module detects an open in the transmission shift lock control solenoid actuator control circuit for 1 s.

Action Taken When the DTC Sets

The body control module will not attempt to enable the control circuit of the transmission shift lock control solenoid actuator until the next key cycle.

Conditions for Clearing the DTC

- A current DTC B270A will clear when the malfunction is no longer present and the ignition switch is cycled.
- A history DTC will clear after 100 ignition cycles with no current DTC active during the 100 ignition cycles.

Scan Tool Reference

Control Module References for scan tool information

Circuit/System Verification

1. Ignition ON.
2. Verify the scan tool Brake Transmission Shift Interlock Solenoid Actuator Command parameter changes from Inactive to Active when the brake pedal is applied.

- **If the parameter does not change**

Refer to **Stop Lamps Malfunction**

- **If the parameter changes**

3. Verify the S3 Transmission Shift Lever moves out of the PARK position when the brake pedal is applied.

- **If the S3 Transmission Shift Lever does not move out of the PARK position**

Refer to Circuit/System Testing.

- **If the S3 Transmission Shift Lever does move out of the PARK position**

All OK.

Circuit/System Testing

1. Ignition OFF and all vehicle systems OFF, disconnect the harness connector at the S3 Transmission Shift Lever. It may take up to 2 min for all vehicle systems to power down.
2. Test for less than 10 ohms between the ground circuit terminal 7 and ground.
 - **If 10 ohms or greater**
 1. Ignition OFF.
 2. Test for less than 2 ohms in the ground circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, repair the open/high resistance in the ground connection.
 - **If less than 10 ohms**
3. Ignition ON, connect a test lamp between the control circuit terminal 1 and the ground circuit terminal 7.
4. Verify the test lamp turns ON and OFF when commanding the Brake Transmission Shift Interlock Solenoid Actuator ON and OFF with a scan tool.
 - **If the test lamp is always OFF**
 1. Ignition OFF, disconnect the harness connector at the K9 Body Control Module.
 2. Test for infinite resistance between the control circuit and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance
 3. Test for less than 2 ohms in the control circuit end to end.

- If 2 ohms or greater, repair the open/high resistance in the circuit.
- If less than 2 ohms
- 4. Ignition ON.
- 5. Verify a test lamp illuminates between each B+ and ignition circuit terminal at the control module harness connector.
 - If the test lamp does not illuminate, repair the circuit or fuse as necessary.
 - If the test lamp illuminates at each B+ and ignition circuit, replace the K9 Body Control Module.
 - **If the test lamp is always ON**
- 1. Ignition OFF, disconnect the harness connector at the K9 Body Control Module, ignition ON.
- 2. Test for less than 1 V between the control circuit and ground.
 - If 1 V or greater, repair the short to voltage on the circuit.
 - If less than 1 V, replace the K9 Body Control Module.
 - **If the test lamp turns ON and OFF**
- 5. Test or replace the S3 Transmission Shift Lever.

Component Testing

Dynamic Test

1. Install a 10 A fused jumper wire between the control terminal 1 and 12 V. Momentarily install a jumper wire between the ground terminal 7 and ground.
2. Verify the M7 Transmission Shift Lock Control Solenoid Actuator turns on & off/clicks, etc.
 - **If the M7 Transmission Shift Lock Control Solenoid Actuator does not turn on & off/clicks, etc.**

Replace the S3 transmission shift lever.

 - **If the M7 Transmission Shift Lock Control Solenoid Actuator does turn on & off/clicks, etc.**
3. All OK

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

- **Transmission Control Replacement**
- **Control Module References** for BCM replacement, programming, and setup

SYMPTOMS - AUTOMATIC TRANSMISSION SHIFT LOCK CONTROL

NOTE: The following steps must be completed before using the symptom tables.

1. Perform the **Diagnostic System Check - Vehicle** before using the Symptom Tables in order to verify that

all of the following are true:

- There are no DTCs set.
- The control modules can communicate via the serial data link.

2. Review the system operation in order to familiarize yourself with the system functions. Refer to **Automatic Transmission Shift Lock Control Description and Operation**.

Visual/Physical Inspection

- Inspect for aftermarket devices which could affect the operation of the automatic transmission shift lock control. Refer to **Checking Aftermarket Accessories**.
- Inspect the easily accessible or visible system components for obvious damage or conditions which could cause the symptom.

Intermittent

Faulty electrical connections or wiring may be the cause of intermittent conditions. Refer to **Testing for Intermittent Conditions and Poor Connections**.

Symptom List

Refer to a symptom diagnostic procedure in order to diagnose the symptom:

Transmission Control Lever Malfunction

TRANSMISSION CONTROL LEVER MALFUNCTION

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Control	B270A 02	B270A 04	B270A 01	-
Ground	-	B270A 04	-	-

Circuit/System Description

The body control module (BCM) controls the transmission shift lock control solenoid actuator by providing a battery positive voltage to the solenoid when the brake pedal is applied. The BCM monitors the voltage and current flow of the control circuit.

Scan Tool Reference

Control Module References for scan tool information

Circuit/System Verification

1. Ignition ON.
2. Verify the scan tool Brake Transmission Shift Interlock Solenoid Actuator Command parameter changes from Inactive to Active when the brake pedal is applied.
 - **If the parameter does not change**

Refer to **Stop Lamps Malfunction**

- **If the parameter changes**
3. Verify the S3 Transmission Shift Lever moves out of the PARK position when the brake pedal is applied.
 - **If the S3 Transmission Shift Lever does not move out of the PARK position**

Refer to Circuit/System Testing.

- **If the S3 Transmission Shift Lever does move out of the PARK position**

All OK.

Circuit/System Testing

1. Ignition OFF and all vehicle systems OFF, disconnect the harness connector at the S3 Transmission Shift Lever. It may take up to 2 min for all vehicle systems to power down.

2. Test for less than 10 ohms between the ground circuit terminal 7 and ground.
 - **If 10 ohms or greater**
 1. Ignition OFF.
 2. Test for less than 2 ohms in the ground circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, repair the open/high resistance in the ground connection.
 - **If less than 10 ohms**
3. Ignition ON, connect a test lamp between the control circuit terminal 1 and the ground circuit terminal 7.
4. Verify the test lamp turns ON and OFF when commanding the Brake Transmission Shift Interlock Solenoid Actuator ON and OFF with a scan tool.
 - **If the test lamp is always OFF**
 1. Ignition OFF, disconnect the harness connector at the K9 Body Control Module.
 2. Test for infinite resistance between the control circuit and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance
 3. Test for less than 2 ohms in the control circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms
 4. Ignition ON.
 5. Verify a test lamp illuminates between each B+ and ignition circuit terminal at the control module harness connector.
 - If the test lamp does not illuminate, repair the circuit or fuse as necessary.
 - If the test lamp illuminates at each B+ and ignition circuit, replace the K9 Body Control Module.
 - **If the test lamp is always ON**
 1. Ignition OFF, disconnect the harness connector at the K9 Body Control Module, ignition ON.
 2. Test for less than 1 V between the control circuit and ground.
 - If 1 V or greater, repair the short to voltage on the circuit.
 - If less than 1 V, replace the K9 Body Control Module.
 - **If the test lamp turns ON and OFF**
5. Test or replace the S3 Transmission Shift Lever.

Component Testing

Dynamic Test

1. Install a 10 A fused jumper wire between the control terminal 1 and 12 V. Momentarily install a jumper wire between the ground terminal 7 and ground.
2. Verify the M7 Transmission Shift Lock Control Solenoid Actuator turns on & off/clicks, etc.
 - **If the M7 Transmission Shift Lock Control Solenoid Actuator does not turn on & off/clicks,**

etc.

Replace the S3 Transmission Shift Lever.

- **If the M7 Transmission Shift Lock Control Solenoid Actuator does turn on & off/clicks, etc.**

3. All OK

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

- **Transmission Control Replacement**
- **Control Module References** for BCM replacement, programming, and setup

DESCRIPTION AND OPERATION

AUTOMATIC TRANSMISSION SHIFT LOCK CONTROL DESCRIPTION AND OPERATION

The automatic transmission park lock control system is a safety device that prevents an inadvertent shift out of PARK. The driver must press the brake pedal before moving the park lever out of the PARK position. The system consists of the following components:

- The automatic transmission shift lock control solenoid, is located within the automatic transmission shift lever.
- The body control module, which controls the voltage supply circuit of the park lock control solenoid.
- The engine control module.

The body control module controls the voltage to the automatic transmission shift lock control solenoid. The following conditions must be met before the body control module will supply voltage to the automatic transmission shift lock control solenoid.

- The ignition is in the ON position.
- The engine control module sends an input via serial data to the body control module indicating the transmission is in the PARK position.
- The body control module determines the brake pedal is applied according the brake pedal position.

Since the automatic transmission shift lock control solenoid is permanently grounded, the body control module supplies voltage to the automatic transmission shift lock control solenoid, unlocking the park lever allowing the driver to move the park lever out of the PARK position as the solenoid energizes. When the brake pedal is not applied, the body control module turns the control voltage output of the park lock control solenoid OFF, de-energizing the park lock control solenoid. The de-energized solenoid mechanically locks the park lever in the PARK position.

ACCESSORIES & EQUIPMENT

Squeaks and Rattles - Spark

DIAGNOSTIC INFORMATION AND PROCEDURES

SQUEAKS AND RATTLES

NOTE: Squeaks and rattles are caused by improperly controlled relative motion between vehicle components. There are 4 ways to prevent squeaks and rattles.

- Attach the component that squeaks or rattles securely.
- Separate the components that squeak or rattle to prevent contact.
- Insulate the components that squeak or rattle.
- Insulate low uniform friction surfaces to eliminate stickslip motion.

SYMPTOMS - SQUEAKS AND RATTLES

Rattle Coming From the Side Rail

Checks	Action
Check the brake lines.	• Tap lightly on the brake lines and listen for a rattle. • Install plastic tie straps to secure the brake lines tightly together.

Rattle Under Vehicle at Higher RPM

Checks	Action
Check for heat shield contact with the underbody.	• Raise the vehicle and perform a visual inspection. • Bend the heat shield slightly to gain clearance from the underbody.

Thump From Rear of Vehicle on Bumps

Checks	Action
Check for a properly secured spare tire or tire repair kit in the rear compartment.	• Open the rear compartment and perform a visual inspection of the spare tire or the tire repair kit and the tools. • Tightly secure the spare tire or the tire repair kit and all tools. • Perform a road test to verify that the noise is eliminated.

Glass Knock Coming From the Rear of the Vehicle When Driving Over Bumps

Checks	Action
Check for an out-of-adjustment hatchback latch.	• Test drive the vehicle in order to verify this condition. • Loosen the latch nuts and adjust the latch downward.

Rattle Coming From Door

Checks	Action
Check for rattling electrical connectors inside the door trim panel.	• Tap on the trim panel and listen for a rattle. • Remove the trim panel and wrap foam padding around the connectors as required.

Squeak When Operating Doors

Checks	Action
Check for a lack of lubrication of the door hinge pins.	• Operate the doors and listen for squeaks. • Lubricate the door hinge pins with light oil and coat with lithium grease.

Squeak Coming From Console When Shifting Manual Transmission Condition Occurs In Cold Weather with a Cold Engine

Checks	Action
Check the manual transaxle control lever lower boot.	• Move the control lever between gears and listen for squeaks. • Remove the floor console and replace the lower shift boot or apply talcum powder to the lower shift boot.

Buzz From the Left Side of Instrument Panel

Checks	Action
Check for vibration of the fuse box cover against the instrument panel side trim.	• Tap on the cover with a finger and listen for a buzz. • Apply felt pads to the side trim where the cover makes contact.

Squeak Coming From Instrument Cluster Trim Plate

Checks	Action
Check for rubbing the cluster trim plate on the instrument panel.	• Test drive the vehicle in order to verify this condition. • Remove the instrument cluster trim plate and install felt tape to the edges.

DIAGNOSTIC INFORMATION AND PROCEDURES

SYMPTOMS - STEERING WHEEL AND COLUMN

NOTE: Review the system operation in order to familiarize yourself with the system functions.

Refer to Steering Wheel and Column Description and Operation.

Symptoms List

Refer to a symptom diagnostic procedure from the following list in order to diagnose the symptom:

- High Effort While Tilting Column.
- Lock System Does Not Unlock.
- Lock System Does Not Lock
- Noise in Steering Column.
- Lock System Does Not Lock.

LOCK SYSTEM DOES NOT UNLOCK

Lock System Does Not Unlock

Condition	Action
Check the ignition lock cylinder for damage.	Replace the ignition lock cylinder. Refer to <u>Ignition Lock Cylinder Replacement (Type B)</u> , <u>Ignition Lock Cylinder Replacement (Type A)</u> .

Check the steering column housing for binding or damage.	Remove the steering shaft and clear the steering column housing. Replace the steering column housing as needed.
--	---

HIGH EFFORT WHILE TILTING COLUMN

High Effort While Tilting Column

Condition	Action
The pivot bolt is damaged or misaligned.	If necessary, replace the steering column. Refer to <u>Steering Column Replacement (Electric Power Steering)</u> .

LOCK SYSTEM DOES NOT LOCK

Lock System Does Not Lock

Condition	Action
With the steering wheel in the straight-ahead position, remove the key and rotate the steering wheel 120 degrees to the right.	If the steering column does not lock after 120 degree rotation, remove the trim panels around the ignition lock cylinder and lower the steering column. Refer to <u>Ignition Lock Cylinder Replacement (Type B)</u> , <u>Ignition Lock Cylinder Replacement (Type A)</u> .
Check the lock cylinder for damage.	Replace the ignition lock cylinder. Refer to <u>Ignition Lock Cylinder Replacement (Type B)</u> , <u>Ignition Lock Cylinder Replacement (Type A)</u> .
Check the steering column housing for binding or damage.	Remove the steering shaft and clear the steering column housing. Replace the steering column housing as needed.

NOISE IN STEERING COLUMN

Noise in Steering Column

Step	Action	Yes	No
1	Did you review the Steering Wheel and Column Description and perform the necessary inspections?	Go to Step 2	Go to <u>Steering Column Replacement (Electric Power Steering)</u>
2	Verify that noise is present in the steering column during operation. Is noise present in the steering column during operation?	Go to Step 3	System OK
3	Inspect the steering column mounting features for the following conditions: Steering column mounting fasteners for looseness		

	Steering column mounting features are sheared		
	Are the steering column mounting features loose?	Go to Step 9	Go to Step 4
4	Inspect the SIR/SRS coil for noise. Is the SIR/SRS coil noisy?	Go to Step 10	Go to Step 5
5	Inspect the lock plate retaining ring for correct installation. Is the lock plate retaining ring installed incorrectly?	Go to Step 11	Go to Step 6
6	Inspect the steering column upper and lower bearings for the following conditions: - Damage - Lubrication - Wear - Proper seating		
	Are the bearings in need of repair or replacement?	Go to Step 12	Go to Step 7
7	Does the tilt joint need to be lubricated?	Go to Step 13	Go to Step 8
8	NOTE: This is best evaluated while driving the vehicle, turning the steering and applying the brake pedal. Inspect the intermediate steering shaft for noise. Is the intermediate steering shaft noisy?		
		Go to Step 14	Go to Step 15
9	NOTE: If the steering column mounting is damaged or sheared, the steering column will need to be replaced. Refer to <u>Steering Column Replacement (Electric Power Steering)</u>. Tighten the steering column mounting fastener to specifications. Refer to <u>Fastener Tightening Specifications</u> . Did you complete the repair?	Go to Step 15	-
10	Replace the SIR/SRS coil. Refer to <u>Steering Wheel Airbag Coil Replacement</u> . Did you complete the repair?	Go to Step 15	-
11	Install the lock plate retaining ring correctly. Did you complete the repair?	Go to Step 15	-
12	NOTE: If the steering column upper and/or lower bearings are not serviceable, the steering column will need to be replaced. Refer to <u>Steering Column Replacement (Electric Power Steering)</u>.		-

	Replace the upper and/or lower bearing, if serviceable. Did you complete the repair?	Go to Step 15	
13	Lubricate the tilt joint. Did you complete the repair?	Go to Step 15	-
14	Replace the appropriate intermediate steering shaft component. Refer to <u>Intermediate Steering Shaft Replacement</u> . Did you complete the repair?	Go to Step 15	-
15	Operate the system in order to verify the repair. Did you correct the condition?	System OK	Go to Step 3

LOOSENESS IN STEERING COLUMN

Looseness in Steering Column

Step	Action	Yes	No
1	Did you review the Steering Wheel and Column Description and perform the necessary inspections?	Go to Step 2	Go to <u>Steering Column Replacement (Electric Power Steering)</u>
2	Verify that the steering column is loose. Is the steering column loose?	Go to Step 3	System OK
3	Inspect the steering column mounting features for the following conditions. - Steering column mounting fasteners for looseness - Steering column mounting features are sheared Are the steering column mounting features loose?	Go to Step 5	Go to Step 4
4	Inspect the upper and/or lower bearings for looseness. Are any of the bearings worn or loose?	Go to Step 6	Go to Step 7
5	NOTE: If the steering column mounting is damaged or sheared, the steering column will need to be replaced. Refer to <u>Steering Column Replacement (Electric Power Steering)</u>. Tighten the steering column mounting fastener to specifications. Refer to <u>Fastener Tightening Specifications</u> . Did you complete the repair?	Go to Step 7	-
	NOTE: If the steering column mounting is damaged or sheared, the steering column will need to be		

6	replaced. Refer to <u>Steering Column Replacement (Electric Power Steering)</u> . Replace the upper and/or lower bearings, if serviceable. Did you complete the repair	Go to Step 7	-
7	Operate the system in order to verify the repair. Did you correct the condition?	System OK	Go to Step 3

REPAIR INSTRUCTIONS

INTERMEDIATE STEERING SHAFT UPPER SEAL REPLACEMENT

Fig. 1: Intermediate Steering Shaft Upper Seal
Courtesy of GENERAL MOTORS COMPANY

Intermediate Steering Shaft Upper Seal Replacement

Callout	Component Name
Preliminary Procedure Disconnect the intermediate steering shaft from the steering gear. Refer to <u>Intermediate Steering Shaft Replacement</u> .	
	Intermediate Steering Shaft Upper Seal
	Procedure 1. When removing the intermediate steering shaft upper seal, lift up the lip on the upper seal to access and release the retaining tabs securing the upper seal to the lower seal.

1	2. After installing the intermediate steering shaft upper seal, lift up the lip on the upper seal to access and ensure the retaining tabs securing the upper seal to the lower seal are fully engaged. NOTE: Note the orientation of the alignment marking on the seal to help aid in installation.
---	--

INTERMEDIATE STEERING SHAFT LOWER SEAL REPLACEMENT

Fig. 2: Intermediate Steering Shaft Lower Seal
Courtesy of GENERAL MOTORS COMPANY

Intermediate Steering Shaft Lower Seal Replacement

Callout	Component Name
Preliminary Procedure	
1. Remove the intermediate steering shaft upper seal. Refer to <u>Intermediate Steering Shaft Upper Seal Replacement</u>. 2. Lower the front suspension frame and steering gear to get an access to remove the intermediate steering shaft lower seal. Refer to <u>Steering Gear Replacement (Electric Power Steering)</u> .	
1	Intermediate Steering Shaft Lower Seal Procedure When installing the intermediate steering shaft lower seal, align the nose of the intermediate steering shaft lower seal to the groove on the power steering gear.

INTERMEDIATE STEERING SHAFT REPLACEMENT

Removal Procedure

1. Turn the steering wheel to the straight forward position and support it from movement.

Fig. 3: Intermediate Steering Shaft Bolts
Courtesy of GENERAL MOTORS COMPANY

2. Remove the 2 intermediate steering shaft bolts (1).

Fig. 4: Intermediate Steering Shaft
Courtesy of GENERAL MOTORS COMPANY

3. Remove the intermediate steering shaft.

Installation Procedure

Fig. 5: Intermediate Steering Shaft
Courtesy of GENERAL MOTORS COMPANY

1. Install the intermediate steering shaft.

Fig. 6: Universal Joint And Steering Pinion Attachment Points
Courtesy of GENERAL MOTORS COMPANY

NOTE: The recess (2) of the fine toothing in the universal joint have to align precisely with the recess (1) of the fine toothing on the steering pinion. The bore in the universal joint have to align with the groove on the steering pinion (3).

Fig. 7: Intermediate Steering Shaft Bolts
Courtesy of GENERAL MOTORS COMPANY

CAUTION: Refer to Fastener Caution .

2. Install the 2 intermediate steering shaft bolts (1) and tighten the intermediate steering shaft bolts to 25 N.m (18 lb ft).

STEERING COLUMN UPPER TRIM COVER REPLACEMENT

Fig. 8: Steering Column Upper Trim Cover
 Courtesy of GENERAL MOTORS COMPANY

Steering Column Upper Trim Cover Replacement

Callout	Component Name
Preliminary Procedure	
1. Remove the steering column lower cover. Refer to <u>Steering Column Lower Trim Cover Replacement</u> . 2. Remove the cluster. Refer to <u>Instrument Cluster Replacement</u> .	
1	Steering Column Upper Trim Cover Procedure Unclip the steering column upper trim cover from the steering column lower trim cover.

STEERING COLUMN LOWER TRIM COVER REPLACEMENT

Fig. 9: Steering Column Lower Trim Cover
 Courtesy of GENERAL MOTORS COMPANY

Steering Column Lower Trim Cover Replacement

Callout	Component Name
1	Steering Column Lower Trim Cover Screw (Qty: 1)
2	Steering Column Lower Trim Cover Screw (Qty: 2)
	Procedure
	Turn the steering wheel until the bolts are reachable.
3	Steering Column Lower Trim Cover

TURN SIGNAL SWITCH REPLACEMENT

Fig. 10: Turn Signal Switch

Courtesy of GENERAL MOTORS COMPANY

Turn Signal Switch Replacement

Callout	Component Name
Preliminary Procedure	
1. Remove the steering column upper trim cover. Refer to <u>Steering Column Upper Trim Cover Replacement</u>. 2. Remove the steering column lower trim cover. Refer to <u>Steering Column Lower Trim Cover Replacement</u>.	
1	Turn Signal Switch Procedure 1. Disconnect any electrical connectors as needed. 2. Release the plastic retaining tabs to release the turn signal switch from steering wheel inflatable restraint module coil.

TURN SIGNAL SWITCH BRACKET REPLACEMENT

Fig. 11: Turn Signal Switch Bracket
 Courtesy of GENERAL MOTORS COMPANY

Turn Signal Switch Bracket Replacement

Callout	Component Name
Preliminary Procedures 1. Remove the steering wheel airbag coil. Refer to <u>Steering Wheel Airbag Coil Replacement</u> . 2. Remove the turn signal switch. Refer to <u>Turn Signal Switch Replacement</u>. 3. Remove the windshield wiper and washer switch. Refer to <u>Windshield Wiper and Washer Switch Replacement</u> .	
1	Turn Signal Switch Bracket Screw (Qty: 2) CAUTION: Refer to <u>Fastener Caution</u> . Tighten 3.4 (30 lb in)
2	Turn Signal Switch Bracket

STEERING WHEEL REPLACEMENT

Fig. 12: Steering Wheel

Courtesy of GENERAL MOTORS COMPANY

Steering Wheel Replacement

Callout	Component Name
Preliminary Procedure Remove the inflatable restraint steering wheel module. Refer to <u>Airbag Steering Wheel Module Replacement</u> .	
1	Steering Wheel Bolt CAUTION: Refer to <u>Fastener Caution</u> . Tighten 38 (28 lb ft)
2	Steering Wheel Procedure 1. Disconnect the electrical connectors as needed. 2. Using the CH-50168-A steering wheel puller, remove the steering wheel carefully. Special Tools

STEERING COLUMN REPLACEMENT (ELECTRIC POWER STEERING)

Removal Procedure

1. Disconnect the battery negative cable. Refer to Battery Negative Cable Disconnection and Connection .

CAUTION: With wheels of the vehicle facing straight ahead, secure the steering wheel utilizing steering column anti-rotation pin, steering column lock, or a strap to prevent rotation. Locking of the steering column will prevent damage and a possible malfunction of the SIR system. The steering wheel must be secured in position before disconnecting the following components:

- The steering column
- The intermediate shaft(s)
- The steering gear

After disconnecting these components, do not rotate the steering wheel or move the front tires and wheels. Failure to follow this procedure may cause the SIR coil assembly to become un-centered and cause possible damage to the SIR coil. If you think the SIR coil has become un-centered, refer to your specific SIR coil's centering procedure to re-center SIR Coil.

2. Turn the steering wheel to the straight ahead position and lock it in place.
3. Remove the steering wheel. Refer to Steering Wheel Replacement.
4. Remove the steering column lower trim cover. Refer to Steering Column Lower Trim Cover Replacement.
5. Remove the steering column upper trim cover. Refer to Steering Column Upper Trim Cover Replacement.
6. Remove the turn signal switch bracket. Refer to Turn Signal Switch Bracket Replacement.
7. Disconnect any electrical connectors as necessary.
8. Remove the steering column opening filler. Refer to Steering Column Opening Filler Replacement .
9. Remove the electric power steering module and bracket assembly from the steering column. Refer to Power Steering Control Module Replacement .

Fig. 13: Intermediate Steering Shaft Upper Bolt
Courtesy of GENERAL MOTORS COMPANY

10. Remove the intermediate steering shaft upper bolt and disconnect the shaft from the steering column. Refer to **Intermediate Steering Shaft Replacement**.

NOTE: Install tie straps between the tilt lever bracket and the base of the steering column to prevent the steering column jacket from pulling apart. The tilt lever **MUST** be in the LOCK (FULL UP) position during the steering column removal and installation to ensure that the tilt lever bracket remains rigid. Also install tie straps around the tilt lever and the steering column jacket to keep the tilt lever in the LOCK position. Do not bend the steering column energy absorbing straps located on the upper steering column mounting bracket.

11. Install tie straps as described above.

Fig. 14: Steering Column Nuts

Courtesy of GENERAL MOTORS COMPANY

12. Remove and DISCARD the steering column nuts (1).

Fig. 15: Steering Column Bolt

Courtesy of GENERAL MOTORS COMPANY

13. Remove the steering column bolt (1).
14. Remove the steering column from the vehicle.

Installation Procedure

1. Install the steering column to the vehicle.

Fig. 16: Steering Column Bolt

Courtesy of GENERAL MOTORS COMPANY

WARNING: In order to ensure the intended function of the steering column in a vehicle during a crash and in order to avoid personal injury to the driver, perform the following:

- Tighten the steering column lower fasteners before you tighten the steering column upper fasteners. Failure to do this can damage the steering column.
- Tighten the steering column fasteners to the specified torque. Overtightening the upper steering column fasteners could affect the steering column collapse.

CAUTION: Refer to Fastener Caution .

NOTE: Start all steering column fasteners by hand before finalizing any torques. Do NOT bend the steering column energy absorbing straps located on the upper steering column mounting bracket during installation.

2. Install the steering column bolt (1) and tighten to 25 (18 lb ft).

Fig. 17: Steering Column Nuts

Courtesy of GENERAL MOTORS COMPANY

3. Install the NEW steering column nuts (1) and tighten to 25 (18 lb ft).
4. Remove the tie straps.
5. Connect the intermediate steering shaft to the steering column.
6. Install the intermediate steering shaft upper bolt and tighten to 23 (17 lb ft).
7. Install the electric power steering module and bracket assembly to the steering column. Refer to **Power Steering Control Module Replacement** .
8. Install the steering column opening filler. Refer to **Steering Column Opening Filler Replacement** .
9. Connect any electrical connectors as necessary.
10. Install the turn signal switch bracket. Refer to **Turn Signal Switch Bracket Replacement**.
11. Install the steering column upper trim cover. Refer to **Steering Column Upper Trim Cover Replacement**.
12. Install the steering column lower trim cover. Refer to **Steering Column Lower Trim Cover Replacement**.
13. Install the steering wheel. Refer to **Steering Wheel Replacement**.
14. Connect the battery negative cable. Refer to **Battery Negative Cable Disconnection and Connection** .

15. Calibrate the steering angle sensor. Refer to **Power Steering Control Module Programming and Setup** .

STEERING ANGLE SENSOR REPLACEMENT

Fig. 18: Steering Angle Sensor
Courtesy of GENERAL MOTORS COMPANY

Steering Angle Sensor Replacement

Callout	Component Name
Preliminary Procedure Remove the intermediate steering shaft upper bolt and disconnect the intermediate steering shaft from the steering column. Refer to <u>Intermediate Steering Shaft Replacement</u> .	
1	Steering Angle Sensor Holder
2	Steering Angle Sensor
Procedure 1. Disconnect the electrical connector. 2. Remove the steering angle sensor from the bracket of steering column. 3. After installation, center the steering angle sensor. Refer to <u>Steering Angle Sensor Centering</u> .	
NOTE:	

	The steering angle sensor should be installed in the correct orientation. If the force is needed on installing check the orientation of sensor. Incorrect installation causes that the sensor can't recognize the steering angle of vehicle normally.
--	--

DESCRIPTION AND OPERATION

STEERING WHEEL AND COLUMN DESCRIPTION AND OPERATION

The steering wheel and column has 4 primary functions:

- Vehicle steering
- Vehicle security
- Driver convenience
- Driver safety

Vehicle Steering

The steering wheel is the first link between the driver and the vehicle. The steering wheel is fastened to a steering shaft within the column. At the lower end of the column, the intermediate shaft connects the column to the steering gear.

The steering column can be adjusted vertically and longitudinally.

Vehicle Security

Theft deterrent components are mounted and designed into the steering column. The following components allow the column to be locked in order to minimize theft:

- The ignition switch
- The steering column lock
- The ignition cylinder
- The theft deterrent immobilizer module, if equipped

Driver Convenience

The steering wheel and column may also have driver controls attached for convenience and comfort. The following controls may be mounted on the steering wheel or column.

- The turn signal switch
- The headlamp dimmer switch
- The wiper/washer switch
- The horn pad
- The redundant radio/entertainment system controls
- The tilt functions

- The telephone system controls

Driver Safety

The steering wheel and column has safety features to protect the driver. The following components may be mounted on or near the steering column:

Energy-Absorbing Steering Column: The energy-absorbing steering column compresses in the event of a front-end collision, which reduces the chance of injury to the driver. The energy-absorbing feature, collapsible steering shaft, and break away mounting features help reduce the injury in the event of an accident.

SIR Coil and Module: For additional information on the operation of the SIR coil and module, refer to **Supplemental Inflatable Restraint System Description and Operation** .

Steering Wheel Angle Sensor: The steering wheel angle sensor is located somewhere along the steering shaft assembly. The sensor measures the position of the steering wheel and the speed at which it is rotated. A signal representing this measurement is provided to the electronic stability control (ESC) in the ABS module.

The Theft Deterrent Immobilizer Module: The immobilizer module is mounted in the steering column lock on cars without Passive Entry Passive Start system (PEPS). Refer to **Immobilizer Description and Operation** .

COMPONENT LOCATOR

SIR IDENTIFICATION VIEWS

The SIR Identification Views shown below illustrate the approximate location of all SIR components available for the vehicle. This will assist in determining the appropriate SIR Disabling and Enabling for a given service procedure, refer to **SIR Disabling and Enabling**.

Fig. 6: Identifying SIR Identification Views
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
1	B59R Front Impact Sensor - Right - Located at the front of the engine compartment, on the right side of the radiator support
2	F101 Passenger Instrument Panel Air Bag - Located at the top right, under the instrument panel
3	F114P Knee Air Bag - Passenger - Located below the glove box in the instrument panel
4	F105R Roof Rail Air Bag - Right - Located in the passenger compartment, along the right roof rail
5	K36 Inflatable Restraint Sensing and Diagnostic Module - Located underneath the center console
6	B63RF Side Impact Sensor - Right Front - Located inside the right front door
7	B60 Passenger Presence Sensor - Located on the passenger front seat underneath the seat bottom trim
8	F109P Seat Belt Anchor Plate Tensioner - Located in the passenger compartment, right side middle, mounted to base of B-pillar
9	F112P Seat Belt Retractor Pretensioner - Passenger - Located in the passenger compartment, right side middle, mounted to base of B-pillar
10	F106P Seat Side Air Bag - Passenger - Located on the seat back of passenger seat
11	B63RM Side Impact Sensor - Right Middle - Located in the passenger compartment, right side under the trim, mounted to base of B-pillar

12	F105R Roof Rail Air Bag - Right - Located in the passenger compartment, along the right roof rail
13	F106RR Seat Side Air Bag - Right Rear - Located on the seat back bolster of the rear passenger seat
14	F106LR Seat Side Air Bag - Left Rear - Located on the seat back bolster of the rear passenger seat
15	F105L Roof Rail Air Bag - Left - Located in the passenger compartment, along the left roof rail
16	B63LM Side Impact Sensor - Left Middle - Located in the passenger compartment, left side under the trim, mounted to base of B-pillar
17	F106D Seat Side Air Bag - Driver - Located on the seat back of driver seat
18	F112D Seat Belt Retractor Pretensioner - Driver - Located in the driver compartment, left side middle, mounted to base of B-pillar
19	F109D Seat Belt Anchor Plate Tensioner - Located in the passenger compartment, left side middle, mounted to base of B-pillar
20	B63LF Side Impact Sensor - Left Front - Located inside the left front door
21	F105L Roof Rail Air Bag - Left - Located in the passenger compartment, along the left roof rail
22	F114D Knee Air Bag - Driver - Located below the steering wheel in the instrument panel
23	F107 Steering Wheel Air Bag - Located on the steering wheel
24	P14 Passenger Air Bag Disable Indicator - Located in the passenger compartment, in the center of the instrument panel
25	C1 Battery - Located In the engine compartment, on the left side, near the underhood fuse block
26	B59L Front Impact Sensor - Left - Located at the front of the engine compartment, on the left side of the radiator support

DTC B0013

Driver Steering Wheel Air Bag Deployment Loop Stage 2

For symptom byte information refer to **Symptom Byte List** .

Diagnostic Fault Information

Circuit	Short to Ground	High Resistance	Open	Short to Voltage	Signal Performance
Steering Wheel Air Bag Stage 1 High Control	B0012 02, B0012 0E	B0012 0D	B0012 04, B0012 0D	B0012 01	-
Steering Wheel Air Bag Stage 1 Low Control	B0012 02, B0012 0E	B0012 0D	B0012 04, B0012 0D	B0012 01	-
Steering Wheel Air Bag Stage 2 High Control	B0013 02, B0013 0E	B0013 0D	B0013 04, B0013 0D	B0013 01	-
Steering Wheel Air Bag Stage 2 Low Control	B0013 02, B0013 0E	B0013 0D	B0013 04, B0013 0D	B0013 01	-

Circuit/System Description

During a frontal crash of sufficient force the inflatable restraint sensing and diagnostic module (SDM) will allow current to flow through the deployment loop in order to deploy the steering wheel air bag. The SDM performs continuous diagnostic tests on the deployment loops to check for proper circuit continuity and for shorts to ground or voltage. There are 2 shorting bars used within the steering wheel air bag coil connector which will short together both steering wheel air bag stage 1 high control circuit and steering wheel air bag stage 1 low control circuit and both steering wheel air bag stage 2 high control circuit and steering wheel air bag stage 2 low control circuit when the connector is disconnected. This will help to prevent unwanted deployment of the steering wheel air bag during servicing.

Conditions for Running the DTC

Ignition voltage is between 9-16 V.

Conditions for Setting the DTC

B0012 01 stage 1 or B0013 01 stage 2

The steering wheel air bag deployment loop is shorted to voltage for 2 s.

B0012 02 stage 1 or B0013 02 stage 2

The steering wheel air bag deployment loop is shorted to ground for 2 s.

B0012 04 stage 1 or B0013 04 stage 2

The steering wheel air bag deployment loop is open for 2 s.

B0012 0D stage 1 or B0013 0D stage 2

The steering wheel air bag deployment loop resistance is greater than 4.4 ohms for 2 s.

B0012 0E stage 1 or B0013 0E stage 2

The steering wheel air bag deployment loop resistance is less than 1.7 ohms for 2 s.

Action Taken When the DTC Sets

- The inflatable restraint sensing and diagnostic module requests the instrument cluster to illuminate the AIR BAG indicator.
- The inflatable restraint sensing and diagnostic module will store a DTC, however if an event occurs the system will still attempt deployment.

Conditions for Clearing the DTC

- The condition for setting the DTC is no longer exists.
- A history DTC will clear once 100 malfunction-free ignition cycles have occurred.

Diagnostic Aid

NOTE: **The following diagnostic aids apply for both current and history DTCs.**

A worn steering wheel air bag coil can cause a repeated history DTC to set. To verify this condition, turn the steering wheel 360 degrees in one direction then back 360 degrees in the other direction, multiple times, while viewing the scan tool Deployment Loop Resistance parameters.

An incorrectly installed connector position assurance (CPA) or incorrectly seated connector can cause a shorting bar to short both control circuits together. Check the connectors and CPAs if a DTC with symptom byte 02 or 0E is set, to ensure the shorting bars are not causing the circuits to be shorted together. Shorting bars are used in the locations listed below:

- Steering wheel air bag assembly
- Steering wheel air bag coil assembly
- Inline harness connectors
- Harness side of the inflatable restraint sensing and diagnostic module connector

Terminal fretting or incorrectly seated connector can cause an open/high resistance condition. Check the circuit terminals for fretting or incorrectly seated connector if a DTC with symptom byte 04 or 0D is set.

Circuit/System Verification

NOTE:

- **Refer to SIR Service Precautions.**
- **Inspect all terminals for damage or corrosion when disconnecting connectors. Damage or corrosion in the following requires repair or replacement of the affected component/connector.**
 - **Steering wheel air bag**
 - **Steering wheel air bag coil**
 - **Inflatable restraint sensing and diagnostic module**
 - **Air bag wiring harness connector**
 - **Inflatable restraint sensing and diagnostic module wiring harness connector**
- **The connector and connector position assurance (CPA) may seat independent of each other. Both the connector and CPA should seat with an audible and/or tactile click. The CPA isolates the shorting-bars within the connector allowing the deployment circuit to operate properly. Replace any CPA that is damaged or missing.**
- **If the condition is intermittent or cannot be duplicated, disconnect the connectors and add dielectric grease / lubricant (Nyogel 760G or equivalent, meeting GM specification 9986087). This procedure will correct the high resistance condition due to terminal fretting corrosion.**

1. Verify the appropriate scan tool Deployment Loop Resistance parameters stay consistently between 2.1-4.0 ohms without any spikes or dropouts while turning the steering wheel 360 degrees in one direction then back 360 degrees in the other direction.

- **If less than 2.1 ohms or greater than 4.0 ohms**

Refer to Circuit/System Testing.

- **If there are spikes or dropouts**

Replace the X85 Steering Wheel Air Bag Coil.

- **If between 2.1-4.0 ohms without any spikes or dropouts**

2. Verify DTC B0012 or B0013 is only set as a history DTC.

- **If the DTC is set as current**

Refer to Circuit/System Testing.

- **If the DTC is set as history**

3. Verify the scan tool Deployment Loop Resistance parameters stay consistently between 2.1-4.0 ohms without any drop outs or spikes while moving the harness near each connector listed below.

- X85 Steering Wheel Air Bag Coil
- F107 Steering Wheel Air Bag
- Any inline harness connector
- K36 Inflatable Restraint Sensing and Diagnostic Module

- **If the reading is erratic while moving the harness, perform the following**

- Inspect each connector terminal for damage or corrosion and repair as necessary.
- Apply dielectric grease / lubricant (Nyogel 760G or equivalent, meeting GM specification 9986087) to each connector terminal.
- Ensure each connector and CPA is correctly seated.

- **If between 2.1-4.0 ohms without any spikes or dropouts**

4. All OK.

Circuit/System Testing

1. Ignition OFF, disconnect the scan tool and disconnect the appropriate harness connector listed below at the F107 Steering Wheel Air Bag.

- DTC B0012 connector X1
- DTC B0013 connector X2

2. Test for greater than 25 ohms between the control circuit terminal 1 and the control circuit terminal 2 at the harness connector.

- **If 25 ohms or less**

1. Disconnect the X1 harness connector at the K36 Inflatable Restraint Sensing and Diagnostic Module.

NOTE: Some connectors may be equipped with shorting bars as a safety

component to prevent accidental deployment. When testing on a connector with shorting bars, the shorting bars must be disabled to ensure accurate test results. Insert an appropriate pick from EL-38125-580 and depress the shorting bars above the appropriate terminals. This will lift the shorting bar from the terminal and allow accurate test results. Take care not to damage the connector, shorting bar, or terminal when depressing the shorting bar.

2. Test for infinite resistance between the two control circuits.
 - If less than infinite resistance, repair the short between the two circuits.
 - If infinite resistance, replace the K36 Inflatable Restraint Sensing and Diagnostic Module.
 - **If greater than 25 ohms**
3. Ignition ON.
4. Test for less than 11 V between each control circuit terminal listed below and ground:
 - Control circuit terminal 1
 - Control circuit terminal 2
 - **If 11 V or greater**
 1. Ignition OFF, disconnect the X1 harness connector at the K36 Inflatable Restraint Sensing and Diagnostic Module, ignition ON.
 2. Test for less than 1 V between the control circuit and ground.
 - If 1 V or greater, repair the short to voltage on the circuit.
 - If less than 1 V, replace the K36 Inflatable Restraint Sensing and Diagnostic Module.
 - **If less than 11 V**
5. Ignition OFF.
6. Test for greater than 25 ohms between each control circuit terminal listed below and ground:
 - Control circuit terminal 1
 - Control circuit terminal 2
 - **If 25 ohms or less**
 1. Disconnect the X1 harness connector at the K36 Inflatable Restraint Sensing and Diagnostic Module.

NOTE: **Some connectors may be equipped with shorting bars as a safety component to prevent accidental deployment. When testing on a connector with shorting bars, the shorting bars must be disabled to ensure accurate test results. Insert an appropriate pick from EL-38125-580 and depress the shorting bars above the appropriate terminals. This will lift the shorting bar from the terminal and allow accurate test results. Take care not to damage the connector, shorting bar, or terminal when depressing the shorting bar.**

2. Test for infinite resistance between the control circuit and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.

- If infinite resistance, replace the K36 Inflatable Restraint Sensing and Diagnostic Module.
 - **If greater than 25 ohms**
7. Install a 3 A fused jumper wire between the control circuit terminal 1 and the control circuit terminal 2, ignition ON.
 8. Verify the appropriate scan tool Deployment Loop Resistance parameter is consistently less than 2 ohms while turning the steering wheel 360 degrees in one direction then back 360 degrees in the other direction.
 - **If the reading is erratic while turning the steering wheel**

Replace the X85 Steering Wheel Air Bag Coil.

- **If 2 ohms or greater**
1. Ignition OFF, disconnect the X1 harness connector at the K36 Inflatable Restraint Sensing and Diagnostic Module.
 2. Test for less than 2 ohms in the X85 Steering Wheel Air Bag Coil and each control circuit end to end.
 - If 2 ohms or greater, replace the X85 Steering Wheel Air Bag Coil or repair the open/high resistance in the circuit.
 - If less than 2 ohms, replace the K36 Inflatable Restraint Sensing and Diagnostic Module.
 - **If less than 2 ohms**
9. Ignition OFF, connect the harness connector at the F107 Steering Wheel Air Bag, press in the CPA (if equipped) until an audible and/or tactile click is heard.
 10. Ignition ON, clear DTCs. Operate the vehicle within the Conditions for Running the DTC.
 11. Verify DTC B0012 or B0013 is not set.
 - **If DTC B0012 or B0013 is set**

Replace the F107 Steering Wheel Air Bag.

- **If DTC B0012 or B0013 is not set**
12. All OK.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

- **Steering Wheel Airbag Coil Replacement**
- **Airbag Steering Wheel Module Replacement**
- **SIR/SRS Wiring Repairs**
- **Control Module References** for inflatable restraint sensing and diagnostic module replacement, programming and setup

DTC B0014, B0021, B0031, OR B0038: SEAT SIDE AIR BAG DEPLOYMENT LOOP

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

Right Rear Seat Side Air Bag Low Control	B0038 02, B0038 0E	B0038 0D	B0038 04, B0038 0D	B0038 01	-

Circuit/System Description

During a side or frontal crash of sufficient force, the inflatable restraint sensing and diagnostic module (SDM) will allow current to flow through the deployment loop in order to deploy an air bag. There are 2 shorting bars used within the connector that will short the control circuits together when the connector is disconnected. This will help to prevent unwanted deployment of the air bag or retractor pretensioner during servicing.

Conditions for Running the DTC

Ignition voltage is between 9-16 V.

Conditions for Setting the DTC

B0014 01, B0021 01, B0031 01, B0038 01

The air bag control circuit is shorted to voltage for 2 seconds.

B0014 02, B0021 02, B0031 02, B0038 02

The air bag control circuit is shorted to ground for 2 seconds.

B0014 04, B0021 04, B0031 04, B0038 04

The air bag control circuit is open for 2 seconds.

B0014 0D, B0021 0D, B0031 0D, B0038 0D

The air bag deployment loop resistance is greater than 4.2 ohms for 2 seconds.

B0014 0E, B0021 0E, B0031 0E, B0038 0E

The air bag deployment loop resistance is less than 1.4 ohms for 2 seconds.

Action Taken When the DTC Sets

- The inflatable restraint sensing and diagnostic module requests the instrument cluster to illuminate the AIR BAG indicator.
- The inflatable restraint sensing and diagnostic module will store a DTC, however if an event occurs the system will still attempt deployments.

Conditions for Clearing the DTC

- The condition for setting the DTC no longer exists.
- A history DTC will clear once 100 malfunction-free ignition cycles have occurred.

Diagnostic Aid

NOTE: **The following diagnostic aids apply for both current and history DTCs.**

An incorrectly installed connector position assurance (CPA) or incorrectly seated connector can cause a shorting bar to short both control circuits together. Check the connectors and CPAs if a DTC with symptom byte 02 or 0E is set, to ensure the shorting bars are not causing the circuits to be shorted together. Shorting bars are used in the locations listed below:

- Front and rear seat side air bags
- Left and right roof rail air bags
- Inline harness connectors
- Harness side of the inflatable restraint sensing and diagnostic module connector

Terminal fretting or incorrectly seated connector can cause an open/high resistance condition. Check the circuit terminals for fretting or incorrectly seated connector if a DTC with symptom byte 04 or 0D is set. DTCs of deployment loops which are in the seat can occur because of stress or damage to the harness due to seat movement. Move the seat to the full extent of travel while using the scan tool to observe deployment type loop parameters.

Circuit/System Verification

NOTE:

- Refer to **SIR Service Precautions**.
- Inspect all terminals for damage or corrosion when disconnecting connectors. Damage or corrosion in the following requires repair or replacement of the affected component/connector.
 - Seat side air bag
 - Inflatable restraint sensing and diagnostic module
 - All wiring harness connectors
 - Inflatable restraint sensing and diagnostic module wiring harness connector
- The connector and connector position assurance (CPA) may seat independent of each other. Both the connector and CPA should seat with an audible and/or tactile click. The CPA isolates the shorting-bars within the connector allowing the deployment circuit to operate properly.
- If the condition is intermittent or cannot be duplicated, disconnect the connectors and add dielectric grease/lubricant (Nyogel 760G or equivalent, meeting GM specification 9986087). This procedure will correct the high resistance condition due to terminal fretting corrosion.

1. Verify the appropriate scan tool Deployment Loop Resistance parameters stay consistently between 2.1-4.0 ohms without any spikes or dropouts while moving the harness near each connector.
 - F106 Seat Side Air Bag
 - Any inline harness connector
 - K36 Inflatable Restraint Sensing and Diagnostic Module
 - **If less than 2.1 ohms or greater than 4.0 ohms**

Refer to Circuit/System Testing.

- **If there are spikes or dropouts, perform the following:**
 - Inspect each connector terminal and harness for damage or corrosion and repair as necessary.
 - Apply dielectric grease/lubricant (Nyogel 760G or equivalent, meeting GM specification 9986087) to each connector terminal.
 - Ensure each connector and CPA is correctly seated.
- **If between 2.1-4.0 ohms without any spikes or dropouts**

2. All OK

Circuit/System Testing

1. Ignition OFF, scan tool disconnected, disconnect the harness connector at the appropriate F106 Seat Side Air Bag.
2. Test for greater than 25 ohms between the control circuit terminals 1 and 2.

- **If 25 ohms or less**

1. Disconnect the X2 harness connector at the K36 Inflatable Restraint Sensing and Diagnostic Module.

NOTE: Some connectors may be equipped with shorting bars as a safety component to prevent accidental deployment. When testing on a connector with shorting bars, the shorting bars must be disabled to ensure accurate test results. Insert an appropriate pick from EL-38125-580 and depress the shorting bars above the appropriate terminals. This will lift the shorting bar from the terminal and allow accurate test results. Take care not to damage the connector, shorting bar, or terminal when depressing the shorting bar.

2. Test for infinite resistance between the 2 control circuits.
 - If less than infinite resistance, repair the short between the 2 circuits.
 - If infinite resistance, replace the K36 Inflatable Restraint Sensing and Diagnostic Module.

- **If greater than 25 ohms**

3. Ignition ON.

4. Test for less than 11 V between each control circuit terminal listed below and ground:

- Control circuit terminal 1
- Control circuit terminal 2

- **If 11 V or greater**

1. Ignition OFF, disconnect the X2 harness connector at the K36 Inflatable Restraint Sensing and Diagnostic Module, ignition ON.

2. Test for less than 1 V between the control circuit and ground.

- If 1 V or greater, repair the short to voltage on the circuit.
- If less than 1 V, replace the K36 Inflatable Restraint Sensing and Diagnostic Module.

- **If less than 11 V**

5. Ignition OFF.
6. Test for greater than 25 ohms between each control circuit terminal listed below and ground:
 - Control circuit terminal 1
 - Control circuit terminal 2
 - **If 25 ohms or less**
 1. Disconnect the X2 harness connector at the K36 Inflatable Restraint Sensing and Diagnostic Module.
 2. Test for infinite resistance between the control circuit and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance, replace the K36 Inflatable Restraint Sensing and Diagnostic Module.
 - **If greater than 25 ohms**
7. Install a 3 A fused jumper wire between the control circuit terminals 1 and 2, ignition ON.
8. Verify the appropriate scan tool Deployment Loop Resistance parameter is less than 2 ohms.
 - **If 2 ohms or greater**
 1. Ignition OFF, disconnect the X2 harness connector at the K36 Inflatable Restraint Sensing and Diagnostic Module.
 2. Test for less than 2 ohms in each control circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, replace the K36 Inflatable Restraint Sensing and Diagnostic Module.
 - **If less than 2 ohms**
9. Ignition OFF, connect the harness connector at the F106 Seat Side Air Bag, press in the CPA (if equipped) until an audible and/or tactile click is heard.
10. Ignition ON, clear DTCs. Operate the vehicle within the Conditions for Running the DTC.
11. Verify DTC B0014, B0021, B0031, or B0038 is not set.
 - **If DTC B0014, B0021, B0031, or B0038 is set**

Test or replace the F106 Seat Side Air Bag.
 - **If DTC B0014, B0021, B0031, or B0038 is not set**
12. All OK.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

- **Front Seat Outboard Seat Back Airbag Replacement**
- **Rear Seat Outboard Seat Back Airbag Replacement**
- **Control Module References** for inflatable restraint sensing and diagnostic module replacement, programming, and setup

DTC B0015, B001A, B001B, OR B0022: SEAT BELT RETRACTOR PRETENSIONER DEPLOYMENT

Circuit/System Description

During a side or frontal crash of sufficient force the Inflatable Restraint Sensing and Diagnostic Module will allow current to flow through the deployment loop in order to deploy an air bag or pretensioner. There are 2 shorting bars which will short together control circuits, when the connector is disconnected. This will help to prevent unwanted deployment of the air bag or pretensioner during servicing.

Conditions for Running the DTC

Ignition voltage is between 9-16 V.

Conditions for Setting the DTC

B0015 01, B001A 01, B001B 01, B0022 01

The pretensioner control circuit is shorted to voltage for 2 seconds.

B0015 02, B001A 02, B001B 02, B0022 02

The pretensioner control circuit is shorted to ground for 2 seconds.

B0015 04, B001A 04, B001B 04, B0022 04

The pretensioner control circuit is open for 2 seconds.

B0015 0D, B001A 0D, B001B 0D, B0022 0D

The pretensioner deployment loop resistance is greater than 4.2 ohms for 2 seconds.

B0015 0E, B001A 0E, B001B 0E, B0022 0E

The pretensioner deployment loop resistance is less than 1.4 ohms for 2 seconds.

Action Taken When the DTC Sets

- The Inflatable Restraint Sensing and Diagnostic Module requests the Instrument Cluster to illuminate the AIR BAG indicator.
- The Inflatable Restraint Sensing and Diagnostic Module will store a DTC, however if an event occurs the system will still attempt deployments.

Conditions for Clearing the DTC

- The condition for setting the DTC no longer exists.
- A history DTC will clear once 100 malfunction-free ignition cycles have occurred.

Diagnostic Aid

NOTE: **The following diagnostic aids apply for both current and history DTCs.**

An incorrectly installed CPA or incorrectly seated connector can cause a shorting bar to short both control circuits together. Check the connectors and CPAs if a DTC with symptom byte 02 or 0E is set, to ensure the shorting bars are not causing the circuits to be shorted together. Shorting bars are used in the locations listed below:

- Driver and passenger anchor or retractor pretensioners
- Inline connectors - on the side of the harness connector
- Harness side of the inflatable restraint sensing and diagnostic module connector

Terminal fretting or incorrectly seated connectors can cause an open/high resistance condition. Check the circuit terminals for fretting or incorrectly seated connector if a DTC with symptom byte 04 or 0D is set. DTCs of deployment loops which are in the seat can occur because of stress or damage to the harness due to seat movement. Move the seat to the full extend of travel while using the scan tool to observe deployment type loop parameters.

Circuit/System Verification

NOTE:

- Refer to **SIR Service Precautions**.
- Inspect all terminals for damage or corrosion when disconnecting connectors. Damage or corrosion in the following requires repair or replacement of the affected component/connector.
 - Seat belt retractor pretensioner
 - Seat belt retractor pretensioner wiring harness connector
 - Seat belt anchor pretensioner
 - Seat belt anchor pretensioner wiring harness connector
 - Inflatable Restraint Sensing and Diagnostic Module
 - Inflatable Restraint Sensing and Diagnostic Module wiring harness connector
- The connector and connector position assurance (CPA) may seat independent of each other. Both the connector and CPA should seat with an audible and/or tactile click. The CPA isolates the shorting-bars within the connector allowing the deployment circuit to operate properly.
- If the condition is intermittent or cannot be duplicated, disconnect the connectors and add dielectric grease / lubricant (Nyogel 760G or equivalent, meeting GM specification 9986087). This procedure will correct the high resistance condition due to terminal fretting corrosion.

1. Verify the scan tool Deployment Loop Resistance parameters stay consistently between 2.1 and 4.0 ohms without any spikes or dropouts while moving the harness near each connector listed below:
 - F112 Seat Belt Retractor Pretensioner
 - F113 Seat Belt Anchor Pretensioner

- Any inline harness
- K36 Inflatable Restraint Sensing and Diagnostic Module
- **If less than 2.1 or greater than 4.0 ohms**

Refer to Circuit/System Testing.

- **If there are spikes or dropouts, perform the following**
 - Inspect each connector terminal and harness for damage or corrosion and repair as necessary.
 - Apply dielectric grease / lubricant (Nyogel 760G or equivalent, meeting GM specification 9986087) to each connector terminal.
 - Ensure each connector and CPA is correctly seated.
- **If within 2.1 and 4.0 ohms without any spikes or dropouts**

2. All OK.

Circuit/System Testing

1. Ignition OFF, disconnect the scan tool. It may take up to 2 minutes for all vehicle systems to power down. Disconnect the appropriate harness connector listed below:
 - F112 Seat Belt Retractor Pretensioner
 - F113 Seat Belt Anchor Pretensioner
2. Test for greater than 25 ohms between the appropriate control circuit terminals listed below:
 - F112 Seat Belt Retractor Pretensioner terminals 1 and 2
 - F113 Seat Belt Anchor Pretensioner terminals 1 and 2
 - **If 25 ohms or less**
1. Disconnect the harness connector at the K36 Inflatable Restraint Sensing and Diagnostic Module.

NOTE: Some connectors may be equipped with shorting bars as a safety component to prevent accidental inflator deployment. When testing on a connector with shorting bars, the shorting bars must be disabled to ensure accurate test results. Insert an appropriate pick from EL-38125-580 and depress the shorting bars above the appropriate terminals. This will lift the shorting bar from the terminal and allow accurate test results. Take care not to damage the connector, shorting bar, or terminal when depressing the shorting bar.

2. Test for infinite resistance between the 2 control circuits.
 - If less than infinite resistance, repair the short between the two circuits.
 - If infinite resistance, replace the K36 Inflatable Restraint Sensing and Diagnostic Module.
 - **If greater than 25 ohms**
3. Ignition ON.
4. Test for less than 11 V between the control circuit terminals listed below and ground:

- F112 Seat Belt Retractor Pretensioner terminal 1
 - F112 Seat Belt Retractor Pretensioner terminal 2
 - F113 Seat Belt Anchor Pretensioner terminal 1
 - F113 Seat Belt Anchor Pretensioner terminal 2
 - **If 11 V or greater**
1. Ignition OFF, disconnect the harness connector at the K36 Inflatable Restraint Sensing and Diagnostic Module, ignition ON.
 2. Test for less than 1 V between each control circuit and ground.
 - If 1 V or greater, repair the short to voltage on the circuit.
 - If less than 1 V, replace the K36 Inflatable Restraint Sensing and Diagnostic Module.
 - **If less than 11 V**
5. Ignition OFF. It may take up to 2 minutes for all vehicle systems to power down.
 6. Test for greater than 25 ohms between the control circuit terminals listed below and ground:
 - F112 Seat Belt Retractor Pretensioner terminal 1
 - F112 Seat Belt Retractor Pretensioner terminal 2
 - F113 Seat Belt Anchor Pretensioner terminal 1
 - F113 Seat Belt Anchor Pretensioner terminal 2
 - **If 25 ohms or less**
 1. Disconnect the harness connector at the K36 Inflatable Restraint Sensing and Diagnostic Module.
 2. Test for infinite resistance between each control circuit and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance, replace the K36 Inflatable Restraint Sensing and Diagnostic Module.
 - **If greater than 25 ohms**
 7. Install a 3 A fused jumper wire between the appropriate control circuit terminals listed below:
 - F112 Seat Belt Retractor Pretensioner terminals 1 and 2
 - F113 Seat Belt Anchor Pretensioner terminals 1 and 2
 8. Ignition ON.
 9. Verify the scan tool Deployment Loop Resistance parameter is less than 2 ohms.
 - **If 2 ohms or greater**
 1. Ignition OFF.
 2. Disconnect the harness connector at the K36 Inflatable Restraint Sensing and Diagnostic Module.
 3. Test for less than 2 ohms in each control circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, replace the K36 Inflatable Restraint Sensing and Diagnostic Module.
 - **If less than 2 ohms**
 10. Ignition OFF, connect the harness connector at the F112 Seat Belt Retractor Pretensioner or F113 Seat Belt Anchor Pretensioner, press in the CPA (if equipped) until an audible and/or tactile click is heard.
 11. Ignition ON, clear DTCs. Operate the vehicle within the Conditions for Running the DTC.

12. Verify DTC B0015, B001A, B001B, or B0022 is not set.

- **If B0015, B001A, B001B, or B0022 is set**

Replace the appropriate F112 Seat Belt Retractor Pretensioner or F113 Seat Belt Anchor Pretensioner.

- **If DTC B0015, B001A, B001B, or B0022 is not set**

13. All OK.

Circuit/System Description

During a side or frontal crash of sufficient force the inflatable restraint sensing and diagnostic module (SDM) will allow current to flow through the deployment loop in order to deploy an air bag or pretensioner. There are 2 shorting bars which will short together control circuits, when the connector is disconnected. This will help to prevent unwanted deployment of the air bag or pretensioner during servicing.

Conditions for Running the DTC

Ignition voltage is between 9-16 V.

Conditions for Setting the DTC

B0016 01, B0023 01

The air bag control circuit is shorted to voltage for 2 seconds.

B0016 02, B0023 02

The air bag control circuit is shorted to ground for 2 seconds.

B0016 04, B0023 04

The air bag control circuit is open for 2 seconds.

B0016 0D, B0023 0D

The air bag deployment loop resistance is greater than 4.2 ohms for 2 seconds.

B0016 0E, B0023 0E

The air bag deployment loop resistance is less than 1.4 ohms for 2 seconds.

Action Taken When the DTC Sets

- The inflatable restraint sensing and diagnostic module requests the instrument cluster to illuminate the AIR BAG indicator.
- The inflatable restraint sensing and diagnostic module will store a DTC, however if an event occurs the system will still attempt deployments.

Conditions for Clearing the DTC

- The condition for setting the DTC no longer exists.
- A history DTC will clear once 100 malfunction-free ignition cycles have occurred.

Diagnostic Aid

NOTE: **The following diagnostic aids apply for both current and history DTCs.**

An incorrectly installed connector position assurance (CPA) or incorrectly seated connector can cause a shorting bar to short both control circuits together. Check the connectors and CPAs if a DTC with symptom byte 02 or 0E is set, to ensure the shorting bars are not causing the circuits to be shorted together. Shorting bars are used in the locations listed below:

- Left and right roof rail air bags
- Inline harness connectors
- Harness side of the inflatable restraint sensing and diagnostic module connector

Terminal fretting or incorrectly seated connectors can cause an open/high resistance condition. Check the circuit terminals for fretting or incorrectly seated connector if a DTC with symptom byte 04 or 0D is set. DTCs of deployment loops which are in the seat DTC can occur because of stress or damage to the harness due to seat movement. Move the seat to the full extent of travel while using the scan tool to observe deployment type loop parameters.

Circuit/System Verification

NOTE:

- **Refer to SIR Service Precautions.**
- **Inspect all terminals for damage or corrosion when disconnecting connectors. Damage or corrosion in the following requires repair or replacement of the affected component/connector.**
 - **Roof rail air bag**
 - **Roof rail air bag wiring harness connector**
 - **Inflatable restraint sensing and diagnostic module**
 - **Inflatable restraint sensing and diagnostic module wiring harness**

connector

- The connector and connector position assurance (CPA) may seat independent of each other. Both the connector and CPA should seat with an audible and/or tactile click. The CPA isolates the shorting-bars within the connector allowing the deployment circuit to operate properly.
- If the condition is intermittent or cannot be duplicated, disconnect the connectors and add dielectric grease / lubricant (Nyogel 760G or equivalent, meeting GM specification 9986087). This procedure will correct the high resistance condition due to terminal fretting corrosion.

1. Verify the appropriate scan tool Deployment Loop Resistance parameter stays consistently between 2.1 and 4.0 ohms without any spikes or dropouts while moving the harness near each connector listed below:
 - F105L Roof Rail Air Bag - Left
 - F105R Roof Rail Air Bag - Right
 - Any inline harness connector
 - K36 inflatable restraint sensing and diagnostic module
 - **If less than 2.1 or greater than 4.0 ohms**

Refer to Circuit/System Testing.

- **If there are spikes or dropouts, perform the following**
 - Inspect each connector terminal and harness for damage or corrosion and repair as necessary
 - Ensure each connector and CPA is correctly seated.
- **If within 2.1 and 4.0 ohms without any spikes or dropouts**

2. All OK

Circuit/System Testing

1. Ignition OFF. Scan tool disconnected. Disconnect the harness connector at the appropriate F105 Roof Rail Air Bag. It may take up to 2 min for all vehicle systems to power down.
2. Test for greater than 25 ohms between the control circuit terminals 1 and 2.
 - **If 25 ohms or less**
 1. Disconnect the X2 harness connector at the K36 inflatable restraint sensing and diagnostic module.

NOTE: Some connectors may be equipped with shorting bars as a safety component to prevent accidental inflator deployment. When testing on a connector with shorting bars, the shorting bars must be disabled to ensure accurate test results. Insert an appropriate pick from EL-38125-580 and depress the shorting bars above the appropriate terminals. This will lift the shorting bar from the terminal and allow accurate test results. Take care not to damage the connector, shorting bar, or terminal when depressing the shorting bar.

2. Test for infinite resistance between the two control circuits.
 - If less than infinite resistance, repair the short between the two circuits.
 - If infinite resistance, replace the K36 inflatable restraint sensing and diagnostic module.
 - **If greater than 25 ohms**
3. Ignition ON.
4. Test for less than 11 V between the control circuit terminals listed below and ground:
 - Control circuit terminal 1
 - Control circuit terminal 2
 - **If 11 V or greater**
 1. Ignition OFF. Disconnect the X2 harness connector at the K36 inflatable restraint sensing and diagnostic module. Ignition ON.
 2. Test for less than 1 V between the control circuit and ground.
 - If 1 V or greater, repair the short to voltage on the circuit.
 - If less than 1 V, replace the K36 inflatable restraint sensing and diagnostic module.
 - **If less than 11 V**
5. Ignition OFF.
6. Test for greater than 25 ohms between the control circuit terminals listed below and ground:
 - Control circuit terminal 1
 - Control circuit terminal 2
 - **If 25 ohms or less**
 1. Disconnect the X2 harness connector at the K36 inflatable restraint sensing and diagnostic module.
 2. Test for infinite resistance between the control circuit and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance, replace the K36 inflatable restraint sensing and diagnostic module.
 - **If greater than 25 ohms**
7. Ignition OFF. Install a 3 A fused jumper wire between the control circuit terminals 1 and 2. Ignition ON.
8. Verify the scan tool Deployment Loop Resistance parameter is less than 2 ohms.
 - **If 2 ohms or greater**
 1. Ignition OFF. Disconnect the X2 harness connector at the K36 inflatable restraint sensing and diagnostic module.
 2. Test for less than 2 ohms in each control circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, replace the K36 inflatable restraint sensing and diagnostic module.
 - **If less than 2 ohms**
9. Ignition OFF, connect the harness connector at the F105 Roof Rail Air Bag, press in the CPA (if equipped) until an audible and/or tactile click is heard.
10. Ignition ON, clear DTCs. Operate the vehicle within the Conditions for Running the DTC.
11. Verify DTC B0016 or B0023 is not set.

- **If DTC B0016 or B0023 is set**

Test or replace the F105 Roof Rail Air Bag.

- **If DTC B0016 or B0023 is not set**

12. All OK.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

Circuit/System Description

During a side or frontal crash of sufficient force the Inflatable Restraint Sensing and Diagnostic Module (SDM) will allow current to flow through the deployment loop in order to deploy an air bag. There are two shorting bars used within the connector that will short together the control circuits, when the connector is disconnected. This will help to prevent unwanted deployment of the air bag or retractor pretensioner during servicing.

Conditions for Running the DTC

Ignition voltage is between 9-16 V.

Conditions for Setting the DTC

B0017 01, B0024 01

The air bag control circuit is shorted to voltage for 2 seconds.

B0017 02, B0024 02

The air bag control circuit is shorted to ground for 2 seconds.

B0017 04, B0024 04

The air bag control circuit is open for 2 seconds.

B0017 0D, B0024 0D

The air bag deployment loop resistance is greater than 4.2 ohms for 2 seconds.

B0017 0E, B0024 0E

The air bag deployment loop resistance is less than 1.4 ohms for 2 seconds.

Action Taken When the DTC Sets

- The Inflatable Restraint Sensing and Diagnostic Module requests the instrument cluster to illuminate the AIR BAG indicator.
- The Inflatable Restraint Sensing and Diagnostic Module will store a DTC, however if an event occurs the system will still attempt deployments.

Conditions for Clearing the DTC

- The condition for setting the DTC no longer exists.
- A history DTC will clear once 100 malfunction-free ignition cycles have occurred.

Diagnostic Aid

NOTE: **The following diagnostic aids apply for both current and history DTCs.**

An incorrectly installed connector position assurance (CPA) or incorrectly seated connector can cause a shorting bar to short both control circuits together. Check the connectors and CPAs if a DTC with symptom byte 02 or 0E is set, to ensure the shorting bars are not causing the circuits to be shorted together. Shorting bars are used in the locations listed below:

- Driver and passenger knee air bags
- Inline harness connectors
- Harness side of the inflatable restraint sensing and diagnostic module connector

Terminal fretting or incorrectly seated connector can cause an open/high resistance condition. Check the circuit terminals for fretting or incorrectly seated connector if a DTC with symptom byte 04 or 0D is set.

Circuit/System Verification

NOTE:

- Refer to SIR Service Precautions.
- Inspect all terminals for damage or corrosion when disconnecting connectors. Damage or corrosion in the following requires repair or replacement of the affected component/connector.
 - Knee air bag
 - Inflatable restraint sensing and diagnostic module
 - All wiring harness connectors
 - Inflatable restraint sensing and diagnostic module wiring harness connector
- The connector and connector position assurance (CPA) may seat independent of each other. Both the connector and CPA should seat with an audible and/or tactile click. The CPA isolates the shorting-bars within the connector allowing the deployment circuit to operate properly.

- **If the condition is intermittent or cannot be duplicated, disconnect the connectors and add dielectric grease/lubricant (Nyogel 760G or equivalent, meeting GM specification 9986087). This procedure will correct the high resistance condition due to terminal fretting corrosion.**

1. Verify the scan tool Deployment Loop Resistance parameters stay consistently between 2.1 and 4.0 ohms without any spikes or dropouts while moving the harness near each connector listed below:

- F114D Knee Air Bag - Driver
- F114P Knee Air Bag - Passenger
- Any inline harness connector
- K36 Inflatable Restraint Sensing and Diagnostic Module
- **If less than 2.1 or greater than 4.0 ohms**

Refer to Circuit/System Testing.

- **If there are spikes or dropouts, perform the following:**
 - Inspect each connector terminal and harness for damage or corrosion and repair as necessary.
 - Apply dielectric grease/lubricant (Nyogel 760G or equivalent, meeting GM specification 9986087) to each connector terminal
 - Ensure each connector and CPA is correctly seated
 - **If between 2.1 and 4.0 ohms without any spikes or dropouts**

2. All OK

Circuit/System Testing

1. Ignition OFF, disconnect the scan tool and disconnect the harness connector at the appropriate F114 Knee Air Bag.
2. Test for greater than 25 ohms between the control circuit terminals 1 and 2.
 - **If 25 ohms or less**
 1. Disconnect the X1 harness connector at the K36 Inflatable Restraint Sensing and Diagnostic Module.

NOTE: Some connectors may be equipped with shorting bars as a safety component to prevent accidental inflator deployment. When testing on a connector with shorting bars, the shorting bars must be disabled to ensure accurate test results. Insert an appropriate pick from EL-38125-580 and depress the shorting bars above the appropriate terminals. This will lift the shorting bar from the terminal and allow accurate test results. Take care not to damage the connector, shorting bar, or terminal when depressing the shorting bar.

2. Test for infinite resistance between the 2 control circuits.

- If less than infinite resistance, repair the short between the 2 circuits.
 - If infinite resistance, replace the K36 Inflatable Restraint Sensing and Diagnostic Module.
- **If greater than 25 ohms**
- 3. Ignition ON.
- 4. Test for less than 11 V between the control circuit terminals listed below and ground:
 - Control circuit terminal 1
 - Control circuit terminal 2
 - **If 11 V or greater**
 - 1. Ignition OFF, disconnect the X1 harness connector at the K36 Inflatable Restraint Sensing and Diagnostic Module, ignition ON.
 - 2. Test for less than 1 V between the control circuit and ground.
 - If 1 V or greater, repair the short to voltage on the circuit.
 - If less than 1 V, replace the K36 Inflatable Restraint Sensing and Diagnostic Module.
 - **If less than 11 V**
- 5. Ignition OFF.
- 6. Test for greater than 25 ohms between the control circuit terminals listed below and ground:
 - Control circuit terminal 1
 - Control circuit terminal 2
 - **If 25 ohms or less**
 - 1. Disconnect the X1 harness connector at the K36 Inflatable Restraint Sensing and Diagnostic Module.
 - 2. Test for infinite resistance between the control circuit and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance, replace the K36 Inflatable Restraint Sensing and Diagnostic Module.
 - **If greater than 25 ohms**
- 7. Install a 3 A fused jumper wire between the control circuit terminals 1 and 2, ignition ON.
- 8. Verify the scan tool Deployment Loop Resistance parameter is less than 2 ohms.
 - **If 2 ohms or greater**
 - 1. Ignition OFF, disconnect the X1 harness connector at the K36 Inflatable Restraint Sensing and Diagnostic Module.
 - 2. Test for less than 2 ohms in each control circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, replace the K36 Inflatable Restraint Sensing and Diagnostic Module.
 - **If less than 2 ohms**
- 9. Ignition OFF, connect the harness connector at the F114 Knee Air Bag, press in the CPA (if equipped) until an audible and/or tactile click is heard.
- 10. Ignition ON, clear DTCs. Operate the vehicle within the Conditions for Running the DTC.
- 11. Verify DTC B0017 or B0024 is not set.

- **If DTC B0017 or B0024 is set**

Replace the appropriate F114 Knee Air Bag.

- **If DTC B0017 or B0024 is not set**

12. All OK.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

- **Instrument Panel Lower Airbag Replacement - Driver Side**
- **Instrument Panel Lower Airbag Replacement - Passenger Side**
- **Control Module References** for K36 Inflatable Restraint Sensing and Diagnostic Module replacement, programming, and setup

Circuit/System Description

During a side or frontal crash of sufficient force the Inflatable Restraint Sensing and Diagnostic Module (SDM) will allow current to flow through the deployment loop in order to deploy an air bag or pretensioner. There are two shorting bars which will short the control circuits together when the connector is disconnected. This will help to prevent unwanted deployment of the air bag or pretensioner during servicing.

Conditions for Running the DTC

Ignition voltage is between 9-16 V.

Conditions for Setting the DTC

B0019 01, B0020 01

The air bag control circuit is shorted to voltage for 2 seconds.

B0019 02, B0020 02

The air bag control circuit is shorted to ground for 2 seconds.

B0019 04, B0020 04

The air bag control circuit is open for 2 seconds.

B0019 0D, B0020 0D

The air bag deployment loop resistance is greater than 4.2 ohms for 2 seconds.

B0019 0E, B0020 0E

The air bag deployment loop resistance is less than 1.4 ohms for 2 seconds.

Action Taken When the DTC Sets

- The Inflatable Restraint Sensing and Diagnostic Module requests the instrument cluster to illuminate the AIR BAG indicator.
- The Inflatable Restraint Sensing and Diagnostic Module will store a DTC, however if an event occurs the system will still attempt deployments.

Conditions for Clearing the DTC

- The condition for setting the DTC no longer exists.
- A history DTC will clear once 100 malfunction-free ignition cycles have occurred.

Diagnostic Aid

NOTE: **The following diagnostic aids apply for both current and history DTCs.**

An incorrectly installed connector position assurance (CPA) or incorrectly seated connector can cause a shorting bar to short both control circuits together. Check the connectors and CPAs if a DTC with symptom byte 02 or 0E is set, to ensure the shorting bars are not causing the circuits to be shorted together. Shorting bars are used in the locations listed below:

- Passenger Instrument Panel Air Bag
- Inline harness connectors
- Harness side of the Inflatable Restraint Sensing and Diagnostic Module connector

Terminal fretting or incorrectly seated connector can cause an open/high resistance condition. Check the circuit terminals for fretting or incorrectly seated connector if a DTC with symptom byte 04 or 0D is set.

Special Tools

EL-38125-580 Terminal Release Tool Kit

Circuit/System Verification

NOTE:

- Refer to **SIR Service Precautions**.
- Inspect all terminals for damage or corrosion when disconnecting connectors. Damage or corrosion in the following requires repair or replacement of the affected component/connector.
 - Passenger Instrument Panel Air Bag
 - Inflatable Restraint Sensing and Diagnostic Module
 - Passenger Instrument Panel Air Bag wiring harness connector
 - Inflatable Restraint Sensing and Diagnostic Module wiring harness connector
- The connector and connector position assurance (CPA) may seat

independent of each other. Both the connector and CPA should seat with an audible and/or tactile click. The CPA isolates the shorting-bars within the connector allowing the deployment circuit to operate properly.

- If the condition is intermittent or cannot be duplicated, disconnect the connectors and add dielectric grease / lubricant (Nyogel 760G or equivalent, meeting GM specification 9986087). This procedure will correct the high resistance condition due to terminal fretting corrosion.

1. Verify the scan tool Deployment Loop Resistance parameters stay consistently between 2.1-4.0 ohms without any spikes or dropouts while moving the harness near each connector listed below:

- F101 Passenger Instrument Panel Air Bag
- Any inline harness connector
- K36 Inflatable Restraint Sensing and Diagnostic Module
- **If less than 2.1 ohms or greater than 4.0 ohms**

Refer to Circuit/System Testing.

- **If there are spikes or dropouts, perform the following**
- Inspect each connector terminal and harness for damage or corrosion and repair as necessary
- Apply dielectric grease / lubricant (Nyogel 760G or equivalent, meeting GM specification 9986087) to each connector terminal
- Insure each connector and CPA is correctly seated.
- **If between 2.1-4.0 ohms without any spikes or dropouts**

2. All OK.

Circuit/System Testing

1. Ignition OFF, scan tool disconnected, disconnect the appropriate X1 (DTC B0019) or X2 (DTC B0020) harness connector at the F101 Passenger instrument panel air bag. It may take up to 2 minutes for all vehicle systems to power down.
2. Test for greater than 25 ohms between the appropriate control circuit terminals listed below:
 - F101 Passenger Instrument Panel Air Bag stage 1 control circuit terminal 1 X1 and 2 X1
 - F101 Passenger Instrument Panel Air Bag stage 2 control circuit terminal 1 X2 and 2 X2
 - **If 25 ohms or less**
1. Disconnect the X1 harness connector at the K36 Inflatable Restraint Sensing and Diagnostic Module.

NOTE: Some connectors may be equipped with shorting bars as a safety component to prevent accidental inflator deployment. When testing on a connector with shorting bars, the shorting bars must be disabled to ensure accurate test results. Insert an appropriate pick from EL-38125-580 and depress the shorting bars above the appropriate terminals. This will lift the shorting bar from the terminal

and allow accurate test results. Take care not to damage the connector, shorting bar, or terminal when depressing the shorting bar.

2. Test for infinite resistance between the two control circuits.
 - If less than infinite resistance, repair the short between the two circuits.
 - If infinite resistance, replace the K36 Inflatable Restraint Sensing and Diagnostic Module.
 - **If greater than 25 ohms**

3. Test for less than 11 V between each control circuit terminals listed below and ground:

- F101 Passenger Instrument Panel Air Bag control circuit terminal 1 X1
- F101 Passenger Instrument Panel Air Bag control circuit terminal 2 X1
- F101 Passenger Instrument Panel Air Bag control circuit terminal 1 X2
- F101 Passenger Instrument Panel Air Bag control circuit terminal 2 X2
- **If 11 V or greater**

Repair the short to voltage on the circuit.

- **If less than 11 V**

4. Ignition OFF.

5. Test for greater than 25 ohms between each control circuit terminals listed below and ground:

- F101 Passenger Instrument Panel Air Bag control circuit terminal 1 X1
- F101 Passenger Instrument Panel Air Bag control circuit terminal 2 X1
- F101 Passenger Instrument Panel Air Bag control circuit terminal 1 X2
- F101 Passenger Instrument Panel Air Bag control circuit terminal 2 X2
- **If 25 ohms or less**

Repair the short to ground on the circuit.

- **If greater than 25 ohms**

6. Install a 3 A fused jumper wire between the control circuit terminals listed below:

- F101 Passenger Instrument Panel Air Bag stage 1 control circuit terminal 1 X1 and 2 X1
- F101 Passenger Instrument Panel Air Bag stage 2 control circuit terminal 1 X2 and 2 X2

7. Ignition ON.

8. Verify the scan tool Deployment Loop Resistance parameter is less than 2 ohms.

- **If 2 ohms or greater**

1. Ignition OFF, disconnect the X1 harness connector at the K36 Inflatable Restraint Sensing and Diagnostic Module.
2. Test for less than 2 ohms in each control circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, replace the K36 Inflatable Restraint Sensing and Diagnostic Module.

- **If less than 2 ohms**

9. Ignition OFF, connect the harness connector at the F101 Passenger Instrument Panel Air Bag, press in the CPA (if equipped) until an audible and/or tactile click is heard.
10. Ignition ON, clear DTCs. Operate the vehicle within the Conditions for Running the DTC.
11. Verify DTC B0019 or B0020 is not set.

- **If DTC B0019 or B0020 is set**

Replace the F101 Passenger Instrument Panel Air Bag.

- **If DTC B0019 or B0020 is not set**

12. All OK.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

- **Airbag Instrument Panel Module Replacement**

DTC B0052: DEPLOYMENT COMMANDED

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using the diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

DTC Descriptors

DTC B0052 00

Deployment Commanded

DTC B0052 56

Deployment Commanded Too Many Transitions

Circuit/System Description

The inflatable restraint sensing and diagnostic module (SDM) senses vehicle impacts and provides deployment signals to the air bags and anchor and/or retractor pretensioners when warranted. The inflatable restraint sensing and diagnostic module sets DTC B0052 after each command for deployment. DTC B0052 will latch and not clear after 3 commanded deployments by the inflatable restraint sensing and diagnostic module. Therefore the

inflatable restraint sensing and diagnostic module has to be replaced.

Conditions for Running the DTC

Ignition voltage is between 9-16 V.

Conditions for Setting the DTC

- The inflatable restraint sensing and diagnostic module detects a frontal impact of sufficient force to warrant deployment of the frontal air bags.
- The inflatable restraint sensing and diagnostic module detects a side impact or rollover (if equipped) of sufficient force to warrant deployment of a seat air bag and/or roof rail air bag.

Action Taken When the DTC Sets

The inflatable restraint sensing and diagnostic module requests the instrument cluster to illuminate the AIR BAG indicator.

Conditions for Clearing the DTC

- DTC B0052 00 is a DTC that may be cleared with a scan tool without replacing the inflatable restraint sensing and diagnostic module. This DTC will not clear if deployment has been commanded more than two times, and the inflatable restraint sensing and diagnostic module would have to be replaced.
- DTC B0052 56 is a latched DTC. The DTC cannot be cleared with the scan tool. Replacement of the inflatable restraint sensing and diagnostic module is required.

Passenger Seat Belt Tension Sensor Circuit Voltage Performance - Signal Invalid

Diagnostic Fault Information

Circuit	Short to Ground	High Resistance	Open	Short to Voltage	Signal Performance
Passenger Seat Belt Tension Sensor Signal	B0071 03	-	B0071 04	B0071 07	B0071 08
Passenger Seat Belt Tension Sensor Voltage Reference	B0071 03	-	B0071 03	-	-
Passenger Seat Belt Tension Sensor Low Reference	-	-	B0071 07	-	-

Circuit/System Description

The seat belt tension sensor is a 2-wire sensor mounted inside the passenger seat belt buckle and provides an input to the Passenger Presence Sensor. When an infant car seat is properly restrained on the front passenger seat, the seat belt is tightly secured through the car seat. The seat belt pulls on the tension sensor and changes the voltage signal to the Passenger Presence Sensor. The Passenger Presence Sensor monitors the belt tension sensor signal circuit and if a fault is detected, DTC will be set. When the Passenger Presence Sensor detects this DTC it will send out a serial data message and the Inflatable Restraint Sensing and Diagnostic Module will notify the customer of the enable/disable status by illuminating the OFF indicator on the PASSENGER AIR BAG ON/OFF indicators. The Inflatable Restraint Sensing and Diagnostic Module will then suppress the deployment of the passenger instrument panel air bag and illuminate the AIR BAG indicator.

Conditions for Running the DTC

Ignition voltage is between 9-16 volts.

Conditions for Setting the DTC

- The Passenger Presence Sensor detects the voltage at the passenger seat belt tension sensor signal circuit is less than 0.5 volt or greater than 4.5 volts for 1 second.
- The Passenger Presence Sensor detects the voltage at the passenger seat belt tension sensor voltage reference circuit is less than 4.5 volts or greater than 9.1 volts for 1 second.
- The Passenger Presence Sensor detects the amperage at the passenger seat belt tension sensor low reference circuit is 25 MA or greater for 1 second.

Action Taken When the DTC Sets

- The Passenger Presence Sensor will set a DTC, and then communicate with the Inflatable Restraint Sensing and Diagnostic Module.
- The Inflatable Restraint Sensing and Diagnostic Module will set DTC B0081
- The Inflatable Restraint Sensing and Diagnostic Module disables the passenger instrument panel air bag.
- The Passenger Presence Sensor will illuminate the passenger air bag status OFF indicator.
- The Inflatable Restraint Sensing and Diagnostic Module requests the instrument panel to illuminate the AIR BAG indicator.

Conditions for Clearing the DTC

- The condition for setting the DTC no longer exists.
- A history DTC will clear once 100 malfunction-free ignition cycles have occurred.

Diagnostic Aids

Inspect the passenger seat belt tension sensor signal, voltage reference, and low reference circuits carefully for cutting and/or chafing.

Circuit/System Testing

NOTE: The seat belt buckle replacement with the seat belt tension sensor must be serviced as a complete unit.

When removing connectors, inspect for damage or corrosion. Damage or corrosion in the following requires repair or replacement of the affected component/connector:

- **Passenger Seat Belt Tension Sensor**
- **Passenger Presence Sensor**
- **Passenger Seat Belt Tension Sensor wiring harness connector**
- **Passenger Presence Sensor wiring harness connector**

1. Ignition OFF and all vehicle systems OFF, disconnect the harness connector at the B153P Seat Belt Buckle-Passenger. It may take up to 2 minutes for all vehicle systems to power down.
2. Ignition ON, test for less than 1 V between the passenger seat belt tension sensor signal circuit terminal 5 and ground.
 - **If 1 V or greater**
 1. Ignition OFF, disconnect the harness connector at the K85 Passenger Presence Module, ignition ON.
 2. Test for less than 1 V between the signal circuit and ground.
 - If 1 V or greater, repair the short to voltage on the circuit.
 - If less than 1 V, replace the B60 Passenger Presence Sensor.
3. Test for greater than 25 ohms between the passenger seat belt tension sensor signal circuit terminal 5 and ground.
 - **If 25 ohms or less**
 1. Ignition OFF, disconnect the harness connector at the K85 Passenger Presence Module. It may take up to 2 minutes for all vehicle systems to power down.
 2. Test for infinite resistance between the signal circuit and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance, replace the B60 Passenger Presence Sensor.
 - **If greater than 25 ohms**
4. Ignition OFF, disconnect the harness connector at the K85 Passenger Presence Module. It may take up to 2 minutes for all vehicle systems to power down.
5. Test for less than 2 ohms between the Passenger Presence Sensor signal circuit terminal 5 and the passenger seat belt tension sensor terminal 5.
 - **If 2 ohms or greater**

Repair the open/high resistance in the circuit

- **If less than 2 ohms**
6. If all circuits test normal, replace the B153P Seat Belt Buckle-Passenger.
 7. Ignition ON, clear DTCs. Operate the vehicle within the Conditions for Running the DTC.

8. Verify DTC B0071 does not set.

- **If DTC B0071 is set**

Replace the K85 Passenger Presence Module.

- **If DTC B0071 is not set**

9. All OK.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

- **SIR/SRS Wiring Repairs**
- **Front Seat Belt Buckle Replacement**

DTC B0074: PASSENGER PRESENCE SENSOR

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

DTC Descriptors

DTC B0074 0D

Passenger Presence Sensor High Resistance

DTC B0074 0E

Passenger Presence Sensor Low Resistance

Circuit/System Description

The Passenger Presence Detection Module monitors the sensor status continually. Whenever the sensor mat has an internal malfunction, the Passenger Presence Detection Module will set DTC B0074.

Conditions for Running the DTC

Ignition voltage is between 9-16 V.

Conditions for Setting the DTC

B0074 0D

The Passenger Presence Detection Module has detected a disconnection from the sensor mat.

B0074 0E

The Passenger Presence Detection Module has detected an open circuit.

The Passenger Presence Detection Module has received a fault signal from the sensor mat.

Action Taken When the DTC Sets

The Inflatable Restraint Sensing and Diagnostic Module requests the instrument cluster to illuminate the AIR BAG indicator.

Conditions for Clearing the DTC

- The condition for setting the DTC no longer exists.
- A history DTC will clear once 100 malfunction-free ignition cycles have occurred.

Diagnostic Aids

- If either the Inflatable Restraint Sensing and Diagnostic Module or Passenger Presence Sensor were replaced verify that the correct part numbers were used for the vehicle application.
- If this DTC is set as either current or history it may have been caused by an electronic device. If an electronic device (Computers, MP3 Players, Cell Phones, Diagnostic Scan Tool, Power Inverter, etc.) was placed on the passenger seat the Passenger Presence Detection Module may command the passenger air bag indicator to turn on and/or command the passenger seat belt indicator to turn on. Make sure there are no objects on the passenger seat and clear the DTCs. If this DTC resets then perform this diagnostic. If the DTC does not reset there is no further work needed on the passenger presence system.
- If this DTC is set as either current or history it may have been caused by an aftermarket seat heater. The aftermarket seat heater may command the passenger air bag indicator to turn on and/or command the passenger seat belt indicator to turn on. Remove the aftermarket seat heater from the passenger seat and clear the DTCs. If this DTC resets then perform this diagnostic. If the DTC does not reset there is no further work needed on the passenger presence system.

Circuit/System Verification

NOTE: This system allows you to service each component separately (module and sensor/sensing mat). Perform a passenger presence system preload test procedure whenever a component is replaced. Refer to **Passenger Presence System Programming and Setup** . Inspect the following component connectors for damage or corrosion. Repair or replace the affected component/connector:

- Passenger Presence Sensor
- Passenger Presence Sensor harness connector
- Passenger Presence Detection Module
- Passenger Presence Detection Module harness connector
- Seat wiring harness to vehicle harness connector

The connector and connector position assurance (CPA) may seat independent of each other. Both the connector and CPA should seat with an audible and/or tactile click.

This system is serviced as a kit (seat foam, module, and/or sensing mat). Perform a Passenger Presence System Preload procedure whenever a component is replaced. Inspect the following component connectors for damage or corrosion. Repair or replace the affected component/connector:

1. Verify that the seat is free of any objects or an aftermarket seat heater.
 - **If objects or an aftermarket seat heater is present**
 1. Remove objects and/or aftermarket seat heater.
 2. Ignition ON, clear the DTC.
 3. Verify that DTC B0074 is not set
 - If the DTC B0074 is set, replace the B60 Passenger Presence Sensor
 - If the DTC B0074 is not set
 4. All OK.
 - **If the seat is empty and does not have an aftermarket seat heater**

2. Verify that DTC B0074 stays current while performing the following:

- Moving the passenger seat forward and backward through its full range of motion.
- Moving the harness near the K85 Passenger Presence Detection Module.
- If applicable, moving the harness near the Passenger Presence Sensor.
- Moving the harness near any seat harness.
- **If DTC B0074 becomes history**

Insure each connector and CPA is correctly seated and inspect each connector terminal for damage or corrosion and repair as necessary.

- **If DTC B0074 stays current**

3. Replace the B60 Passenger Presence Sensor.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

Control Module References for B60 Passenger Presence Sensor replacement

DTC B0081: PASSENGER PRESENCE MODULE (INFLATABLE RESTRAINT SENSING AND DIAGNOSTIC MODULE)

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

DTC Descriptors

DTC B0081 00

Passenger Presence Module Malfunction

DTC B0081 3A

Passenger Presence Module Incorrect Component Installed

DTC B0081 71

Passenger Presence Module Invalid Data

Circuit/System Description

When the ignition is turned ON, the inflatable restraint sensing and diagnostic module and the passenger

presence module perform tests to diagnose critical malfunctions. Upon a successful power-up mode the inflatable restraint sensing and diagnostic module will illuminate both PASSENGER AIRBAG ON/OFF indicators. If the inflatable restraint sensing and diagnostic module detects a fault in the passenger presence module, it may disable the passenger instrument panel air bag deployment loop and/or illuminate the AIRBAG indicator.

Conditions for Running the DTC

Ignition voltage is between 9-16 V.

Conditions for Setting the DTC

B0081 00

The inflatable restraint sensing and diagnostic module has received a fault present message from the passenger presence module.

B0081 3A

The inflatable restraint sensing and diagnostic module has received a message from the passenger presence module indicating a vehicle and passenger presence module mismatch.

B0081 71

The inflatable restraint sensing and diagnostic module has received invalid data from the passenger presence module.

Action Taken When the DTC Sets

- The inflatable restraint sensing and diagnostic module requests the instrument cluster to illuminate the AIR BAG indicator.
- The passenger instrument panel air bag deployment loop will be disabled.

Conditions for Clearing the DTC

- The condition for setting the DTC no longer exists.
- A history DTC will clear once 100 malfunction-free ignition cycles have occurred.

Diagnostic Aids

If either the inflatable restraint sensing and diagnostic module or passenger presence module were replaced verify that the correct part numbers were used for the vehicle application.

Circuit/System Verification

NOTE: Both K36 Inflatable Restraint Sensing and Diagnostic Module and K85 Passenger Presence Module set DTC B0081 but with different symptom bytes. Therefore it is important to identify which module has set the DTC B0081. Use the symptom bytes as a way of identify the correct module to diagnose.

1. Verify that DTC B1001 is not set in the K36 Inflatable Restraint Sensing and Diagnostic Module.
 - **If DTC B1001 is set in the K36 Inflatable Restraint Sensing and Diagnostic Module**

Refer to **Diagnostic Trouble Code (DTC) List - Vehicle** .

- **If DTC B1001 is not set in the K36 Inflatable Restraint Sensing and Diagnostic Module**

2. Verify that DTC B0071, B0074, B0081, B101D, or B101E is not set in the K85 Passenger Presence Module.

- **If any of these DTCs are set in the K85 Passenger Presence Module**

Refer to **Diagnostic Trouble Code (DTC) List - Vehicle** .

- **If none of these DTCs are set in the K85 Passenger Presence Module**

3. Verify that DTC B0081 symptom byte 3A or 71 is not set in the K36 Inflatable Restraint Sensing and Diagnostic Module.

NOTE: The K36 Inflatable Restraint Sensing and Diagnostic Module sets a DTC

B0081 3A when an incorrect K85 Passenger Presence Module is installed.

- If DTC B0081 symptom byte 3A or 71 is set in the K36 Inflatable Restraint Sensing and Diagnostic Module

Replace the K85 Passenger Presence Module.

- If DTC B0081 symptom byte 3A or 71 is not set in the K36 Inflatable Restraint Sensing and Diagnostic Module

4. All OK.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

Control Module References for passenger presence module and inflatable restraint sensing and diagnostic module replacement, programming and setup

DTC B0081: PASSENGER PRESENCE MODULE (PASSENGER PRESENCE SYSTEM)

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

DTC Descriptors

DTC B0081 11

Passenger Presence Module High Input

DTC B0081 4B

Passenger Presence Module Calibration Not Learned

DTC B0081 5A

Passenger Presence Module Not Plausible

Circuit/System Description

When the ignition is turned ON, the inflatable restraint sensing and diagnostic module and the passenger presence module perform tests to diagnose critical malfunctions. Upon a successful power-up mode the inflatable restraint sensing and diagnostic module will illuminate both PASSENGER AIRBAG ON/OFF indicators. If the inflatable restraint sensing and diagnostic module detects a fault in the passenger presence module, it may disable the passenger instrument panel air bag deployment loop, set DTC B0081 and illuminate

the air bag indicator.

Conditions for Running the DTC

Ignition voltage is between 9-16 V.

Conditions for Setting the DTC

Any of the following conditions must exist for 5 s.

B0081 11

The passenger presence module has failed the rezero procedure.

B0081 4B

The passenger presence module is not calibrated.

B0081 5A

The passenger presence module sets this code when the passenger presence module has lost communication with the inflatable restraint sensing and diagnostic module.

Action Taken When the DTC Sets

- The inflatable restraint sensing and diagnostic module requests the instrument cluster to illuminate the AIR BAG indicator.
- The passenger instrument panel air bag deployment loop will be disabled.

Conditions for Clearing the DTC

- The condition for setting the DTC no longer exists.
- A history DTC will clear once 100 malfunction-free ignition cycles have occurred.

Diagnostic Aids

- If either the inflatable restraint sensing and diagnostic module or passenger presence module were replaced verify that the correct part numbers were used for the vehicle application.
- If this DTC is set as either current or history it may have been caused by an electronic device. If an electronic device (Computers, MP3 Players, Cell Phones, Diagnostic Scan Tool, Power Inverter, etc.) was placed on the passenger seat the passenger presence module may command the passenger air bag indicator to turn on and/or command the passenger seat belt indicator to turn on. Make sure there are no objects on the passenger seat and clear the DTCs. If this DTC resets then perform this diagnostic. If the DTC does not reset there is no further work needed on the passenger presence system.
- If this DTC is set as either current or history it may have been caused by an aftermarket seat heater. The aftermarket seat heater may command the passenger air bag indicator to turn on and/or command the passenger seat belt indicator to turn on. Remove the aftermarket seat heater from the passenger seat and

clear the DTCs. If this DTC resets then perform this diagnostic. If the DTC does not reset there is no further work needed on the passenger presence system.

Circuit/System Verification

NOTE:

- This system is serviced as a kit (seat foam, module and sensing mat). Perform a passenger presence system rezero procedure whenever a component is replaced. Refer to Passenger Presence System Programming and Setup .
- Both K36 Inflatable Restraint Sensing and Diagnostic Module and K85 Passenger Presence Module set DTC B0081 but with different symptom bytes. Therefore it is important to identify which module has set the DTC B0081. Use the symptom bytes as a way of identify the correct module to diagnose.
- The K36 Inflatable Restraint Sensing and Diagnostic Module sets a B0081 3A when an incorrect K85 Passenger Presence Module is installed.

1. Verify that the seat is free of any objects or an aftermarket seat heater.
 - **If objects and/or an aftermarket seat heater is present**
 1. Remove objects and/or aftermarket seat heater.
 2. Ignition ON, clear the DTC.
 3. Verify that DTC B0081 is not set
 - If the DTC B0081 is set, replace the K85 Passenger Presence Module
 - If the DTC B0081 is not set
 4. All OK.
 - **If the seat is empty and does not have an aftermarket seat heater**
2. Verify that DTC B0081 3A is not set in the K36 Inflatable Restraint Sensing and Diagnostic Module.
 - **If DTC B0081 3A is set in the K36 Inflatable Restraint Sensing and Diagnostic Module**
Replace the K85 Passenger Presence Module.
 - **If DTC B0081 3A is not set in the K36 Inflatable Restraint Sensing and Diagnostic Module**
3. Verify that DTC B0081 11 or DTC B0081 4B is not set in the K85 Passenger Presence Module.

NOTE: The K36 Inflatable Restraint Sensing and Diagnostic Module sets a redundant B0081 00 DTC when the K85 Passenger Presence Module sets a DTC B0081 11 or B0081 4B.

- If DTC B0081 11 or DTC B0081 4B is set in the K85 Passenger Presence Module

Perform the passenger presence system rezero procedure. Refer to Passenger Presence System Programming and Setup .

- If neither of these DTCs are set in the K85 Passenger Presence Module

4. Verify DTC B0081 5A is not set in the K85 Passenger Presence Module.

- If DTC B0081 5A is set in the K85 Passenger Presence Module

1. Verify the connections at the K36 Inflatable Restraint Sensing and Diagnostic Module and K85 Passenger Presence Module, for terminal corrosion, properly seated connectors, and the connector position assurance is installed.

2. Clear the DTC.

3. Verify DTC B0081 5A does not set in the K85 Passenger Presence Module.

- If DTC B0081 5A sets, replace the K85 Passenger Presence Module.

- If DTC B0081 5A does not set

4. All OK.

- If DTC B0081 5A is not set in the K85 Passenger Presence Module

5. All OK.

Repair Instructions

Perform the Diagnostic Repair Verification after completing the repair.

Circuit/System Description

The impact sensors are equipped on vehicles to supplement the Supplemental Inflatable Restraint (SIR) System performance. The impact sensors are electronic and are not part of the deployment loops, but instead provide inputs to the Inflatable Restraint Sensing and Diagnostic Module. The impact sensors can assist in determining the severity of some frontal and side collisions. The Inflatable Restraint Sensing and Diagnostic Module uses the input from the impact sensors to assist in determining the severity of a collision further supporting air bag deployment. If the Inflatable Restraint Sensing and Diagnostic Module determines a deployment is warranted, the Inflatable Restraint Sensing and Diagnostic Module will cause current to flow through the deployment loops deploying the air bags.

Conditions for Running the DTC

Ignition voltage is between 9-16 V.

Conditions for Setting the DTC

Any of the following conditions exist for 10 seconds:

B0083 01, B0084 01, B0085 01, B0086 01, B0087 01, B0088 01

The sensor has been shorted to voltage.

B0083 02, B0084 02, B0085 02, B0086 02, B0087 02, B0088 02

- The sensor has been shorted to ground.
- The sensor current is greater than 23 mA for greater than 5 milliseconds.

B0083 04, B0084 04, B0085 04, B0086 04, B0087 04, B0088 04

- The sensor circuit is open.
- The Inflatable Restraint Sensing and Diagnostic Module has not received a message from the sensor for greater than 375 milliseconds.

B0083 05, B0084 05, B0085 05, B0086 05, B0087 05, B0088 05

- The sensor circuit is open or high resistance.
- The Inflatable Restraint Sensing and Diagnostic Module has not received a message from the sensor for greater than 375 milliseconds.

B0083 0C, B0084 0C, B0085 0C, B0086 0C, B0087 0C, B0088 0C

- The sensor has been shorted to ground.
- The sensor current is greater than 23 mA for greater than 5 milliseconds.

B0083 39, B0084 39, B0085 39, B0086 39, B0087 39, B0088 39

- The Inflatable Restraint Sensing and Diagnostic Module has received a Not OK message from the sensor.
- The Inflatable Restraint Sensing and Diagnostic Module has not received a message.

B0083 3A, B0084 3A, B0085 3A, B0086 3A, B0087 3A, B0088 3A

- The Inflatable Restraint Sensing and Diagnostic Module has received identification message from the sensor, which does not match the identification stored in the Inflatable Restraint Sensing and Diagnostic Module memory.
- The Inflatable Restraint Sensing and Diagnostic Module has reset the sensor twice without detecting the correct identification message.

B0083 71, B0084 71, B0085 71, B0086 71, B0087 71, B0088 71

The Inflatable Restraint Sensing and Diagnostic Module has received invalid serial data from the sensor.

Action Taken When the DTC Sets

The Inflatable Restraint Sensing and Diagnostic Module requests the instrument panel cluster to illuminate the AIR BAG indicator.

Conditions for Clearing the DTC

- The condition for setting the DTC no longer exists.
- A history DTC will clear once 100 malfunction-free ignition cycles have occurred.
- An ignition cycle is required for the DTC to go from current to history.

Circuit/System Verification

NOTE:

- Refer to SIR Service Precautions.
- Inspect all terminals for damage or corrosion when disconnecting connectors. Damage or corrosion in the following requires repair or replacement of the affected component/connector.
 - Impact sensor
 - Inflatable Restraint Sensing and Diagnostic Module
 - Impact sensor wiring harness connector
 - Inflatable Restraint Sensing and Diagnostic Module wiring harness connector
- The connector and connector position assurance (CPA) may seat independent of each other. Both the connector and CPA should seat with

an audible and/or tactile click. The CPA isolates the shorting-bars within the connector allowing the deployment circuit to operate properly. Replace any CPA that is damaged or missing.

- **If the condition is intermittent or cannot be duplicated, disconnect the connectors and add dielectric grease / lubricant (Nyogel 760G or equivalent, meeting GM specification 9986087). This procedure will correct the high resistance condition due to terminal fretting corrosion.**

1. Verify that DTC B0083-B0088 symptom byte 3A, 39, or 71 is not set as current.

- **If DTC B0083-B0088 symptom byte 3A, 39 or 71 is set as current**

Replace the appropriate B59 or B63 Impact Sensor.

- **If DTC B0083-B0088 symptom byte 3A, 39 or 71 is not set as current**

2. Verify that DTC B0083-B0088 symptom byte 01, 02, 04, or 05 is not set as current.

- **If DTC B0083-B0088 symptom byte 01, 02, 04, or 05 is set as current**

Refer to Circuit/System Testing.

- **If DTC B0083-B0088 symptom byte 01, 02, 04, 05 is not set as current**

3. All OK.

Circuit/System Testing

1. Ignition OFF, disconnect the harness connector at the appropriate B59 or B63 Impact Sensor, wait 120 seconds.

2. Test for less than 10 ohms between the low reference circuit terminal 2 and ground.

- **If 10 ohms or greater**

1. Ignition OFF, disconnect the harness connector at the K36 Inflatable Restraint Sensing and Diagnostic Module.

2. Test for less than 2 ohms in the low reference circuit end to end.

- If 2 ohms or greater, repair the open/high resistance in the circuit.

- If less than 2 ohms, replace the K36 Inflatable Restraint Sensing and Diagnostic Module.

- **If less than 10 ohms**

3. Test for greater than 50k ohms between the signal circuit terminal 1 and ground.

- **If 50k ohms or less**

1. Disconnect the harness connector at the K36 Inflatable Restraint Sensing and Diagnostic Module.

2. Test for infinite resistance between the signal circuit and ground.

- If less than infinite resistance, repair the short to ground on the circuit.

- If infinite resistance, replace the K36 Inflatable Restraint Sensing and Diagnostic Module.

- **If greater than 50k ohms**

4. Ignition ON, test for less than 1 V between the signal circuit terminal 1 and ground.

- **If greater than 1 V**

1. Disconnect the harness connector at the K36 Inflatable Restraint Sensing and Diagnostic Module.
2. Ignition ON, test for less than 1 V between the signal circuit and ground.
 - If greater than 1 V, repair the short to voltage on the circuit.
 - If less than 1 V, replace the K36 Inflatable Restraint Sensing and Diagnostic Module.

- **If less than 1 V**

5. Disconnect the harness connector at the K36 Inflatable Restraint Sensing and Diagnostic Module.
6. Test for less than 2 ohms between the B59 or B63 Impact Sensor signal circuit end to end from the impact sensor terminal 1 and the appropriate K36 Inflatable Restraint Sensing and Diagnostic Module terminal listed below:
 - B63LF Side Impact Sensor - Left Front - Terminal 19 X2
 - B59L Front Impact Sensor - Left - Terminal 23 X2
 - B63RF Side Impact Sensor - Right Front - Terminal 22 X2
 - B59R Front Impact Sensor - Right - Terminal 26 X2
 - B63LR Side Impact Sensor - Left Rear - Terminal 27 X2
 - B63RR Side Impact Sensor - Right Rear - Terminal 30 X2
- **If 2 ohms or greater**

Repair the open/high resistance in the circuit.

- **If less than 2 ohms**

7. Ignition OFF, connect all harness connectors, press in the CPA (if equipped) until an audible and/or tactile click is heard.
8. Ignition ON, clear DTCs. Operate the vehicle within the Conditions for Running the DTC.
9. Verify the DTC does not set.
 - **If the DTC sets**

Replace the B59 or B63 Impact Sensor.

- **If the DTC does not set**

10. All OK.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

- **Airbag Front End Sensor Replacement - Right Side**
- **Airbag Front End Sensor Replacement - Left Side**
- **Airbag Side Impact Center Pillar Sensor Replacement**
- **Airbag Side Impact Sensor Replacement - Front Side Door**

Circuit/System Description

The impact sensors are equipped on vehicles to supplement the Supplemental Inflatable Restraint (SIR) System performance. The impact sensors are electronic and are not part of the deployment loops, but instead provide inputs to the Inflatable Restraint Sensing and Diagnostic Module. The impact sensors can assist in determining the severity of some frontal and side collisions. The Inflatable Restraint Sensing and Diagnostic Module uses the input from the impact sensors to assist in determining the severity of a collision further supporting air bag deployment. If the Inflatable Restraint Sensing and Diagnostic Module determines a deployment is warranted, the Inflatable Restraint Sensing and Diagnostic Module will cause current to flow through the deployment loops deploying the appropriate air bags. The Front impact sensor and side impact sensors utilize a bidirectional 2-wire circuit. The sensors modulate current on the interface to send identification, state of health, and deployment commands to the inflatable restraint sensing and diagnostic module. The Inflatable Restraint Sensing and Diagnostic Module serves as a power source and a ground for the sensors. When the ignition is turned ON and input power from the Inflatable Restraint Sensing and Diagnostic Module is first detected, the sensors respond by performing internal diagnostics and sending an identification to the Inflatable Restraint Sensing and Diagnostic Module. The Inflatable Restraint Sensing and Diagnostic Module considers the identification to be valid if the response time is less than 5 seconds. The sensors continually communicate status messages to the Inflatable Restraint Sensing and Diagnostic Module, which determines if a fault is present in the sensor circuit. When a fault is detected, the Inflatable Restraint Sensing and Diagnostic Module may reset the sensors up to 2 times by removing and reapplying power to it. If the fault is still present, the Inflatable Restraint Sensing and Diagnostic Module will set a DTC.

Conditions for Running the DTC

Ignition voltage is between 9-16 V.

Conditions for Setting the DTC

B0091 01

The Inflatable Restraint Sensing and Diagnostic Module has detected the Front impact sensor has been shorted to voltage

B0091 02

- The Inflatable Restraint Sensing and Diagnostic Module has detected the Front impact sensor has been shorted to ground.
- The Front impact sensor current is greater than 23 mA for greater than 5 milliseconds.

B0091 04

- The Inflatable Restraint Sensing and Diagnostic Module has detected an open/high resistance in the Front impact sensor.
- The Inflatable Restraint Sensing and Diagnostic Module has not received a message from the Front impact sensor for greater than 375 milliseconds.

B0091 05 and B0091 0C

- The Inflatable Restraint Sensing and Diagnostic Module has detected the Front impact sensor has been shorted to voltage.
- The Inflatable Restraint Sensing and Diagnostic Module has detected an open/high resistance in the Front impact sensor.
- The Inflatable Restraint Sensing and Diagnostic Module has not received a message from the Front impact sensor for greater than 375 milliseconds.

B0091 39

- The Inflatable Restraint Sensing and Diagnostic Module has received a Not OK (NOK) message from the Front impact sensor.
- The Inflatable Restraint Sensing and Diagnostic Module has not received a message.

B0091 3A

- The Inflatable Restraint Sensing and Diagnostic Module has received identification message from the Front impact sensor which does not match the identification stored in the Inflatable Restraint Sensing and Diagnostic Module memory.
- The Inflatable Restraint Sensing and Diagnostic Module has reset the Front impact sensor twice without detecting the correct identification message.

B0091 71

The Inflatable Restraint Sensing and Diagnostic Module has received invalid serial data from the Front impact sensor.

Action Taken When the DTC Sets

- The Inflatable Restraint Sensing and Diagnostic Module requests the instrument panel cluster to illuminate the AIR BAG indicator.
- The SIR system is disabled and no deployments are allowed.

Conditions for Clearing the DTC

- The condition for setting the DTC no longer exists.
- A history DTC will clear once 100 malfunction-free ignition cycles have occurred.

Control Module References for scan tool information

Circuit/System Verification

1. For DTC B0091 39, B0091 3A and B0091 71, replace the B59 Front Impact Sensor.
2. For DTC B0091 01, B0091 02, B0091 04, B0091 05 and B0091 0C, perform the Circuit/System Testing.

Circuit/System Testing

1. Ignition OFF.
2. Disconnect the harness connector at the B59 Front Impact Sensor, wait 120 seconds.
3. Test for less than 10 ohms between the low reference circuit terminal 2 and ground.
 - **If 10 ohms or greater**
 1. Ignition OFF, disconnect the X2 harness connector at the K36 Inflatable Restraint Sensing and Diagnostic Module.
 2. Test for less than 2 ohms in the low reference circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, replace the K36 Inflatable Restraint Sensing and Diagnostic Module.
 - **If less than 10 ohms**
4. Test for greater than 50k ohms between the signal circuit terminal 1 and ground.
 - **If 50k ohms or less**
 1. Disconnect the X2 harness connector at the K36 Inflatable Restraint Sensing and Diagnostic Module.

2. Test for infinite resistance between the signal circuit and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance, replace the K36 Inflatable Restraint Sensing and Diagnostic Module.
 - **If greater than 50k ohms**
5. Disconnect the X2 harness connector at the Inflatable Restraint Sensing and Diagnostic Module.
6. Test for less than 2 ohms between the B59 Front Impact Sensor signal circuit terminal 1 and the Inflatable Restraint Sensing and Diagnostic Module terminal 23 X2.
 - **If 2 ohms or greater**
7. Repair the open/high resistance in the circuit.
 - **If less than 2 ohms**
8. Replace the B59 Front Impact Sensor.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

DTC B1001: OPTION CONFIGURATION

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category

DTC Descriptor

DTC B1001 00

Option Configuration

Circuit/System Description

The inflatable restraint sensing and diagnostic module stores a primary data key, which is a 4-digit number. When the ignition is turned ON, the inflatable restraint sensing and diagnostic module compares this information to the information stored in the body control module (BCM) via serial data. If there is a mismatch between the information stored in the inflatable restraint sensing and diagnostic module and body control module, DTC B1001 will set.

Conditions for Running the DTC

System voltage is between 9-16 V.

Conditions for Setting the DTC

The 4-digit Primary Data Key stored in the inflatable restraint sensing and diagnostic module does not match the 4 digits stored in the body control module.

Action Taken When the DTC Sets

- The inflatable restraint sensing and diagnostic module requests the instrument cluster to illuminate the AIR BAG indicator.
- The inflatable restraint sensing and diagnostic module disables all deployments.

Conditions for Clearing the DTC

The last 4-digit Primary Data Key in the inflatable restraint sensing and diagnostic module matches the last 4 digits stored in the Body Control Module.

Diagnostic Aids

- This DTC is an indication that an incorrect inflatable restraint sensing and diagnostic module is installed in the vehicle, or that the inflatable restraint sensing and diagnostic module and/or the body control module was replaced without reprogramming the body control module with the new information.
- If the inflatable restraint sensing and diagnostic module was previously programmed and DTC B1001 is now set, the setup portion of program was not completed. Proceed to the inflatable restraint sensing and diagnostic module setup portion of the **Inflatable Restraint Sensing and Diagnostic Module Programming and Setup**

DTC B1019: SYSTEM CONFIGURATION ERROR

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

DTC Descriptor

DTC B1019 00

System Configuration Error

Circuit/System Description

The inflatable restraint sensing and diagnostic module monitors the number of safety components installed on the vehicle. When the ignition is turned ON, the inflatable restraint sensing and diagnostic module evaluates the number of safety components installed and compares it to the number of components the inflatable restraint sensing and diagnostic module expects to see on the vehicle with its current calibration. If there is a mismatch between detected components and the components programmed with the inflatable restraint sensing and

diagnostic module calibration, DTC B1019 will set. The components (if equipped) that the inflatable restraint sensing and diagnostic module will detect include inflatable restraint deployment loops, impact sensors, passenger presence system components, seat position sensors, disable switches, and seat belt switches.

Conditions for Running the DTC

Ignition voltage is between 9-16 V.

Conditions for Setting the DTC

The setup for the inflatable restraint sensing and diagnostic module has not been completed and the inflatable restraint sensing and diagnostic module does not detect the passenger presence system (if equipped), the correct number of sensors, or deployment loops, that is expected with this calibration.

Action Taken When the DTC Sets

- The inflatable restraint sensing and diagnostic module requests the instrument cluster to illuminate the AIR BAG warning indicator.
- The DTC must be cleared before running the setup inflatable restraint sensing and diagnostic module.
- Air bag indicator will continue to flash until inflatable restraint sensing and diagnostic module setup procedure is complete.

Conditions for Clearing the DTC

- The condition for setting the DTC is no longer present.
- A history DTC will clear once 100 malfunction-free ignition cycles have occurred.

Diagnostic Aids

The inflatable restraint sensing and diagnostic module scan tool deployment loop, impact sensor, and passenger presence (if equipped) data will match what the inflatable restraint sensing and diagnostic module has been programmed to expect to see on the vehicle. B1019 DTC will set if a deployment loop or impact sensor is added or removed from the system, or if the passenger presence is not detected.

DTC B1019 will set when an open/high resistance DTC sets for a deployment loop or impact sensor. This causes mismatch between the learned and actual components connected to the inflatable restraint sensing and diagnostic module.

DTC B1019 can set with no other DTCs if an unused deployment loop or impact sensor circuit is shorted to ground. This causes a mismatch between the learned and actual components connected to the inflatable restraint sensing and diagnostic module.

Scan Tool Reference

Control Module References for scan tool information

Circuit/System Verification

NOTE: DTC B1019 can set after the inflatable restraint sensing and diagnostic module has been replaced and/or reprogrammed before the setup procedure is completed. The setup procedure cannot be completed if DTC B1019 is set as current or history. If a short or open is detected in a deployment circuit prior to the setup procedure being performed, the inflatable restraint sensing and diagnostic module will set DTC B1019.

1. Ignition ON.
2. Verify no other K36 Inflatable Restraint Sensing and Diagnostic Module DTCs are set.
 - **If other K36 Inflatable Restraint Sensing and Diagnostic Module DTCs are set**

Diagnose those DTCs first. Refer to **Diagnostic Trouble Code (DTC) List - Vehicle**
 - **If no other K36 Inflatable Restraint Sensing and Diagnostic Module DTCs are set**
3. Verify the enabled impact sensors identified in the scan tool data list match the number of actual impact sensors installed on the vehicle.
 - **If the number of enabled impact sensors do not match**
 1. Verify the correct K36 Inflatable Restraint Sensing and Diagnostic Module calibration file is loaded in the K36 Inflatable Restraint Sensing and Diagnostic Module.
 - If the K36 Inflatable Restraint Sensing and Diagnostic Module calibration file is correct and

the vehicle contains an incorrect number of sensors, identify which sensors are missing to make the vehicle match the K36 Inflatable Restraint Sensing and Diagnostic Module impact sensor calibration scan tool data list.

- If the calibration file is incorrect
- 2. Reprogram the K36 Inflatable Restraint Sensing and Diagnostic Module. Refer to **Inflatable Restraint Sensing and Diagnostic Module Programming and Setup**
 - **If the number of enabled impact sensors match**
- 4. Verify the enabled deployment loops identified in the scan tool data list match the deployment loops installed on the vehicle.
 - **If the number of enabled deployment loops do not match**
 1. Verify the correct K36 Inflatable Restraint Sensing and Diagnostic Module calibration file is loaded in the K36 Inflatable Restraint Sensing and Diagnostic Module.
 - If the K36 Inflatable Restraint Sensing and Diagnostic Module calibration file is correct and the vehicle contains an incorrect number of loops, identify which deployment loops are missing to make the vehicle match the K36 Inflatable Restraint Sensing and Diagnostic Module impact sensor calibration scan tool data list.
 - If the calibration file is incorrect
 2. Program the K36 Inflatable Restraint Sensing and Diagnostic Module. Refer to **Inflatable Restraint Sensing and Diagnostic Module Programming and Setup**
 - **If the number of enabled deployment loops match**
- 5. Verify a passenger presence system is equipped on the vehicle.
 - **If a passenger presence system is not equipped on the vehicle**

Replace the K36 Inflatable Restraint Sensing and Diagnostic Module.

 - **If a passenger presence system is equipped on the vehicle**
- 6. Verify the scan tool Passenger Presence System Enable Status parameter is Enabled.
 - **If the Passenger Presence System Enable Status parameter is not Enabled**

Refer to **Inflatable Restraint Sensing and Diagnostic Module Programming and Setup**

 - **If the Passenger Presence System parameter is Enabled**
- 7. Verify the scan tool Passenger Presence System Learn Status parameter is Learned.
 - **If the Passenger Presence System Learn Status parameter is not Learned**
 1. Verify the scan tool can communicate with the passenger presence system.
 - If the scan tool will not communicate with the passenger presence system, refer to **Scan Tool Does Not Communicate with Low Speed GMLAN Device**
 - If the scan tool communicates
 2. Ignition OFF, disconnect the scan tool. It may take up to 2 min for all vehicle systems to power down. Ignition ON.
 3. Verify DTC B1019 is not set as current.
 - If the DTC is set as current, refer to **Inflatable Restraint Sensing and Diagnostic Module**

Programming and Setup

- If the DTC is not set as current
- 4. All OK.
 - **If the Passenger Presence System Learn status is Learned**
- 8. Replace the K36 Inflatable Restraint Sensing and Diagnostic Module.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

- **SIR/SRS Wiring Repairs**
- **Control Module References** for inflatable restraint sensing and diagnostic module replacement, programming and setup

PASSENGER PRESENCE SYSTEM REZEROING

Introduction

The inflatable restraints passenger presence system (PPS) is a calibrated system that requires rezeroing anytime the seat cushion trim attachments have been removed or the PPS has been replaced. The procedures below are designed to assist in the rezeroing of the PPS. Before you start, read these procedures carefully and completely. For further information regarding the PPS refer to **Supplemental Inflatable Restraint System Description and Operation**.

NOTE: **The following procedures must be followed:**

1. Read this procedure carefully and completely.
2. The PPS will not function properly if the PPS rezeroing procedure is not performed.
3. Perform the **Diagnostic Repair Verification** after successfully completing the rezeroing procedure to ensure the system is functioning properly.

Passenger Presence System (PPS) Rezeroing Procedure

NOTE: **Before rezeroing the PPS, the front passenger seat must be completely empty of all items. The presence of any items on the front passenger seat will affect the calibration and operation of the PPS. The passenger seat must be between 0°C to 45°C (32°F to 113°F).**

1. Empty the front outboard passenger seat.
2. Verify that all SIR and PPS components, connectors, and connector position assurances (CPAs) are properly connected and mounted.
3. Install a scan tool.
4. Turn ON the ignition, with the engine OFF.

NOTE: DTC B0081 4B may be set prior to rezeroing the system if the system was replaced with a service kit. All other SIR and PPS DTCs must be cleared before rezeroing the PPS. The presence of current or history DTCs will prevent the PPS from rezeroing and may set additional DTCs.

5. Use the scan tool in order to clear the SIR and PPS DTCs.
6. With a scan tool, request the Passenger Presence Sensor Learn procedure.
7. Initiate the Passenger Presence Sensor Learn procedure. The PPS will illuminate both PASSENGER AIR BAG ON and OFF indicators until this procedure has been completed.
8. When the Passenger Presence Sensor Learn procedure has been successfully completed, the PPS will display the current system status.
9. If the Passenger Presence Sensor Learn procedure was unsuccessful, repeat this procedure. Due to the communication status between the SDM and the PPS module, this procedure may have to be repeated until a successful rezero attempt has been achieved.
10. After the PPS has been successfully rezeroed, perform the **Diagnostic Repair Verification** .

SYMPTOMS - SIR

NOTE: Complete the following steps before using the symptom tables:

1. Perform **Diagnostic System Check - Vehicle** before using the symptom tables in order to verify that all of the following are true:
 - There are no DTCs set.
 - The inflatable restraint sensing and diagnostic module (SDM) can communicate via the serial data link.
2. Review the SIR system description and operation in order to familiarize yourself with the system functions. Refer to **Supplemental Inflatable Restraint System Description and Operation**.

Visual/Physical Inspection

- Inspect for aftermarket devices which could affect the operation of the SIR system. Refer to **Checking Aftermarket Accessories** .
- Inspect the easily accessible or visible system components for obvious damage or conditions which could cause the symptom.

Intermittent

Faulty electrical connections or wiring may be the cause of intermittent conditions. Refer to **Testing for Intermittent Conditions and Poor Connections** .

Symptom List

Refer to **Airbag Indicator Malfunction (Driver)**, **Airbag Indicator Malfunction (Passenger)** in order to diagnose the symptom.

AIRBAG INDICATOR MALFUNCTION (DRIVER)

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

Circuit/System Description

When the ignition is turned ON the driver air bag indicator will illuminate, and then turn OFF after the bulb check is complete. The inflatable restraint sensing and diagnostic module (SDM) performs diagnostic tests on the SIR system during the bulb check. If any malfunction exists the inflatable restraint sensing and diagnostic module will request the instrument cluster to illuminate the air bag indicator steady, via serial data. If a preexisting malfunction exists, the air bag indicator will illuminate steady immediately after the ignition is turned ON. If the ignition 1 voltage is outside of the normal operating voltage range of 9-16 V, the inflatable restraint sensing and diagnostic module will command the instrument cluster to illuminate the air bag indicator ON, even with no DTCs present, and then disable all deployment loops.

Diagnostic Aids

- A DTC B1370 may set if the ignition 1 circuit is outside the 9-16 V range.
- A flashing driver air bag indicator is displayed if the inflatable restraint sensing and diagnostic module was programmed but did not fully complete the programming. For a flashing driver airbag indicator, refer to **Inflatable Restraint Sensing and Diagnostic Module Programming and Setup** .

AIRBAG INDICATOR MALFUNCTION (PASSENGER)

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Passenger Air Bag OFF Indicator Control	2	2*	4	-
Passenger Air Bag ON Indicator Control	3	3*	5	-
Passenger Air Bag Disable Indicator Ground	-	1	1	-
1. Both indicators always OFF 2. The OFF indicator will not illuminate 3. The ON indicator will not illuminate 4. The OFF indicator always ON 5. The ON indicator always ON				

* High resistance may cause the appropriate indicator to illuminate less bright than normal

Circuit/System Description

The passenger air bag ON/OFF indicators are used to notify the driver when the passenger presence system has enabled or disabled the passenger instrument panel air bag. When the ignition is turned ON, the ignition voltage is supplied to the passenger presence module. When the Inflatable Restraint Sensing and Diagnostic Module (SDM) receives the appropriate serial data message from the passenger presence module the SDM will then provide voltage to the appropriate indicator.

Circuit/System Verification

NOTE: **The passenger air bag ON and OFF indicators may not operate as expected if there are supplemental inflatable restraint (SIR) DTCs. Repair all SIR DTCs before proceeding with this diagnostic.**

1. Ignition ON.
2. Verify the passenger air bag ON indicator turns ON and OFF when commanding the Passenger Air Bag ON Indicator ON and OFF with a scan tool.
 - **If the air bag ON indicator does not turn ON or OFF**

Refer to Circuit/System Testing.

- **If the air bag ON indicator turns ON or OFF**

3. Verify the passenger air bag OFF indicator turns ON and OFF when commanding the Passenger Air Bag OFF Indicator ON and OFF with a scan tool.

- **If the air bag OFF indicator does not turn ON or OFF**

Refer to Circuit/System Testing.

- **If the air bag OFF indicator turns ON or OFF**

4. All OK.

Circuit/System Testing

NOTE: When removing connectors inspect for damage or corrosion. Damage or corrosion in the following requires repair or replacement of the affected.

- **P17 Info Display Module**
- **P17 Info Display Module wiring harness.**

1. Ignition OFF, disconnect the harness connector at the P17 Info Display Module.

2. Test for less than 10 ohms between the ground circuit terminal 7 and ground.

- **If 10 ohms or greater**

1. Ignition OFF.

2. Test for less than 2 ohms in the ground circuit end to end.

- If 2 ohms or greater, repair the open/high resistance in the circuit.

- If less than 2 ohms, repair the open/high resistance in the ground connection.

- **If less than 10 ohms**

3. Ignition ON, command the passenger air bag OFF indicator OFF with a scan tool.

4. Test for less than 11 V between the control circuit terminal 6 and ground.

- **If 11 V or greater**

1. Ignition OFF, disconnect the X1 harness connector at the K36 Inflatable Restraint Sensing and Diagnostic Module, ignition ON.

2. Test for less than 1 V between the control circuit and ground.

- If 1 V or greater, repair the short to voltage on the circuit.

- If less than 1 V, replace the K36 Inflatable Restraint Sensing and Diagnostic Module.

- **If less than 11 V**

5. Command the passenger air bag OFF indicator ON with a scan tool.

6. Test for greater than 4 V between the control circuit terminal 6 and ground.

- **If 4 V or less**

1. Disconnect the X1 harness connector at the K36 Inflatable Restraint Sensing and Diagnostic

Module.

2. Test for infinite resistance between the control circuit and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance
3. Test for less than 2 ohms in the control circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, replace the K36 Inflatable Restraint Sensing and Diagnostic Module.
 - **If greater than 4 V**
7. Command the passenger air bag ON indicator OFF with a scan tool.
8. Test for less than 11 V between the control circuit terminal 5 and ground.
 - **If 11 V or greater**
 1. Ignition OFF, disconnect the X1 harness connector at the K36 Inflatable Restraint Sensing and Diagnostic Module, ignition ON.
 2. Test for less than 1 V between the control circuit and ground.
 - If 1 V or greater, repair the short to voltage on the circuit.
 - If less than 1 V, replace the K36 Inflatable Restraint Sensing and Diagnostic Module.
 - **If less than 11 V**
9. Command the passenger air bag ON indicator ON with a scan tool.
10. Test for greater than 4 V between the control circuit terminal 5 and ground.
 - **If 4 V or less**
 1. Disconnect the X1 harness connector at the K36 Inflatable Restraint Sensing and Diagnostic Module.
 2. Test for infinite resistance between the control circuit and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance
 3. Test for less than 2 ohms in the control circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, replace the K36 Inflatable Restraint Sensing and Diagnostic Module.
 - **If greater than 4 V**
11. Test or replace the P17 Info Display Module.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

- **Instrument Panel Airbag Arming Status Display Replacement** for P17 Info Display Module replacement
- **Control Module References** for Inflatable Restraint Sensing and Diagnostic Module replacement, programming and setup

SIR DISABLING AND ENABLING

SIR component location affects how a vehicle should be serviced. There are parts of the SIR system installed in various locations around a vehicle. To find the location of the SIR components refer to **Supplemental Inflatable Restraint System Description and Operation**.

There are several reasons for disabling the SIR system, such as repairs to the SIR system or servicing a component near or attached to an SIR component. There are several ways to disable the SIR system depending on what type of service is being performed. The following information covers the proper procedures for disabling/enabling the SIR system.

Condition	Action
If the vehicle was involved in an accident with an air bag deployment.	Disconnect the negative battery cable(s) *. Refer to <u>Repairs and Inspections Required After a Collision</u> .
When performing SIR diagnostics.	Follow the appropriate SIR service manual diagnostic procedure(s) *
When moving, removing or replacing an SIR component or a component attached to an SIR component. (Anytime you remove fasteners.)	Disconnect the negative battery cable(s) *
If the vehicle is suspected of having shorted electrical wires.	Disconnect the negative battery cable(s) *
When performing electrical diagnosis on components other than the SIR system.	Remove the SIR/Airbag fuse(s) when indicated by the diagnostic procedure to disable the SIR system
* DTCs will be lost when the negative battery cable is disconnected.	

SIR Service Precautions

WARNING: When performing service on or near the SIR components or the SIR wiring, the SIR system must be disabled. Failure to observe the correct procedure could cause deployment of the SIR components. Serious injury can occur. Failure to observe the correct procedure could also result in unnecessary SIR system repairs.

The Inflatable Restraint Sensing and Diagnostic Module (SDM) maintains a reserved energy supply. The reserved energy supply provides deployment power for the air bags if the Inflatable Restraint Sensing and Diagnostic Module loses battery power during a collision. Deployment power is available for as much as 2 minutes after disconnecting the vehicle power. Waiting 2 minutes before working on the system after disabling the SIR system prevents deployment of the air bags from the reserved energy supply.

General Service Instructions

The following are general service instructions which must be followed in order to properly repair the vehicle and return it to its original integrity:

- Do not expose air bags to temperatures above 65°C (149°F).

- Verify the correct replacement part number. Do not substitute a component from a different vehicle.
- Use only original GM replacement parts available from your authorized GM dealer. Do not use salvaged parts for repairs to the SIR system.

Discard any of the following components if it has been dropped from a height of 92 cm (3 feet) or greater:

- Inflatable Restraint Sensing and Diagnostic Module (SDM)
- Any air bag
- Driver steering wheel air bag coil
- Any impact sensor
- Seat belt anchor and/or retractor pretensioners
- Passenger presence module and/or occupant sensor

Disabling Procedure - Air Bag Fuse

1. Turn the steering wheel so that the vehicles wheels are pointing straight ahead.
2. Place the ignition in the OFF position.

WARNING: The SDM may have more than one fused power input. To ensure there is no unwanted SIR deployment, personal injury, or unnecessary SIR system repairs, remove all fuses supplying power to the SDM. With all SDM fuses removed and the ignition switch in the ON position, the AIR BAG warning indicator illuminates. This is normal operation, and does not indicate a SIR system malfunction.

3. Locate and remove the fuse(s) supplying power to the Inflatable Restraint Sensing and Diagnostic Module. Refer to **SIR Schematics**, or **Electrical Center Identification Views** .
4. Wait 2 minutes before working on the system.

Enabling Procedure - Air Bag Fuse

1. Place the ignition in the OFF position.
2. Install the fuse(s) supplying power to the Inflatable Restraint Sensing and Diagnostic Module. Refer to **SIR Schematics**, or **Electrical Center Identification Views** .
3. Turn the ignition switch to the ON position. The AIR BAG indicator will illuminate or flash then turn OFF.
4. Perform the Diagnostic System Check - Vehicle if the AIR BAG warning indicator does not operate as described. Refer to **Diagnostic System Check - Vehicle** .

Disabling Procedure - Negative Battery Cable

1. Turn the steering wheel so that the vehicles wheels are pointing straight ahead.
2. Place the ignition in the OFF position.

3. Disconnect the negative battery cable from the battery. Refer to **Battery Negative Cable Disconnection and Connection** .
4. Wait 2 minutes before working on system.

Enabling Procedure - Negative Battery Cable

1. Place the ignition in the OFF position.
2. Connect the negative battery cable to the battery. Refer to **Battery Negative Cable Disconnection and Connection** .
3. Turn the ignition switch to the ON position. The AIR BAG indicator will illuminate or flash then turn OFF.
4. Perform the Diagnostic System Check - Vehicle if the AIR BAG warning indicator does not operate as described. Refer to **Diagnostic System Check - Vehicle** .

REPAIR INSTRUCTIONS

SIR SERVICE PRECAUTIONS

General Service Instructions

WARNING: When performing service on or near the SIR components or the SIR wiring, the SIR system must be disabled. Refer to SIR Disabling and Enabling. Failure to observe the correct procedure could cause deployment of the SIR components, personal injury, or unnecessary SIR system repairs.

NOTE: The Inflatable Restraint Sensing and Diagnostic Module (SDM) maintains a reserved energy supply. The reserved energy supply provides deployment power for the SIR air bags. Deployment power may be available for up to 2 minutes after disconnecting the vehicle power. Disabling the SIR system prevents deployment of the SIR air bags from the reserved energy supply.

NOTE: The following are general service instructions which must be followed in order to properly repair the vehicle and return it to its original integrity:

- Do not expose air bags to temperatures above 85 °C (185 °F)
- Verify the correct replacement part number. Do not substitute a component from a different vehicle
- Use only original GM replacement parts available from your authorized GM dealer. Do not use salvaged parts for repairs to the SIR system

NOTE: Discard any of the following components if it has been dropped from a height of 80 cm (15.75 in) or greater:

- Inflatable Restraint Sensing and Diagnostic Module

- Passenger instrument panel air bag
- Driver steering wheel air bag
- Driver steering wheel air bag coil
- Roof rail air bags
- Front and /or side impact sensors
- Seat belt anchor and/or retractor pretensioners
- Front seat side air bag
- Knee air bag

FRONT END INFLATABLE RESTRAINT DISCRIMINATING SENSOR REPLACEMENT (WITH AY0)

Fig. 7: NO CONTENT
Courtesy of GENERAL MOTORS COMPANY

Front End Inflatable Restraint Discriminating Sensor Replacement (With AY0)

Callout	Component Name
WARNING: Refer to <u>SIR Warning</u> .	
WARNING: Following the deployment of a side impact air bag, inspect the following parts for damage. Replace these parts if necessary:	

- The seat cushion frame
- The seat recliner, if equipped
- The seat adjuster
- The seat back frame

Failure to do so may cause future personal injury.

Preliminary Procedure Disable the SIR system. Refer to **SIR Disabling and Enabling**.

1	Inflatable Restraint Front End Sensor Bolt CAUTION: Refer to <u>Fastener Caution</u> . Tighten 7.5 (66 lb in)
2	Inflatable Restraint Front End Sensor Assembly Procedure 1. Disconnect electrical connector. 2. Loosen the bolt and slide the sensor out of the keyhole slot. NOTE: The bolt is integral to the sensor assembly, DO NOT remove separately.

AIRBAG FRONT END SENSOR REPLACEMENT - RIGHT SIDE

Fig. 8: Airbag Front End Sensor - Right Side
 Courtesy of GENERAL MOTORS COMPANY

Airbag Front End Sensor Replacement - Right Side

Callout	Component Name
WARNING: Do not strike or jolt the inflatable restraint front end sensor. Before applying power to the front end sensor make sure that it is securely fastened. Failure to observe the correct installation procedure could cause SIR deployment, personal injury, or unnecessary SIR system repairs. WARNING: Refer to <u>SIR Warning</u> . Preliminary Procedures 1. Disable the supplemental inflatable restraint (SIR) system. Refer to <u>SIR Disabling and Enabling</u>. 2. Raise and support the vehicle. Refer to <u>Lifting and Jacking the Vehicle</u> .	
	Supplemental Inflatable Restraint Front End Discriminating Sensor Bolt (Qty: 1) CAUTION: Refer to <u>Fastener Caution</u> . Procedure 1. Loosen the bolts and slide the sensors out of the keyhole slots. 2. The bolts are integral to the sensor assembly and DO NOT remove separately.

1	NOTE: Integral sensor assembly bolt uses Left Hand threads. Use counterclockwise rotation to loosen fastener at TORX® tip end. If accessing at pan head end of the fastener, use clockwise rotation to loosen bolt. Tighten 7.5 (66 lb in)
2	Supplemental Inflatable Restraint Front End Discriminating Sensor Assembly Procedure 1. Remove connector position assurance (CPA) retainer. 2. Disconnect electrical connector.

AIRBAG FRONT END SENSOR REPLACEMENT - LEFT SIDE

Fig. 9: Airbag Front End Sensor - Left Side
Courtesy of GENERAL MOTORS COMPANY

Airbag Front End Sensor Replacement - Left Side

Callout	Component Name
WARNING: Do not strike or jolt the inflatable restraint front end sensor. Before applying power to the front end sensor make sure that it is securely fastened. Failure to observe the correct installation procedure	

could cause SIR deployment, personal injury, or unnecessary SIR system repairs.

WARNING:

Refer to SIR Warning .

Preliminary Procedures

1. Disable the supplemental inflatable restraint (SIR) system. Refer to SIR Disabling and Enabling.
2. Raise and support the vehicle. Refer to Lifting and Jacking the Vehicle .

1	Supplemental Inflatable Restraint Front End Discriminating Sensor Bolt (Qty: 1) CAUTION: Refer to <u>Fastener Caution</u> . Procedure 1. Loosen the bolts and slide the sensors out of the keyhole slots. 2. The bolts are integral to the sensor assembly and DO NOT remove separately. NOTE: Integral sensor assembly bolt uses Left Hand threads. Use counterclockwise rotation to loosen fastener at TORX® tip end. If accessing at pan head end of the fastener, use clockwise rotation to loosen bolt. Tighten 7.5 (66 lb in)
2	Supplemental Inflatable Restraint Front End Discriminating Sensor Assembly Procedure 1. Remove connector position assurance (CPA) retainer. 2. Disconnect electrical connector.

AIRBAG SENSING AND DIAGNOSTIC MODULE REPLACEMENT

Fig. 10: Airbag Sensing and Diagnostic Module
 Courtesy of GENERAL MOTORS COMPANY

Airbag Sensing and Diagnostic Module Replacement

Callout	Component Name
Preliminary Procedures 1. Disable the supplemental inflatable restraint (SIR) system. Refer to <u>SIR Disabling and Enabling</u>. 2. Remove the instrument panel lower trim panel. Refer to <u>Front Floor Console Replacement</u>. 3. Disconnect the electrical connector.	
1	Inflatable Restraint Sensing and Diagnostic Module Nut (Qty: 3) CAUTION: Refer to <u>Fastener Caution</u> . Tighten 10 N.m (89 lb in)

AIRBAG STEERING WHEEL MODULE REPLACEMENT

Removal Procedure

WARNING: When carrying a live inflator module, make sure the bag opening is pointed away from you. This minimizes the chance of injury in the case of an accidental deployment. Never carry the inflator module by the wires.

Never carry the inflator module by the connector on the underside of the module.

Make sure that the bag and trim cover are facing up whenever you place a live inflator module on any surface. This is necessary to provide a free space for the bag to expand in the unlikely event of accidental deployment.

Never rest the steering column assembly on the steering wheel with the inflator module face down, and the column vertical. This may result in personal injury.

WARNING: Refer to SIR Warning .

Fig. 11: Insert Suitable Tools To Openings On Both Sides Of Steering Wheel
Courtesy of GENERAL MOTORS COMPANY

1. Disable the supplemental inflatable restraint (SIR) system. Refer to SIR Disabling and Enabling.
2. Insert suitable tools (2) to the openings (1) on both sides of the steering wheel.
3. Release the springs in direction of the arrows by pushing the tool horizontally.
4. Disconnect the electrical connectors.

Installation Procedure

Fig. 12: Steering Wheel Module

Courtesy of GENERAL MOTORS COMPANY

1. Connect the electrical connectors.
2. Align the steering wheel module fasteners to the steering column fastener holes.
3. Push the steering wheel module (1) firmly into the steering column in order to engage the fasteners.
4. Enable the SIR system. Refer to **SIR Disabling and Enabling**.
5. After replacing the module, fully deploy the old module before disposal.

STEERING WHEEL AIRBAG COIL REPLACEMENT

Fig. 13: Steering Wheel Airbag Coil
Courtesy of GENERAL MOTORS COMPANY

Steering Wheel Airbag Coil Replacement

Callout	Component Name
Preliminary Procedures 1. Remove the steering column upper trim cover. Refer to <u>Steering Column Lower Trim Cover Replacement</u> . 2. Remove the steering column lower trim cover. Refer to <u>Steering Column Upper Trim Cover Replacement</u> . 3. Remove the steering wheel. Refer to <u>Steering Wheel Replacement</u> .	
1	Steering Wheel Inflatable Restraint Module Coil Screw Bolt (Qty: 4) CAUTION: Refer to <u>Fastener Caution</u> . Tighten 1.5 N.m (13 lb in)
2	Steering Wheel Inflatable Restraint Module Coil Assembly Procedure Disconnect any electrical connectors as needed.

- Do not remove the centering tab from a new steering wheel inflatable restraint module coil until it has been installed or re-centering will be required.
- If re-centering of the steering wheel inflatable restraint module coil is needed then refer to **Steering Wheel Airbag Coil Replacement**.

AIRBAG STEERING WHEEL MODULE COIL CENTERING

CAUTION: The new SIR coil assembly will be centered. Improper alignment of the SIR coil assembly may damage the unit, causing an inflatable restraint malfunction.

1. Verify that the wheels on the vehicle are straight ahead before centering the supplemental inflatable restraint (SIR) steering wheel module coil.
2. Turn the lobe of the clock spring clockwise until the coil ribbon stops. Do not force.
3. Turn the lobe of the clock spring counterclockwise approximately 3 turns to the neutral position.

Fig. 14: Airbag Steering Wheel Module Coil Centering
Courtesy of GENERAL MOTORS COMPANY

4. Properly align until the arrows face each other. This indicates the CENTER position.

AIRBAG INSTRUMENT PANEL MODULE REPLACEMENT

Removal Procedure

WARNING: When carrying a live inflator module, make sure the bag opening is pointed away from you. This minimizes the chance of injury in the case of an accidental deployment. Never carry the inflator module by the wires. Never carry the inflator module by the connector on the underside of the module.

Make sure that the bag and trim cover are facing up whenever you place a live inflator module on any surface. This is necessary to provide a free space for the bag to expand in the unlikely event of accidental deployment.

Never rest the steering column assembly on the steering wheel with the inflator module face down, and the column vertical. This may result in personal injury.

WARNING: Refer to **SIR Warning** .

1. Disable the SIR system. Refer to **SIR Disabling and Enabling**.
2. Remove the instrument panel assembly. Refer to **Instrument Panel Assembly Replacement** .
3. Remove the windshield defroster nozzle. Refer to **Windshield Defroster Nozzle Replacement** .
4. Remove the instrument panel outer air outlet duct. Refer to **Instrument Panel Outer Air Outlet Duct Replacement** .

Fig. 15: Instrument Panel Inflatable Restraint Module Bolts
Courtesy of GENERAL MOTORS COMPANY

5. Remove the instrument panel inflatable restraint module bolts (1).

Fig. 16: Airbag Module Chute And Hooks
Courtesy of GENERAL MOTORS COMPANY

6. If the airbag module should be removed in order to replace the instrument panel with new one follow the step 6-7. If the airbag module should be removed in order to replace the passenger airbag module with new one follow the step 8-10. Cut one side of the airbag module chute (1) partly to release the hooks (2) of module from the chute.

WARNING: Never install the passenger airbag module into the instrument panel assembly that airbag module chute is cut. This may cause incorrect deployment when the passenger airbag is deployed.

7. Remove the passenger airbag module from the instrument panel after releasing the hooks of uncut side from the passenger airbag module chute.

Fig. 17: Straightening Hooks

Courtesy of GENERAL MOTORS COMPANY

NOTE: **Hooks on I/P compartment side can be released more easily from the chute because these hooks are shorter than the opposite hooks.**

8. Roughly straighten the hooks (1) of side that is close to I/P compartment by using the plier.

Fig. 18: Pushing Chute Out Of Hook Using Flat Tip Screw Driver
Courtesy of GENERAL MOTORS COMPANY

9. One by one release straightened hooks from the hole of chute by pushing the chute out of hook using the flat tip screw driver (1) or similar tool.

Fig. 19: Passenger Airbag Module

Courtesy of GENERAL MOTORS COMPANY

10. Remove the passenger airbag module (1) from the instrument panel releasing the hooks of opposite side from the hole of chute.

Installation Procedure

Fig. 20: Existing Passenger Airbag Module
Courtesy of GENERAL MOTORS COMPANY

WARNING: Never install the passenger airbag module into the instrument panel assembly that airbag module chute is cut. This may cause incorrect deployment when the passenger airbag is deployed.

1. Position new or existing passenger airbag module (1) to the chute (2) on new or existing instrument panel.

CAUTION: Make sure that the passenger airbag is installed into the chute completely.

2. Push the passenger airbag module (1) into the chute (2) until the hooks of airbag module is inserted in the holes of chute completely.

Fig. 21: Instrument Panel Inflatable Restraint Module Bolts
Courtesy of GENERAL MOTORS COMPANY

CAUTION: Refer to Fastener Caution .

3. Install the passenger airbag module bolts (1) and tighten to 10 (89 lb in).
4. Install the instrument panel outer air outlet duct. Refer to **Instrument Panel Outer Air Outlet Duct Replacement** .
5. Install the windshield defroster nozzle. Refer to **Windshield Defroster Nozzle Replacement** .
6. Install the instrument panel assembly. Refer to **Instrument Panel Assembly Replacement** .
7. Enable the SIR system. Refer to **SIR Disabling and Enabling**.
8. After replacing the module, fully deploy the old module before disposal.

INSTRUMENT PANEL LOWER AIRBAG REPLACEMENT - DRIVER SIDE

Fig. 22: Instrument Panel Lower Airbag - Driver Side
 Courtesy of GENERAL MOTORS COMPANY

Instrument Panel Lower Airbag Replacement - Driver Side

Callout	Component Name
WARNING: Refer to <u>SIR Warning</u> .	
Preliminary Procedures 1. Disable the SIR system. Refer to <u>SIR Disabling and Enabling</u>. 2. Remove the steering column opening filler. Refer to <u>Steering Column Opening Filler Replacement</u> .	
1	Inflatable Restraint Instrument Panel Lower Module Bolt (Qty: 2) CAUTION: Refer to <u>Fastener Caution</u> . Tighten 10 (89 lb in)
2	Inflatable Restraint Instrument Panel Lower Module Procedure 1. Disconnect the electrical connector.

- | | |
|--|---|
| | 2. For proper handling and scrapping, refer to <u>Inflatable Restraint Module Handling and Scrapping</u> . |
|--|---|

INSTRUMENT PANEL LOWER AIRBAG REPLACEMENT - PASSENGER SIDE

Fig. 23: Instrument Panel Lower Airbag - Passenger Side
Courtesy of GENERAL MOTORS COMPANY

Instrument Panel Lower Airbag Replacement - Passenger Side

Callout	Component Name
WARNING: Refer to <u>SIR Warning</u> .	
Preliminary Procedures 1. Disable the SIR system. Refer to <u>SIR Disabling and Enabling</u> . 2. Remove the instrument panel compartment. Refer to <u>Instrument Panel Compartment Replacement</u> .	
1	Inflatable Restraint Instrument Panel Lower Module Screw (Qty: 3)
2	Inflatable Restraint Instrument Panel Lower Module Bolt (Qty: 2) CAUTION: Refer to <u>Fastener Caution</u> .

	Tighten 10 (89 lb in)
3	Inflatable Restraint Instrument Panel Lower Module Procedure 1. Disconnect the electrical connector. 2. For proper handling and scrapping, refer to <u>Inflatable Restraint Module Handling and Scrapping</u>.

AIRBAG FRONT PASSENGER PRESENCE SENSOR REPLACEMENT

Fig. 24: Airbag Front Passenger Presence Sensor
Courtesy of GENERAL MOTORS COMPANY

Airbag Front Passenger Presence Sensor Replacement

Callout	Component Name
WARNING: Refer to <u>SIR Warning</u> . WARNING: Replace the passenger presence system as a complete assembly to prevent possible injury to the occupant. All the components in the service kit are assembled and calibrated as a unit. Using only some of the components in the service kit will cause the passenger presence system to operate improperly.	

Preliminary Procedures

- 1. Disable the supplemental inflatable restraint (SIR) system. Refer to **SIR Disabling and Enabling**.
- 2. Remove the seat cushion cover from the passenger seat. Refer to **Front Seat Cushion Cover and Pad Replacement** .

	Inflatable Restraint Front Passenger Presence Module
1	Procedure 1. The inflatable restraint passenger presence module must be replaced as a service kit that also includes the seat cushion heating mat, pad and passenger presence sensor. 2. Re-zero the inflatable restraint passenger presence system whenever the seat cushion or any component of the passenger presence system is removed. Refer to <u>Passenger Presence System Rezeroing</u>.

FRONT SEAT OUTBOARD SEAT BACK AIRBAG REPLACEMENT

Fig. 25: Front Seat Outboard Seat Back Airbag
Courtesy of GENERAL MOTORS COMPANY

Front Seat Outboard Seat Back Airbag Replacement

Callout	Component Name
WARNING: Refer to <u>SIR Warning</u> .	

WARNING:

Following the deployment of a side impact air bag, inspect the following parts for damage. Replace these parts if necessary:

- The seat cushion frame
- The seat recliner, if equipped
- The seat adjuster
- The seat back frame

Failure to do so may cause future personal injury.

Preliminary Procedures

1. Disable the SIR system. Refer to **SIR Disabling and Enabling**.
2. Remove the front seatback cushion cover. Refer to **Driver or Passenger Seat Back Cushion Cover Replacement**.

1	Front Seat Side Inflatable Restraint Module Nut (Qty: 2) CAUTION: Refer to <u>Fastener Caution</u> . Tighten 4 N.m (36 lb in)
2	Front Seat Side Inflatable Restraint Module Assembly TIP: Disconnect the electrical connector.

REAR SEAT OUTBOARD SEAT BACK AIRBAG REPLACEMENT

Fig. 26: Rear Seat Outboard Seat Back Airbag
 Courtesy of GENERAL MOTORS COMPANY

Rear Seat Outboard Seat Back Airbag Replacement

Callout	Component Name
Preliminary Procedure 1. Disable the SIR system, if equipped. Refer to <u>SIR Disabling and Enabling</u>. 2. Remove the rear seat back cushion bolster. Refer to <u>Rear Seat Back Bolster Replacement</u>.	
1	Rear Seat Side Inflatable Restraint Module Bolt (Qty: 4) CAUTION: Refer to <u>Fastener Caution</u> . Tighten 3.5 (31 lb in)
2	Rear Seat Side Inflatable Restraint Module Procedure 1. Remove the connector position assurance (CPA) from the module electrical connector. 2. Disconnect the electrical connector.

AIRBAG SIDE IMPACT CENTER PILLAR SENSOR REPLACEMENT

Fig. 27: AirbRear Seat Outboard Seat Back Airbag Side Impact Sensor - Center Pillar
Courtesy of GENERAL MOTORS COMPANY

Airbag Side Impact Center Pillar Sensor Replacement

Callout	Component Name
WARNING: Refer to <u>SIR Warning</u> . WARNING: Refer to <u>SIR Inflator Module Handling and Storage Warning</u> . WARNING: Following the deployment of a side impact air bag, inspect the following parts for damage. Replace these parts if necessary: • The seat cushion frame • The seat recliner, if equipped • The seat adjuster • The seat back frame Failure to do so may cause future personal injury. Preliminary Procedure	

1. Disable the SIR system. Refer to <u>SIR Disabling and Enabling</u> 2. Remove center pillar lower garnish molding. Refer to <u>Center Pillar Lower Trim Panel Replacement</u> .	
1	Inflatable Restraint Side Impact Sensor Screw CAUTION: Refer to <u>Fastener Caution</u> . Tighten 7.5 (66 lb in)
2	Inflatable Restraint Side Impact Sensor Assembly Procedure 1. Disconnect electrical connector. 2. Loosen the bolts and slide the sensor out of the keyhole slots. TIP: The bolt is integral to the sensor assembly, DO NOT remove separately.

AIRBAG SIDE IMPACT SENSOR REPLACEMENT - FRONT SIDE DOOR

Fig. 28: Inflatable Restraint Front Side Door Side Impact Sensor
Courtesy of GENERAL MOTORS COMPANY

Airbag Side Impact Sensor Replacement - Front Side Door

Callout	Component Name
WARNING: Refer to <u>SIR Warning</u> . WARNING: Refer to <u>SIR Inflator Module Handling and Storage Warning</u> . WARNING: Following the deployment of a side impact air bag, inspect the following parts for damage. Replace these parts if necessary: • The seat cushion frame • The seat recliner, if equipped • The seat adjuster • The seat back frame Failure to do so may cause future personal injury. Preliminary Procedure 1. Disable the SIR system. Refer to <u>SIR Disabling and Enabling</u>. 2. Remove front side door trim panel. Refer to <u>Front Side Door Trim Panel Replacement</u> . 3. For access to sensor detach the water deflector partly from front of door.	
1	Inflatable Restraint Side Impact Sensor Nut CAUTION: Refer to <u>Fastener Caution</u> . Tighten 7.5 (66 lb in)
2	Inflatable Restraint Side Impact Sensor Assembly Procedure 1. Remove the sensor out of the door panel. 2. Disconnect electrical connector.

INSTRUMENT PANEL AIRBAG ARMING STATUS DISPLAY REPLACEMENT

Fig. 29: Instrument Panel Airbag Arming Status Display
 Courtesy of GENERAL MOTORS COMPANY

Instrument Panel Airbag Arming Status Display Replacement

Callout	Component Name
Preliminary Procedure Remove the instrument panel center molding. Refer to <u>Instrument Panel Center Molding Replacement</u> .	
1	Inflatable Restraint Instrument Panel Module Indicator Procedure 1. Remove the indicator from the instrument panel releasing the tab of the indicator. 2. Disconnect the electrical connectors.

AIRBAG ROOF SIDE RAIL MODULE REPLACEMENT

Fig. 30: Airbag Roof Side Rail Module
Courtesy of GENERAL MOTORS COMPANY

Airbag Roof Side Rail Module Replacement

Callout	Component Name
WARNING: In order to prevent SIR deployment, personal injury, or unnecessary SIR system repairs, do not strike the door or the door pillar in the area of the side impact sensor (SIS). Turn OFF the ignition and remove the key when performing service in the area of the SIS. WARNING: When performing service on or near the SIR components or the SIR wiring, the SIR system must be disabled. Refer to SIR Disabling and Enabling. Failure to observe the correct procedure could cause deployment of the SIR components, personal injury, or unnecessary SIR system repairs. Preliminary Procedures 1. Disable the SIR system. Refer to <u>SIR Disabling and Enabling</u>. 2. Remove the headliner. Refer to <u>Headlining Trim Panel Replacement</u> .	
1	Inflatable Restraint Roof Rail Bolt (Qty: 4) CAUTION: Refer to <u>Fastener Caution</u> .

	Tighten 10 N.m (89 lb in)
2	Inflatable Restraint Roof Rail Module Assembly TIP: Disconnect the electrical connector.

FRONT SEAT BELT ANCHOR PLATE TENSIONER REPLACEMENT

Fig. 31: Front Seat Belt Anchor Plate Tensioner
Courtesy of GENERAL MOTORS COMPANY

Front Seat Belt Anchor Plate Tensioner Replacement

Callout	Component Name
WARNING: Refer to <u>SIR Seatbelt Pretensioner Handling Warning</u> .	
Preliminary Procedures 1. Remove the center pillar lower trim panel. Refer to <u>Center Pillar Lower Trim Panel Replacement</u> . 2. Remove the rear side door sill trim plate. Refer to <u>Rear Side Door Sill Trim Plate Replacement</u> .	
1	Front Seat Belt Tensioner Cover Procedure Lower the seat belt tensioner cover.
	Front Seat Belt Tensioner Anchor Bolt

2	CAUTION: Refer to <u>Fastener Caution</u> Tighten 5 (44 lb in)
3	Front Seat Belt Anchor Plate Tensioner Fastener Procedure To access the tool hold the floor panel carpet that covers the tensioner. Tighten 40 (30 lb ft)
4	Front Seat Belt Anchor Plate Tensioner Procedure Disconnect the electrical connector.

DRIVER OR PASSENGER SEAT RETRACTOR SIDE BELT REPLACEMENT

Fig. 32: Driver or Passenger Seat Retractor Side Belt
Courtesy of GENERAL MOTORS COMPANY

Driver or Passenger Seat Retractor Side Belt Replacement

Callout	Component Name
Preliminary Procedures 1. Remove the center pillar upper trim panel. Refer to <u>Center Pillar Upper Trim Panel Replacement</u> .	

2. Remove the center pillar lower trim panel. Refer to <u>Center Pillar Lower Trim Panel Replacement</u> .	
1	Front Seat Belt Upper Anchor Bolt CAUTION: Refer to <u>Fastener Caution</u> . Tighten 40 (30 lb ft)
2	Front Seat Belt Lower Anchor Bolt Procedure 1. Lower the seat belt tensioner cover for bolt removal. 2. Remove the anchor bolt. Tighten 40 (30 lb ft)
3	Front Seat Belt Retractor Bolt Tighten 40 (30 lb ft)
4	Front Seat Belt Assembly Procedure 1. Disconnect the pretensioner connector from the retractor. 2. Remove the retractor from the body panel.

REPAIRS AND INSPECTIONS REQUIRED AFTER A COLLISION

Accident With or Without Air Bag Deployment - Component Inspections

WARNING: Proper operation of the Supplemental Inflatable Restraint (SIR) sensing system requires that any repairs to the vehicle structure return the vehicle structure to the original production configuration. Not properly repairing the vehicle structure could cause non-deployment of the air bag(s) in a frontal collision or deployment of the air bag(s) for conditions less severe than intended.

After any collision, inspect the following components as indicated. If you detect any damage, replace the component. If you detect any damage to the mounting points or mounting hardware, repair the component or replace the hardware as needed.

- The steering column-Inspect the steering column for bending, twisting, buckling or any type of damage.
- The instrument panel knee bolsters and mounting points-Inspect the knee bolsters for bending, twisting, buckling, or any other type of damage.
- The instrument panel brackets, braces, etc.-Inspect for bending, twisting, buckling, or any other type of damage.
- The seat belts-Perform the seat belt operational and functional checks. Refer to **Repairs and Inspections Required After a Collision** .
- The instrument panel cross car beam-Inspect for bending, twisting, buckling, or any other type of damage.
- The instrument panel mounting points and brackets-Inspect for bending, twisting, buckling, or any other type of damage.
- The seats and seat mounting points-Inspect for bending, twisting, buckling, or any other type of damage.
- The roof and headliner mounting points.
- The brake pedal --Inspect the brake pedal for bending, twisting, buckling or any type of damage.

Accident With Frontal Air Bag Deployment - Component Replacement and Inspections

After a collision involving air bag deployment, replace the following components.

- Driver Steering Wheel Air Bag
- Passenger instrument panel air bag, if deployed
- Inflatable Restraint Sensing and Diagnostic Module (SDM), if the Inflatable Restraint Sensing and Diagnostic Module has set DTC B0052 and will not clear
- Front and/or Side Impact Sensors
- Driver/Passenger Seat Side Air Bag, if deployed
- Seat back cover if Side Seat Air Bag is deployed
- Driver/Passenger Seat Belt Anchor and/or Retractor Pretensioners

Perform additional inspections on the following components.

- Steering wheel air bag coil and the coil wiring pigtail-Inspect for melting, scorching, or other damage due to excessive heat.
- Mounting points or mounting hardware for the passenger instrument panel air bag, steering wheel air bag, Inflatable Restraint Sensing and Diagnostic Module, seat side air bag (if deployed) and seat belt anchor and/or retractor pretensioners-Inspect for any damage and repair or replace each component as needed.

Accident With Side Seat Air Bag Deployment - Component Replacement and Inspections

After a collision involving driver/passenger side seat air bag deployment, replace the following components.

- Left/right side impact sensors on the side of the impact.
- Left/right roof rail air bag on the side of the impact.
- Inflatable Restraint Sensing and Diagnostic Module (SDM), if the Inflatable Restraint Sensing and

Diagnostic Module has set DTC B0052 and will not clear.

- Inflatable Restraint Seat Belt Anchor and/or Retractor Pretensioner.
- Driver or passenger seat back cushion cover replacement.

WARNING: Do not repair or replace the seat stitching or seams in the seat back trim cover with an internal mounted seat side airbag module. Replace the complete seat back trim cover from the OEM. Non-OEM seat stitching may cause improper airbag deployment which could result in personal injury.

Perform additional inspections on the following components.

- Mounting points or mounting hardware for the side impact sensors, and driver/passenger side seat air bags on the side of impact-Inspect for any damage and repair or replace each component as needed.
- Mounting points, mounting hardware, headliner and trim pieces for the left/right roof rail air bag on the side of impact-Inspect for any damage and repair or replace each component as needed.
- Mounting points or mounting hardware for the Inflatable Restraint Sensing and Diagnostic Module and seat belt anchor and/or retractor pretensioners-Inspect for any damage and repair or replace each component as needed.
- The seat cushion frame
- The seat recliner and cover, if equipped
- The seat adjuster
- The seat back frame
- Door trim assembly
- Impacted seat cushion side covers and switches

Accident With Seat Belt Pretensioner Deployment Only - Component Replacement and Inspections

After a collision involving driver/passenger Seat Belt Retractor or Anchor Pretensioner deployment, replace the following components.

- Driver and Passenger Inflatable restraint seat belt anchor pretensioner and/or retractor pretensioner
- Inflatable Restraint Sensing and Diagnostic Module (SDM), if the Inflatable Restraint Sensing and Diagnostic Module has set DTC B0052 and will not clear

Perform additional inspections for any damage and repair or replace each component as needed on the following components.

- Mounting points or mounting hardware for the Inflatable Restraint Sensing and Diagnostic Module
- Mounting points or mounting hardware for the Seat Belt Anchor Pretensioners
- Mounting points or mounting hardware for the Seat Belt Retractor Pretensioners

Impact Sensor Replacement Guidelines

The impact sensor replacement policy requires replacing sensors in the area of the accident damage. The area of

accident damage is defined as the portion of the vehicle which is crushed, bent, or damaged due to a collision. An example of this would be a moderate collision where the front of the vehicle impacts a object. If the vehicle has an impact sensor mounted forward of the radiator, it must be replaced.

- Replace the impact sensor whether or not the air bags have deployed.
- Replace the impact sensor even if it appears to be undamaged.

Impact sensor damage which is not visible, such as slight bending of the mounting bracket or cuts in the wire insulation, can cause improper operation of the SIR system. Do not try to determine whether the impact sensor is undamaged, replace the impact sensor. Also, if you follow a diagnostic trouble code (DTC) procedure and a malfunctioning impact sensor is indicated, replace the impact sensor.

INFLATABLE RESTRAINT MODULE HANDLING AND SCRAPPING

Special Tools

- **EL-38826** SIR Deployment Harness
- **EL-39401-B** SIR Deployment Fixture

For equivalent regional tools, refer to **Special Tools**.

Live and Undeployed Air Bag

WARNING: Refer to SIR Inflator Module Handling and Storage Warning .

Take special care when handling or storing an undeployed air bag. An air bag deployment produces a rapid generation of gas. This may cause the air bag, or an object in front of the air bag, to project through the air in the event of an unlikely deployment.

Dual Stage Air Bags

Dual stage air bags have two deployment stages. If stage 1 was used to deploy a dual stage air bag, stage 2 may still be active. Therefore, a deployed dual stage air bag must be treated as an active air bag. If disposal of a dual stage air bag is required, both deployment loops must be energized to deploy the air bag.

Scrapping Procedure

During the course of a vehicle's useful life, certain situations may arise which will require the disposal of a live and undeployed air bag. Do NOT dispose a live and undeployed air bag through normal disposal channels until the air bag has been deployed.

Do not deploy the air bag in the following situations:

- After replacement of an air bag under warranty-the air bag may need to be returned undeployed to the manufacturer.

- If the vehicle is the subject of a product liability claim, related to the SIR system and is subject to a preliminary investigation - do NOT alter the SIR system in any manner.
- If the vehicle is involved in a campaign affecting the air bags - follow the instructions in the campaign service bulletin for proper SIR handling procedures.

Deployment Procedures

NOTE: **Some countries, states or localities may not allow service deployment of air bags without special permission or training. Local laws regarding deploying and scrapping of air bags/devices with pyrotechnics must be followed.**

You can deploy the air bag either inside or outside of the vehicle. The method used depends upon the final disposition of the vehicle. Review the following procedures in order to determine which will work best in a given situation:

Deployment Outside Vehicle - Steering Wheel Air Bag, Instrument Panel Air Bag, and Roof Rail Air Bag

Deploy the air bag outside of the vehicle when the vehicle will be returned to service. Situations that require deployment outside of the vehicle include the following:

- Using the SIR diagnostics, you determine that the air bag is malfunctioning.
- The air bag is cosmetically damaged, scratched, or ripped.
- The air bag pigtail is damaged.
- The air bag connector is damaged.
- The air bag connector terminals are damaged.

Deployment and disposal of a malfunctioning air bag is subject to any required retention period.

WARNING: Refer to SIR Inflator Module Disposal Warning .

1. Turn OFF the ignition.

WARNING: Refer to SIR Inflator Module Handling and Storage Warning .

2. Remove the air bag.

Fig. 33: Identifying Clearance For Deployment Of Inflator Module
Courtesy of GENERAL MOTORS COMPANY

3. Clear a space on the ground about 1.85 m (6 ft) in diameter for deployment of the air bag or deployment fixture. If possible, use a paved, outdoor location free of activity. Otherwise, use a space free of activity on the shop floor. Ensure you have sufficient ventilation.
4. Clear the area of loose or flammable objects.

NOTE: **Dual stage deployments are only used in steering wheel and instrument panel air bags. If stage 1 was used to deploy a dual stage air bag, stage 2 may still be active. If disposal of a dual stage air bag is required, both deployment loops must be energized to deploy the air bag.**

5. If you are deploying a steering wheel air bag, place the air bag in the center of the space with the vinyl trim cover facing up and away from the surface.

Fig. 34: Identifying I/P Module Components
Courtesy of GENERAL MOTORS COMPANY

6. When deploying an instrument panel air bag, perform the following instructions:
 1. Place the **EL-39401-B** fixture in the center of the cleared area.
 2. Fill the deployment fixture with water or sand.
 3. Using the proper nuts and bolts, mount the instrument panel air bag (1) to the deployment fixture (2), with the vinyl trim facing up.
 4. Securely tighten all fasteners that hold the instrument panel air bag (1) to the deployment fixture (2).

Fig. 35: Identifying Fasteners Holding Side Impact Module To Deployment Fixture
Courtesy of GENERAL MOTORS COMPANY

7. When deploying a roof rail air bag, perform the following instructions:
 1. Place the **EL-39401-B** fixture (3) in the center of the cleared area.
 2. Fill the deployment fixture with water or sand to provide sufficient stabilization of fixture during deployment.
 3. Adjust and secure the fixture arms (4) to the deployment fixture (3), using the proper nuts and bolts.
 4. Attach the roof rail air bag in the deployment fixture and securely tighten all fasteners.

Fig. 36: Identifying SIR Deployment Harness & Adapter
Courtesy of GENERAL MOTORS COMPANY

8. Inspect the **EL-38826** harness and the appropriate pigtail adapter (2) for damage. Replace as needed.
9. Short the 2 SIR deployment harness leads (1) together using one banana plug seated into the other.
10. Connect the appropriate pigtail adapter (2) to the SIR deployment harness (1).

Fig. 37: Extending SIR Deployment Harness & Adapter
Courtesy of GENERAL MOTORS COMPANY

11. Extend the SIR deployment harness and adapter to the full length from the deployment fixture or area.

Fig. 38: Identifying Inflator Module, SIR Deployment Harness & Adapter
Courtesy of GENERAL MOTORS COMPANY

NOTE: On a dual stage air bag, both connectors must be attached to the deployment harness adapter. This will ensure that both stage 1 and stage 2 of the deployment loops are energized, regardless of the deployment state.

12. Connect the air bag (1) to the adapter (2) on the SIR deployment harness (3).

NOTE:

- The rapid expansion of gas involved with deploying an air bag is very loud. Notify all the people in the immediate area that you intend to deploy the air bag.
- When the air bag deploys, the deployment fixture may jump about 30 cm (1 ft) vertically. This is a normal reaction of the air bag due to the force of the rapid expansion of gas inside the air bag.

- If you are deploying a dual stage air bag with stage 1 already deployed, the fixture may not move and the noise may have been reduced.

13. Clear the area of people.

Fig. 39: Separating Banana Plugs

Courtesy of GENERAL MOTORS COMPANY

14. Separate the 2 banana plugs on the SIR deployment harness that were shorted together earlier in the procedure.

Fig. 40: Connecting SIR Deployment Harness Wires To Power Source
Courtesy of GENERAL MOTORS COMPANY

15. Place a 12 V minimum/2A minimum power source, such as a vehicle battery, near the shorted end of the harness.
16. Connect the SIR deployment harness wires to the power source. Deployment of the air bag will occur when contact is made.

Fig. 41: View Of Deployment Harness Leads
Courtesy of GENERAL MOTORS COMPANY

17. Disconnect the SIR deployment harness from the power source after the air bag deploys.
18. If the air bag did not deploy, disconnect the adapter and discontinue the procedure and contact the Technical Assistance Group.

If deployment was successful, proceed to the following steps.

WARNING: Refer to SIR Deployed Inflator Modules Are Hot Warning .

19. Seat one banana plug into the other in order to short the deployment harness leads.
20. Put on a pair of shop gloves.

21. Disconnect the pigtail adapter from the air bag as soon as possible.
22. Inspect the pigtail adapter and the SIR deployment harness. Replace as needed.
23. Dispose of the deployed air bag through normal refuse channels.
24. Wash your hands with a mild soap.

Deployment Inside Vehicle - Vehicle Scrapping Procedure

Deploy the air bags inside of the vehicle when destroying the vehicle or when salvaging the vehicle for parts. This includes, but is not limited to, the following situations:

- The vehicle has completed all useful life.
- Irreparable damage occurred to the vehicle in a non-deployment type accident.
- Irreparable damage occurred to the vehicle during a theft.
- The vehicle is being salvaged for parts to be used on a vehicle with a different VIN, as opposed to rebuilding as the same VIN.

WARNING: Refer to SIR Inflatable Module Deployment Outside Vehicle Warning .

1. Lower the driver and passenger windows.
2. Turn the ignition switch to the OFF position and remove the ignition key.
3. Check that all air bags which will be deployed are mounted securely.
4. Remove all loose objects from the front seats.

Fig. 42: Identifying I/P Module Connector To Vehicle Harness Connector (LH Side I/P)
Courtesy of GENERAL MOTORS COMPANY

WARNING: A deployed dual stage inflator module will look the same whether one or both stages were used. Always assume a deployed dual stage inflator module has an active stage 2. Improper handling or servicing can activate the inflator module and cause personal injury.

5. Disconnect the steering wheel air bag yellow connector (1) from vehicle harness yellow connector (3).

Fig. 43: Stripping SIR Wires

Courtesy of GENERAL MOTORS COMPANY

NOTE: If the vehicle is equipped with dual stage air bags the steering wheel air

bag and instrument panel air bag will each have 4 wires. Refer to Component Connector End Views for determining high and low circuits.

6. Cut the yellow harness connector out of the vehicle, leaving at least 16 cm (6 in) of wire at the connector.
7. Strip 13 mm (0.5 in) of insulation from each of the connector wire leads.

Fig. 44: Fabricating 20 Ft. Deployment Harness
Courtesy of GENERAL MOTORS COMPANY

8. Cut two 6.1 m (20 ft) deployment wires from a 0.8 mm (18 gauge) or thicker multi-strand wire. Use these wires to fabricate the driver deployment harness.
9. Strip 13 mm (0.5 in) of insulation from both ends of the wires.
10. Twist together one end from each of the wires in order to short the wires. Deployment wires shall remain shorted, and not connected to a power source until you are ready to deploy the air bag.

Fig. 45: Twisting Connector Wire Leads (High Circuits) To Deployment Harness Wire
Courtesy of GENERAL MOTORS COMPANY

11. Twist together the 2 connector wire leads from the high circuits from both stages of the steering wheel air bag, to one set of deployment wires. Refer to **Component Connector End Views** in order to determine the correct circuits.
12. Inspect that the 3-wire connection is secure.
13. Secure and insulate the 3-wire connection to the deployment harness using electrical tape.

Fig. 46: Twisting Connector Wire Leads (Low Circuits) To Deployment Harness Wire
Courtesy of GENERAL MOTORS COMPANY

14. Twist together the 2 connector wire leads from the low circuits from both stages of the steering wheel air bag, to one set of deployment wires. Refer to **Component Connector End Views** in order to determine the correct circuits.
15. Inspect that the 3-wire connection is secure.
16. Secure and insulate the 3-wire connection to the deployment harness using electrical tape.
17. Connect the deployment harness to the connector on the steering wheel air bag.
18. Route the deployment harness out of the driver side of the vehicle.
19. Disconnect the yellow left roof rail harness connector from the vehicle harness connector.
20. Cut the harness connector out of the vehicle, leaving at least 16 cm (6 in) of wire at the connector.
21. Strip 13 mm (0.5 in) of insulation from each of the connector wire leads.
22. Cut two 6.1 m (20 ft) deployment wires from a 0.8 mm (18 gauge) or thicker multi-strand wire. These wires will be used to fabricate the roof rail air bag deployment harness.
23. Strip 13 mm (0.5 in) of insulation from both ends of the wires.

24. Twist together one end from each of the wires in order to short the wires.
25. Twist together one connector wire lead to one deployment wire.
26. Secure and insulate the connection using electrical tape.
27. Twist together and tape the remaining connector wire lead to the remaining deployment wire.
28. Connect the deployment harness to the yellow connector of the roof rail air bag.
29. Route the deployment harness out of the driver side of the vehicle.

Fig. 47: Identifying I/P Module Connector To Vehicle Harness Connector
Courtesy of GENERAL MOTORS COMPANY

30. Disconnect the instrument panel air bag yellow harness connector (1) from the vehicle harness connector (2).

NOTE: **If the vehicle is equipped with dual stage air bags the steering wheel air bag and instrument panel air bag will each have 4 wires. Refer to Component Connector End Views for determining high and low circuits.**

31. Cut the yellow harness connector out of the vehicle, leaving at least 16 cm (6 in) of wire at the connector.
32. Strip 13 mm (0.5 in) of insulation from each of the connector wire leads.
33. Cut two 6.1 m (20 ft) deployment wires from a 0.8 mm (18 gauge) or thicker multi-strand wire. These wires will be used to fabricate the passenger deployment harness.
34. Strip 13 mm (0.5 in) of insulation from both ends of the wires.
35. Twist together one end from each of the wires in order to short the wires.
36. Twist together the 2 connector wire leads from the high circuits from both stages of the instrument panel air bag to one set of deployment wires. Refer to **Component Connector End Views** in order to determine the correct circuits.
37. Inspect that the 3-wire connection is secure.
38. Secure and insulate the 3-wire connection to the deployment harness using electrical tape.
39. Twist together the 2 connector wire leads from the low circuits from both stages of the instrument panel air bag to one set of deployment wires. Refer to **Component Connector End Views** in order to determine the correct circuits.
40. Inspect that the 3-wire connection is secure.
41. Secure and insulate the 3-wire connection to the deployment harness using electrical tape.
42. Connect the deployment harness to the instrument panel air bag in-line connector.
43. Route the deployment harness out of the passenger side of the vehicle.
44. Disconnect the yellow harness connector to the right roof rail air bag from the vehicle harness connector.
45. Cut the harness connector out of the vehicle, leaving at least 16 cm (6 in) of wire at the connector.
46. Strip 13 mm (0.5 in) of insulation from each of the connector wire leads.
47. Cut two 6.1 m (20 ft) deployment wires from a 0.8 mm (18 gauge) or thicker multi-strand wire. These wires will be used to fabricate the roof rail air bag deployment harness.
48. Strip 13 mm (0.5 in) of insulation from both ends of the wires.
49. Twist together one end from each of the wires in order to short the wires.
50. Twist together one connector wire lead to one deployment wire.
51. Secure and insulate the connection using electrical tape.
52. Twist together and tape the remaining connector wire lead to the remaining deployment wire.
53. Connect the deployment harness to the roof rail air bag yellow connector.
54. Route the deployment harness out of the passenger side of the vehicle.
55. Completely cover the windshield and the front door window openings with a drop cloth.
56. Stretch to the full length all of the deployment harness wires on the right side of the vehicle.
57. Deploy each deployment loop one at a time.
58. Place a power source, 12 V minimum/2A minimum, such as a vehicle battery, near the shorted end of the harnesses.
59. Separate one set of wires and touch the wire ends to the power source in order to deploy the selected air bag.
60. Disconnect the deployment harness from the power source and twist the wire ends together.
61. Continue the same process with the remaining deployment harnesses.

62. Disconnect all harnesses from the vehicle.
63. Discard the harnesses.
64. Scrap the vehicle in the same manner as a non-SIR equipped vehicle.
65. If one or all of the air bags did not deploy, remove the undeployed air bags from the vehicle.

PRETENSIONER HANDLING AND SCRAPPING

Scrapping Procedure

During the course of a vehicle's useful life, certain situations may arise which will necessitate the disposal of a live (undeployed) pretensioner. The following information covers the proper procedures for the disposing of a live (undeployed) pretensioner. Deploy the pretensioner before disposal. Do not dispose of a live (undeployed) pretensioner through normal disposal channels until the pretensioner has been deployed. The following information covers the proper procedures for the disposing of a live (undeployed) pretensioner.

- After replacement of a pretensioner under warranty. The pretensioner may need to be returned undeployed to the original manufacturer of pretensioner.
- If the vehicle is the subject of a Product Liability report related to the SIR system and is subject to a Preliminary Investigation (GM-1241). Do not alter the SIR system in any manner.
- If the vehicle is involved in a campaign affecting the pretensioners. Follow the instructions in the Campaign Service Bulletin for proper SIR handling procedures.

Deployment Procedures

NOTE: **Some countries, states or localities may not allow service deployment of air bags without special permission or training. Local laws regarding deploying and scrapping of air bags/devices with pyrotechnics must be followed.**

The pretensioner can be deployed inside or outside of the vehicle. The method used depends upon the final disposition of the vehicle. Review the following procedures in order to determine which will work best in a given situation.

Deployment Inside the Vehicle

Refer to **Inflatable Restraint Module Handling and Scrapping** for deploying the pretensioner inside vehicle under Vehicle Scrapping Procedure.

Deployment Outside Vehicle for Seat Belt Pretensioners

Deploy the seat belt pretensioners outside of the vehicle when the vehicle will be returned to service. Situations that require deployment outside of the vehicle include the following:

- Using the SIR diagnostics, you determine that the seat belt pretensioner is malfunctioning.
- The pretensioner pigtail (if equipped) is damaged.
- The pretensioner connector is damaged.

- The pretensioner connector terminal is damaged.

Deployment and disposal of a malfunctioning seat belt pretensioner is subject to any required retention period.

WARNING: In order to prevent accidental deployment of the pretensioner which could cause personal injury, do not dispose of an undeployed pretensioner as normal shop waste. The undeployed pretensioner contains substances that could cause severe illness or personal injury if the sealed container is damaged during disposal. Use the following deployment procedures to safely dispose of an undeployed pretensioner. Failure to dispose of a pretensioner as instructed may be a violation of federal, state, or local laws.

WARNING: When you are deploying a pretensioner for disposal, perform the deployment procedures in the order listed. Failure to follow the procedures in the order listed may result in personal injury.

Special Tools

- **EL-39401-B** SIR Deployment Fixture
- **EL-38826** SIR Deployment Harness

Fig. 48: Proper Pretensioner Carrying
Courtesy of GENERAL MOTORS COMPANY

1. Turn the ignition switch to the OFF position.
2. Remove the ignition key.
3. Put on safety glasses.
4. Remove the seat belt pretensioner from the vehicle.
5. When carrying a pretensioner to the deployment area keep the open end of pretensioner pointed away from the body.

Fig. 49: Pretensioner Deployment Area
Courtesy of GENERAL MOTORS COMPANY

6. Clear a space on the ground about 1.85 M (6 ft) in diameter for deployment of the pretensioner. If possible, use a paved, outdoor location free of activity. Otherwise, use a space free of activity on the shop floor. Make sure you have sufficient ventilation.
7. Make sure no loose or flammable objects are in the area.
8. Place the **EL-39401-B** SIR deployment fixture in the center of the cleared area.
9. Fill the fixture plastic reservoir with water or sand.

Fig. 50: Mounting Pretensioner In SIR Deployment Fixture
Courtesy of GENERAL MOTORS COMPANY

10. Mount the pretensioner (1) in the SIR deployment fixture (3) with the open end facing up using the following mounting method.
 1. Adjust and secure the EL-39401-B arms (4) to the deployment fixture (3).
 2. To mount, use the proper size bolt (2) and nut (5) with washers in order to secure the pretensioner (1) to the deployment fixture brackets (4).
 3. Securely tighten all fasteners prior to deployment.

Fig. 51: Identifying SIR Deployment Harness & Adapter
Courtesy of GENERAL MOTORS COMPANY

11. Inspect the **EL-38826** SIR deployment harness and the appropriate pigtail adapter for damage. Replace as needed.
12. Short the 2 SIR deployment harness (1) leads together using one banana plug seated into the other.
13. Connect the appropriate pigtail adapter (2) to the SIR deployment harness (1).

Fig. 52: Extending SIR Deployment Harness & Adapter
Courtesy of GENERAL MOTORS COMPANY

14. Extend the SIR deployment harness and adapter to full length from the deployment fixture.

Fig. 53: Connecting Pretensioner To Adapter
Courtesy of GENERAL MOTORS COMPANY

15. Connect the pretensioner (1) to the adapter (2) on the deployment harness (3).

NOTE: **The rapid gas expansion involved with deploying a pretensioner is very loud. Notify all the people in the immediate area that you intend to deploy the seat belt pretensioner.**

16. Clear the area of people.

Fig. 54: Separating Banana Plugs
Courtesy of GENERAL MOTORS COMPANY

WARNING: When you are deploying a pretensioner for disposal, perform the deployment procedures in the order listed. Failure to follow the procedures in the order listed may result in personal injury.

17. Separate the 2 banana plugs on the SIR deployment harness.

Fig. 55: Deploying Pretensioner

Courtesy of GENERAL MOTORS COMPANY

NOTE: When the seat belt pretensioner deploys, the deployment fixture may jump about 30 cm (1 ft) vertically. This is a normal reaction of the seat belt pretensioner due to the force of the rapid expansion of gas inside the pretensioner.

18. Place a 12 V minimum/2 A minimum power source (i.e., vehicle battery) near the shorted end of the harness.
19. Connect the SIR deployment harness wires to the power source. Pretensioner deployment will occur when contact is made.
20. Disconnect the SIR deployment harness from the power source after the pretensioner deploys.

Fig. 56: View Of Deployment Harness Leads
Courtesy of GENERAL MOTORS COMPANY

21. Seat one banana plug into the other in order to short the deployment harness leads.
22. If the pretensioner did not deploy, disconnect the adapter and discontinue the procedure. Contact the Technical Assistance Group. Otherwise, proceed to the following steps.
23. Put on a pair of shop gloves.
24. Disconnect the pigtail adapter from the pretensioner as soon as possible.
25. Inspect the pigtail adapter and the SIR deployment harness. Replace as needed.
26. Dispose of the deployed pretensioner through normal refuse channels.
27. Wash hands with a mild soap.

DESCRIPTION AND OPERATION

SUPPLEMENTAL INFLATABLE RESTRAINT SYSTEM DESCRIPTION AND OPERATION

SIR System Overview

The supplemental inflatable restraint (SIR) system supplements the protection offered by the seat belts. The SIR system contains an inflatable restraint sensing and diagnostic module (SDM), air bags, seat belt pretensioners (anchor and retractor), and impact sensors. The SDM determines the severity of a collision with the assistance of impact sensors located at strategic points on the vehicle. When the SDM detects a collision, the SDM will process the information provided by the sensors to further support air bag or pretensioner deployment. The SDM will deploy the air bags and pretensioners if it detects a collision of sufficient force. If the force of the impact is not sufficient to warrant air bag deployment, the SDM may still deploy the seat belt pretensioners. The SDM contains a sensing device that converts vehicle velocity changes to an electrical signal. The SDM compares these signals to values stored in memory. If the signals exceed a stored value, the SDM will determine the severity of the impact and either cause current to flow through the frontal deployment loops deploying the frontal air bags and pretensioners, or it will deploy the pretensioners only. The SDM continuously monitors the deployment loops for malfunctions and illuminates the SIR system AIR BAG indicator if a fault is detected. The SDM performs continuous diagnostic monitoring of the SIR system electrical components. Upon detection of a circuit malfunction, the SDM will set a DTC and inform the driver by illuminating the SIR system AIR BAG indicator. The steering column and knee bolsters are designed to absorb energy and compress during frontal collisions in order to limit leg movement and decrease the chance of injury to the driver and passenger.

SIR System AIR BAG Indicator

The SIR system AIR BAG indicator, located in the instrument cluster, is used to notify the driver of SIR system malfunctions and to verify that the inflatable restraint sensing and diagnostic module (SDM) is communicating with the instrument cluster. When the ignition is turned ON, the SDM is supplied with ignition positive voltage. The instrument cluster will momentarily turn on the SIR system AIR BAG indicator. While the indicator is on, the SDM conducts tests on all SIR system components and circuits. If no malfunctions are detected the SDM will communicate with the instrument cluster through the serial data circuit and command the SIR system AIR BAG indicator OFF. The SDM provides continuous monitoring of the air bag circuits by conducting a sequence of checks. If a malfunction is detected the SDM will store a diagnostic trouble code (DTC) and command the instrument cluster to illuminate the SIR system AIR BAG indicator via serial data. The presence of a SIR system malfunction could result in non-deployment of the air bags or deployment in conditions less severe than intended. The SIR system AIR BAG indicator will remain ON until the malfunction has been repaired.

Inflatable Restraint Sensing and Diagnostic Module (SDM)

The inflatable restraint sensing and diagnostic module (SDM) is a microprocessor and the control center for the supplemental inflatable restraint (SIR) system. The SDM contains internal sensors along with external impact sensors, mounted at strategic locations on the vehicle. In the event of a collision, the SDM compares the signals from the internal and external impact sensors to a value stored in memory. When the generated signals exceed the stored value, the SDM will cause current to flow through the appropriate deployment loops to deploy the air bags. The SDM records the SIR system status when a deployment occurs and illuminates the SIR system AIR BAG indicator located in the instrument cluster. The SDM performs continuous diagnostic monitoring of the SIR system electrical components and circuitry when the ignition is turned ON. If the SDM detects a malfunction, a DTC will be stored and the SDM will request the instrument cluster to illuminate the SIR system AIR BAG indicator, notifying the driver that a malfunction exists. In the event that ignition positive voltage is lost during a collision, the SDM maintains a 23-volt loop reserve for deployment of the air bags. It is important

when disabling the SIR system for servicing or rescue operations to allow the 23-volt loop reserve to dissipate, which could take up to 1 minute.

Air Bags

This vehicle contains 10 air bags. The 10 air bags are located in the steering wheel (dual inflators), instrument panel (passenger side) (dual inflators), driver side (B-pillar), passenger side (B-pillar), driver side (C-pillar), passenger side (C-pillar), driver side knee, passenger side knee, left roof rail, and right roof rail. To view the locations of the air bags refer to **SIR Identification Views**. Air bags contain a housing, inflatable air bag, two initiating devices (if dual air bags), canister of gas generating material and, in some cases, stored compressed gas. The deployment loops supply current to deploy the air bags. The driver steering wheel and passenger instrument panel air bags have two stages of deployment, which varies the amount of restraint to the occupant according to the collision severity. For moderate frontal collisions the air bags deploy at less than full deployment which consists of stage 1 of the air bag. For more severe frontal collisions a full deployment is initiated which consists of stage 1 and stage 2 of the air bag. The current passing through the air bags ignites the material in the canister producing a rapid generation of gas and in some cases, the release of compressed gas. The gas produced from this reaction rapidly inflates the air bag. Once the air bag is inflated it quickly deflates through the air bag vent holes and/or the bag fabric. A shorting bar (if equipped) is located in the connector.

Seat Belt Pretensioners (Anchor and Retractor)

The seat belt pretensioners (driver and passenger) consist of a housing, seat belt retractor (located in the B-pillar), seat belt anchor (located on the floor), seat belt webbing, an initiator, and a canister of gas generating materials. To view the locations of the seat belt pretensioners refer to **SIR Identification Views**. The initiator is part of the seat belt pretensioner deployment loop. When the vehicle is involved in a collision of sufficient force, the SDM causes current to flow through the seat belt deployment loops to the initiator. Current passing through the initiator ignites the material in the canister producing a rapid generation of gas. The gas produced from this reaction deploys the seat belt pretensioners which removes all of the slack in the seat belts. Depending on the severity of the collision, the seat belt pretensioners may deploy without the frontal air bags deploying, or they will deploy immediately before the frontal air bags deploy. A shorting bar (if equipped) is located in the connector.

Impact Sensors

This vehicle contains 6 impact sensors. There are 6 impact sensors which are located in the front of the vehicle (2, left and right), in the front doors (2, left and right), and on the B-pillar (2, left and right). To view the locations of the impact sensors refer to **SIR Identification Views**. The impact sensors contain a sensing device which monitors vehicle acceleration and velocity changes to detect side collisions that are severe enough to warrant air bag deployment. The impact sensors are not part of the deployment loop, but instead provide input to the SDM. The SDM contains a microprocessor that performs calculations using the measured accelerations and compares these calculations to a value stored in memory. When the generated calculations exceed the stored value, the SDM will cause current to flow through the deployment loops deploying the appropriate air bags.

Passenger Presence Detection System and Passenger Air Bag Indicator

NOTE: **The passenger presence system is a calibrated unit. When replacing the assembly all parts in the service kit must remain together. Do not mix any of the**

old parts with the new parts. After repairing or replacing the passenger presence system, the Preload test must be performed in order to function properly.

The passenger presence system is used to monitor the weight of an occupant in the front passenger seat and communicate the status to the inflatable restraint sensing and diagnostic module (SDM) whether to enable or suppress the deployment of the passenger instrument panel air bag. The passenger presence system consist of an passenger presence module, silicone filled sensor pad, passenger seat belt tension sensor, wiring harness, and PASSENGER AIR BAG ON/OFF indicators. The silicone filled sensor pad is located under the passenger seat foam cushion and is connected by a hose clamped to the passenger presence module. The weight of the occupant sitting in the front passenger seat is measured as a pressure change within the bladder by the passenger presence module. If the pressure from the occupants weight is less than a specified value, the passenger presence module will send a suppress signal to the inflatable restraint sensing and diagnostic module to disable the passenger instrument panel air bag. If the pressure from the occupants weight is higher than a specified value, the passenger presence module will send an enable signal to the inflatable restraint sensing and diagnostic module to enable the passenger instrument panel air bag. The inflatable restraint sensing and diagnostic module will notify the customer of the enable/disable status by turning ON one of the PASSENGER AIR BAG ON/OFF. The passenger presence system monitors itself for faults and will displays diagnostic trouble codes (DTCs) on the scan tool. When a fault is detected, the passenger presence module sends out a message to the inflatable restraint sensing and diagnostic module. The inflatable restraint sensing and diagnostic module responds by sending a command message to the instrument cluster to illuminate the SIR system AIR BAG indicator.

Seat Belt Indicators

The seat belt indicators are controlled through the inflatable restraint sensing and diagnostic module (SDM). For further information on seat belt indicators refer to **Seat Belt System Description and Operation** .

DIAGNOSTIC INFORMATION AND PROCEDURES

SYMPTOMS - SUSPENSION GENERAL DIAGNOSIS

NOTE: The following step must be completed before using the symptom tables.

Review the system description and operation in order to familiarize yourself with the system functions. Refer to the appropriate description and operation:

- Front Suspension Description and Operation

- **Rear Suspension Description and Operation**
- **Tires and Wheels Description and Operation**

Visual/Physical Inspection

- Inspect for aftermarket devices which could affect the operation of any of the suspension subsystems.
- Inspect the easily accessible or visible system components for obvious damage or conditions which could cause the symptom.
- Inspect for correct tire size and inflation pressure.

Symptom List

Refer to a symptom diagnostic procedure from the following list in order to diagnose the symptom:

- **Ride Diagnosis**
- **Vehicle Leads/Pulls**
- **Body Leans or Sways in Corners**
- **Suspension Bottoms**
- **Torque Steer**
- **Memory Steer**
- **Noise Diagnosis - Front Suspension**
- **Noise Diagnosis - Rear Suspension**

RIDE DIAGNOSIS

Ride Diagnosis

Step	Action	Yes	No
1	Did you review the General Description and perform the necessary inspections?	Go to Step 2	Go to <u>Symptoms - Suspension General Diagnosis</u>
2	NOTE: Verify the vehicle suspension package RPO. Verify that the ride is too soft or too hard. Does the vehicle ride normally?	System OK	Go to Step 3
3	Inspect the tire inflation and adjust to specifications. Refer to <u>Tire Inflation Description</u> . Did you adjust the tire pressure?	Go to Step 6	Go to Step 4
4	Inspect the vehicle trim height. Refer to <u>Trim Height Inspection</u> . Did you find and correct the condition?	Go to Step 6	Go to Step 5
	Inspect the following suspension components for wear or damage:		

5	- Shock absorbers-Refer to <u>Suspension Strut and Shock Absorber Testing - On Vehicle.</u> - Springs		-
	Did you find and correct the condition?	Go to Step 6	
6	Drive the vehicle in order to verify the repair. Did you correct the condition?	System OK	Go to Step 3

VEHICLE LEADS/PULLS

Vehicle Leads/Pulls

Step	Action	Yes	No
DEFINITION: At a constant highway speed on a typical straight road, lead/pull is the amount of effort required at the steering wheel to maintain the vehicle straight path.			
1	Did you review the General Description and perform the visual/physical inspections?	Go to Step 2	Go to <u>Symptoms - Suspension General Diagnosis</u>
2	Road test the vehicle in order to verify the complaint. Does the vehicle operate normally?	System OK	Go to Step 3
3	Inspect the tire/wheel assemblies for the following conditions: - Correct tire pressure-Refer to the tire placard. - Correct tire size-Refer to the tire placard. - Abnormal tire wear or damage		
	Did you find and correct the condition?	Go to Step 9	Go to Step 4
4	Perform the <u>Radial Tire Lead/Pull Correction</u> . Did you find and correct the condition?	Go to Step 9	Go to Step 5
5	Inspect and correct/adjust the suspension and steering systems for the following conditions: - Vehicle trim height-Refer to <u>Trim Height Specifications.</u> - Excessively worn, loose, or damaged components		
	Did you find and correct the condition?	Go to Step 9	Go to Step 6
6	Inspect the brake system for brake drag. With the vehicle suspended on a hoist, brake drag can be identified by rotating each wheel several times and		

	observing whether more force is needed to rotate the left wheel or the right wheel. Did you find and correct the condition?	Go to Step 9	Go to Step 7
7	Inspect the wheel alignment and adjust as necessary. Refer to <u>Wheel Alignment Measurement</u> . Did you correct the condition?	Go to Step 9	Go to Step 8
8	Inspect the steering gear for unequal effort. The vehicle must be suspended on a hoist, the engine running, and the transmission in PARK or NEUTRAL. Grasp the tire assembly and manually simulate a turn from the left of center and the right of center observing whether more force is needed to turn to the left or to the right. If this condition exists replace the steering gear. Did you correct the condition?	System OK	Go to Step 3
9	Operate the vehicle in order to verify the repair. Did you correct the condition?	System OK	Go to Step 3

BODY LEANS OR SWAYS IN CORNERS

Body Leans or Sways in Corners

Step	Action	Yes	No
1	Did you review the General Description and perform the necessary inspections?	Go to Step 2	Go to <u>Symptoms - Suspension General Diagnosis</u>
2	Verify the vehicle leans or sways in corners. Does the vehicle operate normally?	System OK	Go to Step 3
3	Inspect the following components for wear or damage: • Front coil springs • Rear coil springs Are the components worn or damaged?	Go to Step 5	Go to Step 4
4	1. Inspect the stabilizer shaft link for wear or damage. 2. Replace as necessary. Did you find and correct the condition?	Go to Step 6	Go to Step 2
5	Replace the springs as necessary. Did you complete the repair?	Go to Step 6	-
6	Operate the vehicle in order to verify the repair. Did you correct the condition?	System OK	Go to Step 3

SUSPENSION BOTTOMS

Suspension Bottoms

Step	Action	Yes	No
DEFINITION: A loud bang or thump that can usually be felt and/or heard when the vehicle is driven over bumps. This condition is commonly noticed when the vehicle trim height is too low.			
1	Did you review the General Description and perform the necessary inspections?	Go to Step 2	Go to Symptoms - Suspension General Diagnosis
2	Verify that the suspension bottoms. Does the vehicle operate normally?	System OK	Go to Step 3
3	Inspect for vehicle overloading and correct the overloading condition as necessary. Did you find and correct the condition?	Go to Step 6	Go to Step 4
4	Inspect the following components: - Inspect the shock absorbers. Refer to <u>Suspension Strut and Shock Absorber Testing - On Vehicle.</u> - Inspect for damaged coil springs and torsion bar, and replace as necessary. Did you find and correct the condition?	Go to Step 6	Go to Step 5
5	Inspect the vehicle trim height. Refer to <u>Trim Height Inspection.</u> Did you complete the trim height inspection procedure?	Go to Step 6	-
6	Operate the vehicle in order to verify the repair. Did you correct the condition?	System OK	Go to Step 3

TORQUE STEER

Torque Steer

Step	Action	Yes	No
DEFINITION: On a dry, smooth, flat road, the vehicle has a left or right steering force only during acceleration.			
1	Did you review the General Description and perform the necessary inspections?	Go to Step 2	Go to Symptoms - Suspension General Diagnosis
	- Drive the vehicle on a straight, smooth, flat road. - Press the accelerator and determine if any additional steering input is required to maintain a straight ahead direction.		

2	3. Repeat this test with the vehicle traveling in the opposite direction in order to eliminate crosswind effects. Lead/pull caused by unlevel roads and crosswinds are considered normal. Does the vehicle exhibit torque steer when the accelerator is pressed?	Go to Step 3	System OK
3	1. Drive the vehicle on a straight, smooth, flat road at 64-97 km/h (40-60 mph). 2. Remove your foot from the accelerator. 3. Shift the transmission into NEUTRAL in order to allow the vehicle to coast. 4. Is any additional steering input required to maintain a straight ahead direction? 5. Repeat this test with the vehicle traveling in the opposite direction in order to eliminate crosswind effects. Lead/pull caused by unlevel roads and crosswinds are considered normal. Does the vehicle direction change when the steering wheel is momentarily released?	Go to <u>Vehicle Leads/Pulls</u>	Go to Step 4
4	Inspect the front suspension and powertrain mounts for worn or damaged components and repair as necessary. Did you find and correct the condition?	Go to Step 6	Go to Step 5
5	Inspect the vehicle trim height. Refer to <u>Trim Height Inspection</u>. Did you find and correct the condition?	Go to Step 6	-
6	Operate the vehicle in order to verify the repair. Did you correct the condition?	System OK	-

MEMORY STEER

Memory Steer

Step	Action	Yes	No
DEFINITION: A lead or pull in the direction the driver previously turned the vehicle. Additionally, after turning in the opposite direction, the vehicle will want to lead or pull in that direction.			
1	Did you review the General Description and perform the necessary inspections?	Go to Step 2	Go to <u>Symptoms - Suspension General Diagnosis</u>
2	Verify that memory steer is present. Does the system operate normally?	System OK	Go to Step 3

3	1. Raise and support the vehicle. Refer to <u>Lifting and Jacking the Vehicle</u> . 2. Lubricate the tie rod ends and the ball joints if applicable. 3. Inspect the suspension system for worn or damaged components. 4. Repair as necessary.		
	Did you find and correct the condition?	Go to Step 7	Go to Step 4
4	Inspect for binding strut bearings. 1. Disconnect the strut from the steering knuckle. 2. If the strut is abnormally difficult to rotate, repair or replace the upper bearing mount.		
	Did you find and complete the repair?	Go to Step 7	Go to Step 5
5	Inspect for binding in the lower ball joints. If the joint is binding, replace the joint. Did you find and complete the repair?	Go to Step 7	Go to Step 6
6	Inspect the wheel alignment and adjust as necessary. Refer to <u>Wheel Alignment Measurement</u> . Did you complete the wheel alignment?	Go to Step 7	-
7	Operate the vehicle in order to verify the repair. Did you correct the condition?	System OK	-

NOISE DIAGNOSIS - FRONT SUSPENSION

Noise Diagnosis - Front Suspension

Step	Action	Yes	No
DEFINITION: Any noise emitted from the front of the vehicle that is induced by VEHICLE SPEED or DRIVING TERRAIN as related to the front suspension.			
1	Did you review the General Description and perform the necessary Inspections?	Go to Step 2	Go to <u>Symptoms - Suspension General Diagnosis</u>
2	Attempt to duplicate the condition. Road test the vehicle. Did you duplicate the condition?	Go to Step 3	System OK
3	Is the noise reactive to vehicle load or speed?	Go to Step 4	Go to Step 7
	Inspect the tires for the following condition: • Proper tire inflation and adjust as necessary- Refer to <u>Tire Inflation Description</u> . • Unusual tire wear-Refer to <u>Tire Diagnosis</u> -		

4	<u>Irregular or Premature Wear</u> . Inspect the wheel nuts for looseness and tighten as necessary. Refer to <u>Fastener Tightening Specifications</u> . Did you find and correct the condition?	Go to Step 14	Go to Step 5
5	Inspect the front wheel bearings. Refer to <u>Wheel Bearings Diagnosis</u>. Did you find and correct the condition?	Go to Step 14	Go to Step 6
6	Inspect for front axle or transaxle noises. Refer to <u>Symptoms - Automatic Transmission</u> , or <u>Symptoms - Manual Transmission</u> . Did you find and correct the condition?	Go to Step 14	Go to Step 7
7	Bounce the front of the vehicle in order to duplicate the noise. Did you duplicate the noise?	Go to Step 8	Go to Step 9
8	1. Raise and support the vehicle. Refer to <u>Lifting and Jacking the Vehicle</u> . 2. Inspect the front suspension components for looseness. Refer to <u>Fastener Tightening Specifications</u> . 3. Inspect the front suspension components for damage and repair as necessary. Did you find and correct the condition?	Go to Step 14	Go to Step 9
9	1. Install the CH-39570 chassis ear or equivalent. 2. Bounce the front of the vehicle, using CH-39570 chassis ear or equivalent in order to locate the source of the noise. If necessary road test the vehicle. 3. Repair or replace any damaged components as necessary. Did you find and correct the condition?	Go to Step 14	Go to Step 10
10	Inspect the ball joints and steering components for the following conditions: - Lack of lubrication where applicable - Looseness in the ball joints - Looseness in the tie rods Did you find and correct the condition?	Go to Step 14	Go to Step 11

11	Inspect for damaged shock absorbers. Refer to <u>Suspension Strut and Shock Absorber Testing - On Vehicle</u> . Did you find and correct the condition?	Go to Step 14	Go to Step 12
12	Inspect the front stabilizer shaft and stabilizer shaft links for damage and repair as necessary. Refer to <u>Stabilizer Shaft Replacement</u> , or <u>Stabilizer Shaft Link Replacement</u> . Did you find and correct the condition?	Go to Step 14	Go to Step 13
13	Inspect for control arm damage and repair as necessary. Refer to <u>Lower Control Arm Replacement</u> . Did you find and correct the condition?	Go to Step 14	-
14	Operate the system in order to verify the repair. Did you correct the condition?	System OK	Go to Step 3

NOISE DIAGNOSIS - REAR SUSPENSION

Noise Diagnosis - Rear Suspension

Step	Action	Yes	No
DEFINITION: Any noise emitted from the rear of the vehicle that is induced by VEHICLE SPEED or DRIVING TERRAIN as related to the rear suspension.			
1	Did you review the General Description and perform the necessary inspections?	Go to Step 2	Go to <u>Symptoms - Suspension General Diagnosis</u>
2	Attempt to duplicate the condition. Road test the vehicle. Did you duplicate the condition?	Go to Step 3	System OK
3	Is the noise reactive to vehicle load or speed?	Go to Step 4	Go to Step 6
4	Perform the following inspections: - Inspect and adjust the tire inflation. Refer to <u>Tire Inflation Description</u> . - Inspect for unusual tire wear. Refer to <u>Tire Diagnosis - Irregular or Premature Wear</u> . - Inspect the wheel nuts for looseness. Refer to <u>Fastener Tightening Specifications</u> . Did you find and correct the condition?	Go to Step 10	Go to Step 5
5	Inspect the rear wheel bearings. Refer to <u>Wheel Bearings Diagnosis</u> . Did you find and correct the condition?	Go to Step 10	Go to Step 6
6	Bounce the rear of the vehicle in order to duplicate the noise.		

	Did you duplicate the noise?	Go to Step 7	Go to Step 9
7	1. Raise and support the vehicle. Refer to <u>Lifting and Jacking the Vehicle</u> . 2. Inspect the rear suspension components for looseness. Refer to <u>Fastener Tightening Specifications</u> . 3. Inspect the rear suspension components for damage and repair as necessary.		
	Did you find and correct the condition?	Go to Step 10	Go to Step 8
8	Inspect the rear shock absorber. Refer to <u>Suspension Strut and Shock Absorber Testing - On Vehicle</u> . Did you find and correct the condition?	Go to Step 10	Go to Step 9
9	1. Install the CH-39570 chassis ear or equivalent. 2. Bounce the rear of the vehicle, using CH-39570 chassis ear or equivalent, in order to locate the source of the noise. If necessary, road test the vehicle. 3. Repair or replace any defect component as necessary.		
	Did you find and correct the condition?	Go to Step 10	System OK
10	Operate the system in order to verify the repair. Did you correct the condition?	System OK	Go to Step 3

SUSPENSION STRUT AND SHOCK ABSORBER TESTING - ON VEHICLE

Suspension Strut and Shock Absorber Testing - On Vehicle

Step	Action	Yes	No
1	Did you review the General Description and perform the necessary inspections?	Go to Step 2	Go to <u>Symptoms - Suspension General Diagnosis</u>
2	Verify that the customer concern is present. Does the vehicle operate normally?	System OK	Go to Step 3
3	NOTE: A light film of oil on the top portion of the shock reservoir is normal. Inspect each strut or shock absorber for external fluid leakage. Is a strut or shock absorber leaking?	Go to Step 5	Go to Step 4
4	1. Use your hands in order to lift up and push down each corner of the vehicle 3 times. 2. Remove your hands from the vehicle.		

	3. Locate a shock or strut that exceeds 2 cycles. Did you locate a shock or strut that exceeds 2 cycles?	Go to Step 5	Go to Step 6
5	NOTE: Inspect the vehicle trim height in order to correct any possible causes of shock/strut failures. Refer to <u>Trim Height Inspection</u>. Replace the strut or shock absorber. Refer to <u>Strut, Strut Component, or Spring Replacement</u> , or <u>Shock Absorber Replacement</u> .Did you complete the repair?	Go to Step 6	-
6	Operate the vehicle in order to verify the repair. Did you correct the condition?	System OK	Go to Step 3

WHEEL BEARINGS DIAGNOSIS

Wheel Bearings Diagnosis

Step	Action	Yes	No
1	Did you review the General Description and perform the necessary inspections?	Go to Step 2	Go to <u>Symptoms - Suspension General Diagnosis</u>
2	Road test the vehicle in order to verify the customer's complaint. Does the vehicle operate normally?	System OK	Go to Step 3
3	1. Raise and support the vehicle. Refer to <u>Lifting and Jacking the Vehicle</u> . 2. Inspect for tire or wheel damage. Did you find and correct the condition?	Go to Step 7	Go to Step 4
4	1. Install the CH-39570 chassis ear. 2. Road test the vehicle to verify the location of the wheel bearing noise. Did you find and correct the condition?	Go to Step 6	Go to Step 5
	NOTE: Support the vehicle by the lower control arms or the rear axle to prevent movement during wheel bearing/hub inspection. 1. Mount and secure the J-8001 dial indicator. 2. Ensure that the dial indicator contacts the vertical surface of the wheel as close as possible to the top wheel stud.		

5	3. Push and pull on the top of the tire in order to inspect the total travel indicated by the dial indicator.		
	Specification Maximum allowable wheel bearing end play: 0.127 mm (0.005 in)		
	Is the measurement greater than the specified value?	Go to Step 6	System OK
6	Replace the wheel bearing. Refer to <u>Front Wheel Bearing and Hub Replacement</u> , or <u>Rear Wheel Bearing and Hub Replacement</u> .		-
	Did you complete the repair?	Go to Step 7	
7	Road test the vehicle to verify the repair. Does the vehicle operate normally?	System OK	Go to Step 3

TRIM HEIGHT INSPECTION

Trim Height Measurement

Trim height is a predetermined measurement relating to vehicle ride height. Incorrect trim heights can cause the vehicle to bottom out over bumps, damage to the suspension components and symptoms similar to wheel alignment problems. Check the trim heights when diagnosing suspension concerns and before checking the wheel alignment.

Perform the following before measuring the trim heights:

- Set the tire pressure to the specifications shown on the certification label. Refer to **Tire Inflation Description** .
- Check the fuel level. Add additional weight if necessary to simulate a full tank.
- Make sure the passenger and rear compartments are empty, except for the spare tire.
- Make sure the vehicle is on a flat and level surface, such as an alignment rack.
- Check that all the vehicle doors are securely closed.
- Check that the vehicle hood and rear deck lids are securely closed.
- Check for installed after market accessories or modifications that could affect trim height measurement.

Measuring the Trim Height

NOTE: All dimensions are measured vertical to the ground. Trim height should be within ± 10 mm (± 39 in) to be considered correct.

Fig. 2: Identifying Trim Height

Courtesy of GENERAL MOTORS COMPANY

NOTE: The vehicle must be on a flat level surface.

1. Using your hands, lift the front bumper approximately 38 mm (1.49 in).
2. Gently remove your hands and allow the vehicle to lower.
3. Using your hands, bounce the front of the vehicle downward approximately 38 mm (1.49 in).
4. Gently remove your hands and allow the vehicle to rise.
5. Measure and note the C dimension. This height is measured vertically from the ground to the bottom lip of the wheel opening through the centerline of the front wheel.
6. Measure and note the A dimension for the left and right side of the vehicle from the bottom of the front wheel rim to the wheel arc along the centerline of the front wheel.
7. Compare the A and C dimension measurements to the trim height specifications. Refer to **Trim Height Specifications**.
8. If the measurements are not within the specified range, replace the front coil springs as required. Refer to **Strut, Strut Component, or Spring Replacement**.
9. Using your hands, lift the front bumper approximately 38 mm (1.49 in).
10. Gently remove your hands and allow the vehicle to lower.
11. Using your hands, bounce the front of the vehicle downward approximately 38 mm (1.49 in).

12. Gently remove your hands and allow the vehicle to rise.
13. Measure and note the C dimension. This height is measured vertically from the ground to the bottom lip of the wheel opening through the centerline of the rear wheel.
14. Measure and note the B dimension for the left and right side of the vehicle from the bottom of the rear wheel rim to the wheel arc along the centerline of the rear wheel.
15. Compare the B and D dimension measurements to the trim height specifications. Refer to **Trim Height Specifications**.
16. If the measurements are not within the specified range, replace the rear coil springs as required. Refer to **Rear Spring Replacement** .

DIAGNOSTIC INFORMATION AND PROCEDURES

SYMPTOMS - THEFT DETERRENT

NOTE: The following steps must be completed before using the symptom tables.

1. Perform **Diagnostic System Check - Vehicle** in order to verify that all of the following are true:
 - There are no DTCs set.
 - The control modules can communicate via the serial data link.

2. Review the system operation in order to familiarize yourself with the system functions. Refer to the following **Theft Systems Description and Operation**.

Visual/Physical Inspection

- Inspect for aftermarket devices which could affect the operation of the Theft Deterrent System. Refer to **Checking Aftermarket Accessories** .
- Inspect the easily accessible or visible system components for obvious damage or conditions which could cause the symptom.

Intermittent

Faulty electrical connections or wiring may be the cause of intermittent conditions. Refer to **Testing for Intermittent Conditions and Poor Connections** .

Symptom List

Refer to a symptom diagnostic procedure from the following list in order to diagnose the symptom:

- **Content Theft Deterrent Malfunction**
- **Security Indicator Malfunction**

CONTENT THEFT DETERRENT MALFUNCTION

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

Circuit/System Description

The content theft deterrent system is a software based system in which the Body Control Module (BCM) actively monitors certain inputs to determine if unauthorized vehicle access is being attempted. Based on inputs such as the door ajar switches, the rear compartment ajar switch and the hood ajar switch, the BCM determines whether a content theft deterrent alarm is warranted. If unauthorized access is being detected, the BCM will pulse the vehicle horn and flash the exterior lamps as a means of theft deterrence.

Diagnostic Aids

The scan tool BCM Content Theft Deterrent Trigger History 1, 2 and 3 parameters can be used to help isolate an intermittent unwanted content theft deterrent alarm. These parameters are a rolling history of the previous three causes of a theft deterrent alarm. If all three parameters are indicating the same alarm trigger, the indicated input should be the starting point when diagnosing an intermittent concern.

Circuit/System Verification

1. Ignition ON.
2. Verify each indicator/message transition between the ajar and closed state while opening and closing each vehicle door, hood and rear compartment.
 - **If the indicator/message does not change**

Refer to **Door Ajar Indicator Malfunction** or **Hood Ajar Indicator/Message Malfunction** .

- **If each indicator/message changes**
3. Completely lower the driver door window and close all vehicle doors, ignition OFF.
 4. Arm the content theft deterrent system by locking the door with the keyless entry transmitter.
 5. Verify the scan tool BCM Content Theft Deterrent Alarm Status parameter is Armed.
 - **If not Armed**

Refer to **Keyless Entry System Malfunction** .

- **If Armed**
6. Without disarming the system, reach in through the open driver window and open the driver door.
 7. Verify the scan tool BCM Content Theft Deterrent Alarm Status parameter is Alarm.
 - **If not Alarm**

Replace the K9 Body Control Module.

- **If Alarm**

8. All OK.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

Control Module References for Body Control Module replacement, programming and setup

SECURITY INDICATOR MALFUNCTION

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Control	2	2	1	-
1. Security Indicator Always On 2. Security Indicator Inoperative				

Circuit/System Description

The security indicator is controlled by the Body Control Module (BCM) based on commands from the content theft deterrent system. The security indicator is located in the driver information center. When the content theft deterrent system requests the indicator be illuminated, the BCM applies voltage to the control circuit, illuminating the indicator.

Scan Tool Reference

Control Module References for scan tool information

Circuit/System Verification

1. Arm the content theft deterrent system.
2. Verify the security indicator illuminates and/or flash during the arming sequence.
 - **If the indicator does not illuminate and/or flash**

Refer to Circuit/System Testing

- **If the indicator illuminates and/or flashes**
3. All OK

Circuit/System Testing

1. Ignition OFF, disconnect the harness connector at the A5 Driver Information Center.
2. Connect a test lamp between the control circuit terminal 2 and ground, ignition ON.
3. Verify the test lamp turns ON and OFF when commanding the Security Indicator Active and Inactive with a scan tool.
 - **If the test lamp is always OFF**
 1. Ignition OFF, disconnect the harness connector at the K9 Body Control Module.
 2. Test for infinite resistance between the control circuit and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance
 3. Test for less than 2 ohms in the control circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, replace the K9 Body Control Module.
 - **If the test lamp is always ON**
 1. Ignition OFF, disconnect the harness connector at the K9 Body Control Module, ignition ON.
 2. Test for less than 1 V between the control circuit and ground.
 - If 1 V or greater, repair the short to voltage on the circuit.

- If less than 1 V, replace the K9 Body Control Module.
 - **If the test lamp turns ON and OFF**
4. Test or replace the A5 Driver Information Center.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

- **Information Center Telltale Assembly Replacement**
- **Control Module References** for Body Control Module replacement, programming and setup

DESCRIPTION AND OPERATION

THEFT SYSTEMS DESCRIPTION AND OPERATION

When armed, the content theft deterrent system is designed to deter vehicle content theft by pulsing the horns and exterior lamps for approximately 30 seconds when an unauthorized vehicle entry is detected. However, the content theft deterrent system does not affect engine starting.

An unauthorized entry can be any of the following with the content theft deterrent system armed:

- Unauthorized entry into the underhood area
- Unauthorized entry into the rear compartment
- When any door is opened without using the UNLOCK command from a keyless entry transmitter
- After a battery reconnect, if the battery was disconnected with the content theft deterrent system armed

The components of the content theft deterrent system are:

- Body Control Module (BCM)
- Remote control door lock receiver
- Door ajar switches
- Rear compartment ajar switch
- Hood ajar switch

Arming the Content Theft Deterrent System

Use the following procedure in order to arm the system:

1. Place the shift lever in P (park).
2. Turn OFF the ignition.
3. Open any door.

NOTE: **The system is not armed if the doors are locked manually; the power door**

lock switch or remote keyless entry transmitter must be used to arm the content theft deterrent system.

4. Lock the doors with the power door lock switch or by pressing the LOCK button on the transmitter. The system is in standby mode and will not start the arming timer until all doors are closed.
5. The system will begin the arm sequence immediately after the last door is closed. If the keyless entry transmitter is used to arm the system after the vehicle doors are closed, the arm sequence will begin as soon as the LOCK command is received from the transmitter.
6. Pressing the LOCK button on the keyless entry transmitter a second time will bypass the delayed arming function and force the system to arm.

Locking the Vehicle Without Arming the Content Theft Deterrent System

Locking the vehicle may be accomplished without arming the content theft deterrent system. Use of the manual door locks will lock the vehicle, but will not arm the content theft deterrent system.

Disarming an Armed System/Silencing an Alarm

If system arming has been requested by the power door lock switch or the keyless entry transmitter, it must be disarmed.

NOTE: **Disconnecting the battery or removing fuses does not disable the arm or alarm modes, since the BCM stores the content theft deterrent mode status in memory.**

- To disarm the content theft deterrent system in standby mode, perform one of the following:
 - Press the UNLOCK button on the keyless entry transmitter.
 - Insert a valid key into the ignition and switch to the ON position.
- To disarm the content theft deterrent system in the armed mode (non-event) or when activated (during an alarm event):
 - Press the UNLOCK button on the keyless entry transmitter.
 - Insert a valid key into the ignition and switch to the ON position

Content Theft Deterrent Circuit Description

The following is a description of each component used in the content theft deterrent system:

Body Control Module

The content theft deterrent system is an internal function of the BCM which utilizes serial data and various switch inputs information to perform content theft deterrent functions. When the BCM detects an unauthorized entry, it activates the horns and exterior lamps. The BCM has 4 basic modes (disarmed, standby, armed and alarm) for operating the content theft deterrent system. The different modes are described below.

1. The BCM has the content theft deterrent system in a disarmed mode until the following conditions are

detected:

- Ignition key turned to the OFF position.
 - Doors locked by either the power door lock switch or the LOCK button on the transmitter.
2. The BCM enters the standby mode when the above conditions are detected. If a door was already opened when the arm mode was requested, the standby mode does not start the timer until the last door is closed.
 3. When the last door is closed, a 15 second timer is activated. Once the timer has expired, the BCM enters the armed mode. After this delay, any unauthorized entry will activate the alarm mode.
 4. When the BCM detects an unauthorized entry, the BCM enters the alarm mode. The BCM activates the horns and exterior lamps for 30 seconds. This is followed by a three minute time-out with the horn no longer active. If no new intrusions are detected after the time-out, the horn is not active. The system must be disarmed or the intrusion condition removed after the time-out for the system to exit alarm mode.

Remote Control Door Lock Receiver

The keyless entry system can arm and disarm the content theft deterrent system. When the remote control door lock receiver receives a door lock or unlock signal from the transmitter, the remote control door lock receiver sends a message to the BCM via serial data to perform the appropriate arm/disarm functions.

Door Ajar Switches

The content theft deterrent system uses the door ajar switches as a status indicator to activate the alarm. The door ajar switches are monitored by the body control module via a discrete input from each door ajar switch. If the BCM receives a signal indicating a door is opened when the content theft deterrent system is armed, the BCM activates the alarm.

Hood Ajar Switch

The content theft deterrent system uses the hood ajar switch as a status indicator to activate the alarm. The BCM monitors the hood ajar switch via a discrete input from the switch. If the BCM receives a signal indicating the hood has been opened when the content theft deterrent system is armed, the BCM activates the alarm.

Rear Compartment Ajar Switch

The content theft deterrent system uses the rear compartment ajar switch as a status indicator to activate the alarm. The BCM monitors the rear compartment ajar switch via a discrete input from the switch. If the BCM receives a signal indicating the rear compartment has been opened when content theft deterrent system is armed, the BCM activates the alarm.

Inputs

The BCM monitors the following inputs for content theft deterrent:

- Door ajar switches
- Keyless entry transmitter LOCK/UNLOCK buttons; a message from the remote control door lock receiver
- Immobilizer status-The BCM uses the immobilizer status for disarming the system or silencing an alarm

when the correct vehicle key is used to start the vehicle

- Rear compartment ajar switch
- Hood ajar switch

Outputs

The BCM controls the following for content theft deterrent:

- Horn relay
- Exterior lamps

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

DTC Descriptor

DTC C0569 00

System Configuration Malfunction

Circuit/System Description

If the tire type and pressure information is not entered during the body control module (BCM) setup, the tire pressure monitor system indicator icon on the instrument cluster will flash for 1 min and then remain illuminated after the ignition is cycled ON and the instrument cluster bulb check is complete. If equipped, the driver information center will also display a service tire monitor type message. Under these circumstances, DTC C0569 will be set and the tire type and pressure information will need to be entered for the system to function correctly.

Conditions for Running the DTC

Ignition ON.

Conditions for Setting the DTC

The tire type and pressure information is not entered into the BCM during programming and setup.

Action Taken When the DTC Sets

- The tire pressure monitor system indicator icon on the instrument cluster flashes for 1 min and then remains illuminated after the ignition switch is cycled ON and the instrument cluster bulb check is complete.
- If equipped, the driver information center displays a service tire monitor type message.

Conditions for Clearing the DTC

A current DTC will clear when the BCM has undergone the tire type and pressure selection setup procedure and one ignition cycle has occurred.

Diagnostic Aids

A newly replaced BCM will set DTC C0569 after programming on it's initial ignition ON cycle if the module setup information has not been entered.

Description and Operation

Tire Pressure Monitor Description and Operation

Scan Tool Reference

Control Module References for scan tool information

Circuit/System Verification

1. Ignition ON.
2. Enter the tire type and pressure information into the K9 Body Control Module with a scan tool. Refer to **Vehicle Certification, Tire Placard, Anti-Theft, and Service Parts ID Label**.
3. Ignition OFF, then Ignition ON.
4. Verify DTC C0569 is not set.

- **If the DTC is set**

Replace the K9 Body Control Module.

- **If the DTC is not set.**

5. All OK.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

Control Module References for BCM replacement, programming, and setup.

DTC C0765 39

Right Rear Tire Pressure Sensor Internal Malfunction

Circuit/System Description

The tire pressure monitor system has a radio frequency (RF) transmitting pressure sensor in each wheel/tire assembly. As vehicle speed increases, centrifugal force closes the sensors internal roll switch, which puts the sensor into Drive mode. The body control module (BCM) receives and translates the data contained in the tire

pressure sensor RF transmissions into sensor presence, sensor mode, and tire pressure. Once vehicle speed is greater than 40 km/h (25 MPH), the BCM waits for the first sensor to go into Drive mode, then checks if all sensors have gone into Drive mode. If one or more sensors does not go into these modes, or does not transmit at all, the BCM will set DTC C0750, C0755, C0760, or C0765 respectively.

Conditions for Running the DTC

Vehicle speed is greater than 40 km/h (25 MPH).

Conditions for Setting the DTC

- A sensor does not transmit or transmits invalid data to the BCM.
- A sensor low battery condition.

Action Taken When the DTC Sets

- The tire pressure monitor system indicator icon on the instrument cluster flashes for 1 min and then remains illuminated after the ignition switch is cycled ON and the instrument cluster bulb check is complete.
- If equipped, the driver information center displays a service tire monitor type message.

Conditions for Clearing the DTC

A current DTC will clear when the malfunction is no longer present and one ignition cycle occurs.

Diagnostic Aids

- Some aftermarket wheel valve stem holes are located further from the wheel rim than original equipment wheels. When using the tire pressure monitor special tool to activate a sensor, ensure the tool is placed along the tire sidewall and no further than 15 cm (6 in) from the sensor and the antenna is aiming upward.
- Aftermarket wheel valve system locations can cause a sensor to not function correctly.
- A sensor may have been damaged due to a previous wheel/tire service or flat tire event.
- The use of other than GM approved tire sealants can obstruct the sensor pressure sensing port and cause inaccurate tire pressure readings. If this condition is verified, remove the sealer from the tire and replace the sensor. Refer to **Tire Pressure Indicator Sensor Replacement**.
- Occasionally sensor transmissions are not received by the BCM due to vehicle level radio frequency interference from items such as but not limited to aftermarket ignition systems, DVD players, CB radios, or metallic type window tinting.
- The sensor activation procedure may have to be repeated up to 3 times before determining a sensor is malfunctioning. In the event a particular sensor information is displayed on the special tool upon activation but the horn does not chirp, it may be necessary to rotate the wheel valve stem to a different position due to the RF signal being blocked by another component.
- Occasionally sensors can become mislocated due to previous tire rotations where the sensor learn procedure was not performed. Always learn the sensors to ensure the DTC set is for that actual physical corner of the vehicle. Refer to **Tire Pressure Indicator Sensor Learn**.
- A sensor low battery condition will set a sensor DTC but will not illuminate the low tire pressure

indicator or display a message on the driver information center, if equipped. The sensor battery condition can be verified in the scan tool BCM data list. If a sensor low battery condition is indicated on the scan tool, the sensor will need to be replaced. Refer to **Tire Pressure Indicator Sensor Replacement**.

DTC Descriptor

DTC C0775 00

Tire Pressure Monitoring System Sensors Malfunction

Circuit/System Description

If the body control module (BCM) has been reprogrammed or replaced and the tire pressure sensor learn procedure has not been performed, the tire pressure monitor system indicator icon on the instrument cluster will flash for 1 min and then remain illuminated after the power switch is cycled ON and the instrument cluster bulb check is complete. If equipped, the driver information center will also display a service tire monitor type message. Under these circumstances, DTC C0775 will be set in the BCM and the tire pressure sensor learn procedure will need to be performed for the system to function correctly.

Conditions for Running the DTC

Vehicle ON or Vehicle in Service Mode.

Conditions for Setting the DTC

The body control module (BCM) has not learned tire pressure sensor ID and location information from the tire pressure sensors.

Action Taken When the DTC Sets

- The tire pressure monitor system indicator icon on the instrument cluster will flash for 1 min and then remain illuminated after the power switch is cycled ON and the instrument cluster bulb check is complete.
- If equipped, the driver information center displays a service tire monitor type warning message.

Conditions for Clearing the DTC

A current DTC will clear when the BCM has received tire pressure sensor ID and location information from the tire pressure indicator module and at least 1 power switch cycle has occurred.

SYMPTOMS - TIRE PRESSURE MONITORING

1. Perform the **Diagnostic System Check - Vehicle** , before using the Symptom Tables in order to verify that all of the following are true:
 - There are no DTCs set.
 - The control modules can communicate via the serial data link.
2. Review the system operation in order to familiarize yourself with the system functions. Refer to **Tire Pressure Monitor Description and Operation**.

Visual/Physical Inspection

- Inspect for aftermarket devices which could affect the operation of the Tire Pressure Monitoring (TPM) System. Refer to **Checking Aftermarket Accessories** .
- Inspect the easily accessible or visible system components for obvious damage or conditions which could cause the symptom.

Intermittent

Faulty electrical connections or wiring may be the cause of intermittent conditions. Refer to **Testing for Intermittent Conditions and Poor Connections** .

Symptom List

Refer to **Low Tire Pressure Indicator Malfunction** in order to diagnose the symptom.

LOW TIRE PRESSURE INDICATOR MALFUNCTION

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.

- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

Circuit/System Description

The tire pressure monitor system has a radio frequency transmitting pressure sensor in each wheel/tire assembly. As vehicle speed increases, centrifugal force closes the sensor's internal roll switch, which puts the sensor into Drive mode. The sensors send the tire pressure data to the body control module (BCM). The BCM translates the data contained in the tire pressure sensor radio frequency transmissions into sensor presence, sensor mode, and tire pressure. Once vehicle speed is greater than 40 km/h (25 MPH), the BCM waits for the sensors to go into Drive mode.

Each sensor has its own unique identification (ID) code, which it transmits as part of each RF message, that must be learned into the BCM memory. Once all 4 IDs have been learned and vehicle speed is greater than 40 km/h (25 mph), the BCM continuously compares IDs and pressure data in the received transmissions to the learned IDs and pressures to determine if all 4 sensors are present and if one or more tire pressure is low. If the BCM detects a low tire pressure condition or a malfunction in the system, it will send a serial data message to the instrument cluster requesting the appropriate tire pressure monitor indicator illumination and also to display the appropriate data message on the driver information center, if equipped.

Diagnostic Aids

- If unsure about the condition, cycle the ignition and observe the tire pressure monitor indicator icon. If the tire pressure monitor indicator icon is continuously illuminated after the instrument cluster bulb check is completed, a low tire pressure condition is present. Check the tires for damage or leaks and inflate to the tire placard specifications. Refer to **Vehicle Certification, Tire Placard, Anti-Theft, and Service Parts ID Label** . If the tire pressure monitor indicator icon flashes for 1 minute after the instrument cluster bulb check is completed and then remains illuminated, a tire pressure monitor system DTC is set. Perform the **Diagnostic System Check - Vehicle** to proceed with the proper diagnosis.
- Temperature can greatly affect tire pressures. Low tire pressure on a cold morning may cause the tire pressure monitor indicator icon to illuminate. The air pressure in the tire increases as the ambient temperature rises or as the tire warms up while the vehicle is driven. The pressure may increase enough to exceed the predetermined low pressure threshold which will turn OFF the tire pressure monitor indicator icon.
- Some aftermarket wheel valve stem holes are located further from the wheel rim than original equipment wheels. When using the tire pressure monitor special tool to activate a sensor, ensure the tool is placed along the tire sidewall and no further than 15 cm (6 in) from the sensor and the antenna is aiming upward.
- Aftermarket wheel valve stem locations can cause a sensor to not function correctly.
- A sensor may have been damaged due to a previous wheel/tire service or flat tire event.
- The use of other than GM approved tire sealants can obstruct the sensor pressure sensing port and cause inaccurate tire pressure readings. If this condition is verified, remove the sealer from the tire and replace the sensor. Refer to **Tire Pressure Indicator Sensor Replacement**.
- The sensor activation procedure may have to be repeated up to 3 times before determining a sensor is malfunctioning. In the event a particular sensor's information is displayed on the special tool upon activation but the horn does not chirp, it may be necessary to rotate the wheel valve stem to a different position due to the RF signal being blocked by another component.

- Occasionally sensor transmissions are not received by the BCM due to vehicle level RF interference from items such as but not limited to aftermarket ignition systems, DVD players, CB radios, or metallic type window tinting.

Circuit/System Verification

NOTE: Low tire pressure in one or more tires is indicated by a continuously illuminated tire pressure monitor indicator icon after the instrument cluster bulb check is completed. If equipped with a driver information center, a check tire pressure type message will also be displayed.

When a tire pressure monitor DTC is set, the tire pressure monitor indicator icon will flash for 1 min after the instrument cluster bulb check is completed and then remains illuminated. If equipped with a driver information center, a service tire monitor type message will also be displayed.

- Adjust all tire pressures to the correct pressure. Refer to Vehicle Certification, Tire Placard, Anti-Theft, and Service Parts ID Label.
- Drive the vehicle over 40 km/h (25 MPH) for greater than 2 minutes.
- Verify the low tire pressure indicator is OFF.
 - If the low tire pressure indicator is ON**
 - Perform the Tire Pressure Indicator Sensor Learn.
 - Record each tire pressure as indicated by the appropriate scan tool parameter.
 - Check and record the tire pressures with a known accurate hand held tire pressure gauge.
 - Verify that the pressure readings from the scan tool do not differ more than 27.6 kPa (4 PSI) from the actual tire pressure readings.
 - If the pressure readings differ more than 27.6 kPa (4 psi), replace the appropriate B2 Tire Pressure Sensor then perform the Tire Pressure Indicator Sensor Learn.
 - If the pressure readings do not differ more than 27.6 kPa (4 PSI)
- Verify the BCM Tire Type and Pressure selections are setup correctly with a Scan Tool. Refer to the Vehicle Certification, Tire Placard, Anti-Theft, and Service Parts ID Label.
 - If the BCM Tire Type and Pressure selections are incorrect, input the proper placard values for the vehicle with the Scan Tool then drive the vehicle over 40 km/h (25 MPH) for greater than 2 min.

- If the BCM Tire Type and Pressure selections are correct
- 6. Ignition ON.
- 7. Verify the tire pressure monitor indicator icon turns ON and OFF when commanding All Indicators ON and OFF with a scan tool.
 - If the tire pressure monitor icon does not turn ON and OFF, replace the P16 Instrument Cluster.
 - If the tire pressure monitor icon turns ON and OFF
- 8. All OK
 - **If the tire pressure indicator is OFF**
- 4. All OK

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

- **Tire Pressure Indicator Sensor Replacement**
- **Tire Pressure Indicator Sensor Learn**
- **Control Module References** for Instrument Cluster or BCM replacement, programming, and setup

REPAIR INSTRUCTIONS

TIRE PRESSURE INDICATOR SENSOR REPLACEMENT

Removal Procedure

1. Raise the vehicle on a suitable support. Refer to **Lifting and Jacking the Vehicle** .
2. Remove the tire/wheel assembly from the vehicle. Refer to **Tire and Wheel Removal and Installation** .
3. Dismount the tire from the rim. Refer to **Tire Dismounting and Mounting** .

Fig. 1: View Of Tire Pressure Indicator Sensor
Courtesy of GENERAL MOTORS COMPANY

NOTE: When servicing the tire pressure sensor always use a new Schrader® tire pressure monitoring (TPM) sensor and a new TORX screw during installation.

4. Remove the TORX screw (1) from the tire pressure sensor (2) and pull it straight off the tire pressure valve stem (3).

CAUTION: Do not scratch or damage the clear coating on aluminum wheels with the tire changing equipment. Scratching the clear coating could cause the aluminum wheel to corrode and the clear coating to peel from the wheel.

5. Remove the tire pressure valve stem by pulling it through the rim.

Installation Procedure

Fig. 2: View Of Tire Pressure Indicator Sensor
Courtesy of GENERAL MOTORS COMPANY

CAUTION: Refer to Fastener Caution .

NOTE:

- Ensure the flat of the valve, lines up with the flats of the snap in the enclosure.
- TPM valves and TORX screws are single use items.

1. Assemble the tire pressure sensor (2) to the valve stem and install the new TORX screw (3), tighten to 1.3 (11.5 lb in).

NOTE:

Use an approved tire mounting lubricant. **DO NOT** use silicon or corrosive base compounds to lubricate the tire bead and the wheel rim. A corrosive type compound can cause tire or rim deterioration.

2. Apply tire soap to the rubber portion of the valve stem (1).

Fig. 3: View Of Tire Valve Stem Mounting Tool
Courtesy of GENERAL MOTORS COMPANY

3. Using a tire valve stem mounting tool, pull the valve stem through in a direction parallel to the valve hole on the rim.

NOTE: Snap Fit TPM sensors are shipped in the OFF mode. The sensor will exit its OFF state when the tire is inflated.

4. Mount the tire to the rim. Refer to **Tire Dismounting and Mounting** .
5. Install the tire/wheel assembly on the vehicle. Refer to **Tire and Wheel Removal and Installation** .
6. Lower the vehicle.
7. Learn the tire pressure sensors. Refer to **Tire Pressure Indicator Sensor Learn**.

TIRE PRESSURE INDICATOR SENSOR LEARN

Special Tools

- **EL-46079** Tire Pressure Monitor Diagnostic Tool
- **EL-50448** Tire Pressure Monitor Sensor Activation Tool

For equivalent regional tools, refer to **Special Tools**.

Learn Mode Description

The tire pressure monitor system uses the instrument cluster, body control module (BCM), 4 radio frequency transmitting pressure sensors, and the serial data circuit to perform the tire pressure monitor learn mode functions. The sensor learn procedure must be performed after every tire rotation, BCM replacement, or sensor replacement. Once the Learn mode has been enabled, each of the sensors unique identification codes can be learned into the BCM memory. When a sensor ID has been learned, the BCM sounds a horn chirp indicating the sensor has transmitted its ID and the BCM has received and learned it. The BCM must learn the sensor IDs in the proper sequence to determine correct sensor location. The first learned ID is assigned to the left front location, the second to right front, the third to right rear and the fourth to left rear. The turn signals will individually illuminate indicating which location is to be learned in the proper sequence.

Sensor Functions Using EL-46079, EL-50448, or Equivalent

Each sensor has an internal low frequency coil. When the tire pressure monitor special tool is used in activate mode, it produces a low frequency transmission that activates the sensor. The sensor responds to a low frequency activation by transmitting in Learn Mode-Remotely Triggered. When the BCM receives a learn mode transmission while in Learn mode, it will assign that sensors ID to the location on the vehicle relative to the order in which it was learned.

Learn Mode Cancellation

The Learn mode will cancel if the ignition is cycled to OFF or if more than 2 minutes has elapsed for any sensor that has not been learned. If the relearn mode is cancelled before the first sensor is learned, the original sensor IDs will be maintained. If the relearn mode is canceled after the first sensor is learned, the following will occur:

- All stored sensor IDs will be invalidated in the BCM memory.
- If equipped, the driver information center will display dashes instead of tire pressures.
- DTC C0775 will be set.

These conditions will now require the Learn procedure to be repeated for the system to function properly.

Tire Pressure Monitor Learn Procedure

NOTE: In the event when a particular sensor is activated and the horn does not chirp, it may be necessary to rotate the wheel valve stem to a different position due to the sensor signal is being blocked by another component.

1. Apply park brake (manual transmission only).
2. Ignition ON, using a scan tool or driver information center buttons, initiate the Tire Pressure Sensors Learn mode. A double horn chirp will sound indicating the Learn mode has been enabled. The left front turn signal will also be illuminated.
3. Starting with the left front tire, active the sensor by holding the antenna of the tire pressure monitor special tool aimed upward against the tire sidewall close to the wheel rim at the valve stem location. Press

and release the activate button. Ensure that the transmit indicator on the special tool indicates that the sensor activation signal is being transmitted. Wait for a horn chirp. If the horn does not chirp, repeat the sensor activation sequence with the tool. Once the horn chirp has sounded, the sensor information is learned and the turn signal in the next location to be learned will illuminate.

4. After the horn chirp has sounded and the right front turn signal is illuminated, repeat step 3 for the remaining 3 sensors in the following order:
 1. Right front
 2. Right rear
 3. Left rear
5. When the left rear sensor has been learned and a double horn chirp has sounded, the learn process is complete and the BCM exits the Learn mode.

The tire pressure monitor system warns the driver when a significant loss, or gain of tire pressure occurs in any of the 4 tires and allows the driver to display the individual tire pressures and their locations on the driver information center.

The system uses the body control module (BCM), driver information center, instrument cluster, a radio frequency (RF) transmitting pressure sensor in each wheel/tire assembly, and the serial data circuit to perform the system functions. Each sensor has an internal power supply with an approximate 10 year service life.

When the vehicle is stationary, the sensor's internal accelerometer is inactive, which puts the sensors into a Stationary state. In this state the sensors sample tire pressure once every 30 seconds and do not transmit at all if the tire pressure does not change. As vehicle speed increases, centrifugal force activates the sensors internal accelerometer causing the sensors to go into Wake and then Drive mode. In Drive mode, the sensors sample tire pressure once every 30 seconds and transmit in Drive mode once every 60 seconds. The BCM receives and translates the data contained in each sensors RF transmission into sensor presence, sensor mode, and tire pressure. The BCM sends the tire pressure and tire location data to the driver information center via the serial data circuit where they are displayed.

The sensors continuously compare their last pressure sample to their current pressure sample and will transmit in Learn Mode-Pressure Triggered if a 8.3 kPa (1.2 psi) change in tire pressure has been detected in either a Stationary or Drive state. When the tire pressure monitor system detects a significant loss, or gain of tire pressure, the tire pressure monitor indicator icon is illuminated on the instrument cluster and if equipped, a check tire pressure type message is displayed on the driver information center. Both the indicator icon and driver information center message can be cleared by adjusting the tire pressures to the recommended pressures and driving the vehicle above 40 km/h (25 mph) for at least 2 minutes.

If power is disconnected from the BCM or if the vehicle battery is disconnected, each tire pressure monitor sensor ID is retained but all of the tire pressure information is lost. Under these circumstances the BCM cannot assume that the tire pressures were maintained over an unknown period of time. If equipped, the driver information center will display all dashes and the scan tool will indicate a default tire pressure value of 1020 kPa (148 psi) for each tire. Driving the vehicle above 40 km/h (25 mph) for at least 2 minutes will activate the sensors causing the driver information center to display the current tire pressures. The **EL-46079/J-46079** tire pressure monitor diagnostic tool, **EL-50448** tire pressure monitor sensor activation tool, or equivalent may also be used to activate the sensors as well.

The BCM has the ability to detect malfunctions within the tire pressure monitor system. In the event a DTC is set, the tire pressure monitor indicator icon on the instrument cluster will flash for 1 minute and then remain

illuminated after the ignition is turned ON and the instrument cluster bulb check has been completed. Any malfunction detected will cause the driver information center to display a service tire monitor system type message. For more information on other functions of the BCM, refer to Keyless Entry System Description and Operation .

DIAGNOSTIC INFORMATION AND PROCEDURES

TIRE DIAGNOSIS - IRREGULAR OR PREMATURE WEAR

Tire Wear

Fig. 1: View Of Tire Diagnosis - Irregular or Premature Wear
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
1	Under-Inflation, Hard Cornering, Lack of Regular Rotation
2	Incorrect Wheel Alignment, Hard Cornering, Lack of Regular Rotation
3	Incorrect Wheel Alignment, Shock Absorber Failure
4	Over-Inflation, Heavy Acceleration, Lack of Regular Rotation
5	Normal Wear to the Wear Indicator

Inspection Procedure

1. Inspect front tire for wear and damage.
2. Inspect rear tire for wear and damage.
3. Rotate the tires if any of the following conditions exist:
 - The amount of time or distance since the last tire rotation matches the maintenance schedule.
 - The outer tread blocks are worn more than the middle tread blocks (1).
 - The outer tread blocks are worn more than the inner tread blocks (2).
 - The middle tread blocks are worn more than the outer tread blocks (4).
4. Measure the wheel alignment if any of the following conditions exist:

- The tread blocks have feathered edges (3).
 - The outer tread blocks are worn more than the inner tread blocks (2).
 - The inner tread blocks are worn more than the outer tread blocks (2).
5. Inspect the struts or the shock absorbers if the tire tread exhibits a cupped appearance (3).

TIRE DIAGNOSIS - WADDLE COMPLAINT

Fig. 2: View Of Tire Diagnosis - Waddle Complaint
Courtesy of GENERAL MOTORS COMPANY

Tire waddle is a side to side movement at the front of the vehicle and/or the rear of the vehicle. Tire waddle can be caused by the following conditions:

- A steel belt not being straight within the tire
- Excessive lateral runout of the tire
- Excessive lateral runout of the wheel

Tire waddle is most noticeable at a low speed of about 8-48 km/h (5-30 mph). Tire waddle may appear as ride roughness at 80-113 km/h (50-70 mph). Tire waddle may appear as a vibration at 80-113 km/h (50-70 mph).

Inspection Procedure

CAUTION: Refer to Lifting and Jacking the Vehicle .

1. Raise and support the vehicle with safety stands.

WARNING: Wear gloves when inspecting the tires in order to prevent personal injury from steel belts sticking through the tire.

2. Perform the following preliminary inspection:
 1. Mark the tire with a crayon in order to note the start and the stop position.
 2. Rotate each tire and wheel by hand.
 3. Inspect the tire for bulges or bent wheels. Replace as necessary.
3. Use a tire substitution in order to identify the faulty tire. Perform the following steps for a tire substitution check:
 1. Use a comparable tire in order to replace each tire, one at a time.
 2. Test drive the vehicle.
 3. If the problem is tire or wheel related, you will eliminate the problem when you remove the faulty tire from the vehicle.

RADIAL TIRE LEAD/PULL CORRECTION

Radial Tire Lead/Pull Correction

Step	Action	Yes	No
DEFINITION: Lead/pull is the deviation of the vehicle from a straight path on a level road with no pressure on the steering wheel.			
1	Did you perform the Vehicle Leads/Pull diagnostic table?	Go to Step 2	Go to <u>Vehicle Leads/Pulls</u>
2	Road test the vehicle to verify the complaint. Select a smooth level surface to perform the test. Does the condition exist?	Go to Step 3	System OK
3	1. Cross-switch the front tire/wheel assemblies. Refer to <u>Tire and Wheel Removal and Installation</u> . 2. Road test the vehicle on a smooth level surface. Does the vehicle still lead/pull?	Go to Step 4	System OK
4	Does the vehicle lead/pull in the opposite direction?	Go to Step 5	Go to <u>Wheel Alignment Measurement</u>
	1. Cross-switch the left front tire/wheel assembly with the left rear tire/wheel		

5	assembly. Refer to <u>Tire and Wheel Removal and Installation</u>. 2. Road test the vehicle on a smooth level surface. Does the vehicle still lead/pull?	Go to Step 6	Go to Step 7
6	1. Cross-switch the right front tire/wheel assembly with the right rear tire/wheel assembly. Refer to <u>Tire and Wheel Removal and Installation</u>. 2. Road test the vehicle on a smooth level surface. Does the vehicle still lead/pull?	Go to <u>Wheel Alignment Measurement</u>	Go to Step 8
7	Replace the left rear tire. Refer to <u>Tire Dismounting and Mounting</u>. Is the repair complete?	Go to Step 9	-
8	Replace the right rear tire. Refer to <u>Tire Dismounting and Mounting</u>. Is the repair complete?	Go to Step 9	-
9	Verify proper vehicle operation. Does the original condition still exist?	Go to Step 1	System OK

REPAIR INSTRUCTIONS

ALUMINUM WHEEL POROSITY REPAIR

1. Remove the tire and wheel. Refer to **Tire and Wheel Removal and Installation**.
2. Inflate the tire to the manufactures specified pressure as stated on the tire.
3. Submerge the tire/wheel into a water bath in order to locate the leak.
4. Inscribe a mark on the wheel in order to indicate the leak areas.
5. Inscribe a mark on the tire at the valve stem in order to indicate the orientation of the tire to the wheel.

NOTE: Do not damage the exterior surface of the wheel.

6. Remove the tire from the wheel. Refer to **Tire Dismounting and Mounting**.
7. Use number 80 grit sandpaper to scuff the inside of the rim surface at the leak area.
8. Use general purpose cleaner to clean the leak area.
9. Apply 3 mm (0.12 in) thick layer of adhesive/sealant to the leak area.
10. Allow for the adhesive/sealant to dry.
11. Align the inscribed mark on the tire with the valve stem on the wheel.
12. Install the tire to the wheel. Refer to **Tire Dismounting and Mounting**.

13. Pressurize the tire to 276 kPa (40 psi).
14. Submerge the tire/wheel into a water bath in order to ensure the leak is sealed.
15. Inflate the tire to the specified pressure as stated on the tire placard.
16. Balance the tire and wheel. Refer to **Tire and Wheel Assembly Balancing - Off Vehicle** .
17. Install the tire and wheel. Refer to **Tire and Wheel Removal and Installation**.

ALUMINUM WHEEL REFINISHING

Finish Damage Evaluation Procedure

NOTE:

- If the wheels are chrome-plated, do not re-plate or refinish the wheels.
- If the wheels are polished aluminum, do not refinish the wheels in the dealer environment. Utilize a refinisher that meets manufacturer guidelines.

1. Inspect the wheels for damage from uncoated wheel balance weights or from automatic car wash facilities.
2. Inspect the wheels for the following conditions:
 - Corrosion
 - Scrapes
 - Gouges
3. Verify the damage is not deeper than what sanding can remove.
4. Inspect the wheels for cracks. If a wheel has cracks, discard the wheel.
5. Inspect the wheels for bent rim flanges. If a rim flange is bent, discard the wheel.

Refinishing Procedure

WARNING: To avoid serious personal injury when applying any two part component paint system, follow the specific precautions provided by the paint manufacturer. Failure to follow these precautions may cause lung irritation and allergic respiratory reaction.

1. Remove the tire and wheel assembly from the vehicle. Refer to **Tire and Wheel Removal and Installation**.
2. Remove the balance weights from the wheel.
3. Remove the tire from the wheel. Refer to **Tire Dismounting and Mounting**.

NOTE:

- Do not re-machine the wheel.
- Do not use chemicals in order to strip the paint from the wheel.

4. Use a suitable cleaner in order to remove the following contaminants from the wheel:

- Lubricants
 - Wax
 - Dirt
5. Use plastic media blasting in order to remove the paint from the wheel.
 6. If the wheel had a machined aluminum finish, spin the wheel and use sand paper in order to restore the circular machined appearance.

NOTE: The wheel mounting surface and the wheel nut contact surface must remain free of paint.

7. Mask the wheel mounting surface and the wheel nut contact surface.
8. Follow the paint manufacturer instructions for painting the wheel.
9. Install a new valve stem.

NOTE: Use new coated balance weights in order to balance the wheel.

10. Install the tire to the wheel. Refer to **Tire Dismounting and Mounting**.
11. Use a suitable cleaner in order to remove the following contaminants from the wheel mounting surface:
 - Corrosion
 - Overspray
 - Dirt
12. Install the tire and wheel assembly to the vehicle. Refer to **Tire and Wheel Removal and Installation**.

TIRE AND WHEEL REMOVAL AND INSTALLATION

Removal Procedure

Fig. 3: View Of Wheel Cap And Wheel Nuts
Courtesy of GENERAL MOTORS COMPANY

CAUTION: Refer to Lifting and Jacking the Vehicle .

1. Raise and support the vehicle.
2. Remove the wheel cap (1), if equipped.
3. Mark the wheel in relation to the wheel hub flange.
4. Remove the wheel nuts (2).

WARNING: If penetrating oil gets on the vertical surfaces between the wheel and the rotor or drum it could cause the wheel to work loose as the vehicle is driven, resulting in loss of control and an injury accident.

CAUTION: Removing the wheel may be difficult because of foreign materials or a tight fit between the wheel and the hub/rotor. Slightly tap the tire side wall with a rubber mallet in order to remove the wheel. Failure to follow these instructions may result in damage to the wheel.

5. Remove the tire and wheel assembly (3) from the vehicle. If the tire and wheel assembly is difficult to

remove, perform the following steps:

1. Install and tighten all wheel nuts on the affected wheel.
2. Loosen each wheel nut two turns.
3. Lower the vehicle to the ground.
4. Rock the vehicle from side to side.

CAUTION: Refer to Lifting and Jacking the Vehicle .

5. Raise and support the vehicle.
6. Remove the wheel nuts.
7. Remove the tire and wheel assembly.

Installation Procedure

WARNING: Before installing the wheels, remove any buildup of corrosion on the wheel mounting surface and brake drum or disc mounting surface by scraping and wire brushing. Installing wheels with poor metal-to-metal contact at the mounting surfaces can cause wheel fasteners to loosen. This can cause a wheel to come off when the vehicle is moving, causing loss of control and possibly personal injury.

NOTE: Wheel nuts, studs and mounting surfaces must be clean and dry.

1. Remove any corrosion or foreign material from the wheel and the hub mounting surfaces.
2. Clean the threads on the wheel studs and wheel nuts.

Fig. 4: Tire And Wheel Assembly
Courtesy of GENERAL MOTORS COMPANY

3. Install the tire and wheel assembly (3). Align the locating mark of the wheel to the hub.

CAUTION: Refer to Fastener Caution .

NOTE: Tighten the nuts evenly and alternatively in the sequence shown, in order to avoid excessive runout.

4. Install the wheel nuts (2) and tighten in sequence shown to 140 (103 lb ft).
5. Install the wheel cap (1), if equipped.
6. Lower the vehicle to the ground.

TIRE DISMOUNTING AND MOUNTING

CAUTION: Use a tire changing machine in order to dismount tires. Do not use hand tools or tire irons alone in order to remove the tire from the wheel. Damage to the tire beads or the wheel rim could result.

CAUTION: Do not scratch or damage the clear coating on aluminum wheels with the tire changing equipment. Scratching the clear coating could cause the aluminum wheel to corrode and the clear coating to peel from the wheel.

CAUTION: Damage to either the tire bead or the wheel mounting holes can result from the use of improper wheel attachment or tire mounting procedures. It takes up to 70 seconds for all of the air to completely exhaust from a large tire. Failure to follow the proper procedures could cause the tire changer to put enough force on the tire to bend the wheel at the mounting surface. Such damage may result in vibration and/or shimmy and under severe usage lead to wheel cracking.

1. Deflate the tire completely.
2. Use the tire changer in order to remove the tire from the wheel.
3. Use a wire brush or coarse steel wool in order to remove any rubber, light rust or corrosion from the wheel bead seats.

CAUTION: When mounting the tires, use an approved tire mounting lubricant. **DO NOT** use silicon or corrosive base compounds to lubricate the tire bead and the wheel rim. A silicon base compound can cause the tire to slip on the rim. A corrosive type compound can cause tire or rim deterioration.

4. Apply an approved lubricant to the tire bead and the wheel trim.
5. Use the tire changer in order to install the tire to the wheel.

WARNING: To avoid serious personal injury, do not stand over tire when inflating. The bead may break when the bead snaps over the safety hump. Do not exceed 275 kPa (40 psi) pressure when inflating any tire if beads are not seated. If 275 kPa (40 psi) pressure will not seat the beads, deflate, relubricate the beads and reinflate. Overinflation may cause the bead to break and cause serious personal injury.

6. Inflate the tire to the proper air pressure.
7. Ensure that the locating rings are visible on both sides of the tire in order to verify that the tire bead is fully seated on the wheel.

TIRE ROTATION

Rotate the tire and wheel assemblies at frequent intervals to equalize wear. Refer to the Maintenance Schedule in the Owner's Manual. In addition to scheduled rotation, rotate the tire and wheel assembly whenever uneven tire wear is noticed.

Radial tires tend to wear faster in the shoulder area, particularly in front positions. Radial tires in non-drive locations may develop an irregular wear pattern that may increase tire noise. This makes regular rotation

especially necessary.

1. Remove the tire and wheel assemblies. Refer to **Tire and Wheel Removal and Installation.**

Fig. 5: Tire And Wheel Assemblies
Courtesy of GENERAL MOTORS COMPANY

2. Rotate the tire and wheel assemblies as shown in the above diagram.
3. Install the tire and wheel assemblies. Refer to **Tire and Wheel Removal and Installation.**
4. Check the tire inflation pressure and adjust to the tire inflation specifications as necessary.

DESCRIPTION AND OPERATION

P-METRIC SIZED TIRES DESCRIPTION

The tire sidewall has a coded marking system, which provides information about the tire.

Fig. 6: Identifying P-Metric Sized Tires Description
Courtesy of GENERAL MOTORS COMPANY

Tire Marking Example:		
P 245 50 R 16 95 S		
P	Passenger Vehicle Designation	
245	Section Width in mm (245 mm)	
50	Aspect Ratio% (Section Height to Section Width) (50= 50%)	
R	Tire Construction (R= Radial)	
16	Rim Diameter in inches (16= 16")	
95	Max Load Index	91= 615 kg
		92= 630 kg
		93= 650 kg
		94= 670 kg
		95= 690 kg
		96= 710 kg

S	Speed Rating	97= 730 kg
		99= 775 kg
		104= 900 kg
		106= 950 kg
		R = 170 km/h
		S = 180 km/h
		H = 210 km/h
		V = 240 km/h
		W = 270 km/h

Most P-metric tire sizes do not have exact corresponding alphanumeric tire sizes. Replacement tires should be of the same tire performance criteria TPC specification number including the same size, the same load range and the same construction as those originally installed on the vehicle.

Consult a tire dealer if you must replace the P-metric tire with other sizes. Tire companies can best recommend the closest match of alphanumeric to P-metric sizes within their own tire lines.

The above illustration may not correspond with your vehicle, but is meant as an example.

REPLACEMENT WHEELS DESCRIPTION

Replace the wheel if any of the following conditions exist:

- The wheel exhibits excessive runout.
- The wheel is bent.
- The wheel is cracked.
- The wheel is severely rusted.
- The wheel is severely corroded.

NOTE: Air leaks caused by porosity on aluminum wheels are repairable.

- The wheel leaks air.

WARNING: If you are replacing the wheel(s), the wheel stud(s), the wheel nut(s) or the wheel bolt(s), install only new GM original equipment parts. Installation of used parts or non-GM original equipment parts may cause the wheel to loosen, loss of tire air pressure, poor vehicle handling and loss of vehicle control resulting in personal injury.

CAUTION: The use of non-GM original equipment wheels may cause:

- Damage to the wheel bearing, the wheel fasteners and the wheel
- Tire damage caused by the modified clearance to the adjacent

vehicle components

- **Adverse vehicle steering stability caused by the modified scrub radius**
- **Damage to the vehicle caused by the modified ground clearance**
- **Speedometer and odometer inaccuracy**

Replace the wheel, the wheel studs and the wheel nuts, if any of the following conditions exist:

- The wheel has elongated wheel stud holes.
- The wheel nuts loosen repeatedly.

STEEL WHEEL REPAIR DESCRIPTION

CAUTION: Do not heat wheels in an attempt to soften them for straightening or repair damage from striking curbs, etc. Do not weld wheels. The alloy used in these wheels is heat-treated and uncontrolled heating from welding affects the properties of the material.

CAUTION: The use of tubes in tubeless tires is not a recommended repair due to the fact that speed ratings are greatly reduced.

If leaks are found in a steel wheel, replace the wheel with a wheel of original equipment quality.

TIRE INFLATION DESCRIPTION

This vehicle has been engineered to operate up to the stated load capacity with wheel and tire assemblies of the type, size, construction and configuration as originally installed. Maintenance of the tire inflation pressures is critical to the continued satisfactory performance, handling and operating economy of the vehicle.

Operating the vehicle with improperly inflated tires can adversely affect vehicle performance and may contribute to the following:

- Reduced fuel economy
- Tire overloading
- Shortened tire life
- Excessive tire wear
- Uneven tire wear
- Vehicle handling concerns

Inspect the tire pressures when the vehicle has not been driven for at least 3 hours or not more than 1.6 km (1 mi) and when the tires are cool to the touch.

Tire inflation pressures should be inspected monthly and before an extended trip and adjusted to meet the specifications listed for the particular vehicle. Replace any missing or damaged tire valve stem extensions

and/or caps to prevent the intrusion of water and contaminants.

One pound per square inch (psi) equals 6.9 kilopascals (kPa). The following table illustrates the conversion of kilopascals to pounds per square inch:

Inflation Pressure Conversion (Kilopascals to PSI)

kPa	psi	kPa	psi
140	20	215	31
145	21	220	32
155	22	230	33
160	23	235	34
165	24	240	35
170	25	250	36
180	26	275	40
185	27	310	45
190	28	345	50
200	29	380	55
205	30	415	60
Conversion: 6.9 kPa = 1 psi			

For the correct inflation pressures refer to the vehicle Tire Placard.

Tires inflated to a higher than recommended pressure can contribute to the following conditions:

- A hard ride
- Tire bruising
- Rapid tread wear at the center of the tire

Tires inflated to a lower than recommended pressure can contribute to the following conditions:

- Tire squeal on turns
- Hard steering
- Rapid and/or uneven wear on the outer edges of the tread
- Tire rim bruises and tire rim rupture
- Tire cord breakage
- High tire temperatures
- Sluggish vehicle handling
- Higher fuel consumption

Unequal pressure on the same axle can cause the following conditions:

- Uneven braking action
- Steering lead

- Imprecise vehicle handling

TIRES AND WHEELS DESCRIPTION AND OPERATION

The factory installed tires are designed to operate satisfactorily with loads up to and including the full rated load capacity when these tires are inflated to the recommended pressures.

The following factors have an important influence on tire life:

- Correct tire pressures
- Correct wheel alignment
- Proper driving techniques
- Tire rotation

The following factors increase tire wear:

- Heavy cornering
- Excessively rapid acceleration
- Heavy braking

TRANSMISSION

Transmission Cooling - Spark

DIAGNOSTIC INFORMATION AND PROCEDURES

TRANSMISSION FLUID COOLER FLUSHING AND FLOW TEST (JATCO CVT)

GM studies indicate that plugged or restricted transmission oil coolers and pipes cause insufficient transmission lubrication and elevated operating temperatures which can lead to premature transmission failure. Many repeat repair cases could have been prevented by following published procedures for transmission oil cooler flushing and flow checking. This procedure includes flow checking and flushing the auxiliary transmission oil cooler, if equipped.

NOTE: Use the DT-45096 flush and flow test tool or equivalent to flush and flow test the transmission oil cooler and the oil cooler pipes after the transaxle is repaired.

Only the appropriate GM transmission fluid should be used when doing a repair on a GM transmission.

Time allowance for performing the cooler flow checking and flushing procedure has been included in the appropriate labor time guide operations since the 1987 model year. The service procedure steps for oil cooler flushing and flow testing are as follows:

Cooler Flow Check and Flushing Steps

1. Machine Set-up
2. Determine Minimum Flow Rate
3. Back Flush
4. Forward Flush
5. Flow Test
6. Code Recording Procedure
7. Clean-up

For equivalent regional tools, refer to **Special Tools**.

Special Tools

- **DT-45096** Transmission Oil Cooling System Flush and Flow Test Tool
- **DT-45096-50** Transmission Cooler Flush Adapter
- Shop air supply with water/oil filters, regulator and pressure gauge - minimum 90 psi
- Eye protection
- Rubber gloves

Machine Set-Up

Fig. 1: View Of Main Power Switch & Main Function Switch
Courtesy of GENERAL MOTORS COMPANY

1. Verify that the main power switch (1) is in the OFF position.
2. Place the main function switch (2) in the IDLE position.

Fig. 2: Connecting To 12V DC Power Source
Courtesy of GENERAL MOTORS COMPANY

3. Connect **DT-45096** flush and flow test tool to the vehicle 12V DC power source by connecting the red battery clip to the positive, +, battery post on the vehicle and connect the negative lead to a known good chassis ground.
4. Turn the main power switch to the ON position.

Fig. 3: Filling Supply Tank With Transmission Fluid
Courtesy of GENERAL MOTORS COMPANY

CAUTION: Do not overfill the supply vessel. Damage to the unit may result. To verify the fluid level, view the LCD screen display while filling the unit, to ensure the fluid level does not exceed 30 L (32 qt).

5. Fill the supply tank with Dexron®VI through the fill port.
6. Reinstall and tighten the fill cap.

Fig. 4: Applying Shop Air Supply Hose To Quick-Disconnect
Courtesy of GENERAL MOTORS COMPANY

7. Connect a shop air supply hose to the quick-disconnect on the rear panel marked SUPPLY AIR.

Determine Minimum Flow Rate

Fig. 5: Identifying Machine Display Of Automatic Transmission Fluid Temperature
Courtesy of GENERAL MOTORS COMPANY

1. From the machine display, identify the temperature of the automatic transmission fluid that is stored in the supply vessel of **DT-45096** flush and flow test tool.

Fig. 6: Identifying Transmission Oil Cooler Metal Composition
 Courtesy of GENERAL MOTORS COMPANY

2. Determine whether the transmission oil cooler is steel or aluminum by using a magnet (1) at the cooler flange (2) at the radiator.
3. Refer to the table below. Using the temperature from step 1, locate on either the Steel MINIMUM Flow Rate table or the Aluminum MINIMUM Flow Rate table the minimum flow rate in gallons per minutes (GPM). Record the minimum flow rate in GPMs and the supply fluid temperature for further reference.
 - Fluid temperature: 75°F
 - Cooler type: Steel

The MINIMUM flow rate for this example would be 0.8 GPM.

4. Inspect transmission oil cooler lines for damage or kinks that could cause restricted oil flow. Repair as needed and refer to the appropriate GM service manual procedures.

Minimum Flow Rate in Gallons Per Minute (gpm)

Temperature Range	Steel	Aluminum
-------------------	-------	----------

65-66°F	0.6 gpm	0.5 gpm
67-70°F	0.7 gpm	0.6 gpm
71-75°F	0.8 gpm	0.7 gpm
76-80°F	0.9 gpm	0.8 gpm
81-84°F	1.0 gpm	0.9 gpm
85-89°F	1.1 gpm	1.0 gpm
90-94°F	1.2 gpm	1.1 gpm
95-98°F	1.3 gpm	1.2 gpm
99-103°F	1.4 gpm	1.3 gpm
104-108°F	1.5 gpm	1.4 gpm
109-112°F	1.6 gpm	1.5 gpm
113-117°F	1.7 gpm	1.6 gpm
118-120°F	1.8 gpm	1.7 gpm

Back Flush Procedure

Fig. 7: Identifying Special Tool - J 45096-50
Courtesy of GENERAL MOTORS COMPANY

1. Connect the **DT-45096-50** cooler flush adapter (1) to the vehicle transmission oil cooler supply and return

lines at the transmission.

Fig. 8: View Of Black Supply Hose And Clear Waste Hose
Courtesy of GENERAL MOTORS COMPANY

2. Connect the black supply hose (1) to the return line, top connector of the transmission, and the clear waste hose (2) to the feed line, bottom connector of the transmission, to the vehicle cooler lines. This is the reverse flow - backflush direction.

Fig. 9: View Of Main Function Switch FLUSH Position
Courtesy of GENERAL MOTORS COMPANY

3. Turn the main function switch to the FLUSH position. Allow the machine to operate for 30 seconds.

IMPORTANT: To operate machine, supply
ATF must be greater than 65 F.

IDLE

FLUID 16 QTS @ 075F

IMPORTANT: 32 quart maximum
capacity supply vessel.

Fig. 10: View Of Main Function Switch IDLE Position
Courtesy of GENERAL MOTORS COMPANY

4. Turn the main function switch to the IDLE position and allow the supply vessel pressure to dissipate.

Forward Flush

Fig. 11: Identifying Supply And Waste Hoses
Courtesy of GENERAL MOTORS COMPANY

1. Disconnect the supply and waste hoses from the vehicle cooler lines. Reverse the supply and waste hoses to provide a normal flow direction.

IMPORTANT: To operate machine, supply
ATF must be greater than 65 F.

FLUSH

FLUID 18 QTS

IMPORTANT: 32 quart maximum
capacity supply vessel.

Fig. 12: View Of Main Function Switch FLUSH Position
Courtesy of GENERAL MOTORS COMPANY

2. Turn the main function switch to the FLUSH position and allow machine to operate for 30 seconds.

Flow Test

Fig. 13: View Of Main Function Switch FLOW Position
Courtesy of GENERAL MOTORS COMPANY

NOTE: If the flow rate is less than 0.5 gpm, the LCD displays an error message. Refer to the Troubleshooting section of the operation manual.

1. Turn the main function switch to the FLOW position and allow the oil to flow for 15 seconds. Observe and note the flow rate; this is the TESTED flow rate.
2. Compare the TESTED flow rate to the MINIMUM flow rate information previously recorded.
 - If the TESTED flow rate is equal to or greater than the MINIMUM flow rate recorded, the oil cooling system is functioning properly. Perform Code Recording Procedure.
 - If the TESTED flow rate is less than the MINIMUM flow rate previously recorded, repeat the back flush and forward flush procedures.
3. If the TESTED flow rate is less than the MINIMUM flow rate after the second test, perform Code Recording Procedure.

1. Replace the transmission oil cooler.
2. Reconnect supply and waste hoses to the cooler lines in the normal flow direction. Perform Flow Test.
3. Perform Code Recording Procedure.

Code Recording Procedure

IMPORTANT: To operate machine, supply
ATF must be greater than 65 F.

FLOW 1.0 @ 75F CYCLE 6
A10DFB2

IMPORTANT: 32 quart maximum
capacity supply vessel.

Fig. 14: View Of Main Function Switch CODE Position
Courtesy of GENERAL MOTORS COMPANY

1. Turn the main function switch to the CODE position.

NOTE:

- If power is interrupted prior to the recording of the seven-character code, the code will be lost and the flow rate test will need to be repeated.

- The flow test must run for a minimum of 8-10 seconds and be above 0.5 GPM for a code to be generated.

2. Record TESTED flow rate, temperature, cycle and seven-character flow code information on repair order.

Clean-Up

Fig. 15: View Of Main Power Switch & Main Function Switch
Courtesy of GENERAL MOTORS COMPANY

1. Turn the main function switch (2) to the IDLE position and allow the supply vessel pressure to dissipate.
2. Turn the main power switch (1) to the OFF position.

NOTE: A small amount of water may drain from the bottom of the unit when the air supply is disconnected. This is a normal operation of the built-in water

separator.

3. Disconnect the supply and waste hoses and the 12-volt power source from the vehicle.

Fig. 16: Applying Shop Air Supply Hose To Quick-Disconnect
Courtesy of GENERAL MOTORS COMPANY

4. Disconnect the air supply hose from **DT-45096** flush and flow test tool.
5. Dispose of the waste ATF in accordance with all applicable federal, state, and local requirements.

Dissimilar Fluid

1. If the transmission uses fluid other than DEXRON @VI fluid, blow out residual fluid from cooler and cooler lines with compressed air.
2. Connect the oil cooler supply line to the transmission.

3. Put the return line in waste oil container.

CAUTION: Do not run engine for more than 10 seconds or transmission damage may occur.

4. Fill transmission with 6.38 liters (6.75 quarts) of transmission fluid.
5. Run engine at idle for 10 seconds.
6. Remove air cleaner assembly. Refer to **Air Cleaner Assembly Replacement** .
7. Connect the oil cooler return line to the transmission.
8. Install the air cleaner assembly. Refer to **Air Cleaner Assembly Replacement** .

TRANSMISSION FLUID COOLER FLUSHING AND FLOW TEST (AISIN 80-40LE)

GM studies indicate that plugged or restricted transmission oil coolers and pipes cause insufficient transmission lubrication and elevated operating temperatures which can lead to premature transmission failure. Many repeat repair cases could have been prevented by following published procedures for transmission oil cooler flushing and flow checking. This procedure includes flow checking and flushing the auxiliary transmission oil cooler, if equipped.

NOTE: Use the DT-45096 flush and flow test tool or equivalent to flush and flow test the transmission oil cooler and the oil cooler pipes after the transmission is removed for repairs.

Only use the appropriate GM Goodwrench automatic transmission fluid when doing a repair on a GM transmission.

Time allowance for performing the cooler flow checking and flushing procedure has been included in the appropriate labor time guide operations since the 1987 model year. The service procedure steps for oil cooler flushing and flow testing are as follows:

Cooler Flow Check and Flushing Steps

1. Machine Set-up
2. Determine Minimum Flow Rate
3. Back Flush
4. Forward Flush
5. Flow Test
6. Code Recording Procedure
7. Clean-up

Special Tools

- **DT-45096** Transmission Oil Cooling System Flush and Flow Test Tool

- **J-45096-55** Transmission Cooler Flush Adapter
- Shop air supply with water/oil filters, regulator and pressure gauge - minimum 90 psi
- Eye protection
- Rubber gloves

For equivalent regional tools, refer to **Special Tools**.

Machine Set-Up

Fig. 17: View Of Main Power Switch & Main Function Switch
 Courtesy of GENERAL MOTORS COMPANY

1. Verify that the main power switch (1) is in the OFF position.
2. Place the main function switch (2) in the IDLE position.

Fig. 18: Connecting To 12V DC Power Source
Courtesy of GENERAL MOTORS COMPANY

3. Connect **DT-45096** flush and flow test tool to the vehicle 12V DC power source by connecting the red battery clip to the positive, +, battery post on the vehicle and connect the negative lead to a known good chassis ground.
4. Turn the main power switch to the ON position.

Fig. 19: Filling Supply Tank With Transmission Fluid
Courtesy of GENERAL MOTORS COMPANY

CAUTION: Do not overfill the supply vessel. Damage to the unit may result. To verify the fluid level, view the LCD screen display while filling the unit, to ensure the fluid level does not exceed 30 L (32 qt).

5. Fill the supply tank with the appropriate transmission fluid through the fill port.
6. Reinstall and tighten the fill cap.

Fig. 20: Applying Shop Air Supply Hose To Quick-Disconnect
Courtesy of GENERAL MOTORS COMPANY

7. Connect a shop air supply hose to the quick-disconnect on the rear panel marked SUPPLY AIR.

Determine Minimum Flow Rate

Fig. 21: Identifying Machine Display Of Automatic Transmission Fluid Temperature
Courtesy of GENERAL MOTORS COMPANY

NOTE: Due to the large size of the oil cooling system components and the flow capacity of the DT-45096 flush and flow test tool, fluid temperature in excess of 100 degrees Fahrenheit can cause inaccurate flow readings.

1. From the machine display, identify the temperature of the automatic transmission fluid that is stored in the supply vessel of **DT-45096** flush and flow test tool.
2. Refer to the table below. Using the temperature from step 1, locate on the MINIMUM Flow Rate table the minimum flow rate in gallons per minutes (GPM). Record the minimum flow rate in GPMs and the supply fluid temperature for further reference.

Example

- Fluid temperature: 75°F
 - The MINIMUM flow rate for this example would be 1.7 GPM.
3. Inspect transmission oil cooler lines for damage or kinks that could cause restricted oil flow. Repair as needed and refer to the appropriate GM service manual procedures.

Minimum Flow Rate in Gallons Per Minute (gpm)

Temperature Range	Minimum Flow Rate
65-66°F	1.4 gpm
67-71°F	1.5 gpm
72-74°F	1.6 gpm
75-82°F	1.7 gpm
83-91°F	1.8 gpm
92-96°F	1.9 gpm
97-104°F	2.1 gpm
105-113°F	2.2 gpm

Back Flush Procedure

Fig. 22: Cooler Flush Adapter
Courtesy of GENERAL MOTORS COMPANY

1. Connect the **J-45096-55** cooler flush adapter (1) to the vehicle transmission oil cooler supply and return lines at the transmission.

Fig. 23: Black Supply Hose

Courtesy of GENERAL MOTORS COMPANY

2. Connect the black supply hose (1) to the return line, bottom connector of the transmission, and the clear waste hose (2) to the feed line, top connector of the transmission, to the vehicle cooler lines. This is the reverse flow - backflush direction.

Fig. 24: View Of Main Function Switch FLUSH Position
Courtesy of GENERAL MOTORS COMPANY

3. Turn the main function switch to the FLUSH position. Allow the machine to operate for 30 seconds.

IMPORTANT: To operate machine, supply
ATF must be greater than 65 F.

IDLE

FLUID 16 QTS @ 075F

IMPORTANT: 32 quart maximum
capacity supply vessel.

Fig. 25: View Of Main Function Switch IDLE Position
Courtesy of GENERAL MOTORS COMPANY

4. Turn the main function switch to the IDLE position and allow the supply vessel pressure to dissipate.

Forward Flush

Fig. 26: Black Supply Hose

Courtesy of GENERAL MOTORS COMPANY

1. Disconnect the supply hose (1) and waste hose (2) from the vehicle cooler lines. Reverse the supply and waste hoses to provide a normal flow direction.

IMPORTANT: To operate machine, supply
ATF must be greater than 65 F.

FLUSH

FLUID 18 QTS

IMPORTANT: 32 quart maximum
capacity supply vessel.

Fig. 27: View Of Main Function Switch FLUSH Position
Courtesy of GENERAL MOTORS COMPANY

2. Turn the main function switch to the FLUSH position and allow machine to operate for 30 seconds.

Flow Test

Fig. 28: View Of Main Function Switch FLOW Position
Courtesy of GENERAL MOTORS COMPANY

NOTE: If the flow rate is less than 0.5 gpm, the LCD displays an error message. Refer to the Troubleshooting section of the operation manual.

1. Turn the main function switch to the FLOW position and allow the oil to flow for 15 seconds. Observe and note the flow rate; this is the TESTED flow rate.
2. Compare the TESTED flow rate to the MINIMUM flow rate information previously recorded.
 - If the TESTED flow rate is equal to or greater than the MINIMUM flow rate recorded, the oil cooling system is functioning properly. Perform Code Recording Procedure.
 - If the TESTED flow rate is less than the MINIMUM flow rate previously recorded, repeat the back flush and forward flush procedures.
3. If the TESTED flow rate is less than the MINIMUM flow rate after the second test, perform Code Recording Procedure.

1. Replace the transmission oil cooler.
2. Reconnect supply and waste hoses to the cooler lines in the normal flow direction. Perform Flow Test.
3. Perform Code Recording Procedure.
4. Disconnect the supply hose and waste hose from the vehicle cooler lines.
5. Use compressed air to blow the residual transmission fluid out of the oil cooler and lines if the fluid in the **DT-45096** flush and flow test tool is different than what is used in the transmission.

Code Recording Procedure

IMPORTANT: To operate machine, supply
ATF must be greater than 65 F.

FLOW 1.0 @ 75F CYCLE 6
A10DFB2

IMPORTANT: 32 quart maximum
capacity supply vessel.

Fig. 29: View Of Main Function Switch CODE Position
Courtesy of GENERAL MOTORS COMPANY

1. Turn the main function switch to the CODE position.

NOTE:

- If power is interrupted prior to the recording of the seven-character code, the code will be lost and the flow rate test will need to be repeated.
- The flow test must run for a minimum of 8-10 seconds and be above 0.5 GPM for a code to be generated.

2. Record TESTED flow rate, temperature, cycle and seven-character flow code information on repair order.

Clean-Up

Fig. 30: View Of Main Power Switch & Main Function Switch
Courtesy of GENERAL MOTORS COMPANY

1. Turn the main function switch (2) to the IDLE position and allow the supply vessel pressure to dissipate.
2. Turn the main power switch (1) to the OFF position.

NOTE: A small amount of water may drain from the bottom of the unit when the air supply is disconnected. This is a normal operation of the built-in water separator.

3. Disconnect the supply and waste hoses and the 12-volt power source from the vehicle.

Fig. 31: Applying Shop Air Supply Hose To Quick-Disconnect
Courtesy of GENERAL MOTORS COMPANY

4. Disconnect the air supply hose from **DT-45096** flush and flow test tool.
5. Dispose of the waste transmission fluid in accordance with all applicable federal, state, and local requirements.

REPAIR INSTRUCTIONS

TRANSMISSION FLUID COOLER INLET AND OUTLET PIPE REPLACEMENT (AISIN 80-40LE)

Fig. 32: Transmission Cooler Pipes and Hoses
 Courtesy of GENERAL MOTORS COMPANY

Transmission Fluid Cooler Inlet and Outlet Pipe Replacement (Aisin 80-40LE)

Callout	Component Name
Preliminary Procedures 1. Remove the front bumper fascia opening lower cover. Refer to <u>Front Bumper Fascia Opening Lower Cover Replacement</u> . 2. Remove the range selector lever cable bracket. Refer to <u>Range Selector Lever Cable Bracket Replacement</u> .	
1	Transmission Fluid Cooler Pipe Bracket Bolt CAUTION: Refer to <u>Fastener Caution</u> . Tighten 22 (16 lb ft)
2	Transmission Fluid Cooler Pipe Quick Connect
3	Transmission Fluid Cooler Pipe Fitting Nut Tighten 16 (12 lb ft)
	Transmission Fluid Cooler Pipe Procedure

4

1. Note the routing of the transmission line to ensure proper installation.
2. Remove the transmission line from the clips securing the line to the fan shroud. Refer to **Transmission Fluid Cooler Hose/Pipe Quick-Connect Fitting Disconnection and Connection** .
3. Inspect the transmission fluid level. Refer to **Transmission Fluid Level and Condition Check** .

TRANSMISSION FLUID COOLER INLET AND OUTLET PIPE REPLACEMENT (JATCO CVT)

Fig. 33: Transmission Fluid Cooler Inlet and Outlet Pipe
Courtesy of GENERAL MOTORS COMPANY

Transmission Fluid Cooler Inlet and Outlet Pipe Replacement (Jatco CVT)

Callout	Component Name
Preliminary Procedures	
1. Remove the air cleaner assembly. Refer to <u>Air Cleaner Assembly Replacement</u> . 2. Remove the front bumper fascia opening lower cover. Refer to <u>Front Bumper Fascia Opening Lower Cover Replacement</u> .	
1	Transmission Fluid Cooler Pipe Nut (Qty: 2) CAUTION: Refer to <u>Fastener Caution</u> .

	Tighten 11 (97 lb in)
2	Transmission Fluid Cooler Pipe Quick Connect
3	Transmission Fluid Cooler Pipe Procedure 1. Note the routing of the transmission line to ensure proper installation. 2. Remove the transmission line from the clips securing the line to the fan shroud. Refer to <u>Transmission Fluid Cooler Hose/Pipe Quick-Connect Fitting Disconnection and Connection</u> . 3. Inspect the transmission fluid level. Refer to <u>Transmission Fluid Level and Condition Check</u> .

DIAGNOSTIC INFORMATION AND PROCEDURES

SYMPTOMS - CLUTCH

Symptom List

Refer to a symptom diagnostic procedure from the following list in order to diagnose the symptom.

- Clutch Does Not Disengage
- Clutch Slipping
- Clutch Grabbing

- **Clutch Rattle**
- **Release Bearing Noisy with Clutch Engaged**
- **Clutch Noisy**
- **Clutch Pedal Hard to Push**

CLUTCH DOES NOT DISENGAGE

Clutch Does Not Disengage

Causes	Actions
DEFINITION: When the pedal is pressed to the floor, the shift lever does not move freely in and out of reverse gear.	
Damaged clutch disc	Replace the clutch assembly. Refer to <u>Clutch Pressure and Driven Plate Replacement</u> .
Clutch disc hub binding on the input shaft splines	Replace the clutch assembly. Refer to <u>Clutch Pressure and Driven Plate Replacement</u> .
Warped or bent clutch disc	Replace the clutch assembly. Refer to <u>Clutch Pressure and Driven Plate Replacement</u> .
Pedal blocked from full travel	1. Inspect for obstacles that will prevent the pedal from going to the floor. 2. Clear any obstacles from under the pedal area, such as floor mats or interior panels.
Too much travel between pedal and hydraulic clutch master cylinder	1. Inspect the pedal for worn bushings. 2. Replace the pedal bushings if worn.
Hydraulic clutch master cylinder seized or binding	1. Inspect the master cylinder for the piston being able to move freely and full range of travel. 2. Replace the clutch master cylinder as required. Refer to <u>Clutch Master Cylinder Replacement</u>.
Air in the hydraulic clutch system	Bleed the hydraulic clutch system. Refer to <u>Hydraulic Clutch System Bleeding</u> .
Hydraulic clutch actuator cylinder seized or binding	1. Inspect the clutch actuator piston for moving freely. 2. Replace the clutch actuator cylinder if the piston is binding. Refer to <u>Clutch Actuator Cylinder Replacement</u>.
Hydraulic clutch master cylinder leaking internally	1. Inspect for proper pedal reserve. 1. Let up halfway on pedal. 2. Apply the pedal a few times. 3. Inspect to ensure there is still the proper pedal reserve. 2. Replace the clutch master cylinder if it will not hold pedal reserve. Refer to <u>Clutch Master Cylinder Replacement</u>.

CLUTCH SLIPPING

Clutch Slipping

Condition	Action
DEFINITION: The clutch does not engage completely after the pedal is released, after shifting gears, or the clutch slips during maximum engine loads, such as climbing hills or high vehicle speeds. Clutch slipping is identified by increase in engine RPM without increase in vehicle speed. Review the <u>Symptoms - Clutch</u> and perform the necessary inspections.	
Incorrect clutch pedal height, not allowing the clutch master cylinder to return.	Adjust the clutch pedal position switch. Refer to <u>Clutch Pedal Position Sensor Replacement</u> .
The clutch pedal return spring is broken or missing.	Replace the clutch pedal return spring, if equipped. Refer to <u>Clutch Pedal Replacement</u> .
The clutch pedal is binding or sticking.	1. Clear away any items that may be contacting the pedal. 2. Inspect the pedal bushings for ease of movement. 3. Replace the clutch pedal if it is faulty. Refer to <u>Clutch Pedal Replacement</u>.
Clutch master cylinder binding or seized.	Replace the clutch master cylinder. Refer to <u>Clutch Master Cylinder Replacement</u> .
Clutch actuator cylinder binding or seized.	Replace the clutch actuator cylinder. Refer to <u>Clutch Actuator Cylinder Replacement</u> .
Kinked or damaged clutch actuator cylinder front pipe.	1. Inspect for the correct routing of the clutch actuator cylinder front pipe. 2. Route the clutch actuator cylinder front pipe properly. 3. Inspect for loose or faulty engine mounts that may allow the clutch actuator cylinder front pipe to be kinked or pinched. 4. Repair or replace faulty engine mounts. 5. Replace the clutch actuator cylinder front pipe if it is damaged. Refer to <u>Clutch Actuator Cylinder Front Pipe Replacement</u>.
Grease or oil contamination of the clutch disc.	1. Repair the source of the oil leak. 2. Repair the source of the grease leak. 3. Clean the contamination from the clutch components. 4. If contaminants cannot be removed, replace the clutch assembly. Refer to <u>Clutch Pressure and Driven Plate Replacement</u>.
Oil-soaked clutch disc.	Correct the leak at its source and install a new clutch disc.
Weak diaphragm spring.	Replace the clutch assembly. Refer to <u>Clutch Pressure and Driven Plate Replacement</u> .
Driven plate that is not seated.	Start the engine 30-40 times. Do not overheat the engine.
Driven plate is overheated.	Allow the driven plate to cool.
Worn or damaged flywheel.	Replace the engine flywheel.
Worn clutch disc facing.	Replace the clutch assembly. Refer to <u>Clutch Pressure and Driven Plate Replacement</u> .
Burnt or glazed clutch discs.	Replace the clutch assembly. Refer to <u>Clutch Pressure and Driven Plate Replacement</u> .

Improper resurfacing of the flywheel.

Replace the flywheel if it has been improperly resurfaced, allowing contact of the clutch disc hub or insufficient clamping load of the pressure plate.

CLUTCH GRABBING

Clutch Grabbing

Causes	Actions
DEFINITION: The clutch grabs, or chatters, or the clutch is unable to release without the vehicle jerking. An abrupt engagement of the clutch. Review the <u>Symptoms - Clutch</u> and perform the necessary inspections.	
Grease or oil contamination on the clutch facings	1. Repair the cause of the oil leak or grease contamination. 2. Clean the clutch facings. 3. Replace the clutch components if they will not clean. Refer to <u>Clutch Pressure and Driven Plate Replacement</u>.
Loose or faulty engine mounts	1. Inspect the engine mounts for being loose or faulty. 2. Repair or replace the engine/transmission mounts as required.
Clutch pedal sticking	1. Inspect the clutch pedal for correct operation. 2. Replace the clutch pedal if it is faulty. Refer to <u>Clutch Pedal Replacement</u>.
Clutch actuator binding	1. Inspect the clutch actuator for the piston seals binding or sticking. 2. Replace the clutch actuator if it is binding. Refer to <u>Clutch Actuator Cylinder Replacement</u>.
Clutch master cylinder binding	1. Inspect the clutch master cylinder for the piston binding or sticking in the cylinder. 2. Replace the master cylinder if it is faulty. Refer to <u>Clutch Master Cylinder Replacement</u>.
Warped clutch cover	1. Inspect the clutch cover for distortion caused by improperly tightening the clutch cover bolts. 2. Replace the clutch cover if it is distorted. Refer to <u>Clutch Pressure and Driven Plate Replacement</u>.
Improper clutch installation	1. Inspect the pressure plate for distortion caused by improperly tightening the pressure plate bolts. 2. Inspect the clutch disc for a bent hub caused by forcing the installation of the transmission. 3. Inspect for the correct clutch disc. 4. Inspect the clutch disc for being installed backwards. 5. Replace the clutch assembly if it is damaged or the wrong components were installed. Refer to <u>Clutch Pressure and Driven Plate Replacement</u>.
Clutch disc binding on the input	1. Inspect the input shaft for rust dirt or debris.

shaft	- Clean and lubricate the input shaft. - Inspect the clutch disc for a bent hub. - Replace the clutch assembly if the clutch disc is faulty. Refer to <u>Clutch Pressure and Driven Plate Replacement</u>. - Inspect the input shaft for excessive wear on the splines, causing the clutch disc to bind. - Replace the transmission input shaft if it is worn. Refer to <u>Input Shaft Disassemble (HD)</u>.
Clutch pressure plate damaged	- Inspect the pressure plate for bent drive straps caused by improper vehicle use. - Replace the clutch assembly if the clutch pressure plate is damaged. Inform the customer. Refer to <u>Clutch Pressure and Driven Plate Replacement</u>.
Flywheel improperly machined	- Inspect the flywheel for being improperly machined, and causing interference with the clutch disc. - Replace the flywheel if it has been improperly machined.
Flywheel uneven	- Inspect the flywheel surface for being warped or uneven. - Replace the flywheel if it is faulty.

CLUTCH RATTLE

Clutch Rattle

Condition	Action
DEFINITION: A rattle noise coming from the clutch components with the clutch disengaged or engaged. Review the <u>Symptoms - Clutch</u> and perform the necessary inspections.	
Idle rattle clutch engaged	Replace the clutch disc, due to faulty damper springs. Refer to <u>Clutch Pressure and Driven Plate Replacement</u> .
Clutch is improperly installed	Remove the clutch and install it correctly. Refer to <u>Clutch Pressure and Driven Plate Replacement</u> .
Clutch disc damper worn or damaged	- Inspect the clutch disc for a broken or worn damper. - Replace the clutch assembly. Refer to <u>Clutch Pressure and Driven Plate Replacement</u>.
Oil in the driven plate damper	Correct the cause of the oil leak and replace the clutch assembly. Refer to <u>Clutch Pressure and Driven Plate Replacement</u> .
Clutch disc splines and input shaft splines worn	- Inspect the clutch disc hub to input shaft splines for excessive clearance. - Replace the clutch assembly if the clutch splines are worn. Refer to <u>Clutch Pressure and Driven Plate Replacement</u>. - Replace the transmission input shaft if it is worn. Refer to <u>Input Shaft Disassemble (HD)</u>.

RELEASE BEARING NOISY WITH CLUTCH ENGAGED

Release Bearing Noisy with Clutch Engaged

Condition	Action
Check for a binding release bearing.	Clean and re-lubricate the release bearing. Inspect the release bearing for burrs and nicks.
Inspect for an improperly installed release lever.	Remove and reinstall the release lever properly.

CLUTCH NOISY

Clutch Noisy

Condition	Action
Clutch release bearing damaged or worn.	Replace the clutch release bearing. Refer to <u>Clutch Release Bearing Replacement</u> .

CLUTCH PEDAL HARD TO PUSH

Clutch Pedal Hard to Push

Condition	Action
DEFINITION: The clutch pedal requires high effort to operate. Review the <u>Symptoms - Clutch</u> and perform the necessary inspections.	
Incorrect hydraulic fluid.	1. Inspect for the correct fluid in the master cylinder. Refer to <u>Hydraulic Clutch System Bleeding</u>. 2. If mineral oil is found, replace the clutch master cylinder, the clutch actuator cylinder, and flush the hydraulic system and fill with the correct fluid. Refer to <u>Clutch Master Cylinder Replacement</u>, and <u>Hydraulic Clutch System Bleeding</u>.
Contaminated hydraulic fluid.	1. Inspect the hydraulic fluid for water. 2. Inspect the hydraulic fluid for dirt or debris. 3. Inspect the clutch hydraulic fluid for contamination of mineral oil. If contaminated, replace the clutch master cylinder and the clutch actuator cylinder. Refer to <u>Clutch Master Cylinder Replacement</u>. 4. Flush the hydraulic system and fill with the correct fluid. Refer to <u>Hydraulic Clutch System Bleeding</u>.
Clutch pedal binding.	1. Inspect the pedal for binding. 2. Replace the pedal. Refer to <u>Clutch Pedal Replacement</u>.
Clutch pedal spring worn.	1. Inspect the clutch pedal spring for wear. 2. Replace the clutch pedal. Refer to <u>Clutch Pedal Replacement</u>.
Kinked or damaged clutch actuator cylinder front pipe.	1. Inspect for a kinked or damaged clutch actuator cylinder front pipe.

	2. Replace the clutch actuator cylinder front pipe. Refer to <u>Clutch Actuator Cylinder Front Pipe Replacement</u> .
Clutch disc worn too thin.	Replace the clutch assembly. Refer to <u>Clutch Pressure and Driven Plate Replacement</u> .

REPAIR INSTRUCTIONS

CLUTCH PEDAL REPLACEMENT

NOTE: The clutch pedal is part of the brake, accelerator, and clutch pedal assembly and cannot be serviced separately.

To replace the brake, accelerator and clutch pedal assembly. Refer to Brake Pedal Assembly Replacement (Left Hand Drive) , Brake Pedal Assembly Replacement (Right Hand Drive) .

CLUTCH PEDAL RETURN SPRING REPLACEMENT

Fig. 1: Clutch Pedal Return Spring
 Courtesy of GENERAL MOTORS COMPANY

Clutch Pedal Return Spring Replacement

Callout	Component Name
Preliminary Procedure	
Remove the instrument panel lower reinforcement bracket. Refer to <u>Instrument Panel Lower Reinforcement Bracket Replacement</u> .	

1

Clutch Pedal Return Spring

Procedure

Disengage the clutch pedal return spring, using suitable pliers.

CLUTCH MASTER CYLINDER RESERVOIR HOSE REPLACEMENT

Removal Procedure

1. Remove the engine control module (ECM). Refer to **Engine Control Module Replacement** .

Fig. 2: Clutch Master Cylinder Reservoir Hose And Hose Seal

Courtesy of GENERAL MOTORS COMPANY

NOTE: Before disconnecting the reservoir hose, remove the clutch/brake fluid from the reservoir tank.

2. Remove the clutch master cylinder reservoir hose (1) and hose seal (2) from the reservoir tank and the master cylinder.

Installation Procedure

Fig. 3: Clutch Master Cylinder Reservoir Hose Assembly
Courtesy of GENERAL MOTORS COMPANY

1. Install the NEW clutch master cylinder reservoir hose assembly (1) to the reservoir tank and the master cylinder.
2. Bleed hydraulic clutch system. Refer to **Hydraulic Clutch System Bleeding**.
3. Fill the reservoir with clutch/brake fluid up to the MAX level.
4. Install the engine control module (ECM). Refer to **Engine Control Module Replacement** .

CLUTCH MASTER CYLINDER REPLACEMENT

Removal Procedure

1. Remove the battery tray. Refer to **Battery Tray Replacement** .

Fig. 4: Clutch Actuator Cylinder Front Pipe
Courtesy of GENERAL MOTORS COMPANY

NOTE: Before disconnecting the clutch actuator cylinder front pipe, remove the clutch/brake fluid from the reservoir tank.

2. Unclip the clutch actuator cylinder front pipe (1) from the retainers (2).

Fig. 5: Retaining Clip And Clutch Actuator Cylinder Front Pipe
Courtesy of GENERAL MOTORS COMPANY

3. Remove the retaining clip (1).
4. Disconnect the clutch actuator cylinder front pipe (2) from the clutch master cylinder.
5. Remove the clutch master cylinder reservoir hose from the master cylinder. Refer to **Clutch Master Cylinder Reservoir Hose Replacement**.

Fig. 6: 2 Clutch Master Cylinder Mount Nuts
Courtesy of GENERAL MOTORS COMPANY

6. Remove the 2 clutch master cylinder mount nuts (1).

Fig. 7: Push Rod Retainer

Courtesy of GENERAL MOTORS COMPANY

NOTE: Press the 2 latches (arrows) together.

7. Remove the instrument panel lower reinforcement bracket. Refer to **Instrument Panel Lower Reinforcement Bracket Replacement**.
8. Disconnect the push rod retainer (1) from the clutch pedal.
9. Remove the clutch master cylinder (2).

Installation Procedure

Fig. 8: Push Rod Retainer

Courtesy of GENERAL MOTORS COMPANY

NOTE: The retaining clip (arrows) has to engage audibly.

1. Install the clutch master cylinder (2).
2. Connect the push rod retainer (1) to the clutch pedal.
3. Install the instrument panel lower reinforcement bracket. Refer to **Instrument Panel Lower Reinforcement Bracket Replacement** .

Fig. 9: 2 Clutch Master Cylinder Mount Nuts
Courtesy of GENERAL MOTORS COMPANY

CAUTION: Refer to Fastener Caution .

4. Install the 2 clutch master cylinder mount nuts (1) and tighten to 22 (16 lb ft).
5. Install the clutch master cylinder reservoir hose to the master cylinder. Refer to Clutch Master Cylinder Reservoir Hose Replacement.

Fig. 10: Retaining Clip And Clutch Actuator Cylinder Front Pipe
Courtesy of GENERAL MOTORS COMPANY

6. Install the retaining clip (1).
7. Connect the clutch actuator cylinder front pipe (2) to the clutch master cylinder.

Fig. 11: Clutch Actuator Cylinder Front Pipe
Courtesy of GENERAL MOTORS COMPANY

8. Clip the clutch actuator cylinder front pipe (1) to the retainers (2).
9. Bleed the hydraulic clutch system. Refer to **Hydraulic Clutch System Bleeding**.
10. Fill the reservoir with clutch/brake fluid up to the MAX level.
11. Install the battery tray. Refer to **Battery Tray Replacement**.

CLUTCH ACTUATOR CYLINDER FRONT PIPE REPLACEMENT

Removal Procedure

1. Remove the battery tray. Refer to **Battery Tray Replacement**.
2. Remove the air cleaner assembly. Refer to **Air Cleaner Assembly Replacement**.

Fig. 12: Clutch Actuator Cylinder Front Pipe
Courtesy of GENERAL MOTORS COMPANY

3. Unclip the clutch actuator cylinder front pipe (1) from the retainers (2).

Fig. 13: Retaining Clip And Clutch Actuator Cylinder Front Pipe
Courtesy of GENERAL MOTORS COMPANY

NOTE: Before disconnecting the clutch actuator cylinder front pipe, remove the clutch/brake fluid from the reservoir tank.

4. Remove the retaining clip (1).
5. Disconnect the clutch actuator cylinder front pipe (2) from the clutch master cylinder.

Fig. 14: Clutch Actuator Cylinder Front Pipe
Courtesy of GENERAL MOTORS COMPANY

6. Remove the retaining clip (1).
7. Disconnect the clutch actuator cylinder front pipe (2) from the clutch actuator cylinder.
8. Remove the clutch actuator cylinder front pipe.

Installation Procedure

1. Install the clutch actuator cylinder front pipe.

Fig. 15: Clutch Actuator Cylinder Front Pipe
Courtesy of GENERAL MOTORS COMPANY

2. Install the retaining clip (1).
3. Connect the clutch actuator cylinder front pipe (2) to the clutch actuator cylinder.

Fig. 16: Retaining Clip And Clutch Actuator Cylinder Front Pipe
Courtesy of GENERAL MOTORS COMPANY

4. Install the retaining clip (1).
5. Connect the clutch actuator cylinder front pipe (2) to the clutch master cylinder.

Fig. 17: Clutch Actuator Cylinder Front Pipe
Courtesy of GENERAL MOTORS COMPANY

6. Clip the clutch actuator cylinder front pipe (1) to the retainers (2).
7. Bleed the hydraulic clutch system. Refer to **Hydraulic Clutch System Bleeding**.
8. Fill the reservoir with clutch/brake fluid up to the MAX level.
9. Install the air cleaner assembly. Refer to **Air Cleaner Assembly Replacement** .
10. Install battery tray. Refer to **Battery Tray Replacement** .

HYDRAULIC CLUTCH SYSTEM BLEEDING

WARNING: Refer to **Brake Fluid Irritant Warning** .

CAUTION: Refer to **Brake Fluid Effects on Paint and Electrical Components Caution** .

NOTE: Brake fluid must not come in contact with mineral oils and greases. The smallest amount of such could lead to malfunction or breakdown of the clutch.

NOTE: The hydraulic clutch actuation must only be bled from "below", i.e. from the bleeder valve.

Fig. 18: Identifying Valve Cap

Courtesy of GENERAL MOTORS COMPANY

NOTE: The following operational stages must be undertaken to fill the pressure line between the master cylinder and the clutch actuator cylinder. When bleeding, ensure that the brake fluid reservoir is always full and does not run dry.

1. Bleed pressure line between the clutch master cylinder and the clutch actuator cylinder using the following procedure:
 1. Remove the valve cap (1) from the bleeder valve.
 2. Fill brake fluid reservoir up to "MAX" marking.
 3. Press and hold clutch pedal.
 4. Open bleeder valve until air or air/brake fluid mixture emerges.

NOTE: Do not close the bleeder valve too fast.

5. Close the bleeder valve.
6. Release the clutch pedal slowly.
7. Wait approximately 5 seconds.

8. Repeat this bleeding process 4 times.
9. Tighten bleeder valve.
10. Push valve cap on to bleeder valve to protect the bleeder valve.
2. Check shifting for ease of movement with vehicle stationary, with engine running and with clutch disengaged.
3. Road test the vehicle to ensure proper operation.

Undertake road test using varying RPM ranges and frequent gear changes, bring vehicle to operating temperature during this process. Ensure the brake and clutch system is operating correctly.

CLUTCH PEDAL POSITION SENSOR REPLACEMENT

Removal Procedure

1. Remove the instrument panel lower reinforcement bracket. Refer to **Instrument Panel Lower Reinforcement Bracket Replacement** .
2. Remove the intermediate steering shaft. Refer to **Intermediate Steering Shaft Replacement** .

Fig. 19: Clutch Pedal Position Sensor Bolt
Courtesy of GENERAL MOTORS COMPANY

3. Disconnect the clutch pedal position sensor wiring harness connector.
4. Remove the clutch pedal position sensor bolt (1).
5. Remove the clutch pedal position sensor (2).

Installation Procedure

Fig. 20: Clutch Pedal Position Sensor Bolt
Courtesy of GENERAL MOTORS COMPANY

1. Install the clutch pedal position sensor (2).

CAUTION: Refer to Fastener Caution .

2. Install the clutch pedal position sensor bolt (1) and tighten to 3 (27 lb in).
3. Connect the clutch pedal position sensor wiring harness connector.
4. Install the intermediate steering shaft. Refer to **Intermediate Steering Shaft Replacement** .
5. Install the instrument panel lower reinforcement bracket. Refer to **Instrument Panel Lower Reinforcement Bracket Replacement** .

CLUTCH PRESSURE AND DRIVEN PLATE REPLACEMENT

Special Tools

- DT-6263-30 Drift
- DT-6263-23 Clutch Center Guide

For equivalent regional tools, refer to Special Tools.

Removal Procedure

1. Remove the transmission from the vehicle. Refer to Transmission Replacement (MX2, MFM) .

Fig. 21: Clutch Pressure Plate Bolts

Courtesy of GENERAL MOTORS COMPANY

NOTE: Remove the clutch pressure plate bolts symmetrically to avoid clutch pressure plate distortion.

2. Remove and DISCARD the 6 clutch pressure plate bolts (1).
3. Remove the clutch pressure plate and clutch disc (2).

Pressure Plate Inspection Procedure

Fig. 22: Weak And Damaged Diaphragm Spring
Courtesy of GENERAL MOTORS COMPANY

1. Inspect the weak and damaged diaphragm spring (1).
2. Inspect the face that may be polluted by the oil or grease (2).

Clutch Disc Inspection Procedure

Fig. 23: Clutch Disc Inspection

Courtesy of GENERAL MOTORS COMPANY

1. Measure the rivet head depth from the clutch disc surface and replace if the depth is below the limit.

Specifications

- Rivet head depth for standard equals 1.1 mm (0.043 in).
 - Rivet head depth for limit equals 0.4 mm (0.016 in).
2. Replace the clutch disc if the clutch disc surface is contaminated or if the clutch disc rivets are loose.

Clutch Disc Runout In A Rotational Direction Inspection Procedure

Fig. 24: Measuring Runout In Rotational Direction
Courtesy of GENERAL MOTORS COMPANY

Measure the runout in a rotational direction and replace if the runout exceeds the limit.

Specifications

The disc runout limit in a rotational direction equals 0.7 mm (0.028 in).

Installation Procedure

Fig. 25: Clutch Pressure Plate And Clutch Disc
Courtesy of GENERAL MOTORS COMPANY

1. Install the clutch pressure plate and clutch disc (1) to the flywheel.
2. Attach the **DT-6263-23** clutch center guide to the **DT-6263-30** drift.
3. Align the clutch pressure plate and clutch disc onto the flywheel using the **DT-6263-23** clutch center guide (2) and the **DT-6263-30** drift.

CAUTION: Refer to Fastener Caution .

4. Install the 6 NEW clutch pressure plate bolts (3) and tighten the bolts crosswise to 28 N•m (21 lb ft).
5. Remove the **DT-6263-23** clutch center guide (2) and the **DT-6263-30** drift.
6. Install the transmission to the vehicle. Refer to **Transmission Replacement (MX2, MFM)** .

CLUTCH PEDAL ARM REPLACEMENT

Removal Procedure

1. Remove the clutch actuator cylinder. Refer to **Clutch Actuator Cylinder Replacement**.

Fig. 26: Clutch Pedal Arm Bolt And Nut
Courtesy of GENERAL MOTORS COMPANY

2. Loosen the clutch pedal arm bolt and nut (1).
3. Remove the clutch release arm (2).

Installation Procedure

Fig. 27: Clutch Pedal Arm

Courtesy of GENERAL MOTORS COMPANY

1. Install the clutch pedal arm (2) to the clutch fork shaft and align to the marked position (3).

CAUTION: Refer to Fastener Caution .

2. Install the clutch pedal arm bolt and nut (1) and tighten to 17 (13 lb ft).
3. Install the clutch actuator cylinder. Refer to **Clutch Actuator Cylinder Replacement**.

CLUTCH RELEASE BEARING REPLACEMENT

Removal Procedure

1. Remove the transmission from the vehicle. Refer to **Transmission Replacement (MX2, MFM)** .
2. Remove the clutch pedal arm. Refer to **Clutch Pedal Arm Replacement**.

Fig. 28: Clutch Release Bearing

Courtesy of GENERAL MOTORS COMPANY

3. Remove the clutch release bearing (1).

Fig. 29: Clutch Fork Shaft Bushing
Courtesy of GENERAL MOTORS COMPANY

4. Remove the clutch fork shaft bushing (1).
5. Remove the clutch fork shaft (2).
6. Remove the clutch fork shaft bushing (3).

Installation Procedure

Fig. 30: Clutch Fork Shaft Bushing
Courtesy of GENERAL MOTORS COMPANY

1. Install the clutch fork shaft bushing (3).
2. Coat the clutch fork shaft and bushing with grease.
3. Install the clutch fork shaft (2).
4. Install the clutch fork shaft bushing (1).

Fig. 31: Clutch Release Bearing

Courtesy of GENERAL MOTORS COMPANY

5. Coat the spline of the transmission input shaft with multi-purpose grease (1).
6. Coat the release bearing bore and the connecting of the clutch fork shaft with multi-purpose grease (2).
7. Install the clutch release bearing (3).
8. Install the clutch pedal arm. Refer to **Clutch Pedal Arm Replacement**.
9. Install the transmission to the vehicle. Refer to **Transmission Replacement (MX2, MFM)** .

CLUTCH ACTUATOR CYLINDER REPLACEMENT

Removal Procedure

1. Remove the air cleaner assembly. Refer to **Air Cleaner Assembly Replacement** .

Fig. 32: Clutch Actuator Cylinder Front Pipe
Courtesy of GENERAL MOTORS COMPANY

NOTE: Before disconnecting the clutch actuator cylinder front pipe, remove the clutch/brake fluid from the reservoir tank.

2. Remove the retaining clip (1).
3. Disconnect the clutch actuator cylinder front pipe (2) from the clutch actuator cylinder.

Fig. 33: Clutch Actuator Cylinder Mount Bolts
Courtesy of GENERAL MOTORS COMPANY

4. Remove the clutch actuator cylinder mount bolts (1).
5. Remove the clutch actuator cylinder (2).

Installation Procedure

Fig. 34: Clutch Actuator Cylinder Mount Bolts
Courtesy of GENERAL MOTORS COMPANY

1. Install the clutch actuator cylinder (2).

CAUTION: Refer to Fastener Caution .

2. Install the clutch actuator cylinder mount bolts (1) and tighten to 22 (16 lb ft).

Fig. 35: Clutch Actuator Cylinder Front Pipe
Courtesy of GENERAL MOTORS COMPANY

3. Install the retaining clip (1).
4. Connect the clutch actuator cylinder front pipe (2) to the clutch actuator cylinder.
5. Bleed the hydraulic clutch system. Refer to **Hydraulic Clutch System Bleeding**.
6. Fill the reservoir with clutch/brake fluid up to the MAX level.
7. Install the air cleaner assembly. Refer to **Air Cleaner Assembly Replacement** .

CLUTCH RELEASE BEARING AND DOOR SHAFT INSPECTION

Release Bearing Inspection

Fig. 36: Clutch Release Bearing and Door Shaft Inspection
Courtesy of GENERAL MOTORS COMPANY

1. Inspect for a noisy, worn, and damaged release bearing.
2. Inspect for a grabbing rotation of release bearing.
3. Replace the release bearing if necessary.

Release Shaft Inspection

Fig. 37: Warped Shaft And Worn Fork
Courtesy of GENERAL MOTORS COMPANY

1. Inspect for a warped shaft (1).
2. Inspect for a worn fork (2).
3. Replace the shaft if necessary.

DESCRIPTION AND OPERATION

CLUTCH SYSTEM DESCRIPTION AND OPERATION

Driving Members

The driving members consist of 2 flat surfaces machined to a smooth finish. One of these is the rear face of the engine flywheel, and the other is the pressure plate. The pressure plate is fitted into a steel cover, which is bolted to the flywheel.

Driven Members

The driven member is the clutch disc with a splined hub which is free to slide lengthwise along the splines of the input shaft, but which drives the input shaft through these same splines.

The driving and driven members are held in contact by spring pressure. This pressure is exerted by a diaphragm spring in the pressure plate assembly.

Operating Members

The clutch release system consists of the clutch pedal, the clutch fork shaft, the clutch pedal arm and the release bearing. When pressure is applied to the clutch pedal, the clutch fork shaft pushes against the release bearing by rotating. The bearing then pushes against the diaphragm spring in the pressure plate assembly, thereby releasing the clutch.

DTC P0501: VEHICLE SPEED SENSOR

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

DTC Descriptor

DTC P0501

Vehicle Speed Sensor Performance

Circuit/System Description

The vehicle speed sensor (VSS) is a 3 wire sensor. The engine control module (ECM) provides a 5 volt reference circuit, low reference circuit and a signal circuit to the VSS. The VSS is a Hall Effect type sensor that produces a square wave output signal to the ECM. As vehicle speed increases, the output frequency of the VSS signal increases. The ECM converts the square wave output signal into km/h (MPH). The ECM supplies the VSS signal to other control modules on the vehicle through the serial data communications line.

Conditions for Running the DTC

- The engine speed is greater than 2 496 RPM.
- The mass air flow is greater than 179.75 mg/stroke.
- The engine coolant temperature is greater than 70°C (158°F).
- The DTC runs continuously when the above conditions are met.

Conditions for Setting the DTC

The ECM detects that the vehicle speed parameter is 0 km/h (0 MPH) for 25 s.

Action Taken When the DTC Sets

DTC P0501 is a Type B DTC.

Conditions for Clearing the DTC

DTC P0501 is a Type B DTC.

Scan Tool Reference

Control Module References for scan tool information

Circuit/System Verification

1. Operate the vehicle while observing the scan tool Output Speed Sensor parameter. It should vary with the vehicle speed and match the speedometer indicator.
 - **If the vehicle speed does not match with the speedometer indicator**

Refer to Circuit/System Testing.
 - **If the vehicle speed does match the speedometer indicator**
2. Operate the vehicle within the conditions for running the DTC to verify the DTC does not set. You may also operate the vehicle within the conditions that you observed from the Freeze Frame/Failure Records.
3. Verify the DTC does not set.
 - **If the DTC sets**

Refer to Circuit/System Testing.
 - **If the DTC does not set**
4. All OK.

Circuit/System Testing

1. Ignition OFF, disconnect the Transmission Output Shaft Speed Sensor harness connector.

2. Test for less than 5 ohms between the low reference circuit terminal A and ground.
 - **If 5 ohms or greater**
 1. Disconnect the X1 harness connector at the Engine Control Module.
 2. Test for less than 2 ohms in the circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, replace the Engine Control Module.
 - **If less than 5 ohms**
3. Ignition ON.
4. Test for 4.8-5.2 V between the 5 V reference circuit terminal C and ground.
 - **If less than 4.8 V**
 1. Test for infinite resistance between the 5 V reference circuit and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance
 1. Disconnect the X1 harness connector at the Engine Control Module.
 2. Test for less than 2 ohms in the 5 V reference circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, replace the Engine Control Module.
 - **If greater than 5.2 V**
 1. Disconnect the X1 harness connector at the Engine Control Module.
 2. Test for less than 0.3 V between the 5 V reference circuit terminal 47 and ground.
 - If 0.3 V or greater, repair the short to voltage on the circuit.
 - If less than 0.3 V, replace the Engine Control Module.
 - **If between 4.8-5.2 V**
 - 5. Ignition OFF.
 - 6. Test for less than 1 V between the signal circuit terminal B and ground.
 - **If 1 V or greater**
 1. Disconnect the X1 harness connector at the Engine Control Module.
 2. Test for less than 0.3 V between the signal circuit terminal 27 and ground.
 - If 0.3 V or greater, repair the short to voltage on the circuit.
 - If less than 0.3 V, replace the Engine Control Module.
 - **If less than 1 V**
 - 7. Ignition OFF, disconnect the X1 harness connector at the Engine Control Module.
 - 8. Test for less than 2 ohms between the signal circuit terminal 27 at the Engine Control Module and the signal circuit terminal B at the Transmission Output Shaft Speed Sensor.
 - **If 2 ohms or greater**

Repair the open/high resistance in the circuit.
 - **If less than 2 ohms**

9. Test for infinite resistance between the signal circuit terminal B and ground at the Transmission Output Shaft Speed Sensor.

- **If less than infinite resistance**

Repair the short to ground on the circuit.

- **If infinite resistance**

10. Replace the Transmission Output Shaft Speed Sensor.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

- **Control Module References** for ECM replacement, programming and setup.
- **Vehicle Speed Sensor Replacement (MX2, MFM)**

DTC P0502 OR P0503: VEHICLE SPEED SENSOR

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

DTC Descriptors

DTC P0502

Vehicle Speed Sensor Circuit Low Voltage

DTC P0503

Vehicle Speed Sensor Circuit Intermittent

Circuit/System Description

Vehicle speed information is provided to the engine control module (ECM) by the transmission output shaft speed (TOSS) sensor. The TOSS Sensor consists of a magneto-resistive (MR) sensor mounted to the transmission case which interfaces with a rotor pressed onto the transmission output shaft. The MR sensor contains a permanent magnet and a semiconductor plate to which reference voltage is applied. As the output shaft spins, the rotor directs the field of the permanent magnet either toward or away from the plate. The TOSS Sensor produces a frequency signal that is proportional to vehicle speed. The ECM converts the TOSS signal to vehicle speed, displayed on the scan tool in kilometers per hour or miles per hour. The TOSS Sensor also sends signal to some modules such as instrument panel cluster (IPC), radio, HVAC control module or telematics communication interface control module if equipped.

Conditions for Running the DTC

P0502

- The engine torque is between 90-8192.
- The minimum throttle is greater than 8%.
- The engine speed is between 1500-6500 RPM.
- The ignition voltage is between 11-32 V.

P0503

- The transmission output shaft speed is greater than 200 RPM.
- The change in transmission output shaft speed is less than 150 RPM.
- The ignition voltage is between 11-32 V.
- The engine speed is between 200-7500 RPM.
- The vehicle speed is less than 200 km/h (124 mph).

Conditions for Setting the DTC

P0502

The ECM detects that the transmission output shaft speed signal is less than 60 RPM for 4.5 s.

P0503

The ECM detects that the loop-to-loop change in transmission output shaft speed signal is greater than 350 RPM for 3.3 s.

Action Taken When the DTC Sets

DTCs P0502 and P0503 are Type B DTCs.

Conditions for Clearing the DTC

DTCs P0502 and P0503 are Type B DTCs.

DTC Type Reference

Powertrain Diagnostic Trouble Code (DTC) Type Definitions

Scan Tool Reference

Control Module References for scan tool information

Circuit/System Verification

1. Operate the vehicle at 16-32 km/h (10-20 mph) while observing the scan tool VSS parameter. The reading should vary with the vehicle speed and match the instrument panel speedometer indicator.
2. Operate the vehicle within the Conditions For Running the DTC to verify the DTC does not reset. You may also operate the vehicle within the conditions that you observed from the Freeze Frame/Failure Records.

Circuit/System Testing

1. Ignition OFF, disconnect the harness connector at the B14A Transmission Output Shaft Speed Sensor.
2. Ignition ON, test for 4.8-5.2 V between the 5V reference circuit terminal C and ground.
 - If greater than the specified range, test the 5V reference circuit for a short to voltage. If the circuit tests normal, replace the K20 ECM.
 - If less than the specified range, test the 5V reference circuit for a short to ground or an open/high resistance. If the circuit tests normal, replace the K20 ECM.
3. Ignition OFF, test for less than 5ohms between the low reference circuit terminal A and ground.
 - If greater than the specified range, test the low reference circuit for an open/high resistance. If the circuit tests normal, replace the K20 ECM.

NOTE: **You may need to disconnect all the modules that share the signal circuit in order to isolate the condition. Refer to Manual Transmission Schematics to identify the modules that share the signal circuit.**

4. Ignition OFF, test for greater than 10ohms between the signal circuit terminal B and ground.
 - If less than the specified range, test the signal circuit for a short to ground. If the circuit tests

normal, replace the K20 ECM.

5. Ignition OFF, disconnect the harness connector at the K20 ECM.
6. Ignition OFF, test for less than 50hms in the signal circuit end to end.
 - If greater than the specified range, test the signal circuit for an open/high resistance.
7. Ignition ON, test for less than 10 V between the signal circuit terminal B and ground.
 - If greater than the specified value, test the signal circuit for a short to voltage.
8. If all circuits test normal, replace the B14A Transmission Output Shaft Speed Sensor.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

Control Module References for ECM replacement, setup and programming

DTC P0502 OR P0503: VEHICLE SPEED SENSOR (LL0 ENGINE)

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

DTC Descriptors

DTC P0502

Vehicle Speed Sensor (VSS) Circuit Low Voltage

DTC P0503

Vehicle Speed Sensor (VSS) Circuit Intermittent

Circuit/System Description

The vehicle speed sensor (VSS) is a 3 wire sensor. The engine control module (ECM) provides a 5 volt reference circuit, low reference circuit and a signal circuit to the VSS. The VSS is a Hall Effect type sensor that produces a square wave output signal to the ECM. As vehicle speed increases, the output frequency of the VSS signal increases. The ECM converts the square wave output signal into vehicle speed shown as km/h (MPH). The ECM supplies the VSS signal to other control modules on the vehicle through the serial data communications line.

Conditions for Running the DTC

P0502

- DTC P0101, P0102, P0103, P0106, P0107, P0108, P0300, P0301, P0302, P0303, P0304, P0305, P0306

or P0503 is not set.

- Ignition voltage is between 11-32 V.
- Throttle position is 8 % or greater.
- Engine speed is between 1, 500-6, 500 RPM.

P0503

- Ignition voltage is between 11-32 V.
- Engine speed is between 200-7, 500 RPM for 5 s or greater.
- VSS signal is 200 RPM or greater for 2 s or greater.
- Change in VSS signal is 150 RPM or less for 2 s or greater.

Conditions for Setting the DTC

P0502

VSS signal is less than 60 RPM for 4.5 s.

P0503

Change in VSS signal is 350 RPM or greater for 3.3 s.

Action Taken When the DTC Sets

P0502 and P0503 are Type B DTCs.

Conditions for Clearing the DTC

P0502 and P0503 are Type B DTCs.

Diagnostic Aids

The battery must be fully charged. Refer to **Battery Inspection/Test** .

Special Tools

J-38522-A Vehicle Signal Generator

For equivalent regional tools, refer to **Special Tools**.

Circuit/System Verification

CAUTION: Support the lower control arms in the normal horizontal position in order to avoid damage to the drive axles. Do not operate the vehicle in gear with the wheels hanging down at full travel.

1. Raise and support the drive wheels in a horizontal position.
2. Start and idle the engine.
3. Place the transmission in second gear and release the clutch pedal.
4. Verify the scan tool Vehicle Speed Sensor parameter increases as the drive wheel speed increases.
 - **If the Vehicle Speed Sensor parameter does not increase**

Refer to Circuit/System Testing.

- **If the Vehicle Speed Sensor parameter does increase**
5. Operate the vehicle within the conditions for running the DTC to verify the DTC does not set. You may also operate the vehicle within the conditions that you observed from the Freeze Frame/Failure Records.
 - **If the DTC sets**

Refer to Circuit/System Testing.

- **If the DTC does not set**

6. All OK.

Circuit/System Testing

1. Ignition OFF and all vehicle systems OFF. Disconnect the harness connector at the B115 Vehicle Speed Sensor. It may take up to 2 minutes for all vehicle systems to power down.
2. Test for less than 10 ohms between the low reference circuit terminal 2 and ground.
 - **If 10 ohms or greater**
 1. Disconnect the X3 harness connector at the K20 Engine Control Module.
 2. Test for less than 2 ohms in the circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, replace the K20 Engine Control Module.
 - **If less than 10 ohms**
3. Ignition ON.
4. Test for 4.8-5.2 V between the 5 V reference circuit terminal 1 and ground.
 - **If less than 4.8 V**
 1. Ignition OFF, disconnect the X3 harness connector at the K20 Engine Control Module.
 2. Test for infinite resistance between the 5 V reference circuit and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance
 3. Test for less than 2 ohms in the 5 V reference circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, replace the K20 Engine Control Module.
 - **If greater than 5.2 V**
 1. Ignition OFF, disconnect the X3 harness connector at the K20 Engine Control Module, Ignition ON.
 2. Test for less than 1 V between the 5 V reference circuit and ground.
 - If 1 V or greater, repair the short to voltage on the circuit.
 - If less than 1 V, replace the K20 Engine Control Module.
 - **If between 4.8-5.2 V**
5. Ignition OFF, connect the test leads of the J-38522-A vehicle signal generator as follows:
 - Red test lead to the signal circuit terminal 3 at the B115 Vehicle Speed Sensor wire harness connector.
 - Black test lead to ground at the transmission case.
 - Double black power and ground lead wire to B+ and ground.
6. Set and adjust the J-38522-A vehicle signal generator to the following switch positions:
 - Signal switch to 5 V.
 - Frequency switch to 600 Hz.

- Duty cycle switch to 50% or normal position.
7. Ignition ON.
 8. Verify the scan tool Vehicle Speed Sensor parameter displays between 41-51 km/h (25.5-31.5 mph).
 - **If the vehicle speed sensor parameter is not within the specified range**
 1. Ignition OFF, disconnect the X3 harness connector at the K20 Engine Control Module.
 2. Test for infinite resistance between the signal circuit terminal 3 and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance
 3. Test for less than 2 ohms in the signal circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, replace the K20 Engine Control Module.
 - **If the vehicle speed sensor parameter is within the specified range**
 9. Replace the B115 Vehicle Speed Sensor.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

- **Vehicle Speed Sensor Replacement (MX2, MFM)**
- **Control Module References** for ECM replacement, programming and setup.

DTC P0806-P0808: CLUTCH PEDAL POSITION (CPP) SENSOR (LL0 ENGINE)

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

Low Reference	-	0%	-

Circuit/System Description

The clutch pedal position (CPP) sensor is a three wire sensor, connected to a 5 V reference circuit, a low reference circuit and a signal circuit. The engine control module supplies 5 V to the CPP sensor and also provides a sensor ground path on the low reference circuit. The CPP sensor sends a voltage signal to the ECM on the signal circuit. The voltage on the signal circuit will vary from a voltage less than or equal to 5 V when the clutch pedal is released, to a voltage less than or equal to 1.5 V when the clutch pedal is applied.

Conditions for Running the DTC

P0806

- DTC P0335, P0336, P0502, P0503, P0807 or P0808 is not set.
- The vehicle speed is greater than 8 kmh (5 mph).
- The ignition is ON.

P0807 and P0808

- DTC P0651 is not set.
- The system voltage is more than 9 V.
- The ignition is ON.

Conditions for Setting the DTC

P0806

The CPP sensor is stuck in range.

P0807

The CPP sensor voltage is less than 0.1 V for more than 1 s.

P0808

The CPP sensor voltage is more than 5.2 V for more than 1 s.

Action Taken When the DTC Sets

DTC P0806 - P0808 are Type A DTCs.

Conditions for Clearing the DTC

DTC P0806 - P0808 are Type A DTCs.

Circuit/System Verification

1. If DTC P0651 or P080A is set, refer to **Diagnostic Trouble Code (DTC) List - Vehicle** .
2. Ignition ON.
3. Verify the scan tool CPP Sensor percent parameter varies from 0% when the clutch pedal is released, to 100% when the clutch pedal is in the apply position.

- **If the percentage does not vary from 0% to 100%**

Refer to Circuit/System Testing.

- **If the percentage varies from 0% to 100%**

4. Perform the CPP learn procedure.
5. Operate the vehicle within the conditions for running the DTC to verify the DTC does not set. You may also operate the vehicle within the conditions that you observed from the Freeze Frame/Failure Records data.

- **If the DTC sets**

Refer to Circuit/System Testing.

- **If the DTC does not set**

6. All OK.

Circuit/System Testing

1. Ignition OFF, disconnect the harness connector of the B25B Clutch Pedal Position Sensor.
2. Test for less than 5 ohms between the low reference circuit terminal A and ground:

- **If 5 ohms or greater**

1. Disconnect the X3 harness connector at the K20 Engine Control Module.
2. Test for less than 2 ohms in the circuit end to end.

- If 2 ohms or greater, repair the open/high resistance in the circuit.

- If less than 2 ohms, replace the K20 Engine Control Module.

- **If less than 5 ohms**

3. Ignition ON.

4. Test for 4.8-5.2 V between the 5 V reference circuit terminal C and ground:
 - **If less than 4.8 V**
 1. Ignition OFF, disconnect the X3 harness connector at the K20 Engine Control Module.
 2. Test for infinite resistance between the 5 V reference circuit and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance
 3. Test for less than 2 ohms in the 5 V reference circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, replace the K20 Engine Control Module.
 - **If greater than 5.2 V**
 1. Ignition OFF, disconnect the X3 harness connector at the K20 Engine Control Module.
 2. Test for less than 1 V between the 5 V reference circuit and ground.
 - If 1 V or greater, repair the short to voltage on the circuit.
 - If less than 1 V, replace the K20 Engine Control Module.
 - **If between 4.8-5.2 V**
5. Verify the scan tool CPP Sensor voltage parameter is less than 0.1 V.
 - **If 0.1 V or greater**
 1. Ignition OFF, disconnect the X3 harness connector at the K20 Engine Control Module, Ignition ON.
 2. Test for less than 1 V between the signal circuit terminal B and ground.
 - If 1 V or greater, repair the short to voltage on the circuit.
 - If less than 1 V, replace the K20 Engine Control Module.
 - **If less than 0.1 V**
6. Install a 3 A fused jumper wire between the signal circuit terminal B and the 5 V reference circuit terminal C.
7. Verify the scan tool CPP Sensor voltage parameter is greater than 4.9 V.
 - **If 4.9 V or less**
 1. Ignition OFF, remove the jumper wire, disconnect the X3 harness connector at the K20 Engine Control Module.
 2. Test for infinite resistance between the signal circuit terminal B and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance
 3. Test for less than 2 ohms in the signal circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, replace the K20 Engine Control Module.
 - **If greater than 4.9 V**
8. Test or replace the B25B Clutch Pedal Position Sensor.

Component Testing

Static Test

- 1. Ignition OFF, disconnect the harness connector of the B25B Clutch Pedal Position Sensor.
- 2. Measure the resistance between the signal terminal B and the low reference terminal A at the B25B Clutch Pedal Position Sensor. Depress the clutch pedal through the entire range. The resistance should vary from low to high and vice versa without any spikes or dropouts.
 - o **If the resistance is erratic with spikes or dropouts**

Replace the B25B Clutch Pedal Position Sensor.

- o **If the resistance is not erratic without spikes or dropouts**
- 3. All OK.

Control Module References for scan tool information

Circuit/System Verification

1. Ignition ON.
2. Verify the scan tool CPP Sensor parameter in the Manual Transmission Data of the ECM data list is between 0.2-4.8 V and changes smoothly without any spikes or dropouts when slowly applying and releasing the clutch pedal.
 - **If not between 0.2-4.8 V, does not change or has spikes or dropouts**

Refer to Circuit/System Testing.
 - **If between 0.2-4.8 V and changes smoothly without any spikes or dropouts**
3. All OK.

Circuit/System Testing

1. Ignition OFF and all vehicle systems OFF, disconnect the harness connector at the B25B Clutch Pedal Position Sensor. It may take up to 2 minutes for all vehicle systems to power down.

2. Test for less than 10 ohms between the low reference circuit terminal C and ground.
 - **If 10 ohms or greater**
 1. Ignition OFF, disconnect the harness connector at the K20 ECM.
 2. Test for less than 2 ohms in the low reference circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, replace the K20 ECM.
 - **If less than 10 ohms**
3. Ignition ON.
4. Test for 4.8-5.2 V between the 5 V reference circuit terminal A and ground.
 - **If less than 4.8 V**
 1. Ignition OFF, disconnect the harness connector at the K20 ECM.
 2. Test for infinite resistance between the 5 V reference circuit and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance
 3. Test for less than 2 ohms in the 5 V reference circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, replace the K20 ECM.
 - **If greater than 5.2 V**
 1. Ignition OFF, disconnect the harness connector at the K20 ECM, ignition ON.
 2. Test for less than 1 V between the 5 V reference circuit and ground.
 - If 1 V or greater, repair the short to voltage on the circuit.
 - If less than 1 V, replace the K20 ECM.
 - **If between 4.8-5.2 V**
5. Verify the scan tool CPP Sensor parameter is less than 0.2 V.
 - **If 0.2 V or greater**
 1. Ignition OFF, disconnect the harness connector at the K20 ECM, ignition ON.
 2. Test for less than 1 V between the signal circuit terminal B and ground.
 - If 1 V or greater, repair the short to voltage on the circuit.
 - If less than 1 V, replace the K20 ECM.
 - **If less than 0.2 V**
6. Install a 3 A fused jumper wire between the signal circuit terminal B and the 5 V reference circuit terminal A.
7. Verify the scan tool CPP Sensor parameter is greater than 4.8 V.
 - **If 4.8 V or less**
 1. Ignition OFF, disconnect the harness connector at the K20 ECM.
 2. Test for infinite resistance between the signal circuit terminal B and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance

3. Test for less than 2 ohms in the signal circuit end to end.
 - If 2ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, replace the K20 ECM.

- **If greater than 4.8 V**

8. Test or replace the B25B Clutch Pedal Position Sensor.

Component Testing

Static Test

1. Ignition OFF, disconnect the harness connector at the B25B Clutch Pedal Position Sensor.
2. Test for 2.1-3.9 Kohms between the 5 V reference terminal A and the low reference terminal C.
 - **If not between 2.1-3.9 Kohms**

Replace the B25B Clutch Pedal Position Sensor.

- **If between 2.1-3.9 Kohms**

3. Test for 2.1-3.9 Kohms without any spikes or dropouts between the signal terminal B and the low reference terminal C while moving the sensor through the entire range.

- **If not between 2.1-3.9 Kohms or has spikes or dropouts**

Replace the B25B Clutch Pedal Position Sensor.

- **If between 2.1-3.9 Kohms and there are no spikes or dropouts**

4. All OK

Dynamic Test

1. Install a 3 A fused jumper wire between the 5 V reference terminal A and 5 V. Install a jumper wire between the low reference terminal C and ground.
2. Test for 0.25-4.75 V without any spikes or dropouts between the signal terminal B and the low reference terminal C while moving the sensor through the entire range.
 - **If not between 0.25-4.75 V or has spikes or dropouts**

Replace the B25B Clutch Pedal Position Sensor.

- **If between 0.25-4.75 V and there are no spikes or dropouts**

3. All OK

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the diagnostic procedure.

- Refer to **Control Module References** for control solenoid valve assembly replacement, setup and

programming.

- Perform the **Clutch Pedal Position Sensor Learn** following the replacement of the ECM or CPP sensor or any repair that affects the CPP sensor alignment.

DTC P080A: CLUTCH PEDAL POSITION (CPP) SENSOR

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

DTC Descriptor

DTC P080A

Clutch Pedal Position (CPP) Not Learned

Circuit/System Description

The clutch pedal position (CPP) is a three wire sensor, connected to a 5 V reference circuit, a low reference circuit and a signal circuit. The engine control module (ECM) supplies 5 V to the CPP sensor and also provides a sensor ground path on the low reference circuit. The CPP sensor sends a voltage signal to the ECM on the signal circuit. The voltage on the signal circuit will vary from a voltage less than or equal to 5 V when the clutch pedal is released to a voltage less than or equal to 1.5 V when the clutch pedal is applied.

Conditions for Running the DTC

Clutch pedal fully applied.

Conditions for Setting the DTC

Clutch pedal position not learned.

Action Taken When the DTC Sets

P080A is a Type C DTC.

Conditions for Clearing the DTC

P080A is a Type C DTC.

DTC Descriptor

DTC P0812

Reverse Position Switch Circuit

Circuit/System Description

The reverse gear switch is a normally open switch that closes with the reverse gear engagement. When the switch is open, the engine control module (ECM) should detect a high signal voltage input. When the switch is closed, the ECM should detect a low signal voltage input.

Conditions for Running the DTC

- No vehicle speed sensor faults exist.
- Reverse switch is ON.

Conditions for Setting the DTC

The ECM detects circuit failure of the reverse input switch.

Action Taken When the DTC Sets

DTC P0812 is a Type C DTC.

Conditions for Clearing the DTC

DTC P0812 is a Type C DTC.

Circuit/System Verification

Ignition ON, observe the scan tool Reverse Position Switch parameter. The reading should be Off and change to On when the transmission is shifted into reverse.

Circuit/System Testing

1. Ignition OFF, disconnect the harness connector at the B16 Backup Lamp Switch.
2. Ignition OFF, test for less than 1 ohms between the ground circuit terminal 2 and ground.
 - If greater than the specified value, test the ground circuit for an open/high resistance.
3. Ignition ON, verify the scan tool Reverse Position Switch parameter is Off.
 - If not the specified value, test the signal circuit terminal 1 for a short to ground. If the circuit tests normal, replace the K20 Engine Control Module.
4. Ignition ON, install a 3 A fused jumper wire between the signal circuit terminal 1 and ground. Verify the scan tool Reverse Position Switch parameter is On.
 - If not the specified value, test the signal circuit for a short to voltage or an open/high resistance. If the circuit tests normal, replace the K20 Engine Control Module.
5. If all circuits test normal, test or replace the B16 Backup Lamp Switch.

Circuit/System Description

The reverse gear switch is a normally open switch that closes with the reverse gear engagement. When the switch is open the engine control module should detect a high signal voltage input. When the switch is closed the ECM should detect a low signal voltage input.

Conditions for Running the DTC

- No vehicle speed sensor faults exist.
- Reverse switch is ON.

Conditions for Setting the DTC

The ECM detects circuit malfunction of the reverse input switch.

Action Taken When the DTC Sets

DTC P0812 is a Type C DTC.

Conditions for Clearing the DTC

DTC P0812 is a Type C DTC.

Reference Information

Schematic Reference

COMPONENT CONNECTOR END VIEWS - INDEX

Description and Operation

Exterior Lighting Systems Description and Operation

Electrical Information Reference

- **Circuit Testing**
- **Connector Repairs**

- **Testing for Intermittent Conditions and Poor Connections**
- **Wiring Repairs**

Scan Tool Reference

Control Module References for scan tool information

Circuit/System Verification

1. Ignition ON.
2. Verify the scan tool Reverse Position Switch parameter should be Off and change to On when the transmission is shifted into reverse.
 - **If the parameter does not change from Off to On**

Refer to Circuit/System Testing.
 - **If the parameter changes from Off to On**
3. Operate the vehicle within the Conditions for Running the DTC. You may also operate the vehicle within the conditions that you observed from the Freeze Frame/Failure Records data.
4. Verify the DTC does not set.
 - **If the DTC sets**

Refer to Circuit/System Testing.
 - **If the DTC does not set**
5. All OK.

Circuit/System Testing

1. Ignition OFF, disconnect the harness connector at the B16 Backup Lamp Switch.
2. Test for less than 5 ohms between the ground circuit terminal 2 and ground.
 - **If 5 ohms or greater**
 1. Test for less than 2 ohms in the ground circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, repair the open/high resistance in the ground connection.
 - **If less than 5 ohms**
3. Ignition ON, transmission in neutral position.
4. Verify the scan tool Reverse Position Switch parameter is Off.
 - **If the parameter ON**
 1. Disconnect the X1 harness connector at the K20 Engine Control Module.
 2. Test for infinite resistance between the signal circuit terminal 1 and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.

- If infinite resistance, replace the K20 Engine Control Module.
- **If the parameter is OFF**
- 5. Ignition ON, install a 3 A fused jumper wire between the signal circuit terminal 1 at the B16 Backup Lamp Switch harness connector and ground.
- 6. Verify the scan tool Reverse Position Switch parameter is On.
 - **If the parameter is Off**
 1. Disconnect the X1 harness connector at the K20 Engine Control Module.
 2. Test for less than 2 ohms in the signal circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, replace the K20 Engine Control Module.
 - **If the parameter is On**
- 7. Test or replace the B16 Backup Lamp Switch.

Component Testing

1. Ignition OFF, disconnect the harness connector at the B16 Backup Lamp Switch.
2. Place the transmission in Reverse position.
3. Test for less than 5 ohms between the signal terminal 1 and the ground terminal 2 at the B16 Backup Lamp Switch.
 - **If 5 ohms or greater**

Replace the B16 Backup Lamp Switch.
 - **If less than 5 ohms**
4. All OK.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

- **Backup Lamp Switch Replacement (MX2, MFM)**
- **Control Module References** for ECM replacement, programming and setup.

SYMPTOMS - MANUAL TRANSMISSION

Symptom List

In order to troubleshoot problems, refer to the troubleshooting procedures in the following list.

- **Transmission Shifts Hard**
- **Transmission Gear Clash When Shifting Gears**
- **Transmission Noisy**
- **Transmission Jumps Out of Gear**

- **Transmission Fluid Leak Diagnosis**

CLUTCH PEDAL POSITION SENSOR LEARN

NOTE: The clutch pedal position (CPP) sensor learn procedure is required when the following service procedures have been performed regardless of whether DTC P080A is set:

- An engine control module (ECM) replacement
- A CPP sensor replacement
- Any repairs which affect the CPP sensor relationship

1. Install a scan tool.
2. Monitor the ECM for DTCs with a scan tool. If other DTCs are set, except DTC P080A, refer to **Diagnostic Trouble Code (DTC) List - Vehicle** for the applicable DTC that set.
3. With a scan tool, select Clutch Pedal Position Learn under Module Setup in Engine Control Module and perform the following instructions displayed on the scan tool screen.

NOTE: The CPP sensor learn procedure cannot be performed more than once per ignition cycle. The clutch pedal needs to be fully depressed and held steady throughout this procedure in order to perform a correct learning.

4. The scan tool will display under CPP Learn Status: Not Learned, In Process, Complete, Fail - Low Volt, Fail - High Volt or Fail Moving. The scan tool will display under CPP Learn Status Complete if the process was successful.
5. If the scan tool indicates that DTC P080A ran and passed this ignition the CPP sensor learn procedure is complete. If the scan tool indicates DTC P080A failed or did not run this ignition, refer to **DTC P080A**. If any other DTC is set, refer to **Diagnostic Trouble Code (DTC) List - Vehicle** for the applicable DTC.
6. Turn OFF the ignition for 30 s after the learn procedure has successfully completed in order to store the CPP sensor variation values in ECM history.

TRANSMISSION SHIFTS HARD

Transmission Shifts Hard

Possible Cause	Action
Worn synchronizer ring	Replace the synchronizer ring.
Worn synchronizer sleeve or gear	Replace the sleeve or gear.
Bent or deformed shift shaft	Replace the shift shaft.
Excessive free travel of all gears in axial direction	Replace the gear.
Worn bearings on input shaft or counter shaft	Replace the bearing.
Distorted or broken clutch disc	Replace the clutch disc.
Damaged pressure plate	Replace the pressure plate.

TRANSMISSION GEAR CLASH WHEN SHIFTING GEARS

Transmission Gear Clash When Shifting Gears

Cause	Actions
Bent or distorted shift shaft or shift fork	Replace the shift shaft or shift fork.

TRANSMISSION NOISY

Many noises that appear to come from the transmission may actually originate with other sources such as the tires, road surfaces, wheel bearings or the engine and exhaust system.

Identify the cause of any noise before attempting to repair the clutch, the transmission or their related linkages.

To verify suspected transmission noises:

1. Select a smooth, level asphalt road to reduce tire and resonant body noise.
2. Drive the vehicle far enough to warm up all the lubricants thoroughly.
3. Record the speed and the gear range of the transmission when the noise occurs.
4. Check for noises with the vehicle stopped, but with the engine running.
5. Determine if the noise occurs while the vehicle operates in the following:
 - Drive-Under a light acceleration or a heavy pull.
 - Float-Maintaining a constant speed with a light throttle on a level road.
 - Coast-With the transmission in gear and the throttle partly or fully closed.
 - All of the above

Checking Bearing Noise

Differential Side Bearing Noise

Differential side bearing noise and wheel bearing noise can be confused easily. Since side bearings are pre-loaded, a differential side bearing noise should not diminish much when the differential/transmission is run with the wheels off the ground.

Wheel Bearing Noise

Wheel bearings produce a rough growl or grating sound that will continue when the vehicle is coasting and the transmission is in NEUTRAL. Since wheel bearings are not pre-loaded, a wheel bearing noise should diminish considerably when the wheels are off the ground.

Transmission Noisy

Checks	Actions
Insufficient Lubricant	Supply the lubricant.
Worn Input Shaft Gear	Replace the gear.
Worn Bearings on the Input Shaft Gears	Replace the bearing.
Worn Clutch Release Bearing	Replace the clutch release bearing.
Worn Bearings on the Input Shaft or Counter Shaft	Replace the bearing.

Worn Input Shaft or Counter Shaft Gear	Replace the gear.
Worn or Damaged Synchronizer Ring	Replace the synchronizer ring.
Worn or Damaged Synchronizer Sleeve	Replace the synchronizer sleeve.
Worn Differential Gear or Bearing	Replace the gear or bearing.
Worn or Damaged Synchronizer Ring in the selected GearRange	Replace the synchronizer ring.
Worn or Damaged Gear in the selected Gear Range	Replace the gear.
Worn or Damaged Bearing in the selected Gear Range	Replace the bearing.

TRANSMISSION JUMPS OUT OF GEAR

Transmission Jumps Out of Gear

Checks	Actions
Worn Shift Fork	Replace the shift fork.
Worn Synchronizer Sleeve or Gear	Replace the sleeve or gear.
Worn Bearings on Input Shaft or Counter Shaft	Replace the bearing.
Excessive Back-Lash of Gear	Adjust the back-lash of gear.

TRANSMISSION FLUID LEAK DIAGNOSIS

Transmission Fluid Leak Diagnosis

Checks	Actions
Damaged Gasket, Oil Seal or O-ring	Replace the gasket, oil seal or O-ring.
Worn or Damaged Gear in the Selected Gear Range	Replace the gear.
Worn or Damaged Bearing in the Selected Gear Range	Replace the synchronizer ring and related components.

REPAIR INSTRUCTIONS - ON VEHICLE

TRANSMISSION REAR MOUNT BRACKET REPLACEMENT (MX2, MFM)

Removal Procedure

1. Raise and support the vehicle. Refer to **Lifting and Jacking the Vehicle** .
2. Using a suitable jack stand, support the rear of the powertrain.

Fig. 6: Transmission Bracket Mount
Courtesy of GENERAL MOTORS COMPANY

3. Remove the transmission bracket mount to mount through bolt and nut (1).

Fig. 7: Transmission Mount Brackets
Courtesy of GENERAL MOTORS COMPANY

4. Remove the transmission mount bracket bolts (1).
5. Remove the transmission mount bracket (2).

Installation Procedure

Fig. 8: Transmission Mount Brackets
Courtesy of GENERAL MOTORS COMPANY

1. Install the transmission mount bracket (2).

CAUTION: Refer to Fastener Caution .

2. Install the transmission mount bracket bolts (1) and tighten to 60 (44 lb ft).

Fig. 9: Transmission Bracket Mount
Courtesy of GENERAL MOTORS COMPANY

3. Install the transmission bracket mount to mount through bolt and nut (1) and tighten to 80 (59 lb ft).
4. Remove the jack stand.
5. Lower the vehicle.

TRANSMISSION REAR MOUNT REPLACEMENT (MX2, MFM)

Removal Procedure

1. Raise and support the vehicle. Refer to **Lifting and Jacking the Vehicle** .
2. Using a suitable jack stand, support the rear of the powertrain.

Fig. 10: Transmission Mount And Frame Bolt
Courtesy of GENERAL MOTORS COMPANY

3. Remove the transmission bracket mount to mount through bolt and nut (1).
4. Remove the transmission mount to frame bolt (2).
5. Remove the transmission mount (3).

Installation Procedure

Fig. 11: Transmission Mount And Frame Bolt
Courtesy of GENERAL MOTORS COMPANY

1. Install the transmission mount (3).

CAUTION: Refer to Fastener Caution .

2. Install the transmission mount to frame bolt (2) and tighten to 100 (74 lb ft).
3. Install the transmission bracket mount to mount through bolt and nut (1) and tighten to 80 (59 lb ft).
4. Remove the jack stand.
5. Lower the vehicle.

TRANSMISSION MOUNT REPLACEMENT - LEFT SIDE (MX2, MFM)

Removal Procedure

1. Remove the battery tray. Refer to **Battery Tray Replacement** .
2. Install the engine support fixture. Refer to **Engine Support Fixture** .

Fig. 12: Left Transmission Mount Bolt
Courtesy of GENERAL MOTORS COMPANY

3. Remove the left transmission mount bolt (1) and nut (2) from the transmission mount bracket.

Fig. 13: Left Transmission Mount And Body Bolts
Courtesy of GENERAL MOTORS COMPANY

4. Remove the left transmission mount to body bolts (1).
5. Remove the transmission mount (2) from the vehicle.

Installation Procedure

Fig. 14: Left Transmission Mount And Body Bolts
Courtesy of GENERAL MOTORS COMPANY

1. Install the transmission mount (2) to the vehicle.

CAUTION: Refer to Fastener Caution .

2. Install the transmission mount to body bolts (1) and tighten to 50 (37 lb ft).

Fig. 15: Left Transmission Mount Bolt
Courtesy of GENERAL MOTORS COMPANY

3. Install the left transmission mount bolt (1) and nut (2) to transmission mount bracket and tighten to 95 (70 lb ft).
4. Remove the engine support fixture. Refer to **Engine Support Fixture** .
5. Install the battery tray. Refer to **Battery Tray Replacement** .

TRANSMISSION REPLACEMENT (MX2, MFM)

Removal Procedure

1. Raise and support the vehicle. Refer to **Lifting and Jacking the Vehicle** .
2. Drain the transmission fluid. Refer to **Transmission Fluid Drain and Fill**.

Fig. 16: Clutch Housing Lower Plate Bolt
Courtesy of GENERAL MOTORS COMPANY

3. Remove the clutch housing lower plate bolt (1) and clutch housing lower plate (2).
4. After removing the related parts for the powertrain assembly removal, remove the powertrain assembly from the vehicle. Refer to **Engine Replacement (LFM)** , **Engine Replacement (LL0)** .

Fig. 17: Radiator Inlet And Outlet Hose Clamp
Courtesy of GENERAL MOTORS COMPANY

5. Loosen the radiator inlet and outlet hose clamp (1).
6. Disconnect the radiator inlet and outlet hoses (2, 3) and remove the radiator and condenser assembly (4).

Fig. 18: Oxygen Sensor Electrical Connector
Courtesy of GENERAL MOTORS COMPANY

7. Disconnect the oxygen sensor electrical connector (1).
8. Remove the crankshaft position sensor. Refer to **Crankshaft Position Sensor Replacement** .
9. Disconnect the electrical connector (2) from the backup light switch.
10. Unclip the engine wiring harness (3) from the oxygen sensor connector bracket and engine wiring harness brackets.

Fig. 19: Electrical Connector

Courtesy of GENERAL MOTORS COMPANY

11. Disconnect the electrical connector (1) from the vehicle speed sensor (2).
12. Separate the wiring harness from the transmission.
13. Remove the transmission mount bracket - left side. Refer to **Transmission Mount Bracket Replacement - Left Side (MX2, MFM)**.
14. Remove the transmission rear mount bracket. Refer to **Transmission Rear Mount Bracket Replacement (MX2, MFM)**.
15. Remove the front wheel drive shaft from the transmission. Refer to **Front Wheel Drive Shaft Replacement** .
16. Remove the starter. Refer to **Starter Replacement** .

Fig. 20: Transmission Upper Bolts
Courtesy of GENERAL MOTORS COMPANY

17. Remove the transmission upper bolts (1).
18. Remove the transmission lower nut (2).
19. Remove the transmission lower bolt (3).
20. Remove the clutch housing upper plate (4).
21. Separate the transmission from the engine.

Installation Procedure

Fig. 21: Transmission Upper Bolts
Courtesy of GENERAL MOTORS COMPANY

1. Install the transmission to the engine.

CAUTION: Refer to Fastener Caution .

2. Install the clutch housing upper plate (4).
3. Install the transmission lower bolt (3) and tighten to 61 (44 lb ft).
4. Install the transmission lower nut (2) and tighten to 61 (44 lb ft).
5. Install the transmission upper bolts (1) and tighten to 61 (44 lb ft).
6. Install the starter. Refer to **Starter Replacement** .
7. Install the front wheel drive shaft to the transmission. Refer to **Front Wheel Drive Shaft Replacement** .
8. Install the transmission rear mount bracket. Refer to **Transmission Rear Mount Bracket Replacement (MX2, MFM)**.
9. Install the transmission mount bracket - left side. Refer to **Transmission Mount Bracket Replacement - Left Side (MX2, MFM)**.

Fig. 22: Electrical Connector

Courtesy of GENERAL MOTORS COMPANY

10. Position the wiring harness into the transmission.
11. Connect the electrical connector (1) to the vehicle speed sensor (2).

Fig. 23: Oxygen Sensor Electrical Connector
Courtesy of GENERAL MOTORS COMPANY

12. Clip in the engine wiring harness (3) to the oxygen sensor connector bracket and engine wiring harness brackets.
13. Connect the electrical connector (2) to the backup lamp switch.
14. Install the crankshaft position sensor. Refer to **Crankshaft Position Sensor Replacement** .
15. Connect the oxygen sensor electrical connector (1).

Fig. 24: Radiator Inlet And Outlet Hose Clamp
Courtesy of GENERAL MOTORS COMPANY

16. Install the radiator and condenser assembly (4) and connect the radiator inlet and outlet hoses (2, 3).
17. Install the radiator inlet and outlet hose clamp (1).
18. Install the powertrain assembly to the vehicle and then install the related parts. Refer to **Engine Replacement (LFM)** , **Engine Replacement (LL0)** .

Fig. 25: Clutch Housing Lower Plate Bolt
Courtesy of GENERAL MOTORS COMPANY

19. Install the clutch housing lower plate (2) and clutch housing lower plate bolts (1) and tighten to 10 (89 lb in).
20. Fill the transmission with fluid. Refer to **Transmission Fluid Drain and Fill**.
21. Bleed the hydraulic clutch system. Refer to **Hydraulic Clutch System Bleeding**.
22. Fill the reservoir with clutch/brake fluid up to the MAX level.

MANUAL TRANSMISSION SHIFT LEVER AND SELECTOR LEVER CABLE REPLACEMENT (MX2, MFM)

Removal Procedure

1. Remove the air cleaner assembly. Refer to **Air Cleaner Assembly Replacement**.

Fig. 26: Shift Lever And Selector Lever Cable
Courtesy of GENERAL MOTORS COMPANY

2. Remove the shift lever and selector lever cable (1) from the transmission control lever (2).
3. Remove the shift lever and selector lever cable from the shift lever and selector lever cable bracket (3).
4. Raise and support the vehicle. Refer to **Lifting and Jacking the Vehicle** .

Fig. 27: Shift Lever And Selector Lever Cable Bracket Nuts
Courtesy of GENERAL MOTORS COMPANY

5. Remove the shift lever and selector lever cable bracket nuts (1) from the underbody.
6. Lower the vehicle.
7. Remove the front floor console. Refer to **Front Floor Console Replacement** .

Fig. 28: Shift Lever And Selector Lever Cable U-clip
Courtesy of GENERAL MOTORS COMPANY

8. Remove the shift lever and selector lever cable U-clip (1).
9. Remove the shift lever and selector lever cable pin (2).

Fig. 29: Shift Lever And Selector Lever Cable Ends
Courtesy of GENERAL MOTORS COMPANY

10. Disconnect the shift lever and selector lever cable ends (1).
11. Push the cable socket tabs (3) in order to release the shift lever and selector lever cable.
12. Remove the shift lever and selector lever cable socket (2) from the transmission control housing.

Fig. 30: Transmission Control Bolts
Courtesy of GENERAL MOTORS COMPANY

13. Remove the transmission control bolts (1) and nuts (2).
14. Remove the transmission control.

Fig. 31: Shift Lever And Selector Lever Cable Grommet Nuts
Courtesy of GENERAL MOTORS COMPANY

15. Remove the shift lever and selector lever cable grommet nuts (1).
16. Remove the shift lever and selector lever cable from the vehicle.

Installation Procedure

1. Install the shift lever and selector lever cables to the vehicle.

Fig. 32: Shift Lever And Selector Lever Cable Grommet Nuts
Courtesy of GENERAL MOTORS COMPANY

CAUTION: Refer to Fastener Caution .

2. Install the shift lever and selector lever cable grommet nut (1) and tighten to 6 (53 lb in).

Fig. 33: Shift Lever And Selector Lever Cable
Courtesy of GENERAL MOTORS COMPANY

3. Install the shift lever and selector lever cable (1) to shift lever and selector lever cable bracket (3).
4. Install the shift lever and selector lever cable to transmission control lever (2).
5. Raise and support the vehicle. Refer to **Lifting and Jacking the Vehicle** .

Fig. 34: Shift Lever And Selector Lever Cable Bracket Nuts
Courtesy of GENERAL MOTORS COMPANY

6. Install the shift lever and selector lever cable bracket nuts (1) to the underbody and tighten to 6 (53 lb in).
7. Lower the vehicle.

Fig. 35: Shift Lever Cable U-Clip

Courtesy of GENERAL MOTORS COMPANY

8. Position the transmission control in the vehicle.
9. Connect the shift lever cable end.
10. Install the shift lever cable U-clip (1).
11. Install the shift lever cable socket (2) to the transmission control housing.

Fig. 36: Transmission Control Bolts
Courtesy of GENERAL MOTORS COMPANY

12. Install the transmission control bolts (1) and nuts (2) and tighten to 6 (53 lb in)
13. Install the selector lever cable socket (3) to the transmission control housing.
14. Connect the selector lever cable end.
15. Install the selector lever cable pin (4).
16. Install the front floor console. Refer to **Front Floor Console Replacement** .
17. Install the air cleaner. Refer to **Air Cleaner Assembly Replacement** .

TRANSMISSION CONTROL REPLACEMENT

Removal Procedure

1. Remove the front floor console. Refer to **Front Floor Console Replacement** .

Fig. 37: Shift Lever And Selector Lever Cable U-clip
Courtesy of GENERAL MOTORS COMPANY

2. Remove the shift lever and selector lever cable U-clip (1).
3. Remove the shift lever and selector lever cable pin (2).

Fig. 38: Shift Lever And Selector Lever Cable Ends
Courtesy of GENERAL MOTORS COMPANY

4. Disconnect the shift lever and selector lever cable ends (1).
5. Push the cable socket tabs (3) in order to release the shift lever and selector lever cable.
6. Remove the shift lever and selector lever cable socket (2) from the transmission control housing.

Fig. 39: Transmission Control Bolts
Courtesy of GENERAL MOTORS COMPANY

7. Remove the transmission control bolts (1) and nuts (2).
8. Remove the transmission control from the vehicle.

Installation Procedure

Fig. 40: Shift Lever Cable U-Clip

Courtesy of GENERAL MOTORS COMPANY

1. Position the transmission control in the vehicle.
2. Connect the shift lever cable end.
3. Install the shift lever cable U-clip (1).
4. Install the shift lever cable socket (2) to the transmission control housing.

Fig. 41: Transmission Control Bolts
Courtesy of GENERAL MOTORS COMPANY

CAUTION: Refer to Fastener Caution .

5. Install the transmission control bolts (1) and nuts (2) and tighten to 6 (53 lb in).
6. Install the selector lever cable socket (3) to the transmission control housing.
7. Connect the selector lever cable end.
8. Install the selector lever cable pin (4).
9. Install the front floor console. Refer to Front Floor Console Replacement .

SELECTOR AND SHIFT LEVER CABLE BRACKET REPLACEMENT

Removal Procedure

1. Remove the air cleaner assembly. Refer to Air Cleaner Assembly Replacement .

Fig. 42: Shift Lever And Selector Lever Cable
Courtesy of GENERAL MOTORS COMPANY

2. Remove the shift lever and selector lever cable (1) from the transmission control lever (2).
3. Remove the shift lever and selector lever cable from the shift lever and selector lever cable bracket (3).

Fig. 43: Selector And Shift Lever Cable Bracket Bolts
Courtesy of GENERAL MOTORS COMPANY

4. Remove the selector and shift lever cable bracket bolts (1) from the transmission.
5. Remove the selector and shift lever cable bracket (2) and bushing (3) from the transmission.

Installation Procedure

Fig. 44: Selector And Shift Lever Cable Bracket Bolts
Courtesy of GENERAL MOTORS COMPANY

1. Install the selector and shift lever cable bracket (2) and bushing (3) to the transmission.

CAUTION: Refer to Fastener Caution .

2. Install the selector and shift lever cable bracket bolts (1) to the transmission and tighten to 23 (17 lb ft).

Fig. 45: Shift Lever And Selector Lever Cable
Courtesy of GENERAL MOTORS COMPANY

3. Install the shift lever and selector lever cable (1) to the shift lever and selector lever cable bracket (3).
4. Install the shift lever and selector lever cable to transmission control lever (2).
5. Install the air cleaner assembly. Refer to **Air Cleaner Assembly Replacement** .

BACKUP LAMP SWITCH REPLACEMENT (MX2, MFM)

Fig. 46: Backup Lamp Switch
 Courtesy of GENERAL MOTORS COMPANY

Backup Lamp Switch Replacement (MX2, MFM)

Callout	Component Name
Preliminary Procedures	
Remove the air cleaner assembly. Refer to <u>Air Cleaner Assembly Replacement</u> .	
1	Backup Lamp Switch CAUTION: Refer to <u>Component Fastener Tightening Caution</u> . Procedure Disconnect the electrical connector. Tighten 17 (13 lb ft) Special Tools DT-50182 Backup Lamp Switch Remover/Installer For equivalent regional tools, refer to <u>Special Tools</u>

VEHICLE SPEED SENSOR REPLACEMENT (MX2, MFM)

Fig. 47: Vehicle Speed Sensor

Courtesy of GENERAL MOTORS COMPANY

Vehicle Speed Sensor Replacement (MX2, MFM)

Callout	Component Name
Preliminary Procedure Raise and support the vehicle. Refer to <u>Lifting and Jacking the Vehicle</u> .	
1	Vehicle Speed Sensor Mount Bolt (Qty: 1) CAUTION: Refer to <u>Fastener Caution</u> . Procedure Disconnect the electrical connector. Tighten 9 (80 lb in)
2	Vehicle Speed Sensor Assembly

FRONT WHEEL DRIVE SHAFT SEAL REPLACEMENT - LEFT SIDE (MX2, MFM)

Fig. 48: Front Wheel Drive Shaft Seal - Left Side (MX2, MFM)
 Courtesy of GENERAL MOTORS COMPANY

Front Wheel Drive Shaft Seal Replacement - Left Side (MX2, MFM)

Callout	Component Name
Preliminary Procedures	
1. Raise and support the vehicle. Refer to <u>Lifting and Jacking the Vehicle</u> . 2. Remove the front wheel drive shaft from the transmission. Refer to <u>Front Wheel Drive Shaft Replacement</u> .	
1	Left Front Wheel Drive Shaft Oil Seal Procedure 1. Remove the left wheel drive shaft oil seal using the DT-7004 slide hammer and the DT-586 universal seal remover. 2. Coat NEW left front wheel drive shaft oil seal with transmission fluid. 3. Install the NEW left front wheel drive shaft oil seal using the DT-50181 oil seal installer and hammer. TIP: Do not reuse the wheel drive shaft oil seal. Special Tools

- **DT-586** Universal Seal Remover
- **DT-7004** Slide Hammer
- **DT-50181** Oil Seal Installer

For equivalent regional tools, refer to **Special Tools**.

FRONT WHEEL DRIVE SHAFT SEAL REPLACEMENT - RIGHT SIDE (MX2, MFM)

Fig. 49: Front Wheel Drive Shaft Seal - Right Side (MX2, MFM)

Courtesy of GENERAL MOTORS COMPANY

Front Wheel Drive Shaft Seal Replacement - Right Side (MX2, MFM)

Callout	Component Name
Preliminary Procedures	
1. Raise and support the vehicle. Refer to Lifting and Jacking the Vehicle . 2. Remove the front wheel drive shaft from the transmission. Refer to Front Wheel Drive Shaft Replacement .	
	Right Front Wheel Drive Shaft Oil Seal
	Procedure
	1. Remove the right wheel drive shaft oil seal using the DT-7004 slide hammer with the

1

DT-586 universal seal remover.

2. Coat the NEW right front wheel drive shaft oil seal with transmission fluid.
3. Install the NEW right front wheel drive shaft oil seal using the **DT-49088** oil seal installer and hammer.

TIP: Do NOT reuse the front wheel drive shaft oil seal.

Special Tools

- **DT-586** Universal Seal Remover
- **DT-7004** Slide Hammer
- **DT-49088** Oil Seal Installer

For equivalent regional tools, refer to **Special Tools**.

TRANSMISSION FLUID LEVEL INSPECTION

Removal Procedure

1. Raise and support the vehicle. Refer to **Lifting and Jacking the Vehicle** .

Fig. 50: Transmission Case Oil Fill Plug
Courtesy of GENERAL MOTORS COMPANY

WARNING: Refer to Checking Hot Transmission Fluid through Drain Plug Hole
Warning .

2. Clean away all dirt and debris from the transmission case plug area.

NOTE: It is not necessary to check the fluid level unless oil discoloration occurs or leakage is suspected. Make sure to check the fluid level with the engine stopped. Check if the vehicle is level.

3. Remove and discard the transmission case oil fill plug (1) and check the oil level. The fluid level should be up to the bottom edge of the fluid plug hole.
4. If the level is low, add manual transmission fluid through the fill plug hole until the fluid begins to run out.

Installation Procedure

Fig. 51: Transmission Case Oil Fill Plug
Courtesy of GENERAL MOTORS COMPANY

CAUTION: Refer to Component Fastener Tightening Caution .

1. Install the NEW transmission case oil fill plug (1) and tighten to 25 (18 lb ft).
2. Lower the vehicle.

TRANSMISSION FLUID DRAIN AND FILL

Removal Procedure

WARNING: The transmission fluid is hot. Caution must be taken to prevent personal injury when the transmission fluid drains from the transmission.

1. Raise and support the vehicle. Refer to Lifting and Jacking the Vehicle .

Fig. 52: Transmission Case Oil Fill Plug
Courtesy of GENERAL MOTORS COMPANY

2. Clean away all dirt and debris from the transmission case plug area.
3. Remove and discard the transmission case oil drain plug (2).
4. Drain transmission fluid into a suitable container.
5. Remove and discard the transmission case oil fill plug (1).

Installation Procedure

Fig. 53: Transmission Case Oil Fill Plug
Courtesy of GENERAL MOTORS COMPANY

CAUTION: Refer to Component Fastener Tightening Caution .

1. Install the NEW transmission case oil drain plug (2) and tighten to 25 (18 lb ft).
2. Add transmission fluid until it seeps out of the fluid level check plug hole.
3. Install the NEW transmission case oil fill plug (1) and tighten to 25 (18 lb ft).
4. Lower the vehicle.

TRANSMISSION MOUNT BRACKET REPLACEMENT - LEFT SIDE (MX2, MFM)

Removal Procedure

1. Remove the left transmission mount. Refer to Transmission Mount Replacement - Left Side (MX2, MFM).
2. Remove the power brake booster pump bracket from left transmission mount bracket. Refer to Power Brake Booster Pump Replacement (Manual Transmission) .

Fig. 54: Left Transmission Mount Bracket Bolts
Courtesy of GENERAL MOTORS COMPANY

3. Disconnect the backup lamp switch connector.
4. Remove the left transmission mount bracket bolts (1).
5. Remove the left transmission mount bracket (2).

Installation Procedure

Fig. 55: Left Transmission Mount Bracket Bolts
Courtesy of GENERAL MOTORS COMPANY

1. Install the left transmission mount bracket (2).

CAUTION: Refer to Fastener Caution .

2. Install the left transmission mount bracket bolts (1) and tighten to 60 (44 lb ft).
3. Connect the backup lamp switch connector.
4. Install the power brake booster pump bracket to left transmission mount bracket. Refer to **Power Brake Booster Pump Replacement (Manual Transmission)** .
5. Install the left transmission mount. Refer to **Transmission Mount Replacement - Left Side (MX2, MFM)**.

REPAIR INSTRUCTIONS - OFF VEHICLE

TRANSMISSION DISASSEMBLE (HD)

Special Tools

- **DT-7004** Sliding Hammer
- **DT-46496** Gear, Bearing Installer
- **DT-49082** Needle Bearing Remover/installer
- **DT-49084** Input Shaft Holder
- **DT-46554** Differential Bearing Puller and Plate Adapter Kit
- **DT-50511** Shift Detent Remover

For equivalent regional tools, refer to **Special Tools**.

1. Remove the manual transmission. Refer to **Transmission Replacement (MX2, MFM)**.
2. Remove the clutch pedal arm. Refer to **Clutch Pedal Arm Replacement**.
3. Remove the clutch release bearing, shaft and bushing. Refer to **Clutch Release Bearing Replacement**.

Fig. 56: Selector And Shift Lever Cable Bracket Bolts
 Courtesy of GENERAL MOTORS COMPANY

4. Remove the selector and shift lever cable bracket bolts (1).
5. Remove the selector and shift lever cable bracket (2) and bushing (3).

Fig. 57: Backup Light Switch

Courtesy of GENERAL MOTORS COMPANY

6. Remove the backup light switch (1).
7. Remove the vehicle speed sensor assembly bolt (2).
8. Remove the vehicle speed sensor assembly (3).

Fig. 58: Side Cover Bolts

Courtesy of GENERAL MOTORS COMPANY

9. Remove 8 side cover bolts (1).
10. Remove side cover (2) using a rubber hammer.
11. Remove the sealant on the side cover and the transmission case.

Fig. 59: Input Shaft Circlip

Courtesy of GENERAL MOTORS COMPANY

12. Remove the input shaft circlip (1).

Fig. 60: Gear Shift Fork Pin

Courtesy of GENERAL MOTORS COMPANY

13. Remove the 5th gear shift fork pin (1) using a pin punch and a hammer.

Fig. 61: Input Shaft 5th Gear Fork
Courtesy of GENERAL MOTORS COMPANY

14. Pull and remove the input shaft 5th gear fork (1) and the synchronizer hub assembly (2) together.
15. Remove the 5th gear synchronizer hub plate (3).
16. Remove the synchronizer ring, levers and sleeve from the 5th synchronizer hub assembly.

Fig. 62: Input Shaft 5th Gear

Courtesy of GENERAL MOTORS COMPANY

17. Pull and remove the input shaft 5th gear (1).
18. Remove the input shaft 5th gear bearing (2).

Fig. 63: View Of DT-49084 Input Shaft Holder
Courtesy of GENERAL MOTORS COMPANY

19. Move the shift shaft lever into the 4th gear position.
20. Hold the input shaft using the **DT-49084** input shaft holder (1).
21. Remove the caulking and the counter shaft 5th gear nut (2).

Fig. 64: View Of DT-46554 differential bearing puller and plate adapter kit
Courtesy of GENERAL MOTORS COMPANY

22. Remove the counter shaft 5th gear (2) using the **DT-46554** differential bearing puller and plate adapter kit (1).

Fig. 65: Left Case Plate Screws And Plate
Courtesy of GENERAL MOTORS COMPANY

23. Remove 6 left case plate screws (1).
24. Remove the left case plate (2).
25. Remove the countershaft bearing shim (3).

Fig. 66: Reverse Idle Gear Shaft Bolt And Gasket
Courtesy of GENERAL MOTORS COMPANY

NOTE: The case (Left) can not be removed without removing the reverse idle gear shaft bolt.

26. Remove the reverse idle gear shaft bolt (1) and gasket (2).

Fig. 67: Right Case Side Bolts

Courtesy of GENERAL MOTORS COMPANY

27. Remove the bolts (1) from the right case side.

Fig. 68: Left Case Side Bolts

Courtesy of GENERAL MOTORS COMPANY

28. Remove 12 bolts (1) from the left case side.
29. Remove the sensor connector bracket (2) and the two wiring harness brackets (3) from the left case side.
30. Remove the left side case by hitting with a rubber hammer lightly.
31. Remove the sealant on the case.

Fig. 69: Reverse Gear Shift Lever Bolts
Courtesy of GENERAL MOTORS COMPANY

32. Remove the reverse gear shift lever bolts (1).
33. Remove the reverse gear shift lever (2).

Fig. 70: Reverse Idle Gear And Shaft
Courtesy of GENERAL MOTORS COMPANY

34. Push the reverse idle gear toward the inner case.
35. Pulling shaft and remove the reverse idle gear (2) and shaft (1).
36. Remove the reverse idle gear (2) from the shaft assembly.

Fig. 71: Shift Interlock Bolt And Washer
Courtesy of GENERAL MOTORS COMPANY

NOTE: **Certainly remove the shift interlock bolt. Otherwise, gear shift and shaft assembly can not be removed.**

37. Remove the shift interlock bolt (1) and washer (2).

Fig. 72: 5Th And Reverse Gear Shift Shaft
Courtesy of GENERAL MOTORS COMPANY

38. Remove the 5th and reverse gear shift shaft (1)

Fig. 73: Shift Control Lever Inner And Outer Pins
Courtesy of GENERAL MOTORS COMPANY

39. Remove the shift control lever inner and outer pins (1).

Fig. 74: Shift Control Lever

Courtesy of GENERAL MOTORS COMPANY

40. Remove the shift control lever shaft (1).
41. Remove the shift control shaft detent spring (2).
42. Remove the shift interlock plate (3).
43. Remove the shift control lever (4).
44. Remove the shift control shaft detent spring (5).
45. Remove the 5th and reverse gear inhibitor cam (6).
46. Remove the shift shaft detent cam spring (7).
47. Remove the shift control shaft seal using a screwdriver (8)..

Fig. 75: Gear Unit And Shift Shaft Assembly
Courtesy of GENERAL MOTORS COMPANY

NOTE: **Be careful not to damage the teeth of the countershaft pinion and differential ring gear.**

48. Remove the gear unit and the shift shaft assembly (1) together.
49. Remove the high and the low speed shift shaft assembly from the gear unit.

Fig. 76: Wooden Prying Device

Courtesy of GENERAL MOTORS COMPANY

50. Insert a wooden prying device (1) into the lower side of the differential.
51. Remove the differential assembly (2) by moving it right and left.

Fig. 77: DT-49082 Needle Bearing Remover/Installer
Courtesy of GENERAL MOTORS COMPANY

52. Remove the shift and select shaft needle bearings using the **DT-49082** needle bearing remover/installer (1).

Fig. 78: Oil Gutter

Courtesy of GENERAL MOTORS COMPANY

53. Remove the oil gutter (1).
54. Remove the differential left side oil seal (2) using a hammer and a copper chisel.

Fig. 79: Countershaft Bearing Outer Race
Courtesy of GENERAL MOTORS COMPANY

55. Remove the countershaft bearing outer race (2) using the **DT-46496** gear, bearing installer (1) and hammer.

Fig. 80: Shift Shaft Detent

Courtesy of GENERAL MOTORS COMPANY

NOTE: **Inspect the detent for damage. If the detent is damaged, remove and discard the detent.**

56. Remove the shift shaft detent (3) using the **DT-50511** shift detent remover (1) and **DT-7004** sliding hammer (2).

Fig. 81: Differential Right Side Oil Seal

Courtesy of GENERAL MOTORS COMPANY

- 57. Remove the differential right side oil seal (1) using a hammer and a copper chisel.
- 58. Remove the input shaft oil seal (2) using a screwdriver.

SYNCHRONIZERS CLEANING AND INSPECTION (HD)

Fig. 82: Synchronizers Cleaning And Inspection (HD)
Courtesy of GENERAL MOTORS COMPANY

Measure the distance between the synchronizer sleeve and the shift fork. If the distance is over the limit, replace the shift fork.

Specification

- The standard distance between the synchronizer sleeve and the shift fork is 0.2-0.6 mm (0.008-0.024 in).
- The allowable distance limit between the synchronizer sleeve and the shift fork is 1.0 mm (0.039 in).

TRANSMISSION ASSEMBLE (HD)

Special Tools

- **DT-46496** Gear, Bearing Installer
- **DT-49080** Gear, Bearing Installer
- **DT-49082** Needle Bearing Remover/Installer
- **DT-49083** Needle Bearing Installer
- **DT-49084** Input Shaft Holder
- **DT-49088** Oil Seal Installer

- **DT-50179** Input Shaft Seal Installer
- **DT-50181** Oil Seal Installer

For equivalent regional tools, refer to **Special Tools**.

Fig. 83: Input Shaft Oil Seal And Differential Right Side Oil Seal
Courtesy of GENERAL MOTORS COMPANY

NOTE: Coat the transmission inner parts with gear fluid when installing.

1. Install the new input shaft oil seal (2) using the **DT-50179** input shaft seal installer (1).
2. Install the new differential right side oil seal (4) using the **DT-49088** oil seal installer (3).

Fig. 84: Differential Right Side Oil Seal

Courtesy of GENERAL MOTORS COMPANY

3. Install the new differential left side oil seal (2) using the **DT-50181** oil seal installer (1).

Fig. 85: Shift Shaft Detent

Courtesy of GENERAL MOTORS COMPANY

4. Install the new shift shaft detent (1) using a hammer.

Fig. 86: Oil Gutter

Courtesy of GENERAL MOTORS COMPANY

5. Install the oil gutter (1).

Fig. 87: Shift And Selector Shaft Needle Bearing
Courtesy of GENERAL MOTORS COMPANY

6. Install the shift and selector shaft needle bearing using the **DT-49083** needle bearing installer (1) and **DT-49082** needle bearing remover/installer (2).

Fig. 88: Differential Assembly

Courtesy of GENERAL MOTORS COMPANY

7. Install the differential assembly (1) to the right side of the transmission case. Position the differential ring gear surface lower than the right side of the transmission case surface.

Fig. 89: Gear Unit And Shift Shaft Assembly
Courtesy of GENERAL MOTORS COMPANY

8. Install the low- and high-speed shift shaft assembly onto the gear unit.

NOTE: **Do NOT damage the teeth of the counter shaft pinion and the differential ring gear.**

9. Push the gear unit (1) by matching the unit with the input and the counter shaft hole.

Fig. 90: 5Th And Reverse Gear Shift Shaft
Courtesy of GENERAL MOTORS COMPANY

10. Install the 5th and reverse gear shift shaft (1).

Fig. 91: Reverse Idle Gear Shaft Assembly
Courtesy of GENERAL MOTORS COMPANY

NOTE: Match the marking of the reverse idle gear shaft bolt hole with the protrusion of the transmission case - right side.

11. Install the reverse idle gear shaft assembly (1).
12. Install the reverse gear shift lever (2).

CAUTION: Refer to Fastener Caution .

13. Install the reverse gear shift lever bolts (3) and tighten to 23 (17 lb ft).

Fig. 92: NEW shift control shaft seal
Courtesy of GENERAL MOTORS COMPANY

14. Install the NEW shift control shaft seal (1).
15. Install the 5th and reverse gear inhibitor cam (2).
16. Install the shift shaft detent cam spring (3).
17. Install the shift control shaft detent spring (4).
18. Install the shift interlock plate (5).
19. Install the shift control lever (6).
20. Install the shift control shaft detent spring (7).
21. Install the shift control lever shaft (8).

Fig. 93: Shift Control Lever Inner And Outer Pins
Courtesy of GENERAL MOTORS COMPANY

NOTE: When installing the inner and outer pins, make the crevices of 2 pins symmetric to each other.

22. Install the new shift control lever inner and outer pins (1).

Fig. 94: Shift Interlock Bolt And Washer
Courtesy of GENERAL MOTORS COMPANY

23. Install the shift interlock washer (2) and bolt (1) and tighten to 23 (17 lb ft).

Fig. 95: Left Case Side Bolts

Courtesy of GENERAL MOTORS COMPANY

24. Coat the transmission case with recommended transmission case sealant - THREE BOND 1215 or LOCTITE 5702.
25. Install the transmission left side case to the transmission right side case.
26. Install the sensor connector bracket (2) and two wiring harness brackets (3) to the left case side.
27. Install 12 bolts (1) onto the left side case and tighten to 19 (14 lb ft).

Fig. 96: Right Case Side Bolts

Courtesy of GENERAL MOTORS COMPANY

28. Install the bolts (1) onto the right case and tighten to 19 (14 lb ft).

Fig. 97: Reverse Idle Gear Shaft Bolt And Gasket
Courtesy of GENERAL MOTORS COMPANY

29. Install the reverse idle gear shaft gasket (2) and bolt (1) and tighten to 33 (24 lb ft).

Fig. 98: Countershaft Bearing Outer Race
Courtesy of GENERAL MOTORS COMPANY

NOTE: Check if the bearing and the outer race are correctly installed by rotating counter shaft.

30. Install the countershaft bearing outer race (2) using the **DT-46496** gear, bearing installer (1).

Fig. 99: Measuring Clearance Between Transmission Case Surface And Bearing Outer Race Using A Straight Ruler And A Gauge

Courtesy of GENERAL MOTORS COMPANY

31. Measure the clearance between the transmission case surface (3) and the bearing outer race (2) using a straight ruler (1) and a gauge. Refer to Transmission Case Surface and Bearing Outer Races Clearance Table in **Manual Transmission Specifications (HD)**.
32. Select a shim so that clearance is within standard.

Fig. 100: Left Case Plate Screws And Plate
Courtesy of GENERAL MOTORS COMPANY

33. Install the counter shaft bearing shim (3).
34. Install the left case plate (2).
35. Install the 6 new left case plate screws (1) and tighten to 9 (80 lb in).

Fig. 101: Countershaft 5th Gear

Courtesy of GENERAL MOTORS COMPANY

NOTE: Position the machined boss side toward the side cover plate.

36. Install the countershaft 5th gear (2) using the **DT-49080** gear, bearing installer (1).

Fig. 102: Input Shaft 5th Gear Bearing
Courtesy of GENERAL MOTORS COMPANY

37. Insert the input shaft 5th gear bearing (1) into the input shaft.
38. Install the input shaft 5th gear (2).

Fig. 103: Exploded View Of 5th Gear Synchronizer Hub Assembly
Courtesy of GENERAL MOTORS COMPANY

NOTE: Make sure that the lever mark must be showed after assembly.

39. Assemble the 5th gear synchronizer hub assembly.
- Position the longer boss side of hub (2) toward inner side.
 - Position the chamfered spline of sleeve (1) toward inner side and install the hub (2) to the sleeve (1).
 - Position the lever marks side toward outer side and install the levers (3) into the hub (2).
 - Install the synchronizer ring (4) inserting ring lugs into the spaces between levers (3).

Fig. 104: 5th Gear Fork

Courtesy of GENERAL MOTORS COMPANY

NOTE: Position the longer boss side of hub toward inner side and match the hub mark (1) with the input shaft punched mark (2). Make sure that the lever marks (3) must be showed to the 5th synchronizer hub assembly.

40. Install 5th gear fork to the synchronizer hub assembly.
41. Install the 5th gear fork (4) and synchronizer hub assembly (5) to the input shaft.

Fig. 105: Gear Shift Fork Pin

Courtesy of GENERAL MOTORS COMPANY

42. Install the new 5th gear shift fork pin (1) using a pin punch and hammer.

Fig. 106: Exploded View Of 5th Gear Synchronizer Hub Plate
Courtesy of GENERAL MOTORS COMPANY

43. Install the 5th gear synchronizer hub plate (2).
44. Install the new input shaft circlip (1).

Fig. 107: Holding Input Shaft Using DT-49084
Courtesy of GENERAL MOTORS COMPANY

45. Move the shift shaft lever into the 5th gear position.
46. Hold the input shaft using the **DT-49084** input shaft holder (1).
47. Install the new countershaft nut and tighten to 70 (52 lb ft).
48. Caulk the nut using a chisel and hammer.

Fig. 108: Side Cover Bolts

Courtesy of GENERAL MOTORS COMPANY

49. Coat the side cover with recommended Side Cover Sealant-THREE BOND 1215 or LOCTITE 5702.
50. Install the side cover (2).
51. Install 8 side cover bolts (1) and tighten to 10 (89 lb in).

Fig. 109: Backup Light Switch

Courtesy of GENERAL MOTORS COMPANY

- 52. Install the vehicle speed sensor assembly (3).
- 53. Install the vehicle speed sensor assembly bolt (2) and tighten to 9 (80 lb in).
- 54. Install the backup light switch (1) and tighten to 17 (13 lb ft).

Fig. 110: Selector And Shift Lever Cable Bracket Bolts
Courtesy of GENERAL MOTORS COMPANY

55. Install the selector and shift lever cable bracket (2) and bushing (3).
56. Install the selector and shift lever cable bracket bolts (1) and tighten to 23 (17 lb ft).
57. Install the clutch release bearing, shaft and bushing. Refer to **Clutch Release Bearing Replacement**.
58. Install the clutch pedal arm. Refer to **Clutch Pedal Arm Replacement**.
59. Install the transmission assembly. Refer to **Transmission Replacement (MX2, MFM)**.

INPUT SHAFT DISASSEMBLE (HD)

Special Tools

DT-46494 Gear, Bearing Remover

For equivalent regional tools, refer to **Special Tools**.

Fig. 111: Input Shaft Right Bearing
Courtesy of GENERAL MOTORS COMPANY

1. Remove the gear unit. Refer to **Transmission Disassemble (HD)**.
2. Position the bearing to the **DT-46494** gear, bearing remover (2) to the right bearing.
3. Remove the input shaft right bearing (1) using a press.

Fig. 112: 5th Gear Spacer, Left Bearing and 4th Gear
Courtesy of GENERAL MOTORS COMPANY

4. Position the 4th gear to the **DT-46494** gear, bearing remover (4).
5. Remove the 5th gear spacer (1), left bearing (2) and 4th gear (3) with the press.

Fig. 113: 4th Gear Bearing

Courtesy of GENERAL MOTORS COMPANY

6. Remove the 4th gear bearing (1).
7. Remove the 4th gear synchronizer ring (2).
8. Remove the 3rd-4th synchronizer circlip (3).

Fig. 114: 3rd-4th Synchronizer Hub Assembly
Courtesy of GENERAL MOTORS COMPANY

9. Position the 3rd gear to the **DT-46494** gear, bearing remover (3).
10. Remove the 3rd-4th synchronizer hub assembly (1) synchronizer ring and 3rd gear (2) with the press.

Fig. 115: 3rd-4th Synchronizer Hub Assembly
Courtesy of GENERAL MOTORS COMPANY

11. Push the hub (1) from the 3rd-4th synchronizer hub assembly
12. Remove the synchronizer sleeve (2) and key unit (3).

Fig. 116: Input Shaft 3rd Gear Bearing
Courtesy of GENERAL MOTORS COMPANY

13. Remove the input shaft 3rd gear bearing (1).

INPUT SHAFT ASSEMBLE (HD)

Special Tools

- **DT-46496** Gear, Bearing Installer
- **DT-49080** Gear, Bearing Installer

For equivalent regional tools, refer to **Special Tools**.

Fig. 117: 3rd Gear Bearing

Courtesy of GENERAL MOTORS COMPANY

NOTE: Coat all of the inner parts the gear, the bearing and the oil seal with gear fluid.

1. Install the 3rd gear bearing (2).
2. Install the 3rd gear and synchronizer ring (1).

Fig. 118: 3rd-4th Synchronizer Hub
Courtesy of GENERAL MOTORS COMPANY

3. Install the 3rd-4th synchronizer hub (2) to the sleeve (1).

NOTE: **Make sure that the key units is properly seated into the key groove of sleeve and hub.**

4. Install the key units (3) into the key groove of the hub and sleeve.

Fig. 119: View Of DT-46496 Gear, Bearing Installer And A Hammer
Courtesy of GENERAL MOTORS COMPANY

NOTE:

- Position the longer flange of hub toward the third gear and match the key groove of hub to the synchronizer ring lug.
- When installing gear, bearing and hub assembly, install them slowly using the DT-46496 gear, bearing installer (1) and a hammer. If overpressed, the gear teeth may be damaged

5. Insert the 3rd-4th hub assembly (2) into the input shaft.
6. Install the 3rd-4th hub assembly using the **DT-46496** gear, bearing installer (1) and hammer.

Fig. 120: 3rd-4th Synchronizer Circlip
Courtesy of GENERAL MOTORS COMPANY

7. Install the 3rd-4th synchronizer circlip (2).

NOTE: Match the synchronizer ring lug to the key groove of hub.

8. Install the 4th synchronizer ring (1).

Fig. 121: Input Shaft 4th Gear Bearing And 4th Gear
Courtesy of GENERAL MOTORS COMPANY

9. Install the input shaft 4th gear bearing (2) and 4th gear (1).

Fig. 122: Input Shaft Left Side Bearing
Courtesy of GENERAL MOTORS COMPANY

10. Install the input shaft left side bearing (3) using the **DT-49080** gear, bearing installer (1) and hammer.
11. Install the 5th gear spacer (2) using the **DT-49080** gear, bearing installer (1) and hammer.

Fig. 123: Input Shaft Right Bearing
Courtesy of GENERAL MOTORS COMPANY

12. Install the input shaft right bearing (2) to the input shaft using the **DT-49080** gear, bearing installer (1) and hammer.
13. Install the gear unit. Refer to **Transmission Assemble (HD)**.

COUNTER GEAR SHAFT DISASSEMBLE (HD)

Special Tools

DT-46494 Gear, Bearing Remover

For equivalent regional tools, refer to **Special Tools**.

Fig. 124: Countershaft Right Side Bearing
Courtesy of GENERAL MOTORS COMPANY

1. Remove the gear unit. Refer to Transmission Disassemble (HD).
2. Remove the counter shaft right side bearing.

Fig. 125: Counter Shaft Left Bearing And 4th Gear
Courtesy of GENERAL MOTORS COMPANY

3. Position the 4th gear to the **DT-46494** gear, bearing remover (3).
4. Remove the counter shaft left bearing (1) and 4th gear (2) using a press.

Fig. 126: Counter Shaft 3rd-4th Gear Spacer
Courtesy of GENERAL MOTORS COMPANY

5. Remove the counter shaft 3rd-4th gear spacer (1).
6. Position the 2nd gear to the **DT-46494** gear, bearing remover (4).
7. Remove the 3rd gear (2) and 2nd gear (3) with the press.

Fig. 127: Counter Shaft 2nd Gear Bearing
Courtesy of GENERAL MOTORS COMPANY

8. Remove the counter shaft 2nd gear bearing (1).
9. Remove the 2nd gear synchronizer ring (2).
10. Remove the 1st-2nd gear synchronizer circlip (3).

Fig. 128: 1st-2nd Gear Synchronizer Hub Assembly
Courtesy of GENERAL MOTORS COMPANY

11. Position the 1st gear to the **DT-46494** gear, bearing remover (3).
12. Remove the 1st-2nd gear synchronizer hub assembly (1), 1st gear synchronizer ring and 1st gear (2) with the press.
13. Remove the 1st gear synchronizer ring from the 1st gear.

Fig. 129: Synchronizer Sleeve And Key Units
Courtesy of GENERAL MOTORS COMPANY

14. Push the hub (1) from the 1st-2nd gear synchronizer hub assembly.
15. Disassemble the synchronizer sleeve (2) and key units (3).

Fig. 130: Counter Shaft 1st Gear Bearing And 1st Gear Spacer
Courtesy of GENERAL MOTORS COMPANY

16. Remove the counter shaft 1st gear bearing (1) and the 1st gear spacer (2).

COUNTER GEAR SHAFT ASSEMBLE (HD)

Special Tools

- **DT-49079** Gear, Bearing Installer
- **DT-49080** Gear, Bearing Installer
- **DT-49081** Gear, Bearing Installer

For equivalent regional tools, refer to **Special Tools**.

Fig. 131: 1st Gear Synchronizer Ring And 1st Gear Spacer
Courtesy of GENERAL MOTORS COMPANY

NOTE: Coat the inner parts of the gear, the bearing and the oil seal with gear fluid.

1. Install the 1st gear spacer (1).
2. Install the 1st gear bearing (2).
3. Install the 1st gear (3).
4. Install the 1st gear synchronizer ring (4).

Fig. 132: 1st-2nd Gear Synchronizer Sleeve
Courtesy of GENERAL MOTORS COMPANY

NOTE: Make sure that the key units is properly seated into the key groove of sleeve and hub.

5. Install the hub (2) to the 1st-2nd gear synchronizer sleeve (1).
6. Install the key units (3) into the key groove of the hub and sleeve.

Fig. 133: 1st-2nd Gear Synchronizer Hub Assembly
Courtesy of GENERAL MOTORS COMPANY

NOTE: Match the key groove of hub to the 1st gear synchronizer ring lug.

7. Install the 1st-2nd gear synchronizer hub assembly (2) into the counter shaft using the **DT-49081** gear, bearing installer (1) and hammer.

Fig. 134: 1st-2nd Gear Synchronizer Circlip
Courtesy of GENERAL MOTORS COMPANY

8. Install the 1st-2nd gear synchronizer circlip (2).

NOTE: Match the 2nd synchronizer ring lug to the key groove of hub.

9. Install the 2nd synchronizer ring (1).

Fig. 135: 2nd Gear Bearing

Courtesy of GENERAL MOTORS COMPANY

10. Install the 2nd gear bearing (1).
11. Install the 2nd gear (2).

Fig. 136: 3rd-4th Gear Space

Courtesy of GENERAL MOTORS COMPANY

12. Insert the 3rd gear and the 3rd-4th gear spacer into the counter shaft.
13. Install the 3rd-4th gear spacer (2) and the 3rd gear (3) using the **DT-49079** gear, bearing installer (1) and a hammer.

Fig. 137: Installing 4th Gear Using DT-49080 Tool
Courtesy of GENERAL MOTORS COMPANY

14. Install the 4th gear (2) to the counter shaft using the **DT-49080** gear, bearing installer (1) and a hammer.

Fig. 138: Installing Left Side Bearing Using DT-49080 Tool
Courtesy of GENERAL MOTORS COMPANY

15. Install the left side bearing (2) onto the countershaft using the **DT-49080** gear, bearing installer (1) and hammer.

Fig. 139: Countershaft Right Side Bearing
Courtesy of GENERAL MOTORS COMPANY

16. Install the countershaft right side bearing.
17. Install the gear unit. Refer to **Transmission Assemble (HD)**.

SHIFT SHAFT AND FORK ASSEMBLIES DISASSEMBLE (HD)

1st-2nd Gear Shift Shaft Disassemble

Fig. 140: 1st-2nd Gear Shift Yoke Pin And 1st-2nd Gear Shift Fork
Courtesy of GENERAL MOTORS COMPANY

1. Remove the gear unit. Refer to **Transmission Disassemble (HD)**.
2. Remove the 1st-2nd gear shift shaft assembly from the gear unit.
3. Fix the shift shaft assembly into a vise with a protector.

NOTE: **Mark the place and direction of the shift fork and yoke before removing them. This will aid the reassembly**

4. Remove the 1st-2nd gear shift yoke pin (1) using a pin punch and a hammer.
5. Remove the 1st-2nd gear shift yoke (2).
6. Remove the 1st-2nd gear shift fork pin (3) using a pin punch and a hammer.
7. Remove the 1st-2nd gear shift fork (4).

3rd-4th Gear Shift Shaft Disassemble

Fig. 141: 3rd-4th Gear Shift Fork Pin
Courtesy of GENERAL MOTORS COMPANY

1. Remove the gear unit. Refer to **Transmission Disassemble (HD)**.
2. Remove the 3rd-4th gear shift shaft assembly from the gear unit.
3. Fix the 3rd-4th gear shift shaft assembly into a vise with a protector.
4. Remove the 3rd-4th gear shift fork pin (1) using a pin punch and a hammer.
5. Remove the 3rd-4th gear shift fork (2).
6. Remove the 3rd-4th gear shift yoke pin (3) using a pin punch and a hammer.
7. Remove the 3rd-4th gear shift yoke (4).

5th Reverse Gear Shift Shaft Disassemble

Fig. 142: 5th-Reverse Gear Ball And Reverse Shift Guide Ball
Courtesy of GENERAL MOTORS COMPANY

1. Remove the gear unit. Refer to **Transmission Disassemble (HD)**.
2. Remove the 5th-reverse gear shift shaft assembly from the gear unit.
3. Remove the shift shaft not installed with yoke by pushing (1).
4. Remove the 5th-reverse gear ball (3) and the reverse shift guide ball and spring (2) from the reverse shift arm.
5. Fix the shift shaft assembly into a vise with a protector.

Fig. 143: 5th Gear Shift Yoke Pin And Reverse Gear Shift Arm
Courtesy of GENERAL MOTORS COMPANY

6. Remove the reverse gear shift arm pin (1) using a pin punch and hammer.
7. Remove the reverse gear shift arm (2).
8. Remove the 5th gear shift yoke pin (3) using a pin punch and a hammer.
9. Remove the 5th gear shift yoke (4).

SHIFT SHAFT AND FORK ASSEMBLIES CLEANING AND INSPECTION (HD)

Fig. 144: Shift Shaft and Fork Assemblies Cleaning and Inspection (HD)
Courtesy of GENERAL MOTORS COMPANY

1. Inspect for bent, deformed or damaged shift shaft.
2. Replace the shift shaft if necessary

SHIFT FORK CLEANING AND INSPECTION (HD)

Fig. 145: Shift Fork Cleaning and Inspection (HD)
Courtesy of GENERAL MOTORS COMPANY

Measure the end thickness of shift fork and replace if necessary.

Specifications

- The standard shift fork end thickness for the low speed shift fork is 8.7 mm (0.343 in).
- The shift fork end thickness limit for the low speed shift fork is 8.56 mm (0.337 in).
- The standard shift fork end thickness for the high speed shift fork is 7.8 mm (0.307 in).
- The shift fork end thickness limit for the high speed shift fork is 7.66 mm (0.302 in).
- The standard shift fork end thickness for the fifth gear shift fork is 7.8 mm (0.307 in).
- The shift fork end thickness limit for the fifth gear shift fork is 7.66 mm (0.302 in).

SHIFT SHAFT AND FORK ASSEMBLIES ASSEMBLE (HD)

1st-2nd Gear Shift Shaft Assembly

Fig. 146: 1st-2nd Gear Shift Yoke Pin And 1st-2nd Gear Shift Fork
Courtesy of GENERAL MOTORS COMPANY

1. Place the shift shaft into a vise with a protector.
2. Install the 1st-2nd gear shift fork (4).
3. Install the new 1st-2nd gear shift fork pin (3) using a pin punch and a hammer.
4. Install the 1st-2nd gear shift yoke (2).
5. Install the new 1st-2nd gear shift yoke pin (1) using a pin punch and a hammer.
6. Install the 1st-2nd gear shift shaft assembly into the gear unit.
7. Install the gear unit. Refer to **Transmission Assemble (HD)**.

3rd-4th Gear Shift Shaft Assembly

Fig. 147: 3rd-4th Gear Shift Fork Pin
Courtesy of GENERAL MOTORS COMPANY

1. Place the shift shaft into a vise with a protector.
2. Install the 3rd-4th gear shift yoke (4).
3. Install the new 3rd-4th gear shift yoke pin (3) using a pin punch and a hammer.
4. Install the 3rd-4th gear shift fork (2).
5. Install the new 3rd-4th gear shift fork pin (1) using a pin punch and a hammer.
6. Install the 3rd-4th gear shift shaft assembly into the gear unit.
7. Install the gear unit. Refer to **Transmission Assemble (HD)**.

5th Reverse Gear Shift Shaft Assembly

Fig. 148: 5th Gear Shift Yoke Pin And Reverse Gear Shift Arm
Courtesy of GENERAL MOTORS COMPANY

1. Place the shift shaft into a vise with a protector.
2. Install the 5th gear shift yoke (4).
3. Install the new 5th gear shift yoke pin (3) using a pin punch and a hammer.
4. Install the reverse gear shift arm (2).
5. Install the new reverse gear shift arm pin (1) using a pin punch and a hammer.

Fig. 149: 5th-Reverse Gear Ball And Reverse Shift Guide Ball
Courtesy of GENERAL MOTORS COMPANY

6. Install the reverse shift guide ball and spring (2).
7. Install the 5th-reverse gear ball (3).
8. Install the shift shaft by pushing (1).
9. Install 5th-reverse gear shift shaft assembly into the gear unit.
10. Install the gear unit. Refer to Transmission Disassemble (HD).

DESCRIPTION AND OPERATION

TRANSMISSION SYSTEM DESCRIPTION AND OPERATION

This 5-speed transmission assembly adopts the synchronized mesh type of 5 forward speed. The reverse speed gear is driven by sliding idle gear without synchronizer.

Reverse Gear Mis-Shift Preventing Mechanism

5th and reverse gear cam prevents the gear from directly being shifted from 5th to reverse when shifting to reverse from 5th. So, when shifting to reverse, be sure to shift to reverse from neutral position.

Fig. 150: Reverse Gear Mis-Shift Preventing Mechanism
Courtesy of GENERAL MOTORS COMPANY

In case of shifting to 5th gear, shift and select shaft rotates to right that shift and select lever arm fixes on the groove of 5th and reverse gear shift cam.

When shifting to reverse from 5th gear, shifting to reverse is impossible because 5th and reverse gear shift cam fixes on cam stopper case.

When shifting to reverse from neutral position between 5th and reverse, gear shift and select lever arm rotates to left and shifting is possible.

Differential

The differential is integrated with transmission case and installed on chassis together with the engine. It changes the direction of power and increase torque. The reduction gear is installed parallel to a counter shaft and is a helical gear type. The differential gear is a bevel gear type and is integrated with a reduction gear.

ACCESSORIES & EQUIPMENT

Waterleaks - Spark

DIAGNOSTIC INFORMATION AND PROCEDURES

WATERLEAK TEST PREPARATION

- GM vehicles are designed to operate under normal environmental conditions.
- The design criteria for sealing materials and components takes into consideration the sealing forces required to withstand the natural elements. These specifications cannot take into consideration any artificial conditions, i.e., high pressure car washes.
- The water leak test procedure has been correlated to the natural elements and will determine the ability of a vehicle to perform under normal operating conditions.
- The first step in diagnosing a leak is determining the conditions under which a leak occurs. If the general leak area can be found, the exact entry point can be isolated using a water hose or an air hose. Some trim panels or components may need to be removed in order to repair the leak.
- If leaks are found around a door, door window, rear compartment lid or liftgate area this does not necessarily indicate a bad weatherstrip. An adjustment to these areas may resolve the condition.

Watertest Stand Assembly

Fig. 1: View Of Watertest Stand Assembly
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
1	Pipe (0.5 x 36 in)
2	Reducing Tee, Right Stand Only (0.5 x 0.5 x 0.25 in)
3	Coupling, Left Stand Only, (0.5 in)
4	Tee, Left Stand Only (0.5 in)
5	Cross, Right Stand Only (0.5 in)
6	Pipe to Hose Nipple, Right Stand Only (0.5 in)
7	Female Hose Coupling (5/8 in)
8	Input Hose, Right Stand Only (2.0 ft) (5/8 in diameter)
9	Close Nipple (0.5 in)
10	Cross (0.5 in) with Weld-On Cap (0.5 in)
11	Nipple (0.5 x 12 in)
12	Cap (0.5 in)
13	Female Hose Coupling (5/8 in)
14	Cross Hose (12 ft) (5/8 in diameter)
15	Hose Quick Connect
16	Pipe to Hose Nipple (0.5 in)
17	Pipe (0.5 x 60 in)
18	Water Pressure Gauge, Right Stand Only
19	Full Jet Spray Nozzle, No. 1/2GG-25 or Equivalent
20	Coupling (0.5 in)

1. Assemble the water test stand as shown.

Fig. 2: Illustrating How Water Spray From Stands Should Overlap Vehicle
Courtesy of GENERAL MOTORS COMPANY

2. Position the stands as shown. The water spray from the stands should overlap the vehicle as shown.
3. Have an assistant inside of the vehicle during the test in order to locate any leaks.
4. The water pressure at the nozzle should maintain a 155 kPa (22 psi), for at least 4 minutes.

Fig. 3: Identifying Proper Water Spray Angles
Courtesy of GENERAL MOTORS COMPANY

5. In order to check the windshield, aim the water spray 30 degrees down and 45 degrees toward the rear.
Aim the water towards the corner of the windshield.
6. In order to check the side windows for leaks, position the water stand towards the center of the rear quarter, aiming the water spray 30 degrees down and 45 degrees toward the rear.
7. In order to check the back window, aim the water spray 30 degrees down and 30 degrees toward the front.

WATER HOSE TEST

Fig. 4: Performing Water Hose Test
Courtesy of GENERAL MOTORS COMPANY

NOTE: Use a water hose without the nozzle attached.

1. Have an assistant inside of the vehicle in order to locate the leak.
2. Begin testing at the base of the window or the windshield.
3. Slowly move the hose upward and across the top of the vehicle.

AIR HOSE TEST

Fig. 5: Performing Air Hose Test

Courtesy of GENERAL MOTORS COMPANY

CAUTION: The air hose test should only be used on fully cured urethane adhesive. Otherwise, damage to the urethane adhesive bead could result in additional leaks.

1. Using a liquid detergent, diluted with water in a spray bottle, spray the window at the edges. Begin at the bottom and gradually move up and across the top.

NOTE: The compressed air should not exceed 205 kPa (30 psi).

2. Have an assistant inside of the vehicle with an air hose.
3. Have the assistant aim the compressed air at the suspected areas.

Bubbles will form in the soap solution at the location of the leak.

REPAIR INSTRUCTIONS

BODY WATERLEAK REPAIR

Fig. 6: Cutting Out Portion Of Adhesive Caulking (1 Of 2)
Courtesy of GENERAL MOTORS COMPANY

WARNING: If the vehicle interior is exposed to moisture and becomes soaked up to the level of the sensing and diagnostic module (SDM), the SDM and SDM harness connector must be replaced. The SDM could be activated when powered, which could cause airbag deployment and result in personal injury.

Depending on the location of the waterleak, you may have to remove certain interior components in order to repair the leak.

1. If the floor carpet is wet, refer to **Floor Carpet Drying** .

Fig. 7: Cutting Out Portion Of Adhesive Caulking (2 Of 2)
Courtesy of GENERAL MOTORS COMPANY

2. Cut out a portion of the adhesive caulk in the leak area from inside or outside of the vehicle.
3. Clean and remove all loose particles of the adhesive old caulk from the area.
4. Apply joint body and seam sealer where the old adhesive caulk was removed.
5. Allow the adhesive caulk to dry for several hours.
6. Test for leaks.
7. Install the trim, if removed.

STATIONARY WINDOW WATERLEAK REPAIR

WARNING: If any water enters the vehicle interior up to the level of the carpet or higher and soaks the carpet, the sensing and diagnostic module (SDM) and the SDM harness connector may need to be replaced. The SDM could be activated when powered, which could cause deployment of the air bag (s) and result in personal injury. Before attempting these procedures, the

SIR system must be disabled. Refer to Disabling the SIR System.

With the ignition OFF, inspect the SDM mounting area, including the carpet. If any significant soaking or evidence of significant soaking is detected, you must perform the following tasks:

- 1. Remove all water.**
- 2. Repair the water damage.**
- 3. Replace the SDM harness connector.**
- 4. Replace the SDM.**

Failure to follow these tasks could result in possible air bag deployment, personal injury or otherwise unneeded SIR system repairs.

1. If the floor carpet is wet refer to **Floor Carpet Drying** .
2. Remove the trim moldings or the headliner in order to repair the leak, if needed.
3. Determine the source of water entry.
4. If water is leaking at the edge of the windshield, reseal the windshield using Urethane Adhesive Caulking Kit GM P/N 12346392 or the equivalent.
5. If water leaks into the vehicle at the sides of the stationary windows, reseal the window using Urethane Adhesive Caulking Kit GM P/N 12346392 or the equivalent.

FASTENER TIGHTENING SPECIFICATIONS

Fastener Tightening Specifications

Application	Specification	
	Metric	English
Tie Rod Jam Nut	75 N.m	55 lb ft

REPAIR INSTRUCTIONS

WHEEL ALIGNMENT MEASUREMENT

Steering and vibration concerns are not always the result of incorrect alignment. One possible cause is wheel

and tire imbalance. Another possibility is tire lead due to worn or improperly manufactured tires. Lead/pull is defined as follows: At a constant highway speed on a typical straight road, lead/pull is the amount of effort required at the steering wheel to maintain the vehicle's straight path. Lead is the vehicle deviation from a straight path on a level road without pressure on the steering wheel. Refer to **Radial Tire Lead/Pull Correction** .

Before performing any adjustments affecting wheel alignment, perform the following inspections in order to ensure correct alignment readings:

- Inspect for visible damage to the suspension components and replace as necessary.
- Inspect the tires for the proper inflation and irregular tire wear. Refer to **Tire Diagnosis - Irregular or Premature Wear** .
- Inspect the runout of the wheels and the tires. Refer to **Tire and Wheel Runout Specifications** .
- Inspect the wheel bearings for backlash and excessive play. Refer to **Wheel Bearings Diagnosis** .
- Inspect the ball joints for looseness or wear.
- Inspect the tie rod ends for looseness or wear.
- Inspect the control arms and stabilizer shaft for looseness or wear.
- Inspect the steering gear for looseness at the frame. Refer to **Fastener Tightening Specifications** .
- Inspect the struts/shock absorbers for wear, leaks, and any noticeable noises. Refer to **Suspension Strut and Shock Absorber Testing - On Vehicle** .
- Inspect the vehicle trim height. Refer to **Trim Height Inspection** .
- Inspect the steering wheel for excessive drag or poor return due to stiff or rusted linkage or suspension components.
- Inspect the fuel level. The fuel tank should be full or the vehicle should have a compensating load added.

Give consideration to excess loads, such as tool boxes, sample cases, etc. If normally carried in the vehicle, these items should remain in the vehicle during alignment adjustments. Give consideration also to the condition of the equipment being used for the alignment. Follow the equipment manufacturer's instructions.

Satisfactory vehicle operation may occur over a wide range of alignment settings. However, if the setting exceeds the service allowable specifications, correct the alignment to the service preferred specifications. Refer to **Wheel Alignment Specifications**.

Perform the following steps in order to measure the front and rear alignment angles:

1. Install the alignment equipment according to the manufacturer's instructions.
2. Jounce the front and the rear bumpers 3 times prior to checking the wheel alignment.
3. Measure the alignment angles and record the readings.

NOTE: Record the "Before" and "After" alignment measurements.

4. Adjust alignment angles to vehicle specifications, if necessary. Refer to **Wheel Alignment Specifications**.

FRONT CASTER ADJUSTMENT

The front caster is not adjustable. If the front caster angle is not within specifications, inspect for suspension support misalignment or front suspension damage. Replace any damaged suspension components as necessary.

FRONT CAMBER ADJUSTMENT

The front camber is not adjustable. If the front camber angle is not within specifications, inspect for suspension support misalignment or front suspension damage. Replace any damaged suspension components as necessary.

WHEEL ALIGNMENT - STEERING WHEEL ANGLE AND/OR FRONT TOE ADJUSTMENT

Fig. 1: Tie Rod Jam Nut

Courtesy of GENERAL MOTORS COMPANY

1. Ensure that the steering wheel is set in a straight ahead position and centered.
2. Loosen the tie rod jam nut (1).
3. Adjust the toe to specification by turning the adjuster (2). Refer to **Wheel Alignment Specifications**.

CAUTION: Refer to Fastener Caution .

4. Install the tie rod jam nut (1) and tighten to 75 N.m (55 lb ft).

DESCRIPTION AND OPERATION

CAMBER DESCRIPTION

Fig. 2: Camber Description

Courtesy of GENERAL MOTORS COMPANY

Camber is the tilting of the wheels from the vertical when viewed from the front of the vehicle. When the wheels tilt outward at the top, the camber is positive (+). When the wheel tilts inward at the top, the camber is negative (-). The amount of tilt is measured in degrees from the vertical. Camber settings influence the directional control and the tire wear.

Too much positive camber will result in premature wear on the outside of the tire and cause excessive wear on the suspension parts.

Too much negative camber will result in premature wear on the inside of the tire and cause excessive wear on the suspension parts.

Unequal side-to-side camber of 1 degree or more will cause the vehicle to pull or lead to the side with the most positive camber.

CASTER DESCRIPTION

Fig. 3: Caster Description

Courtesy of GENERAL MOTORS COMPANY

Caster is the tilting of the uppermost point of the steering axis either forward or backward, when viewed from the side of the vehicle. A backward tilt is positive (+) and a forward tilt is negative (-). Caster influences directional control of the steering but does not affect the tire wear. Caster is affected by the vehicle height, therefore it is important to keep the body at its designed height.

Overloading the vehicle or a weak or sagging rear spring will affect caster. When the rear of the vehicle is lower than its designated trim height, the front suspension moves to a more positive caster. If the rear of the vehicle is higher than its designated trim height, the front suspension moves to a less positive caster.

With too little positive caster, steering may be touchy at high speed and wheel returnability may be diminished when coming out of a turn. If one wheel has more positive caster than the other, that wheel will pull toward the center of the vehicle. This condition will cause the vehicle to pull or lead to the side with the least amount of positive caster.

LEAD/PULL DESCRIPTION

NOTE: Vehicles will tend to lead/pull in the direction of the road slope as part of normal operation.

At a constant highway speed on a typical straight road, lead/pull is the amount of effort required at the steering wheel to maintain the vehicle's straight path.

Lead/pull is usually caused by the following factors:

- Road slope
- Variability in tire construction
- Wheel alignment (front cross caster and camber)
- Unbalanced steering gear

MEMORY STEER DESCRIPTION

Memory steer is when the vehicle wants to lead or pull in the direction the driver previously turned the vehicle. Additionally, after turning in the opposite direction, the vehicle will want to lead or pull in that direction.

SCRUB RADIUS DESCRIPTION

Ideally, the scrub radius is as small as possible. Normally, the SAI angle and the centerline of the tire and the wheel intersect below the road surface, causing a positive scrub radius. With struts, the SAI angle is much larger than the long arm/short arm type of suspension. This allows the SAI angle to intersect the camber angle above the road surface, forming a negative scrub radius. The smaller the scrub radius, the better the directional stability. Installing aftermarket wheels that have additional offset will dramatically increase the scrub radius. The newly installed wheels may cause the centerline of the tires to move further away from the spindle. This will increase the scrub radius.

A large amount of scrub radius can cause severe shimmy after hitting a bump. Four-wheel drive vehicles with large tires use a steering damper to compensate for an increased scrub radius. Scrub radius is not directly measurable by the conventional methods. Scrub radius is projected geometrically by engineers during the design phase of the suspension.

THRUST ANGLES DESCRIPTION

Fig. 4: Thrust Angles Description

Courtesy of GENERAL MOTORS COMPANY

The front wheels aim or steer the vehicle. The rear wheels control tracking. This tracking action relates to the thrust angle (3). The thrust angle is the path that the rear wheels take. Ideally, the thrust angle is geometrically aligned with the body centerline (2).

In the illustration, toe-in is shown on the left rear wheel, moving the thrust line (1) off center. The resulting deviation from the centerline is the thrust angle.

If the thrust angle is not set properly the vehicle may "dog track", the steering wheel may not be centered or it could be perceived as a bent axle. Thrust angle can be checked during a wheel alignment.

Positive thrust angle means the thrust line is pointing to the right hand side (RHS) of the vehicle.

Negative thrust angle means the thrust line is pointing to the left hand side (LHS) of the vehicle.

If the thrust angle is out of specification, moving the axle to body relationship will change the thrust angle reading.

If the vehicle is out in the Positive (+) direction-moving the RHS forward and/or LHS rearward will move the thrust angle towards zero degrees.

If the vehicle is out in the Negative (-) direction-moving the RHS rearward and/or LHS forward will move the thrust angle towards zero degrees.

TOE DESCRIPTION

Fig. 5: Toe Description

Courtesy of GENERAL MOTORS COMPANY

Toe is a measurement of how much the front and/or rear wheels are turned in or out from a straight-ahead position. When the wheels are turned in, toe is positive (+). When the wheels are turned out, toe is negative (-). The actual amount of toe is normally only a fraction of a degree. The purpose of toe is to ensure that the wheels roll parallel.

Toe also offsets the small deflections of the wheel support system that occur when the vehicle is rolling forward. In other words, with the vehicle standing still and the wheels set with toe-in, the wheels tend to roll parallel on the road when the vehicle is moving. Improper toe adjustment will cause premature tire wear and cause steering instability.

TORQUE STEER DESCRIPTION

Fig. 6: Torque Steer Description
Courtesy of GENERAL MOTORS COMPANY

A vehicle pulls or leads in one direction during hard acceleration. A vehicle pulls or leads in the other direction during deceleration.

The following factors may cause torque steer to be more apparent on a particular vehicle:

- A slightly smaller diameter tire on the right front increases a right torque lead. Inspect the front tires for differences in the brand, the construction, or the size. If the tires appear to be similar, change the front tires from side-to-side and retest the vehicle. Tire and wheel assemblies have the most significant effect on torque steer correction.
- A large difference in the right and left front tire pressure
- Left-to-right differences in the front view axle angle may cause significant steering pull in a vehicle. The pull will be to the side with the most downward sloping axle from the differential to the wheels. Axles typically slope downward from the differential. The slope of the transaxle pan to level ground may be used as an indication of bias axle angles. The side with the higher transaxle pan (shown on the left side of the illustration) has the most downward sloping axle angle.

WANDER DESCRIPTION

Wander is the undesired drifting or deviation of a vehicle to either side from a straight path with hand pressure on the steering wheel. Wander is a symptom of the vehicle's sensitivity to external disturbances, such as road

crown and crosswind, and accentuated by poor on-center steering feel.

DIAGNOSTIC INFORMATION AND PROCEDURES

SYMPTOMS - WHEEL DRIVE SHAFTS

NOTE: Complete the following steps prior to beginning the wheel drive shaft diagnosis.

1. Perform the **Vibration Analysis - Road Testing** in order to effectively diagnose the concern.
2. Review the system operation in order to become familiar with the system function. Refer to **Wheel Drive Shafts Description and Operation**.

Visual/Physical Inspection

- Inspect for aftermarket equipment and modifications which could affect the operation of the wheel drive shafts or other rotating components.
- Inspect the easily accessible or visible system components for obvious damage or conditions which could cause the symptom.
- Thoroughly inspect the entire wheel drive shaft for visible damage, leaking joint seals and missing seal clamps.
- Inspect the wheel drive shaft seals for cuts, tears or other damage which may allow the loss of lubricant and the entry of contaminants.

Symptom List

After performing the Visual/Physical Inspection and no visual signs of damage or other interference impairing the wheel drive shaft function is apparent, it may be necessary to remove the wheel drive shaft from the vehicle

and manipulate the joints manually. Any binding or otherwise impeded movement of the joints may indicate damage which could contribute to the concern. Refer to the following:

- **Click Noise In Turns**
- **Clunk When Accelerating from Coast**
- **Clunk Noise When Accelerating During Turns**

CLICK NOISE IN TURNS

A click noise occurring during turns may be caused by a worn or damaged wheel drive shaft outer joint. This may be more apparent while simultaneously turning and accelerating. This click is caused by wear and/or damage to the constant velocity joint bearings and/or races. Commonly, this damage or wear is caused by the loss of lubricating grease from the constant velocity joint and the entry of foreign material or contaminants.

Carefully inspect the wheel drive shaft seals for cuts, tears or other damage which may allow the lubricating grease to escape. The loss of this grease will cause damage to the wheel drive shaft constant velocity joint in a very short period of time.

If inspection reveals no visual evidence of wear or damage, it may be necessary to remove the wheel drive shaft from the vehicle and manipulate the outer joint manually. Any binding or impeded movement of the joint may indicate damage which could contribute to the concern.

CLUNK WHEN ACCELERATING FROM COAST

A clunk noise occurring when accelerating from coast or a standing start may be caused by a worn or damaged wheel drive shaft inner joint. The common cause of wheel drive shaft inner joint damage is the loss of lubricating grease and/or the presence of foreign material and contaminants in the joint. This usually occurs as a result of a torn or damaged inner joint seal.

Carefully inspect the wheel drive shaft seal for cuts, tears or other damage that may allow the loss of the lubricating grease and/or the entry of contaminants.

If inspection reveals no visual evidence of wear or damage, it may be necessary to remove the wheel drive shaft from the vehicle and manipulate the inner joint manually. Do not allow the joint to separate from the wheel drive shaft bar. Any binding or impeded movement of the joint may indicate damage which could contribute to the concern.

CLUNK NOISE WHEN ACCELERATING DURING TURNS

A clunk noise that occurs while accelerating during turns may be caused by wear and/or damage to the inboard and the outboard joints in combination. The loss of lubricant and/or the presence of contaminants can cause damage to the internal components of the joints.

Carefully inspect the joint seals for cuts, tears or other damage. Joint seals that are damaged may allow lubricant leakage and the entry of contaminants.

If inspection reveals no visual evidence of wear or damage, it may be necessary to remove the wheel drive shaft

from the vehicle and manipulate the joints manually. Do not allow the joints to separate from the wheel drive shaft bar. Any binding or impeded movement of the joints may indicate damage which could contribute to the concern.

REPAIR INSTRUCTIONS

FRONT WHEEL DRIVE SHAFT REPLACEMENT

Special Tools

- **DT-6332** Seal Protector
- **DT-50183** Wheel Drive Shaft Remover
- **DT-50186** Wheel Hub Holding Tool
- **DT-50188** Hub Spindle Remover

Removal Procedure

CAUTION: Refer to **Vehicle Lifting and Jacking Caution** .

1. Raise and support the vehicle. Refer to **Vehicle Lifting and Jacking Caution** .
2. Remove the tire and wheel assembly. Refer to **Tire and Wheel Removal and Installation** .
3. Drain the transmission fluid. Refer to **Transmission Fluid Drain and Fill** , for Y4A/Y4M Transmission, **Transmission Fluid Drain and Fill** , for AisinTM80-40 Transmission or **Transmission Fluid Drain and Fill (Maintenance)** , **Transmission Fluid Drain and Fill (Repair)** for Jatco CVT Transmission (Repair).

Fig. 1: Special Wheel Nut Tool

Courtesy of GENERAL MOTORS COMPANY

4. Install the **DT-50186** tool (1) to the wheel hub with the wheel nuts.

Fig. 2: Wheel Drive Shaft Retaining Nut And Washer
Courtesy of GENERAL MOTORS COMPANY

NOTE: Use a suitable tool to release the crimping on the wheel drive shaft retaining nut.

NOTE: The wheel drive shaft retaining nut (1) must be discarded after removal.

5. Remove the wheel drive shaft nut (1) and washer (2) from the wheel drive shaft and discard.
6. Remove the **DT-50186** tool from the wheel hub.
7. Disconnect the outer tie rod assembly from the steering knuckle. Refer to **Steering Linkage Outer Tie Rod Replacement** .
8. Separate the control arm ball joint from the steering knuckle. Refer to **Lower Control Arm Replacement** .

Fig. 3: Special Tool DT-50188

Courtesy of GENERAL MOTORS COMPANY

9. Using the **DT-50188** remover (2), separate the wheel drive shaft from the steering knuckle (1).

Fig. 4: Special Tool DT-50188

Courtesy of GENERAL MOTORS COMPANY

10. For the manual transmission, install the **DT-50183** remover (1) on the groove of inner joint and remove the wheel drive shaft from the transaxle.

Fig. 5: Removing Wheel Drive Shaft From Transaxle
Courtesy of GENERAL MOTORS COMPANY

11. For the automatic transmission, insert a big flat-head screwdriver between the inner joint and the transaxle and remove the wheel drive shaft from the transaxle.

Installation Procedure

Fig. 6: Protector Tool

Courtesy of GENERAL MOTORS COMPANY

1. Position the **DT-6332** protector in the transaxle.
2. Install the wheel drive shaft until the wheel drive shaft splines are past the axle seal.
3. Remove the **DT-6332** protector from the wheel drive shaft.
4. Install the wheel drive shaft until it is fully seated in the transaxle.

NOTE: In the following step, **DO NOT** pull on the wheel drive shaft. Pull only on the inner joint.

5. With the wheel drive shaft installed, grasp the inner tripod housing and pull the tripod outward to ensure that the wheel drive shaft is properly engaged. The wheel drive shaft will remain in place if properly installed.
6. Install the wheel drive shaft to the front wheel hub/bearing.
7. Install the control arm ball joint to the steering knuckle. Refer to **Lower Control Arm Replacement** .
8. Install the outer tie rod assembly to the steering knuckle. Refer to **Steering Linkage Outer Tie Rod Replacement** .

Fig. 7: Wheel Drive Shaft Retaining Nut And Washer
Courtesy of GENERAL MOTORS COMPANY

9. Hand tighten the NEW wheel drive shaft nut (2) on the wheel drive shaft (1).

Fig. 8: Special Wheel Nut Tool

Courtesy of GENERAL MOTORS COMPANY

10. Install the **DT-50186** tool (1) to the wheel hub with two wheel nuts.
11. Support the **DT-50186** tool (1) outer end on a safety stand.

CAUTION: Refer to Fastener Caution .

12. Using a torque wrench and the appropriate size socket, install the wheel drive shaft nut and tighten to 240 (177 lb ft).
13. Remove the **DT-50186** tool (1) from the wheel hub.

Fig. 9: Staking Wheel Drive Shaft Nut With Punch
Courtesy of GENERAL MOTORS COMPANY

14. Using a punch (1), stake the wheel drive shaft nut.
15. Install the tire and wheel assembly. Refer to **Tire and Wheel Removal and Installation** .
16. Lower the vehicle.
17. Fill the transaxle fluid and inspect the fluid level of the transaxle. Refer to **Transmission Fluid Drain and Fill** , for Y4A/Y4M Transmission, **Transmission Fluid Drain and Fill** , for Aisin 80-40 Transmission or **Transmission Fluid Drain and Fill (Maintenance)** , **Transmission Fluid Drain and Fill (Repair)** for Jatco CVT Transmission (Repair).

FRONT WHEEL DRIVE SHAFT INNER JOINT REPLACEMENT

Disassemble Procedure

1. Remove the wheel drive shaft from the vehicle. Refer to **Front Wheel Drive Shaft Replacement**.

Fig. 10: Wheel Drive Shaft Bar

Courtesy of GENERAL MOTORS COMPANY

2. Position wheel drive shaft bar in a soft-jawed vise and clamp securely.

Fig. 11: Removing Boot Retaining Clamp Using A Needle-Nose Plier

6. Install the tripod housing (2) on the wheel drive shaft (1).

Fig. 20: Removing Boot Retaining Clamp Using A Needle-Nose Plier
Courtesy of GENERAL MOTORS COMPANY

7. Using a needle-nose plier, install the boot retaining clamp (1) with the ear (2) hooked for the tripod housing (3).
8. Move the tripod assembly in a circular motion 4 or 5 times to distribute the grease in the tripod assembly.
9. Install the wheel drive shaft from the vehicle. Refer to **Front Wheel Drive Shaft Replacement**.

FRONT WHEEL DRIVE SHAFT OUTER JOINT REPLACEMENT

Special Tools

DT-50185 Wheel Drive Shaft Outer Joint Boot Clamp Installer

NOTE: Outer constant velocity joint and axle shaft cannot be separated and are replaced as a complete assembly.

Disassemble Procedure

1. Remove the wheel drive shaft from the vehicle. Refer to **Front Wheel Drive Shaft Replacement**.

Fig. 21: Wheel Drive Shaft Bar

Courtesy of GENERAL MOTORS COMPANY

2. Clamp the drive axle shaft in a soft-jawed vice.
3. Remove the inner joint boot from the wheel drive shaft. Refer to **Front Wheel Drive Shaft Inner Joint Replacement**.

Fig. 22: Boot Retaining Clamp, Outer Joint And Boot
Courtesy of GENERAL MOTORS COMPANY

4. Using a flat-bladed tool, remove the boot retaining clamp (2) from the outer joint (1) and the boot (3). Discard the clamp.
5. Using a pair of side cutters, remove and discard the boot retaining clamp (4) from the boot (3) and the wheel drive shaft (5). Discard the clamp.

Fig. 23: Boot And Wheel Drive Shaft
Courtesy of GENERAL MOTORS COMPANY

6. Slide the boot toward the inner joint and remove the boot (2) from the wheel drive shaft (1).

Assemble Procedure

Fig. 24: Boot And Wheel Drive Shaft
Courtesy of GENERAL MOTORS COMPANY

NOTE: **Ensure the seal clamp is positioned correctly in the seal groove.**

1. Position the boot (2) on the wheel drive shaft (1).

Fig. 25: Boot And Wheel Drive Shaft
Courtesy of GENERAL MOTORS COMPANY

2. Ensure that the boot (1) is properly seated in the groove (2) in the wheel drive shaft (3).

Fig. 26: Wheel Drive Shaft Outer Joint Boot Clamp Installer
Courtesy of GENERAL MOTORS COMPANY

3. Using the **DT-50185** wheel drive shaft outer joint boot clamp installer (1), close the clamp (2) for the wheel drive shaft until the gap (A) measures 2.10 mm (0.83 in).

Fig. 27: Placing Lubricant Inside Outer Joint Boot
Courtesy of GENERAL MOTORS COMPANY

4. Place approximately half the lubricant (2) inside the outer joint boot (1) and the other half in the outer joint (3)

Fig. 28: Wheel Drive Shaft Outer Joint Boot Clamp Installer
Courtesy of GENERAL MOTORS COMPANY

5. Using the **DT-50185** wheel drive shaft outer joint boot clamp installer (1), close the clamp (2) for the outer joint until the gap (A) measures 2.10 mm (0.83 in).
6. Remove the wheel drive shaft from the bench vise.
7. Move the outer joint in a circular motion 4 to 5 times to distribute the lubricant.
8. Install the wheel drive shaft in the vehicle. Refer to **Front Wheel Drive Shaft Replacement**.

WHEEL DRIVE SHAFT INNER JOINT INSPECTION

Fig. 29: Drive Shaft Tripod Bushing Clamp And Tripod Housing
Courtesy of GENERAL MOTORS COMPANY

1. Remove the wheel drive shaft tripod bushing clamp (2) from the tripod housing (3).
2. Remove the wheel drive shaft tripod housing (3) from the wheel drive shaft.
3. Remove the wheel drive shaft tripod joint boot bushing (1).
4. Using a suitable cleaner, remove the excess grease from the tripod assembly.
5. Inspect the following items for damage or excessive wear:
 - The wheel drive shaft tripod boot
 - The wheel drive shaft tripod assembly
 - The wheel drive shaft tripod joint housing
 - The wheel drive shaft
6. If any of the items in step 5 are found to be defective, replace those items that are serviceable.

DESCRIPTION AND OPERATION

WHEEL DRIVE SHAFTS DESCRIPTION AND OPERATION

Wheel drive shafts are flexible assemblies consisting of an inner tripod joint and an outer constant velocity joint connected by an axle shaft. The inner joint is completely flexible and can plunge in and out. The outer joint is

also flexible, but cannot plunge in and out. These drive axles are used to transmit rotational force from the transaxle to the front tire and wheel assemblies.

Seal and Clamp

The wheel drive shafts use inboard and outboard joint seals made of thermoplastic material and clamps made of stainless steel. The functions of the seals are as follows:

- The seals protect the internal parts of the inboard and outboard joints.
 - They protect the joint lubricating grease from surrounding detrimental atmospheric conditions, such as extreme temperatures, ozone gas, etc.
 - They protect the joint lubricating grease from foreign materials, such as stones, dirt, water, salt, etc.
- The seals facilitate angular and axial movement of the inboard joint.
- The seals facilitate angular movement of the outboard joint.

The function of the clamps is as follows:

- Provide a leak proof connection at both the housing and the axle shaft for the inboard and outboard joints.
- The thermoplastic material performs well against normal handling, operational wear and conditions. This material however, is not strong enough to withstand abusive handling or damage due to objects such as sharp tools or the sharp edge of any other surrounding component on the vehicle.

Inner Joint

The inner joints are of the tripod design without an over-extension limitation retainer. The inner joints incorporate a male spline which interlocks with the transaxle or the intermediate drive shaft if equipped, using snap rings.

Outer Joint

The outer joints are of the Rzeppa, constant velocity joint design. The shaft end which mates with the wheel bearing and hub assembly, incorporates a spline.

|---|

Circuit/System Description

The body control module (BCM) controls the single speed rear wiper motor by its active high output to the external rear wiper motor relay. When the BCM activates its output and applies battery to the coil of the relay, the relay energizes, allowing battery voltage from the fuse to be applied through the switched contacts of the rear wiper motor relay to the control input of the rear wiper motor. The motor then operates continuously at low speed.

Conditions for Running the DTC

- Vehicle in Service Mode
- The system voltage is between 9-16 V.

Conditions for Setting the DTC

A short to ground or an open/high resistance is detected in the rear window wiper control circuit.

Action Taken When the DTC Sets

Rear wiper operation is suspended.

Conditions for Clearing the DTC

A current DTC clears when the diagnostic runs and passes.

Scan Tool Reference

Control Module References for scan tool information

Circuit/System Verification

1. Vehicle in Service Mode.
2. Verify the scan tool Rear Wiper Switch parameter changes between Off and On when turning the rear wipers ON and OFF..
 - **If the parameter does not change**

Refer to Circuit/System Testing - Rear Wiper/Washer Switch Malfunction.
 - **If the parameter changes**
3. Verify the Rear Wiper Motor turns On when commanding the Rear Wiper Active with a scan tool.
 - **If the Rear Wiper Motor does not turn ON**

Refer to Circuit/System Testing - Rear Wiper Motor Malfunction
 - **If the Rear Wiper Motor turns ON**
4. All OK.

Circuit/System Testing

Rear Wiper/Washer Switch Malfunction

1. Vehicle OFF and all vehicle systems OFF, disconnect the harness connector at the S82 Windshield Wiper/Washer Switch. It may take up to 11 min for all vehicle systems to power down.
2. Test for less than 10 ohms between the low reference circuit terminal 1 and ground.
 - **If 10 ohms or greater**
 1. Vehicle OFF.
 2. Test for less than 2 ohms in the low reference circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, replace the K9 Body Control Module.
 - **If less than 10 ohms**
3. Vehicle in Service Mode.
4. Test for greater than 8 V between the signal circuit terminal 7 and ground.
 - **If less than 8 V**
 1. Vehicle OFF, disconnect the harness connector at the K9 Body Control Module.
 2. Test for infinite resistance between the signal circuit and ground
 - If less than infinite resistance, repair the short to ground on the circuit.

- If infinite resistance
- 3. Test for less than 2 ohms in the signal circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, replace the K9 Body Control Module.
- **If 8 V or greater**
- 5. Vehicle OFF, disconnect the X2 harness connector at the K9 Body Control Module, vehicle in Service Mode.
- 6. Test for less than 1 V between the S82 Windshield Wiper/Washer Switch signal circuit terminal 7 and ground.
 - **If 1 V or greater**

Repair the short to voltage on the circuit.

- **If less than 1 V**
- 7. Test or replace the S82 Windshield Wiper/Washer Switch.

Rear Wiper Motor Malfunction

1. Vehicle OFF, and all vehicle systems OFF. Disconnect the harness connector at the M45 Rear Wiper Motor. It may take up to 2 min for all vehicle systems to power down.
2. Test for less than 10 ohms between the ground circuit terminal 1 and ground.
 - **If 10 ohms or greater**
 1. Test for less than 2 ohms in the ground circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, repair the open/high resistance in the ground connection.
 - **If less than 10 ohms**
3. Vehicle in Service Mode.
4. Verify a test lamp illuminates between the B+ circuit terminal 3 and the ground circuit terminal 1.
 - **If the test lamp does not illuminate**
 1. Vehicle OFF, remove the test lamp. Disconnect the X2 harness connector at the X50A Fuse Block - Underhood.
 2. Test for less than 2 ohms in the control circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, replace the X50A Fuse Block - Underhood.
 - **If the test lamp illuminates**
5. Connect a test lamp between the control circuit terminal 2 and the ground circuit terminal 1.
6. Verify the test lamp does NOT turn ON and OFF when commanding the Rear Wiper On and Off with a scan tool.
 - **If the test lamp turns ON and OFF**

Test or replace the M45 Rear Wiper Motor.

- **If the test lamp does not turn ON and OFF**
- 7. Vehicle OFF, connect the harness connector at the M45 Rear Wiper Motor. Disconnect the X2 harness connector at the X50A Fuse Block - Underhood, It may take up to 2 min for all vehicle systems to power down.
- 8. Test for less than 10 ohms between each ground circuit listed below and ground:
 - Terminal 39
 - Terminal 44
 - **If 10 ohms or greater**
 - 1. Test for less than 2 ohms in the ground circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, repair the open/high resistance in the ground connection.
 - **If less than 10 ohms**
- 9. Vehicle in Service Mode.
- 10. Verify the M45 Rear Wiper Motor is not activated.
 - **If the M45 Rear Wiper Motor is activated**
 - 1. Vehicle OFF, disconnect the harness connector at the M45 Rear Wiper Motor, vehicle in Service Mode.
 - 2. Test for less than 1 V between the control circuit terminal 2 and ground.
 - If 1 V or greater, repair the short to voltage on the circuit.
 - If less than 1 V, replace the M45 Rear Wiper Motor.
 - **If the M45 Rear Wiper Motor is not activated**
- 11. Connect a 20 A fused jumper wire between both of the circuits listed below and B+:
 - B+ Circuit Terminal 29
 - Control Circuit Terminal 30
- 12. Verify the M45 Rear Wiper Motor activates.
 - **If the M45 Rear Wiper Motor does not activate**
 - 1. Vehicle OFF, remove the jumper wire, disconnect the harness connector at the M45 Rear Wiper Motor, vehicle in Service Mode.
 - 2. Test for infinite resistance between the control circuit and ground.
 - If less than Infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance
 - 3. Test for less than 2 ohms in the control circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, replace the M45 Rear Wiper Motor.
 - **If the M45 Rear Wiper Motor activates**
- 13. Vehicle OFF, connect the X2 harness connector at the X50A Fuse Block - Underhood. Disconnect the X4 harness connector at the K9 Body Control Module, vehicle in Service Mode.
- 14. Verify the M45 Rear Wiper Motor is not activated.
 - **If the M45 Rear Wiper Motor is activated**

1. Vehicle OFF, disconnect the X2 harness connector at the X50A Fuse Block - Underhood, vehicle in Service Mode.
2. Test for less than 1 V between the control circuit terminal 27 and B+.
 - If 1 V or greater, repair the short to voltage on the circuit.
 - If less than 1 V, replace the X50A Fuse Block - Underhood.
 - **If the M45 Rear Wiper Motor is not activated**
15. Connect a 10 A fused jumper wire between the control circuit terminal 10 and B+.
16. Verify the M45 Rear Wiper Motor activates.
 - **If the M45 Rear Wiper Motor does not activate**
 1. Vehicle OFF, remove the jumper wire, disconnect the X2 harness connector at the X50A Fuse Block - Underhood.
 2. Test for infinite resistance between the control circuit terminal 27 and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If less than infinite resistance
 3. Test for less than 2 ohms in the control circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, test or replace the X50A Fuse Block - Underhood.
 - **If the M45 Rear Wiper Motor activates**
17. Test or replace the K9 Body Control Module.

Component Testing

Windshield Wiper/Washer Switch

1. Vehicle OFF, disconnect the harness connector at the S82 Windshield Wiper/Washer Switch.
2. Test for infinite resistance between the signal terminal 7 and the low reference terminal 1 with the rear window washer switch in the open position.
 - **If less than infinite resistance**

Replace the S82 Windshield Wiper/Washer Switch.
 - **If infinite resistance**
3. Verify the resistance reading is within the range specified below between the signal circuit terminal 7 and the low reference circuit terminal 1 by cycling the switch between Rear Wiper position and Rear Washers position.
 - Rear Wiper : 624-644ohms
 - Rear Wiper Sweep : 1.99-2.01kohms
 - Rear Washer : 6.11-6.13kohms
 - **If not within range specified**

Replace the S82 Windshield Wiper/Washer Switch.

- If within range specified

4. All OK

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

- **Rear Window Wiper Motor Replacement**
- **Windshield Wiper and Washer Switch Replacement**
- **Control Module References** or BCM replacement, programming and setup

DTC B3715 OR B3875: WINDSHIELD WIPER RELAY

Diagnostic Instructions

Circuit/System Description

The body control module (BCM) controls the wiper motor based on input from the windshield wiper/washer switch. The BCM monitors the wiper/washer switch through two separate signal circuits and a low reference circuit. The windshield wiper switch high signal circuit is used to determine high speed wiper operation, the windshield wiper switch low signal is used to determine low speed, intermittent, and mist operation through the use of a resistor ladder, and the windshield washer switch signal circuit is used to determine washer operation.

The BCM controls the windshield wiper motor through two output controls, controlling two relays which determine the desired wiper speed, high or low.

Conditions for Running the DTC

- The DTC runs only when a wiper output is actively being requested by the BCM.
- The system voltage is between 9-16 V.

Conditions for Setting the DTC

- A short to ground is detected in the Front Wiper Relay control circuit or in the High Speed Relay control circuit.
- A short to voltage or an open/high resistance is detected in the Front Wiper Relay control circuit or in the

High Speed Relay control circuit.

Action Taken When the DTC Sets

The BCM will not activate the wiper output.

Conditions for Clearing the DTC

- A current DTC will clear when the condition for setting the fault is no longer present.
- A history DTC will clear after 50 consecutive ignition cycles without a fault present.

Control Module References for scan tool information

Circuit/System Verification

1. Ignition ON.
2. Verify the scan tool Windshield Wiper High Speed Switch parameter changes between Active and Inactive when activating the high speed windshield wipers.
 - **If the parameter does not change**

Refer to Circuit/System Testing - Windshield Wiper/Washer Switch Malfunction.
 - **If the parameter changes**

3. Verify the scan tool Windshield Wiper Switch parameter changes between Off and Low when activating the low speed windshield wipers.

- **If the parameter does not change**

Refer to Circuit/System Testing - Windshield Wiper/Washer Switch Malfunction.

- **If the parameter changes**

4. Verify the scan tool Windshield Wiper Switch parameter changes between Delay 1 and Delay 5 when cycling the intermittent speed windshield wipers.

- **If the parameter does not change**

Test or replace the S82 Windshield Wiper/Washer Switch.

- **If the parameter changes**

5. Verify the M75 Windshield Wiper Motor changes between Off, Low, and High when cycling the S82 Windshield Wiper/Washer Switch between Off, Low, and High.

- **If the Windshield Wiper Motor does not cycle between Off, Low, and High**

Refer to Circuit/System Testing - Windshield Wiper Motor Malfunction

- **If the Windshield Wiper Motor cycles between Off, Low, and High**

6. Ignition OFF.

7. Verify the scan tool Windshield Wiper Park Switch parameter is Active.

- **If the parameter does not change**

Refer to Circuit/System Testing - Windshield Wiper Motor Malfunction.

- **If the parameter changes**

8. All OK.

Circuit/System Testing

Windshield Wiper/Washer Switch Malfunction

1. Ignition OFF and all vehicle systems OFF, disconnect the harness connector at the S82 Windshield Wiper/Washer Switch. It may take up to 11 min for all vehicle systems to power down.

2. Test for less than 10 ohms between the low reference circuit terminal 1 and ground.

- **If 10 ohms or greater**

1. Ignition OFF, disconnect the harness connector at the K9 Body Control Module.

2. Test for less than 2 ohms in the low reference circuit end to end.

- If 2 ohms or greater, repair the open/high resistance in the circuit.

- If less than 2 ohms, replace the K9 Body Control Module.

- **If less than 10 ohms**

3. Ignition ON.
4. Verify the scan tool Windshield Wiper High Speed Switch parameter is Inactive.
 - **If not Inactive**
 1. Ignition OFF, disconnect the harness connector at the K9 Body Control Module.
 2. Test for infinite resistance between the signal circuit terminal 4 and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance, replace the K9 Body Control Module.
 - **If Inactive**
5. Install a 3 A fused jumper wire between the signal circuit terminal 4 and the low reference circuit terminal 1.
6. Verify the scan tool Windshield Wiper High Speed Switch parameter is Active.
 - **If not Active**
 1. Ignition OFF, remove the jumper wire, disconnect the harness connector at the K9 Body Control Module, ignition ON.
 2. Test for less than 1 V between the signal circuit and ground.
 - If 1 V or greater, repair the short to voltage on the circuit.
 - If less than 1 V
 3. Test for less than 2 ohms in the signal circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, replace the K9 Body Control Module.
 - **If Active**
7. Test for greater than 8 V between the signal circuit terminal 3 and ground.
 - **If less than 8 V**
 1. Ignition OFF, disconnect the harness connector at the K9 Body Control Module.
 2. Test for infinite resistance between the signal circuit and ground
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance
 3. Test for less than 2 ohms in the signal circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, replace the K9 Body Control Module.
 - **If 8 V or greater**
8. Ignition OFF, disconnect the X3 harness connector at the K9 Body Control Module, ignition ON.
9. Test for less than 1 V between the S82 Windshield Wiper/Washer Switch signal circuit terminal 3 and ground.
 - **If 1 V or greater**

Repair the short to voltage on the circuit.
 - **If less than 1 V**

10. Test or replace the S82 Windshield Wiper/Washer Switch.

Windshield Wiper Motor Malfunction

1. Ignition OFF and all vehicle systems OFF, disconnect the harness connector at the M75 Windshield Wiper Motor. It may take up to 2 min for all vehicle systems to power down.
2. Test for less than 10 ohms between the appropriate ground circuit terminal listed below and ground.
 - Terminal 6, (LHD)
 - Terminal 4, (RHD)
 - **If 10 ohms or greater**
 1. Ignition OFF.
 2. Test for less than 2 ohms in the ground circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, repair the open/high resistance in the ground connection.
 - **If less than 10 ohms**
3. Ignition ON.
4. Verify the scan tool Windshield Wiper Park Switch parameter is Inactive.
 - **If not Inactive**
 1. Ignition OFF, disconnect the harness connector at the K9 Body Control Module.
 2. Test for infinite resistance between the appropriate signal circuit terminal listed below and ground.
 - Terminal 4, (LHD)
 - Terminal 6, (RHD)
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance, replace the K9 Body Control Module.
 - **If Inactive**
5. Install a 3 A fused jumper wire between the appropriate signal circuit terminal listed below and ground.
 - Terminal 4, (LHD)
 - Terminal 6, (RHD)
6. Verify the scan tool Windshield Wiper Park Switch parameter is Active.
 - **If not Active**
 1. Ignition OFF, remove the jumper wire, disconnect the harness connector at the K9 Body Control Module, ignition ON.
 2. Test for less than 1 V between the signal circuit and ground.
 - If 1 V or greater, repair the short to voltage on the circuit.
 - If less than 1 V
 3. Test for less than 2 ohms in the signal circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, replace the K9 Body Control Module.
 - **If Active**

7. Connect a test lamp between the control circuit terminal 2 and ground, ignition ON.
8. Verify the test lamp does NOT turn ON and OFF when commanding the Windshield Washer Relay Low and Off with a scan tool.

- **If the test lamp turns ON and OFF**

Test or replace the M75 Windshield Wiper Motor.

- **If the test lamp does not turn ON and OFF**

9. Connect a test lamp between the appropriate circuit terminal listed below and ground, ignition ON.
 - Terminal 3, (LHD)
 - Terminal 1, (RHD)
10. Verify the test lamp does NOT turn ON and OFF when commanding the Windshield Washer Relay High and Off with a scan tool.

- **If the test lamp turns ON and OFF**

Test or replace the M75 Windshield Wiper Motor.

- **If the test lamp does not turn ON and OFF**

11. Ignition OFF and all vehicle systems OFF, connect the harness connector at the M75 Windshield Wiper Motor. Disconnect the X2 (LHD) or X1 and X2 (RHD) harness connector(s) at the X50A Fuse Block - Underhood. It may take up to 2 min for all vehicle systems to power down.
12. Test for less than 10 ohms between the ground circuit terminals listed below and ground.

- Terminal 39
- Terminal 35

- **If 10 ohms or greater**

1. Ignition OFF.
2. Test for less than 2 ohms in the ground circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, repair the open/high resistance in the ground connection.

- **If less than 10 ohms**

13. Ignition ON.

14. Verify the M75 Windshield Wiper Motor is not activated.

- **If the M75 Windshield Wiper Motor is activated**

1. Ignition OFF, disconnect the harness connector at the M75 Windshield Wiper Motor, ignition ON.
2. Test for less than 1 V between the control circuit terminals listed below and ground.
 - Terminal 2
 - Terminal 3, (LHD)
 - Terminal 1, (RHD)
 - If 1 V or greater, repair the short to voltage on the circuit.
 - If less than 1 V, replace the M75 Windshield Wiper Motor.

- **If the M75 Windshield Wiper Motor is not activated**
- 15. Connect a 20 A fused jumper wire between the control circuit terminals listed below, one at a time, and B+.
 - Terminal 5, (LHD)
 - Terminal 29, (RHD)
 - Terminal 6, (LHD)
 - Terminal 7, (RHD)
- 16. Verify the M75 Windshield Wiper Motor activates.
 - **If the M75 Windshield Wiper Motor does not activate**
 1. Ignition OFF, remove the jumper wire, disconnect the harness connector at the M75 Windshield Wiper Motor.
 2. Test for infinite resistance between the control circuit and ground.
 - If less than Infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance
 3. Test for less than 2 ohms in the control circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, replace the M75 Windshield Wiper Motor.
 - **If the M75 Windshield Wiper Motor activates**
- 17. Ignition OFF, connect the X2 (LHD) or X1 and X2 (RHD) harness connector(s) at the X50A Fuse Block - Underhood. Disconnect the X4 harness connector at the K9 Body Control Module, ignition ON.
- 18. Verify the M75 Windshield Wiper Motor low speed is not activated.
 - **If the M75 Windshield Wiper Motor low speed is activated**
 1. Ignition OFF, disconnect the X2 harness connector at the X50A Fuse Block - Underhood, ignition ON.
 2. Test for less than 1 V between the X2 harness connector at the X50A Fuse Block - Underhood control circuit terminal 16 and ground.
 - If 1 V or greater, repair the short to voltage on the circuit.
 - If less than 1 V, replace the X50A Fuse Block - Underhood.
 - **If the M75 Windshield Wiper Motor low speed is not activated**
- 19. Ignition OFF, disconnect the X5 harness connector at the K9 Body Control Module, ignition ON.
- 20. Verify the M75 Windshield Wiper Motor High Speed is not activated.
 - **If the M75 Windshield Wiper Motor high speed is activated**
 1. Ignition OFF, disconnect the X2 harness connector at the X50A Fuse Block - Underhood, ignition ON.
 2. Test for infinite resistance between the X2 harness connector at the X50A Fuse Block - Underhood control circuit terminal 24 and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance, replace the X50A Fuse Block - Underhood.
 - **If the M75 Windshield Wiper Motor high speed is not activated**

21. Connect a 10 A fused jumper wire between the control circuit terminal 16 X4 and B+.
22. Verify the M75 Windshield Wiper Motor activates.
 - **If the M75 Windshield Wiper Motor does not activate**
 1. Ignition OFF, remove the jumper wire, disconnect the X2 harness connector at the X50A Fuse Block - Underhood.
 2. Test for infinite resistance between the X2 harness connector at the X50A Fuse Block - Underhood control circuit terminal 25 and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If less than infinite resistance
 3. Test for less than 2 ohms in the control circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, test or replace the X50A Fuse Block - Underhood.
 - **If the M75 Windshield Wiper Motor activates**
23. Connect a 10 A fused jumper wire between the control circuit terminal 24 X5 and ground.
24. Verify the M75 Windshield Wiper Motor activates.
 - **If the M75 Windshield Wiper Motor does not activate**
 1. Ignition OFF, remove the jumper wire, disconnect the X2 harness connector at the X50A Fuse Block - Underhood.
 2. Test for less than 1 V between the X2 harness connector at the X50A Fuse Block - Underhood control circuit terminal 26 and ground.
 - If 1 V or greater, repair the short to ground on the circuit.
 - If less than 1 V
 3. Test for less than 2 ohms in the control circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, test or replace the X50A Fuse Block - Underhood.
 - **If the M75 Windshield Wiper Motor activates**
25. Replace the K9 Body Control Module.

Component Testing

Windshield Wiper/Washer Switch

1. Ignition OFF, disconnect the harness connector at the S82 Windshield Wiper/Washer Switch.
2. Test for infinite resistance between the signal terminal 4 and the low reference terminal 1 with the switch in the open position.
 - **If less than infinite resistance**

Replace the S82 Windshield Wiper/Washer Switch.
 - **If infinite resistance**
3. Test for less than 2 ohms between the signal circuit terminal 4 and the low reference circuit terminal 1

with the switch in the closed position.

- **If 2 ohms or greater**

Replace the S82 Windshield Wiper/Washer Switch.

- **If less than 2 ohms**

4. Test for infinite resistance between the signal terminal 3 and the low reference terminal 1 with the switch in the open position.

- **If less than infinite resistance**

Replace the S82 Windshield Wiper/Washer Switch.

- **If infinite resistance**

5. Verify the resistance readings are within the specified range listed below between the signal circuit terminal 3 and the low reference circuit terminal 1 by pushing the switch in the listed positions below.

- Delay 1 : 3.75-3.85kohms
- Delay 2 : 2.75-2.85kohms
- Delay 3 : 1.95-2.05kohms
- Delay 4 : 1.25-1.35kohms
- Delay 5 : 765-775ohms

- **If not within the specified range**

Replace the S82 Windshield Wiper/Washer Switch.

- **If within the specified range**

6. All OK

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

- **Windshield Wiper Motor Replacement**
- **Windshield Wiper and Washer Switch Replacement**
- **Control Module References** for BCM replacement, programming and setup

DTC B3811: REAR WASHER RELAY

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

DTC Descriptor

DTC B3811

Rear Washer Relay Circuit

For symptom byte information, refer to **Symptom Byte List** .

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Rear Washer Switch Control	2	3	3	-
Rear Washer Relay Control	B3811 02	B3811 04	B3811 01	-
Rear Washer Fluid Pump Control	1	1	2	-
Rear Washer Fluid Pump Ground	-	1	1, 2	-
1. Rear Washer Inoperative. 2. Rear Washer Always ON. 3. Rear Wipers and Washers Inoperative.				

Circuit/System Description

When the body control module (BCM) detects that the Rear Wiper/Wash switch has activated the momentary Wash switch, it activates a high side drive output which supplies battery to the coil of the rear washer pump relay. This energizes the relay, which switches battery power to the washer pump motor. The BCM will also activate continuous low speed windshield wipers as described above. This Washer and Wiper operation shall be continued so long as the switch remains active. Upon termination, the rear wash motor will be deactivated and the wiper shall move to its Park position and deactivate.

Conditions for Running the DTC

- Ignition ON.
- The system voltage is between 9-16 V.

Conditions for Setting the DTC

B3811 01

A short to voltage has been detected on the rear window washer pump relay control circuit

B3811 02

A short to ground is detected in the rear washer relay control circuit.

B3811 04

A open/high resistance has been detected on the rear window washer pump relay control circuit

Action Taken When the DTC Sets

Rear washer operation is disabled.

Conditions for Clearing the DTC

- A current DTC clears when the diagnostic runs and passes.
- A history DTC will clear after 50 consecutive ignition cycles without a fault present.

Description and Operation

Wiper/Washer System Description and Operation

Electrical Information Reference

- **Circuit Testing**
- **Connector Repairs**
- **Testing for Intermittent Conditions and Poor Connections**
- **Wiring Repairs**

Scan Tool Reference

Control Module References for scan tool information

Circuit/System Verification

1. Ignition ON.
2. Verify the scan tool Rear Wiper Switch parameter changes between Off and On when pressing the windshield washer switch.

- **If the parameter does not change**

Refer to **Rear Wiper System Malfunction**

- **If the parameter changes**

3. Verify the rear window washers turn On when commanding the Rear Washer Relay Active with a scan tool.

- **If the Rear Window Washers do not turn ON**

Refer to Circuit/System Testing

- **If the Rear Window Washers turn ON**

4. All OK.

Circuit/System Testing

1. Ignition OFF, and all vehicle systems OFF. Disconnect the harness connector at the G19 Rear Window Washer Pump. It may take up to 2 min for all vehicle systems to power down.
2. Test for less than 10 ohms between the ground circuit terminal 2 and ground.
 - **If 10 ohms or greater**
 1. Test for less than 2 ohms in the ground circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, repair the open/high resistance in the ground connection.
 - **If less than 10 ohms**
3. Connect a test lamp between the control circuit terminal 1 and the ground circuit terminal 2, ignition ON.
4. Verify the test lamp does NOT turn ON and OFF when commanding the Rear Washer Relay Active and Inactive with a scan tool.
 - **If the test lamp turns ON and OFF**

Test or replace the G19 Rear Window Washer Pump.

- **If the test lamp does not turn ON and OFF**

5. Ignition OFF, connect the harness connector at the G19 Rear Window Washer Pump. Disconnect the X2 harness connector at the X50A Fuse Block - Underhood, It may take up to 2 min for all vehicle systems to power down.
6. Test for less than 10 ohms between the ground circuit terminal 39 and ground.
 - **If 10 ohms or greater**
 1. Test for less than 2 ohms in the ground circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, repair the open/high resistance in the ground connection.
 - **If less than 10 ohms**
7. Ignition OFF, connect the X2 harness connector at the X50A Fuse Block - Underhood. Disconnect the X1 harness connector at the X50A Fuse Block - Underhood, ignition ON.
8. Verify the G19 Rear Window Washer Pump is not activated.
 - **If the G19 Rear Window Washer Pump is activated**
 1. Ignition OFF, disconnect the harness connector at the G19 Rear Window Washer Pump, ignition ON.
 2. Test for less than 1 V between the control circuit terminal 1 and ground.

- If 1 V or greater, repair the short to voltage on the circuit.
 - If less than 1 V, replace the G19 Rear Window Washer Pump.
 - **If the G19 Rear Window Washer Pump is not activated**
9. Connect a 20 A fused jumper wire between the control circuit terminal 14 and B+.
 10. Verify the G19 Rear Window Washer Pump activates.
 - **If the G19 Rear Window Washer Pump does not activate**
 1. Ignition OFF, remove the jumper wire, disconnect the harness connector at the G19 Rear Window Washer Pump, ignition ON.
 2. Test for infinite resistance between the control circuit and ground.
 - If less than Infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance
 3. Test for less than 2 ohms in the control circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, replace the G19 Rear Window Washer Pump.
 - **If the G19 Rear Window Washer Pump activates**
 11. Ignition OFF, connect the X1 harness connector at the X50A Fuse Block - Underhood. Disconnect the X1 harness connector at the K9 Body Control Module, ignition ON.
 12. Verify the G19 Rear Window Washer Pump is not activated.
 - **If the G19 Rear Window Washer Pump is activated**
 1. Ignition OFF, disconnect the X2 harness connector at the X50A Fuse Block - Underhood, ignition ON.
 2. Test for less than 1 V between the control circuit terminal 4 and B+.
 - If 1 V or greater, repair the short to voltage on the circuit.
 - If less than 1 V, replace the X50A Fuse Block - Underhood.
 - **If the G19 Rear Window Washer Pump is not activated**
 13. Connect a 10 A fused jumper wire between the control circuit terminal 6 and B+.
 14. Verify the G19 Rear Window Washer Pump activates.
 - **If the G19 Rear Window Washer Pump does not activate**
 1. Ignition OFF, remove the jumper wire, disconnect the X2 harness connector at the X50A Fuse Block - Underhood.
 2. Test for infinite resistance between the control circuit terminal 4 and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If less than infinite resistance
 3. Test for less than 2 ohms in the control circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, test or replace the X50A Fuse Block - Underhood.
 - **If the G19 Rear Window Washer Pump activates**
 15. Replace the K9 Body Control Module.

Component Testing

Windshield Wiper/Washer Switch

1. Ignition OFF, disconnect the harness connector at the S82 Windshield Wiper/Washer Switch.
2. Test for infinite resistance between the signal terminal 7 and the low reference terminal 1 with the rear window washer switch in the open position.

- **If less than infinite resistance**

Replace the S82 Windshield Wiper/Washer Switch.

- **If infinite resistance**

3. Verify the resistance reading is within the range specified below between the signal circuit terminal 7 and the low reference circuit terminal 2 by cycling the switch between Rear Wiper position and Rear Washers position.

- Rear Wiper : 624-644ohms
- Rear Wiper Sweep : 1.99-2.01kohms
- Rear Washer : 6.11-6.13kohms

- **If not within range specified**

Replace the S82 Windshield Wiper/Washer Switch.

- **If within range specified**

4. All OK

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

- **Relay Replacement (Within an Electrical Center)** , **Relay Replacement (Attached to Wire Harness)**
- **Windshield Washer Pump Replacement**
- **Windshield Wiper and Washer Switch Replacement**
- **Control Module References** for BCM replacement, programming and setup

DTC B3873: FRONT WASHER RELA

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

DTC Descriptors

DTC B3873 01

Front Washer Relay Circuit Short to Battery

DTC B3873 02

Front Washer Relay Circuit Short to Ground

DTC B3873 04

Front Washer Relay Circuit Open Circuit

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Windshield Washer Switch Signal	2	1	-	-
Windshield Washer Pump Control	1	1	2	-
Windshield Washer Relay Control	B3873 02	B3873 04	B3873 01	-
Windshield Washer Pump Ground	-	1	-	-
Windshield Wiper/Washer Switch Low Reference	-	1	-	-
1. Washer Inoperative 2. Washer Always ON				

Circuit/System Description

The body control module (BCM) controls the windshield washer pump based on an input from the windshield wiper/washer switch. The BCM monitors the washer switch through the windshield washer switch signal circuit. When the washer switch is closed, ground is supplied to the windshield washer switch signal circuit. When this is the case, the BCM will command the windshield washer pump and the low speed wipers on.

Conditions for Running the DTC

- Ignition ON.
- The system voltage is between 9-16 V.

Conditions for Setting the DTC

- A short to ground or an open/high resistance is detected in the windshield washer relay control circuit.
- A short to voltage is detected in the windshield washer relay control circuit.

Action Taken When the DTC Sets

Washer operation is suspended.

Conditions for Clearing the DTC

A current DTC clears when the diagnostic runs and passes.

Scan Tool Reference

Control Module References for scan tool information

Circuit/System Verification

1. Ignition ON.
2. Verify the scan tool Windshield Washer Switch parameter changes between Active and Inactive when pressing the windshield washer switch.
 - **If the parameter does not change**

Refer to Circuit/System Testing - Windshield Wiper/Washer Switch Malfunction.
 - **If the parameter changes**
3. Verify the windshield washers turn On when commanding the Windshield Washer Relay Active with a scan tool.
 - **If the Windshield Washers do not turn ON**

Refer to Circuit/System Testing - Windshield Washer Pump Malfunction
 - **If the Windshield Washers turn ON**

4. All OK.

Circuit/System Testing

Windshield Wiper/Washer Switch Malfunction

1. Ignition OFF and all vehicle systems OFF, disconnect the harness connector at the S82 Windshield Wiper/Washer Switch. It may take up to 11 min for all vehicle systems to power down.
2. Test for less than 10 ohms between the low reference circuit terminal 1 and ground.
 - **If 10 ohms or greater**
 1. Ignition OFF.
 2. Test for less than 2 ohms in the low reference circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, replace the K9 Body Control Module.
 - **If less than 10 ohms**
3. Ignition ON.
4. Verify the scan tool Windshield Washer Switch parameter is Inactive.
 - **If not Inactive**
 1. Ignition OFF, disconnect the harness connector at the K9 Body Control Module.
 2. Test for infinite resistance between the signal circuit terminal 8 and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance, replace the K9 Body Control Module.
 - **If Inactive**
5. Install a 3 A fused jumper wire between the signal circuit terminal 8 and the low reference circuit terminal 1.
6. Verify the scan tool Windshield Washer Switch parameter is Active.
 - **If not Active**
 1. Ignition OFF, remove the jumper wire, disconnect the harness connector at the K9 Body Control Module, ignition ON.
 2. Test for less than 1 V between the signal circuit and ground.
 - If 1 V or greater, repair the short to voltage on the circuit.
 - If less than 1 V
 3. Test for less than 2 ohms in the signal circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, replace the K9 Body Control Module.
 - **If Active**
7. Test or replace the S82 Windshield Wiper/Washer Switch.

Windshield Washer Pump Malfunction

1. Ignition OFF, and all vehicle systems OFF. Disconnect the harness connector at the G24 Windshield Washer Pump. It may take up to 2 min for all vehicle systems to power down.
2. Test for less than 10 ohms between the ground circuit terminal 2 and ground.
 - **If 10 ohms or greater**
 1. Test for less than 2 ohms in the ground circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, repair the open/high resistance in the ground connection.
 - **If less than 10 ohms**
3. Connect a test lamp between the control circuit terminal 1 and the ground circuit terminal 2, ignition ON.
4. Verify the test lamp does NOT turn ON and OFF when commanding the Windshield Washer Relay Active and Inactive with a scan tool.
 - **If the test lamp turns ON and OFF**

Test or replace the G24 Windshield Washer Pump.

- **If the test lamp does not turn ON and OFF**
5. Ignition OFF, connect the harness connector at the G24 Windshield Washer Pump. Disconnect the X2 harness connector at the X50A Fuse Block - Underhood, It may take up to 2 min for all vehicle systems to power down.
 6. Test for less than 10 ohms between the ground circuit terminal 39 and ground.
 - **If 10 ohms or greater**
 1. Test for less than 2 ohms in the ground circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, repair the open/high resistance in the ground connection.
 - **If less than 10 ohms**
 7. Ignition OFF, connect the X2 harness connector at the X50A Fuse Block - Underhood and disconnect the X1 harness connector at the X50A Fuse Block - Underhood, ignition ON..
 8. Verify the G24 Windshield Washer Pump is not activated.
 - **If the G24 Windshield Washer Pump is activated**
 1. Ignition OFF, disconnect the harness connector at the G24 Windshield Washer Pump, ignition ON.
 2. Test for less than 1 V between the control circuit terminal 1 and ground.
 - If 1 V or greater, repair the short to voltage on the circuit.
 - If less than 1 V, replace the G24 Windshield Washer Pump.
 - **If the G24 Windshield Washer Pump is not activated**
 9. Connect a 20 A fused jumper wire between the control circuit terminal 8 and B+.
 10. Verify the G24 Windshield Washer Pump activates.
 - **If the G24 Windshield Washer Pump does not activate**
 1. Ignition OFF, remove the jumper wire, disconnect the harness connector at the G24 Windshield Washer Pump, ignition ON.
 2. Test for infinite resistance between the control circuit and ground.

- If less than Infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance
- 3. Test for less than 2 ohms in the control circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, replace the G24 Windshield Washer Pump.
 - **If the G24 Windshield Washer Pump activates**
- 11. Ignition OFF, connect the X1 harness connector at the X50A Fuse Block - Underhood. Disconnect the X4 harness connector at the K9 Body Control Module, ignition ON.
- 12. Verify the G24 Windshield Washer Pump is not activated.
 - **If the G24 Windshield Washer Pump is activated**
 1. Ignition OFF, disconnect the X2 harness connector at the X50A Fuse Block - Underhood, ignition ON.
 2. Test for less than 1 V between the control circuit terminal 18 and B+.
 - If 1 V or greater, repair the short to voltage on the circuit.
 - If less than 1 V, replace the X50A Fuse Block - Underhood.
 - **If the G24 Windshield Washer Pump is not activated**
- 13. Connect a 10 A fused jumper wire between the control circuit terminal 14 and B+.
- 14. Verify the G24 Windshield Washer Pump activates.
 - **If the G24 Windshield Washer Pump does not activate**
 1. Ignition OFF, remove the jumper wire, disconnect the X2 harness connector at the X50A Fuse Block - Underhood.
 2. Test for infinite resistance between the control circuit terminal 18 and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If less than infinite resistance
 3. Test for less than 2 ohms in the control circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, test or replace the X50A Fuse Block - Underhood.
 - **If the G24 Windshield Washer Pump activates**
- 15. Replace the K9 Body Control Module.

Component Testing

Windshield Wiper/Washer Switch

1. Ignition OFF, disconnect the harness connector at the S82 Windshield Wiper/Washer Switch.
2. Test for infinite resistance between the signal terminal 8 and the low reference terminal 1 with the switch in the open position.
 - **If less than infinite resistance**

Replace the S82 Windshield Wiper/Washer Switch.

- **If infinite resistance**
- 3. Test for less than 2 ohms between the signal circuit terminal 8 and the low reference circuit terminal 1 with the switch in the closed position.

- **If 2 ohms or greater**

Replace the S82 Windshield Wiper/Washer Switch.

- **If less than 2 ohms**

- 4. All OK

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

- **Windshield Washer Pump Replacement**
- **Relay Replacement (Within an Electrical Center)** , **Relay Replacement (Attached to Wire Harness)**
- **Windshield Wiper and Washer Switch Replacement**
- **Control Module References** for BCM replacement, programming, and setup.

SYMPTOMS - WIPER/WASHER SYSTEMS

NOTE: **The following steps must be completed before using the symptom tables:**

1. Perform **Diagnostic System Check - Vehicle** , in order to verify that all of the following conditions are true:
 - No DTCs are set.
 - The control modules can communicate via the serial data link.
2. Refer to **Wiper/Washer System Description and Operation** in order to familiarize yourself with the system functions.

Visual/Physical Inspection

- Inspect for aftermarket devices which may affect the operation of the windshield wiper/washer system. Refer to **Checking Aftermarket Accessories** .
- Inspect the easily accessible or visible system components for obvious damage or conditions which may cause the symptom.
- Inspect the washer fluid reservoir for the proper fluid level.

Intermittent

Faulty electrical connections or wiring may be the cause of intermittent conditions. Refer to **Testing for Intermittent Conditions and Poor Connections** .

Symptom List

Refer to a symptom diagnostic procedure from the following list in order to diagnose the symptom:

- **Windshield Wiper System Malfunction**
- **Washer Malfunction**
- **Rear Washer System Malfunction**
- **Rear Wiper System Malfunction**

WINDSHIELD WIPER SYSTEM MALFUNCTION

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

Windshield Wiper Relay Ground	-	1	-	-
1. Delay or Low Speed Wipers Inoperative 2. High Speed Wipers Inoperative 3. Wipers Do Not Park 4. Wipers Always ON				

Circuit/System Description

The body control module (BCM) controls the wiper motor based on input from the windshield wiper/washer switch. The BCM monitors the wiper/washer switch through two separate signal circuits and a low reference circuit. The windshield wiper switch high signal circuit is used to determine high speed wiper operation, the windshield wiper switch low signal is used to determine low speed, intermittent, and mist operation through the use of a resistor ladder, and the windshield washer switch signal circuit is used to determine washer operation.

The BCM controls the windshield wiper motor through two output controls, controlling two relays which determine the desired wiper speed, high or low.

Conditions for Running the DTC

- The DTC runs only when a wiper output is actively being requested by the BCM.
- The system voltage is between 9-16 V.

Conditions for Setting the DTC

- A short to ground is detected in the Front Wiper Relay control circuit or in the High Speed Relay control circuit.
- A short to voltage or an open/high resistance is detected in the Front Wiper Relay control circuit or in the High Speed Relay control circuit.

Action Taken When the DTC Sets

The BCM will not activate the wiper output.

Conditions for Clearing the DTC

- A current DTC will clear when the condition for setting the fault is no longer present.
- A history DTC will clear after 50 consecutive ignition cycles without a fault present.

Scan Tool Reference

Control Module References for scan tool information

Circuit/System Verification

1. Ignition ON.
2. Verify the scan tool Windshield Wiper High Speed Switch parameter changes between Active and Inactive when activating the high speed windshield wipers.
 - **If the parameter does not change**

Refer to Circuit/System Testing - Windshield Wiper/Washer Switch Malfunction.

- **If the parameter changes**
3. Verify the scan tool Windshield Wiper Switch parameter changes between Off and Low when activating the low speed windshield wipers.
 - **If the parameter does not change**

Refer to Circuit/System Testing - Windshield Wiper/Washer Switch Malfunction.

- **If the parameter changes**

4. Verify the scan tool Windshield Wiper Switch parameter changes between Delay 1 and Delay 5 when cycling the intermittent speed windshield wipers.

- **If the parameter does not change**

Test or replace the S82 Windshield Wiper/Washer Switch.

- **If the parameter changes**

5. Verify the M75 Windshield Wiper Motor changes between Off, Low, and High when cycling the S82 Windshield Wiper/Washer Switch between Off, Low, and High.

- **If the Windshield Wiper Motor does not cycle between Off, Low, and High**

Refer to Circuit/System Testing - Windshield Wiper Motor Malfunction

- **If the Windshield Wiper Motor cycles between Off, Low, and High**

6. Ignition OFF.
7. Verify the scan tool Windshield Wiper Park Switch parameter is Active.

- **If the parameter does not change**

Refer to Circuit/System Testing - Windshield Wiper Motor Malfunction.

- **If the parameter changes**

8. All OK.

Circuit/System Testing

Windshield Wiper/Washer Switch Malfunction

1. Ignition OFF and all vehicle systems OFF, disconnect the harness connector at the S82 Windshield Wiper/Washer Switch. It may take up to 11 min for all vehicle systems to power down.
2. Test for less than 10 ohms between the low reference circuit terminal 1 and ground.
 - **If 10 ohms or greater**
 1. Ignition OFF, disconnect the harness connector at the K9 Body Control Module.
 2. Test for less than 2 ohms in the low reference circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, replace the K9 Body Control Module.
 - **If less than 10 ohms**
3. Ignition ON.
4. Verify the scan tool Windshield Wiper High Speed Switch parameter is Inactive.
 - **If not Inactive**

1. Ignition OFF, disconnect the harness connector at the K9 Body Control Module.
2. Test for infinite resistance between the signal circuit terminal 4 and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance, replace the K9 Body Control Module.
- **If Inactive**
5. Install a 3 A fused jumper wire between the signal circuit terminal 4 and the low reference circuit terminal 1.
6. Verify the scan tool Windshield Wiper High Speed Switch parameter is Active.
 - **If not Active**
 1. Ignition OFF, remove the jumper wire, disconnect the harness connector at the K9 Body Control Module, ignition ON.
 2. Test for less than 1 V between the signal circuit and ground.
 - If 1 V or greater, repair the short to voltage on the circuit.
 - If less than 1 V
 3. Test for less than 2 ohms in the signal circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, replace the K9 Body Control Module.
 - **If Active**
7. Test for greater than 8 V between the signal circuit terminal 3 and ground.
 - **If less than 8 V**
 1. Ignition OFF, disconnect the harness connector at the K9 Body Control Module.
 2. Test for infinite resistance between the signal circuit and ground
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance
 3. Test for less than 2 ohms in the signal circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, replace the K9 Body Control Module.
 - **If 8 V or greater**
8. Ignition OFF, disconnect the X3 harness connector at the K9 Body Control Module, ignition ON.
9. Test for less than 1 V between the S82 Windshield Wiper/Washer Switch signal circuit terminal 3 and ground.
 - **If 1 V or greater**

Repair the short to voltage on the circuit.
 - **If less than 1 V**
10. Test or replace the S82 Windshield Wiper/Washer Switch.

Windshield Wiper Motor Malfunction

1. Ignition OFF and all vehicle systems OFF, disconnect the harness connector at the M75 Windshield Wiper Motor. It may take up to 2 min for all vehicle systems to power down.
2. Test for less than 10 ohms between the appropriate ground circuit terminal listed below and ground.
 - Terminal 6, (LHD)
 - Terminal 4, (RHD)
 - **If 10 ohms or greater**
 1. Ignition OFF.
 2. Test for less than 2 ohms in the ground circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, repair the open/high resistance in the ground connection.
 - **If less than 10 ohms**
3. Ignition ON.
4. Verify the scan tool Windshield Wiper Park Switch parameter is Inactive.
 - **If not Inactive**
 1. Ignition OFF, disconnect the harness connector at the K9 Body Control Module.
 2. Test for infinite resistance between the appropriate signal circuit terminal listed below and ground.
 - Terminal 4, (LHD)
 - Terminal 6, (RHD)
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance, replace the K9 Body Control Module.
 - **If Inactive**
5. Install a 3 A fused jumper wire between the appropriate signal circuit terminal listed below and ground.
 - Terminal 4, (LHD)
 - Terminal 6, (RHD)
6. Verify the scan tool Windshield Wiper Park Switch parameter is Active.
 - **If not Active**
 1. Ignition OFF, remove the jumper wire, disconnect the harness connector at the K9 Body Control Module, ignition ON.
 2. Test for less than 1 V between the signal circuit and ground.
 - If 1 V or greater, repair the short to voltage on the circuit.
 - If less than 1 V
 3. Test for less than 2 ohms in the signal circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, replace the K9 Body Control Module.
 - **If Active**
7. Connect a test lamp between the control circuit terminal 2 and ground, ignition ON.
8. Verify the test lamp does NOT turn ON and OFF when commanding the Windshield Washer Relay Low and Off with a scan tool.

- **If the test lamp turns ON and OFF**

Test or replace the M75 Windshield Wiper Motor.

- **If the test lamp does not turn ON and OFF**

9. Connect a test lamp between the appropriate circuit terminal listed below and ground, ignition ON.
 - Terminal 3, (LHD)
 - Terminal 1, (RHD)
10. Verify the test lamp does NOT turn ON and OFF when commanding the Windshield Washer Relay High and Off with a scan tool.

- **If the test lamp turns ON and OFF**

Test or replace the M75 Windshield Wiper Motor.

- **If the test lamp does not turn ON and OFF**

11. Ignition OFF and all vehicle systems OFF, connect the harness connector at the M75 Windshield Wiper Motor. Disconnect the X2 (LHD) or X1 and X2 (RHD) harness connector(s) at the X50A Fuse Block - Underhood. It may take up to 2 min for all vehicle systems to power down.
12. Test for less than 10 ohms between the ground circuit terminals listed below and ground.
 - Terminal 39
 - Terminal 35
 - **If 10 ohms or greater**
 1. Ignition OFF.
 2. Test for less than 2 ohms in the ground circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, repair the open/high resistance in the ground connection.
 - **If less than 10 ohms**
13. Ignition ON.
14. Verify the M75 Windshield Wiper Motor is not activated.

- **If the M75 Windshield Wiper Motor is activated**

1. Ignition OFF, disconnect the harness connector at the M75 Windshield Wiper Motor, ignition ON.
2. Test for less than 1 V between the control circuit terminals listed below and ground.
 - Terminal 2
 - Terminal 3, (LHD)
 - Terminal 1, (RHD)
 - If 1 V or greater, repair the short to voltage on the circuit.
 - If less than 1 V, replace the M75 Windshield Wiper Motor.

- **If the M75 Windshield Wiper Motor is not activated**

15. Connect a 20 A fused jumper wire between the control circuit terminals listed below, one at a time, and B+.

- Terminal 5, (LHD)
 - Terminal 29, (RHD)
 - Terminal 6, (LHD)
 - Terminal 7, (RHD)
16. Verify the M75 Windshield Wiper Motor activates.
 - **If the M75 Windshield Wiper Motor does not activate**
 - 1. Ignition OFF, remove the jumper wire, disconnect the harness connector at the M75 Windshield Wiper Motor.
 - 2. Test for infinite resistance between the control circuit and ground.
 - If less than Infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance
 - 3. Test for less than 2 ohms in the control circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, replace the M75 Windshield Wiper Motor.
 - **If the M75 Windshield Wiper Motor activates**
 17. Ignition OFF, connect the X2 (LHD) or X1 and X2 (RHD) harness connector(s) at the X50A Fuse Block - Underhood. Disconnect the X4 harness connector at the K9 Body Control Module, ignition ON.
 18. Verify the M75 Windshield Wiper Motor low speed is not activated.
 - **If the M75 Windshield Wiper Motor low speed is activated**
 - 1. Ignition OFF, disconnect the X2 harness connector at the X50A Fuse Block - Underhood, ignition ON.
 - 2. Test for less than 1 V between the X2 harness connector at the X50A Fuse Block - Underhood control circuit terminal 16 and ground.
 - If 1 V or greater, repair the short to voltage on the circuit.
 - If less than 1 V, replace the X50A Fuse Block - Underhood.
 - **If the M75 Windshield Wiper Motor low speed is not activated**
 19. Ignition OFF, disconnect the X5 harness connector at the K9 Body Control Module, ignition ON.
 20. Verify the M75 Windshield Wiper Motor High Speed is not activated.
 - **If the M75 Windshield Wiper Motor high speed is activated**
 - 1. Ignition OFF, disconnect the X2 harness connector at the X50A Fuse Block - Underhood, ignition ON.
 - 2. Test for infinite resistance between the X2 harness connector at the X50A Fuse Block - Underhood control circuit terminal 24 and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance, replace the X50A Fuse Block - Underhood.
 - **If the M75 Windshield Wiper Motor high speed is not activated**
 21. Connect a 10 A fused jumper wire between the control circuit terminal 16 X4 and B+.
 22. Verify the M75 Windshield Wiper Motor activates.
 - **If the M75 Windshield Wiper Motor does not activate**

1. Ignition OFF, remove the jumper wire, disconnect the X2 harness connector at the X50A Fuse Block - Underhood.
2. Test for infinite resistance between the X2 harness connector at the X50A Fuse Block - Underhood control circuit terminal 25 and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If less than infinite resistance
3. Test for less than 2 ohms in the control circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, test or replace the X50A Fuse Block - Underhood.
 - **If the M75 Windshield Wiper Motor activates**
23. Connect a 10 A fused jumper wire between the control circuit terminal 24 X5 and ground.
24. Verify the M75 Windshield Wiper Motor activates.
 - **If the M75 Windshield Wiper Motor does not activate**
 - 1. Ignition OFF, remove the jumper wire, disconnect the X2 harness connector at the X50A Fuse Block - Underhood.
 - 2. Test for less than 1 V between the X2 harness connector at the X50A Fuse Block - Underhood control circuit terminal 26 and ground.
 - If 1 V or greater, repair the short to ground on the circuit.
 - If less than 1 V
 - 3. Test for less than 2 ohms in the control circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, test or replace the X50A Fuse Block - Underhood.
 - **If the M75 Windshield Wiper Motor activates**
25. Replace the K9 Body Control Module.

Component Testing

Windshield Wiper/Washer Switch

1. Ignition OFF, disconnect the harness connector at the S82 Windshield Wiper/Washer Switch.
2. Test for infinite resistance between the signal terminal 4 and the low reference terminal 1 with the switch in the open position.
 - **If less than infinite resistance**

Replace the S82 Windshield Wiper/Washer Switch.

 - **If infinite resistance**
3. Test for less than 2 ohms between the signal circuit terminal 4 and the low reference circuit terminal 1 with the switch in the closed position.
 - **If 2 ohms or greater**

Replace the S82 Windshield Wiper/Washer Switch.

- **If less than 2 ohms**

4. Test for infinite resistance between the signal terminal 3 and the low reference terminal 1 with the switch in the open position.

- **If less than infinite resistance**

Replace the S82 Windshield Wiper/Washer Switch.

- **If infinite resistance**

5. Verify the resistance readings are within the specified range listed below between the signal circuit terminal 3 and the low reference circuit terminal 1 by pushing the switch in the listed positions below.
 - Delay 1 : 3.75-3.85kohms
 - Delay 2 : 2.75-2.85kohms
 - Delay 3 : 1.95-2.05kohms
 - Delay 4 : 1.25-1.35kohms
 - Delay 5 : 765-775ohms
- **If not within the specified range**

Replace the S82 Windshield Wiper/Washer Switch.

- **If within the specified range**

6. All OK

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

- **Windshield Wiper Motor Replacement**
- **Windshield Wiper and Washer Switch Replacement**
- **Control Module References** for BCM replacement, programming and setup

WASHER MALFUNCTION

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.

Windshield Washer Pump Ground	-	1	-	-
Windshield Wiper/Washer Switch Low Reference	-	1	-	-
1. Washer Inoperative 2. Washer Always ON				

Circuit/System Description

The body control module (BCM) controls the windshield washer pump based on an input from the windshield wiper/washer switch. The BCM monitors the washer switch through the windshield washer switch signal circuit. When the washer switch is closed, ground is supplied to the windshield washer switch signal circuit. When this is the case, the BCM will command the windshield washer pump and the low speed wipers on.

Conditions for Running the DTC

- Ignition ON.
- The system voltage is between 9-16 V.

Conditions for Setting the DTC

- A short to ground or an open/high resistance is detected in the windshield washer relay control circuit.
- A short to voltage is detected in the windshield washer relay control circuit.

Action Taken When the DTC Sets

Washer operation is suspended.

Conditions for Clearing the DTC

A current DTC clears when the diagnostic runs and passes.

Circuit/System Verification

1. Ignition ON.
2. Verify the scan tool Windshield Washer Switch parameter changes between Active and Inactive when pressing the windshield washer switch.
 - **If the parameter does not change**

Refer to Circuit/System Testing - Windshield Wiper/Washer Switch Malfunction.
 - **If the parameter changes**
3. Verify the windshield washers turn On when commanding the Windshield Washer Relay Active with a scan tool.
 - **If the Windshield Washers do not turn ON**

Refer to Circuit/System Testing - Windshield Washer Pump Malfunction
 - **If the Windshield Washers turn ON**
4. All OK.

Circuit/System Testing

Windshield Wiper/Washer Switch Malfunction

1. Ignition OFF and all vehicle systems OFF, disconnect the harness connector at the S82 Windshield Wiper/Washer Switch. It may take up to 11 min for all vehicle systems to power down.
2. Test for less than 10 ohms between the low reference circuit terminal 1 and ground.
 - **If 10 ohms or greater**
 1. Ignition OFF.
 2. Test for less than 2 ohms in the low reference circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, replace the K9 Body Control Module.
 - **If less than 10 ohms**
3. Ignition ON.
4. Verify the scan tool Windshield Washer Switch parameter is Inactive.
 - **If not Inactive**
 1. Ignition OFF, disconnect the harness connector at the K9 Body Control Module.
 2. Test for infinite resistance between the signal circuit terminal 8 and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance, replace the K9 Body Control Module.
 - **If Inactive**
5. Install a 3 A fused jumper wire between the signal circuit terminal 8 and the low reference circuit terminal 1.
6. Verify the scan tool Windshield Washer Switch parameter is Active.
 - **If not Active**
 1. Ignition OFF, remove the jumper wire, disconnect the harness connector at the K9 Body Control Module, ignition ON.
 2. Test for less than 1 V between the signal circuit and ground.
 - If 1 V or greater, repair the short to voltage on the circuit.
 - If less than 1 V
 3. Test for less than 2 ohms in the signal circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, replace the K9 Body Control Module.
 - **If Active**
7. Test or replace the S82 Windshield Wiper/Washer Switch.

Windshield Washer Pump Malfunction

1. Ignition OFF, and all vehicle systems OFF. Disconnect the harness connector at the G24 Windshield Washer Pump. It may take up to 2 min for all vehicle systems to power down.

2. Test for less than 10 ohms between the ground circuit terminal 2 and ground.
 - **If 10 ohms or greater**
 1. Test for less than 2 ohms in the ground circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, repair the open/high resistance in the ground connection.
 - **If less than 10 ohms**
3. Connect a test lamp between the control circuit terminal 1 and the ground circuit terminal 2, ignition ON.
4. Verify the test lamp does NOT turn ON and OFF when commanding the Windshield Washer Relay Active and Inactive with a scan tool.
 - **If the test lamp turns ON and OFF**

Test or replace the G24 Windshield Washer Pump.

- **If the test lamp does not turn ON and OFF**
5. Ignition OFF, connect the harness connector at the G24 Windshield Washer Pump. Disconnect the X2 harness connector at the X50A Fuse Block - Underhood, It may take up to 2 min for all vehicle systems to power down.
 6. Test for less than 10 ohms between the ground circuit terminal 39 and ground.
 - **If 10 ohms or greater**
 1. Test for less than 2 ohms in the ground circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, repair the open/high resistance in the ground connection.
 - **If less than 10 ohms**
 7. Ignition OFF, connect the X2 harness connector at the X50A Fuse Block - Underhood and disconnect the X1 harness connector at the X50A Fuse Block - Underhood, ignition ON..
 8. Verify the G24 Windshield Washer Pump is not activated.
 - **If the G24 Windshield Washer Pump is activated**
 1. Ignition OFF, disconnect the harness connector at the G24 Windshield Washer Pump, ignition ON.
 2. Test for less than 1 V between the control circuit terminal 1 and ground.
 - If 1 V or greater, repair the short to voltage on the circuit.
 - If less than 1 V, replace the G24 Windshield Washer Pump.
 - **If the G24 Windshield Washer Pump is not activated**
 9. Connect a 20 A fused jumper wire between the control circuit terminal 8 and B+.
 10. Verify the G24 Windshield Washer Pump activates.
 - **If the G24 Windshield Washer Pump does not activate**
 1. Ignition OFF, remove the jumper wire, disconnect the harness connector at the G24 Windshield Washer Pump, ignition ON.
 2. Test for infinite resistance between the control circuit and ground.
 - If less than Infinite resistance, repair the short to ground on the circuit.

- If infinite resistance
- 3. Test for less than 2 ohms in the control circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, replace the G24 Windshield Washer Pump.
 - **If the G24 Windshield Washer Pump activates**
- 11. Ignition OFF, connect the X1 harness connector at the X50A Fuse Block - Underhood. Disconnect the X4 harness connector at the K9 Body Control Module, ignition ON.
- 12. Verify the G24 Windshield Washer Pump is not activated.
 - **If the G24 Windshield Washer Pump is activated**
 1. Ignition OFF, disconnect the X2 harness connector at the X50A Fuse Block - Underhood, ignition ON.
 2. Test for less than 1 V between the control circuit terminal 18 and B+.
 - If 1 V or greater, repair the short to voltage on the circuit.
 - If less than 1 V, replace the X50A Fuse Block - Underhood.
 - **If the G24 Windshield Washer Pump is not activated**
- 13. Connect a 10 A fused jumper wire between the control circuit terminal 14 and B+.
- 14. Verify the G24 Windshield Washer Pump activates.
 - **If the G24 Windshield Washer Pump does not activate**
 1. Ignition OFF, remove the jumper wire, disconnect the X2 harness connector at the X50A Fuse Block - Underhood.
 2. Test for infinite resistance between the control circuit terminal 18 and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If less than infinite resistance
 3. Test for less than 2 ohms in the control circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, test or replace the X50A Fuse Block - Underhood.
 - **If the G24 Windshield Washer Pump activates**
- 15. Replace the K9 Body Control Module.

Component Testing

Windshield Wiper/Washer Switch

1. Ignition OFF, disconnect the harness connector at the S82 Windshield Wiper/Washer Switch.
2. Test for infinite resistance between the signal terminal 8 and the low reference terminal 1 with the switch in the open position.
 - **If less than infinite resistance**

Replace the S82 Windshield Wiper/Washer Switch.
 - **If infinite resistance**

3. Test for less than 2 ohms between the signal circuit terminal 8 and the low reference circuit terminal 1 with the switch in the closed position.

- **If 2 ohms or greater**

Replace the S82 Windshield Wiper/Washer Switch.

- **If less than 2 ohms**

4. All OK

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

- **Windshield Washer Pump Replacement**
- **Relay Replacement (Within an Electrical Center)** , **Relay Replacement (Attached to Wire Harness)**
- **Windshield Wiper and Washer Switch Replacement**
- **Control Module References** for BCM replacement, programming, and setup.

REAR WIPER SYSTEM MALFUNCTION

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Rear Wiper Switch Signal	2	1	1	-
Rear Wiper MotorControl	1	1	2	-
Rear Window Wiper Relay Control	1	1	2	-
Rear Wiper Relay Control	1	1	2	-
Rear Wiper Motor Ground	-	1	1	-
Rear Wiper Relay Ground	-	1	-	-
1. Rear Wiper Inoperative. 2. Rear Wiper Always ON.				

Circuit/System Description

The body control module (BCM) controls the single speed rear wiper motor by its active high output to the external rear wiper motor relay. When the BCM activates its output and applies battery to the coil of the relay,

the relay energizes, allowing battery voltage from the fuse to be applied through the switched contacts of the rear wiper motor relay to the control input of the rear wiper motor. The motor then operates continuously at low speed.

Circuit/System Verification

1. Ignition ON.
2. Verify the scan tool Rear Wiper Switch parameter changes between Off and On when turning the rear wipers ON and OFF..
 - **If the parameter does not change**

Refer to Circuit/System Testing - Rear Wiper/Washer Switch Malfunction.
 - **If the parameter changes**
3. Verify the Rear Wiper Motor turns On when commanding the Rear Wiper Active with a scan tool.
 - **If the Rear Wiper Motor does not turn ON**

Refer to Circuit/System Testing - Rear Wiper Motor Malfunction
 - **If the Rear Wiper Motor turns ON**

4. All OK.

Circuit/System Testing

Rear Wiper/Washer Switch Malfunction

1. Ignition OFF and all vehicle systems OFF, disconnect the harness connector at the S82 Windshield Wiper/Washer Switch. It may take up to 11 minutes for all vehicle systems to power down.
2. Test for less than 10 ohms between the low reference circuit terminal 1 and ground.
 - **If 10 ohms or greater**
 1. Ignition OFF.
 2. Test for less than 2 ohms in the low reference circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, replace the K9 Body Control Module.
 - **If less than 10 ohms**
3. Ignition ON.
4. Test for greater than 8 V between the signal circuit terminal 7 and ground.
 - **If less than 8 V**
 1. Ignition OFF, disconnect the harness connector at the K9 Body Control Module.
 2. Test for infinite resistance between the signal circuit and ground
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance
 3. Test for less than 2 ohms in the signal circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, replace the K9 Body Control Module.
 - **If 8 V or greater**
5. Ignition OFF, disconnect the X2 harness connector at the K9 Body Control Module, ignition ON.
6. Test for less than 1 V between the S82 Windshield Wiper/Washer Switch signal circuit terminal 7 and ground.
 - **If 1 V or greater**

Repair the short to voltage on the circuit.
 - **If less than 1 V**
7. Test or replace the S82 Windshield Wiper/Washer Switch.

Rear Wiper Motor Malfunction

1. Ignition OFF, and all vehicle systems OFF. Disconnect the harness connector at the M45 Rear Wiper Motor. It may take up to 2 minutes for all vehicle systems to power down.
2. Test for less than 10 ohms between the ground circuit terminal 1 and ground.

- **If 10 ohms or greater**

1. Test for less than 2 ohms in the ground circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, repair the open/high resistance in the ground connection.

- **If less than 10 ohms**

3. Ignition ON.
4. Verify a test lamp illuminates between the B+ circuit terminal 3 and the ground circuit terminal 1.
 - **If the test lamp does not illuminate**
 1. Ignition OFF, remove the test lamp. Disconnect the X2 harness connector at the X50A Fuse Block - Underhood.
 2. Test for less than 2 ohms in the control circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, replace the X50A Fuse Block - Underhood.
 - **If the test lamp illuminates**
5. Connect a test lamp between the control circuit terminal 2 and the ground circuit terminal 1.
6. Verify the test lamp does NOT turn ON and OFF when commanding the Rear Wiper On and Off with a scan tool.
 - **If the test lamp turns ON and OFF**

Test or replace the M45 Rear Wiper Motor.

- **If the test lamp does not turn ON and OFF**

7. Ignition OFF, connect the harness connector at the M45 Rear Wiper Motor. Disconnect the X2 harness connector at the X50A Fuse Block - Underhood, It may take up to 2 minutes for all vehicle systems to power down.
8. Test for less than 10 ohms between the ground circuits listed below and ground.
 - Terminal 39
 - Terminal 44
 - **If 10 ohms or greater**
 1. Test for less than 2 ohms in the ground circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, repair the open/high resistance in the ground connection.
 - **If less than 10 ohms**
9. Ignition ON.
10. Verify the M45 Rear Wiper Motor is not activated.
 - **If the M45 Rear Wiper Motor is activated**
 1. Ignition OFF, disconnect the harness connector at the M45 Rear Wiper Motor, ignition ON.
 2. Test for less than 1 V between the control circuit terminal 1 and ground.
 - If 1 V or greater, repair the short to voltage on the circuit.

- If less than 1 V, replace the M45 Rear Wiper Motor.
 - **If the M45 Rear Wiper Motor is not activated**
11. Connect a 20 A fused jumper wire between the circuits listed below and B+.
 - B+ Circuit Terminal 29
 - Control Circuit Terminal 30
 12. Verify the M45 Rear Wiper Motor activates.
 - **If the M45 Rear Wiper Motor does not activate**
 1. Ignition OFF, remove the jumper wire, disconnect the harness connector at the M45 Rear Wiper Motor, ignition ON.
 2. Test for infinite resistance between the control circuit and ground.
 - If less than Infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance
 3. Test for less than 2 ohms in the control circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, replace the M45 Rear Wiper Motor.
 - **If the M45 Rear Wiper Motor activates**
 13. Ignition OFF, connect the X2 harness connector at the X50A Fuse Block - Underhood. Disconnect the X4 harness connector at the K9 Body Control Module, ignition ON.
 14. Verify the M45 Rear Wiper Motor is not activated.
 - **If the M45 Rear Wiper Motor is activated**
 1. Ignition OFF, disconnect the X2 harness connector at the X50A Fuse Block - Underhood, ignition ON.
 2. Test for less than 1 V between the control circuit terminal 10 and B+.
 - If 1 V or greater, repair the short to voltage on the circuit.
 - If less than 1 V, replace the X50A Fuse Block - Underhood.
 - **If the M45 Rear Wiper Motor is not activated**
 15. Connect a 10 A fused jumper wire between the control circuit terminal 10 and B+.
 16. Verify the M45 Rear Wiper Motor activates.
 - **If the M45 Rear Wiper Motor does not activate**
 1. Ignition OFF, remove the jumper wire, disconnect the X2 harness connector at the X50A Fuse Block - Underhood.
 2. Test for infinite resistance between the control circuit terminal 27 and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If less than infinite resistance
 3. Test for less than 2 ohms in the control circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, test or replace the X50A Fuse Block - Underhood.
 - **If the M45 Rear Wiper Motor activates**

17. Test or replace the K9 Body Control Module.

Component Testing

Windshield Wiper/Washer Switch

1. Ignition OFF, disconnect the harness connector at the S82 Windshield Wiper/Washer Switch.
2. Test for infinite resistance between the signal terminal 7 and the low reference terminal 1 with the rear window washer switch in the open position.
 - **If less than infinite resistance**

Replace the S82 Windshield Wiper/Washer Switch.
 - **If infinite resistance**
3. Verify the resistance reading is within the range specified below between the signal circuit terminal 7 and the low reference circuit terminal 1 by cycling the switch between Rear Wiper position and Rear Washers position.
 - Rear Wiper : 624-644ohms
 - Rear Wiper Sweep : 1.99-2.01kohms
 - Rear Washer : 6.11-6.13kohms
 - **If not within range specified**

Replace the S82 Windshield Wiper/Washer Switch.
 - **If within range specified**
4. All OK

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

- **Rear Window Wiper Motor Replacement**
- **Windshield Wiper and Washer Switch Replacement**
- **Control Module References** or BCM replacement, programming and setup

REAR WASHER SYSTEM MALFUNCTION

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

DTC Descriptor

DTC B3811

Rear Washer Relay Circuit

For symptom byte information, refer to Symptom Byte List .

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Rear Washer Switch Control	2	3	3	-
Rear Washer Relay Control	B3811 02	B3811 04	B3811 01	-
Rear Washer Fluid Pump Control	1	1	2	-
Rear Washer Fluid Pump Ground	-	1	1, 2	-
1. Rear Washer Inoperative. 2. Rear Washer Always ON. 3. Rear Wipers and Washers Inoperative.				

Circuit/System Description

When the body control module (BCM) detects that the Rear Wiper/Wash switch has activated the momentary Wash switch, it activates a high side drive output which supplies battery to the coil of the rear washer pump relay. This energizes the relay, which switches battery power to the washer pump motor. The BCM will also activate continuous low speed windshield wipers as described above. This Washer and Wiper operation shall be continued so long as the switch remains active. Upon termination, the rear wash motor will be deactivated and the wiper shall move to its Park position and deactivate.

Conditions for Running the DTC

- Ignition ON.
- The system voltage is between 9-16 V.

Conditions for Setting the DTC

B3811 01

A short to voltage has been detected on the rear window washer pump relay control circuit

B3811 02

A short to ground is detected in the rear washer relay control circuit.

B3811 04

A open/high resistance has been detected on the rear window washer pump relay control circuit

Action Taken When the DTC Sets

Rear washer operation is disabled.

Conditions for Clearing the DTC

- A current DTC clears when the diagnostic runs and passes.
- A history DTC will clear after 50 consecutive ignition cycles without a fault present.

Scan Tool Reference

Control Module References for scan tool information

Circuit/System Verification

1. Ignition ON.
2. Verify the scan tool Rear Wiper Switch parameter changes between Off and On when pressing the windshield washer switch.

- **If the parameter does not change**

Refer to **Rear Wiper System Malfunction**

- **If the parameter changes**

3. Verify the rear window washers turn On when commanding the Rear Washer Relay Active with a scan tool.

- **If the Rear Window Washers do not turn ON**

Refer to Circuit/System Testing

- **If the Rear Window Washers turn ON**

4. All OK.

Circuit/System Testing

1. Ignition OFF, and all vehicle systems OFF. Disconnect the harness connector at the G19 Rear Window Washer Pump. It may take up to 2 min for all vehicle systems to power down.
2. Test for less than 10 ohms between the ground circuit terminal 2 and ground.
 - **If 10 ohms or greater**
 1. Test for less than 2 ohms in the ground circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, repair the open/high resistance in the ground connection.
 - **If less than 10 ohms**
3. Connect a test lamp between the control circuit terminal 1 and the ground circuit terminal 2, ignition ON.
4. Verify the test lamp does NOT turn ON and OFF when commanding the Rear Washer Relay Active and Inactive with a scan tool.
 - **If the test lamp turns ON and OFF**

Test or replace the G19 Rear Window Washer Pump.

- **If the test lamp does not turn ON and OFF**

5. Ignition OFF, connect the harness connector at the G19 Rear Window Washer Pump. Disconnect the X2 harness connector at the X50A Fuse Block - Underhood, It may take up to 2 min for all vehicle systems to power down.
6. Test for less than 10 ohms between the ground circuit terminal 39 and ground.
 - **If 10 ohms or greater**
 1. Test for less than 2 ohms in the ground circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, repair the open/high resistance in the ground connection.
 - **If less than 10 ohms**
7. Ignition OFF, connect the X2 harness connector at the X50A Fuse Block - Underhood. Disconnect the X1 harness connector at the X50A Fuse Block - Underhood, ignition ON.
8. Verify the G19 Rear Window Washer Pump is not activated.
 - **If the G19 Rear Window Washer Pump is activated**
 1. Ignition OFF, disconnect the harness connector at the G19 Rear Window Washer Pump, ignition ON.
 2. Test for less than 1 V between the control circuit terminal 1 and ground.

- If 1 V or greater, repair the short to voltage on the circuit.
 - If less than 1 V, replace the G19 Rear Window Washer Pump.
 - **If the G19 Rear Window Washer Pump is not activated**
9. Connect a 20 A fused jumper wire between the control circuit terminal 14 and B+.
 10. Verify the G19 Rear Window Washer Pump activates.
 - **If the G19 Rear Window Washer Pump does not activate**
 - 1. Ignition OFF, remove the jumper wire, disconnect the harness connector at the G19 Rear Window Washer Pump, ignition ON.
 - 2. Test for infinite resistance between the control circuit and ground.
 - If less than Infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance
 - 3. Test for less than 2 ohms in the control circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, replace the G19 Rear Window Washer Pump.
 - **If the G19 Rear Window Washer Pump activates**
 11. Ignition OFF, connect the X1 harness connector at the X50A Fuse Block - Underhood. Disconnect the X1 harness connector at the K9 Body Control Module, ignition ON.
 12. Verify the G19 Rear Window Washer Pump is not activated.
 - **If the G19 Rear Window Washer Pump is activated**
 - 1. Ignition OFF, disconnect the X2 harness connector at the X50A Fuse Block - Underhood, ignition ON.
 - 2. Test for less than 1 V between the control circuit terminal 4 and B+.
 - If 1 V or greater, repair the short to voltage on the circuit.
 - If less than 1 V, replace the X50A Fuse Block - Underhood.
 - **If the G19 Rear Window Washer Pump is not activated**
 13. Connect a 10 A fused jumper wire between the control circuit terminal 6 and B+.
 14. Verify the G19 Rear Window Washer Pump activates.
 - **If the G19 Rear Window Washer Pump does not activate**
 - 1. Ignition OFF, remove the jumper wire, disconnect the X2 harness connector at the X50A Fuse Block - Underhood.
 - 2. Test for infinite resistance between the control circuit terminal 4 and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If less than infinite resistance
 - 3. Test for less than 2 ohms in the control circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, test or replace the X50A Fuse Block - Underhood.
 - **If the G19 Rear Window Washer Pump activates**
 15. Replace the K9 Body Control Module.

Component Testing

Windshield Wiper/Washer Switch

1. Ignition OFF, disconnect the harness connector at the S82 Windshield Wiper/Washer Switch.
2. Test for infinite resistance between the signal terminal 7 and the low reference terminal 1 with the rear window washer switch in the open position.
 - **If less than infinite resistance**

Replace the S82 Windshield Wiper/Washer Switch.

- **If infinite resistance**
3. Verify the resistance reading is within the range specified below between the signal circuit terminal 7 and the low reference circuit terminal 2 by cycling the switch between Rear Wiper position and Rear Washers position.
 - Rear Wiper : 624-644ohms
 - Rear Wiper Sweep : 1.99-2.01kohms
 - Rear Washer : 6.11-6.13kohms
 - **If not within range specified**

Replace the S82 Windshield Wiper/Washer Switch.

- **If within range specified**
4. All OK

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

- **Relay Replacement (Within an Electrical Center)** , **Relay Replacement (Attached to Wire Harness)**
- **Windshield Washer Pump Replacement**

REPAIR INSTRUCTIONS

WINDSHIELD WIPER AND WASHER SWITCH REPLACEMENT

Fig. 4: Windshield Wiper And Washer Switch
 Courtesy of GENERAL MOTORS COMPANY

Windshield Wiper and Washer Switch Replacement

Callout	Component Name
Preliminary Procedure Remove the steering column upper trim covers. Refer to <u>Steering Column Upper Trim Cover Replacement</u> .	
1	Windshield Wiper Washer Switch TIP: Release the retaining tab and then remove the switch.

WINDSHIELD WASHER NOZZLE HOSE REPLACEMENT

Fig. 5: Windshield Washer Nozzle Hose
 Courtesy of GENERAL MOTORS COMPANY

Windshield Washer Nozzle Hose Replacement

Callout	Component Name
Preliminary Procedures 1. Remove the hood insulator. 2. Place a clean container under the front passenger side (RHD: driver side) near where the windshield washer nozzle and windshield washer pump hose will be disconnected. 3. Remove the front wheelhouse liner to access the washer nozzle hose. Refer to <u>Front Wheelhouse Liner Replacement</u> . 4. Recover all lost windshield washer solvent.	
1	Windshield Washer Nozzle Hose TIP: Disconnect the washer hose from both hood mounted washer nozzles.

WINDSHIELD WASHER NOZZLE REPLACEMENT

Fig. 6: Windshield Washer Nozzle
 Courtesy of GENERAL MOTORS COMPANY

Windshield Washer Nozzle Replacement

Callout	Component Name
Preliminary Procedures	
1. Disconnect the washer hose from the washer nozzles. 2. Remove the hood insulator.	
1	Windshield Washer Nozzle Assembly TIP: Push the washer nozzle retaining tab from the bottom side in order to release the nozzle and push the nozzle outboard from the hood to remove.

REAR WINDOW WASHER NOZZLE REPLACEMENT

Fig. 7: Rear Window Washer Nozzle
 Courtesy of GENERAL MOTORS COMPANY

Rear Window Washer Nozzle Replacement

Callout	Component Name
Preliminary Procedures	
1. Remove the rear end spoiler. Refer to <u>Rear End Spoiler Replacement</u> . 2. Remove the rear window washer nozzle hose.	
1	Rear Window Washer Nozzle TIP: Push the washer nozzle retaining tab from the bottom side.

WINDSHIELD WASHER SOLVENT CONTAINER FILLER TUBE REPLACEMENT

Fig. 8: Windshield Washer Solvent Container Filler Tube
Courtesy of GENERAL MOTORS COMPANY

Windshield Washer Solvent Container Filler Tube Replacement

Callout	Component Name
1	Windshield Washer Solvent Container Filler Tube Assembly Procedure Pull the upper tube assembly from the lower washer container and inspect the grommet, replace if damaged.

WINDSHIELD WASHER SOLVENT CONTAINER REPLACEMENT

Fig. 9: Windshield Washer Solvent Container
 Courtesy of GENERAL MOTORS COMPANY

Windshield Washer Solvent Container Replacement

Callout	Component Name
Preliminary Procedures 1. Remove the tire and wheel. Refer to <u>Tire and Wheel Removal and Installation</u> . 2. Remove the front wheelhouse liner. Refer to <u>Front Wheelhouse Liner Replacement</u> . 3. Disconnect the washer hose from the washer pump. 4. Disconnect the electrical connector.	
1	Windshield Washer solvent Container Nut (Qty: 3) CAUTION: Refer to <u>Fastener Caution</u> . Tighten 9 N.m (80 lb in)
2	Windshield Washer Solvent Container Assembly

WINDSHIELD WASHER PUMP REPLACEMENT

Fig. 10: Windshield Washer Pump
 Courtesy of GENERAL MOTORS COMPANY

Windshield Washer Pump Replacement

Callout	Component Name
Preliminary Procedures	
1. Remove the tire and wheel. Refer to <u>Tire and Wheel Removal and Installation</u> . 2. Remove the front wheelhouse liner. Refer to <u>Front Wheelhouse Liner Replacement</u> . 3. Disconnect the washer hose from the washer pump. 4. Disconnect the electrical connector.	
1	Windshield Washer Solvent Pump
2	Rear Window Washer Solvent Pump

AIR INLET GRILLE PANEL REPLACEMENT

Fig. 11: Air Inlet Grille Panel
 Courtesy of GENERAL MOTORS COMPANY

Air Inlet Grille Panel Replacement

Callout	Component Name
Preliminary Procedure	
Remove the wiper arms. Refer to <u>Windshield Wiper Arm Replacement</u> .	
1	Air Inlet Grille Panel Clip (Qty: 5)
2	Air Inlet Grille Panel Assembly
Procedure	
Remove hood rear weatherstrip.	

WINDSHIELD WIPER ARM REPLACEMENT

Fig. 12: Windshield Wiper Arm
 Courtesy of GENERAL MOTORS COMPANY

Windshield Wiper Arm Replacement

Callout	Component Name
1	Windshield Wiper Arm Finish Cap TIP: Use a small flat-bladed tool to remove finish cap.
2	Windshield Wiper Arm Nut (Qty: 2) CAUTION: Refer to <u>Fastener Caution</u> . Tighten 24 N.m (18 lb in)
3	Windshield Wiper Arm Washer
4	Windshield Wiper Arm Assembly TIP: Use the wiper arm puller if the arm fails to release from the wiper motor pivot shaft.

REAR WINDOW WIPER ARM REPLACEMENT

Fig. 13: Rear Window Wiper Arm
 Courtesy of GENERAL MOTORS COMPANY

Rear Window Wiper Arm Replacement

Callout	Component Name
1	Rear Window Wiper Arm Finish Cap TIP: Use a small flat-bladed tool to remove finish cap.
2	Rear Window Wiper Arm Nut CAUTION: Refer to Fastener Caution . Tighten 9 N.m (80 lb in)
3	Rear Window Wiper Arm Assembly TIP: Use the wiper arm puller if the arm fails to release from the wiper motor pivot shaft.

WINDSHIELD WIPER BLADE REPLACEMENT

Fig. 14: Windshield Wiper Blade
 Courtesy of GENERAL MOTORS COMPANY

Windshield Wiper Blade Replacement

Callout	Component Name
Preliminary Procedure	
Raise the wiper arm up off the windshield.	
1	Windshield Wiper Arm Blade Assembly
	Procedure
	1. Push inward the square tab at the center top side of the wiper blade. 2. Rotate the wiper blade downward slightly. 3. Carefully release the wiper arm back to the windshield.
	TIP: Discard if rubber appears worn or does not wipe the windshield clean.

REAR WINDOW WIPER BLADE REPLACEMENT

Fig. 15: Rear Window Wiper Blade
Courtesy of GENERAL MOTORS COMPANY

Rear Window Wiper Blade Replacement

Callout	Component Name
1	Rear Window Wiper Arm Blade Assembly Procedure Push the rear window wiper blade from the rear window wiper arm.

WINDSHIELD WIPER MOTOR REPLACEMENT

Fig. 16: Windshield Wiper Motor
 Courtesy of GENERAL MOTORS COMPANY

Windshield Wiper Motor Replacement

Callout	Component Name
Preliminary Procedures 1. Remove the windshield wiper arms. Refer to <u>Windshield Wiper Arm Replacement</u>. 2. Remove the air inlet grille panel. Refer to <u>Air Inlet Grille Panel Replacement</u>. 3. Remove the windshield wiper transmission. Refer to <u>Windshield Wiper Transmission Replacement</u>.	
1	Windshield Wiper Motor Bolt (Qty: 2) CAUTION: Refer to <u>Fastener Caution</u> . Tighten 13 N.m (10 lb ft)
2	Windshield Wiper Motor Nut (Qty: 1) Tighten 23 N.m (17 lb ft)
3	Windshield Wiper Motor Assembly

REAR WINDOW WIPER MOTOR REPLACEMENT

Fig. 17: Rear Window Wiper Motor
Courtesy of GENERAL MOTORS COMPANY

Rear Window Wiper Motor Replacement

Callout	Component Name
Preliminary Procedures 1. Remove the rear window wiper arms. Refer to <u>Rear Window Wiper Arm Replacement</u>. 2. Remove the liftgate trim panel. Refer to <u>Liftgate Trim Panel Replacement</u>. 3. Disconnect the wiper motor connector.	
1	Rear Window Wiper Motor Bolt (Qty: 3) CAUTION: Refer to <u>Fastener Caution</u>. Tighten 8 N.m (71 lb in)
2	Rear Window Wiper Motor Assembly

WINDSHIELD WIPER TRANSMISSION REPLACEMENT

Fig. 18: Windshield Wiper Transmission
 Courtesy of GENERAL MOTORS COMPANY

Windshield Wiper Transmission Replacement

Callout	Component Name
Preliminary Procedures 1. Remove the windshield wiper arms. Refer to <u>Windshield Wiper Arm Replacement</u>. 2. Remove the air inlet grille panel. Refer to <u>Air Inlet Grille Panel Replacement</u>.	
1	Windshield Wiper Transmission Frame Bolt (Qty: 3) CAUTION: Refer to <u>Fastener Caution</u> . Tighten 10 N.m (89 lb in)
2	Windshield Wiper Transmission Frame Assembly

WINDSHIELD WIPER ARM ADJUSTMENT

Fig. 19: Windshield Wiper Arm
 Courtesy of GENERAL MOTORS COMPANY

Windshield Wiper Arm Adjustment

Callout	Component Name
TIP: When installing the windshield wiper arm, perform this procedure for wiper arm to be in original position.	
1. Check the mark to install the wiper arm at the lower blackout of the windshield. 2. Position the wiper arm blade to this mark.	

DESCRIPTION AND OPERATION

WIPER/WASHER SYSTEM DESCRIPTION AND OPERATION

Wiper/Washer System Components

The wiper/washer system consists of the following electrical components:

- Windshield Wiper Relay
- Windshield Wiper Speed Control Relay
- Windshield Washer Pump Relay
- Windshield Washer Pump
- Windshield Wiper Motor

- Windshield Wiper/Washer Switch
- Windshield Wiper Motor Fuse
- Windshield Washer Pump Fuse
- Body Control Module (BCM)
- Rear Wiper Motor
- Rear Wiper Motor Fuse
- Rear Wiper Relay
- Rear Washer Pump Relay
- Rear Washer Pump Fuse

Windshield Wiper System

The body control module (BCM) determines the front wipe/wash system mode of operation by monitoring several signals from the Windshield Wiper/Washer Switch as indicated in the wiper switch.

The Windshield Wiper/Washer Switch receives a reference ground signal from the BCM. Each input of the BCM provides a switched battery pull-up for each front wiper/washer switch output signal it receives. All the BCM inputs are recognized as active when the wiper switch provides a path to the referenced ground signal. The first signal received by the BCM is the result of 6 resistors in the front wiper switch configured as a resistor ladder network. This signal is connected to a BCM analog to digital input. Depending on the function selected (High, Low, Intermittent 1 thru 5, Mist, Off), the Windshield Wiper/Washer Switch connects a different set of resistors into the circuit resulting in different voltages appearing on the BCM A/D input. By monitoring this voltage, the BCM determines how to control the wiper motor On/Off Relay. It should be noted that High, Low, and Mist all have the same value on this signal circuit. The second signal received from the front wiper switch is active only when the front wiper switch is in the high speed wiper position. When the wiper switch is not in the high speed position, the switch is open and the signal circuit is pulled to battery by the BCM. When the wiper switch is in the high speed position, the switch pulls the circuit low. The BCM determines how to control the Wiper high/low speed relay from this input. The third signal received from the front wiper switch is from the momentary windshield wash control switch. When the washer switch is not active the switch is open and the signal circuit is pulled to battery by the BCM. When the washer switch is active, the switch pulls the circuit low. The BCM controls the windshield wash and windshield wash activated wiper operation based on this input.

The BCM controls Windshield Wiper Motor operation through two output signals and the monitoring of one input signal. The two outputs (one high side drive, one low side drive) are used to control two external wiper motor relays: Windshield Wiper Motor on/off relay: which provides the wiper motor with battery power when it is activated by the high side drive signal (switched battery) from the BCM. When left deactivated, the normally closed contacts provide a ground to the wiper motor. Wiper high/low speed relay: when activated by a low side drive signal (ground) from the BCM, it switches the power supplied by the wiper motors on/off relay to the motors high speed input. When left deactivated, the normally closed contacts connect the power supplied by the wiper motors on/off relay to the motors low speed input. The input used by the BCM is from the park switch located in the wiper motor assembly. When the wiper blades are not in the park position, the wiper park switch is open and the circuit is pulled up to battery by the BCM. When the wiper blades are in the park position at the bottom of the glass, the wiper park switch closes to ground pulling the park signal circuit low.

To initiate low speed operation, the BCM only energizes the front Windshield Wiper Motor on/off relay. This allows battery voltage from the wiper fuse to be applied through the switched contacts of the wiper motor on/off

relay, through the normally closed contacts of the wiper high/low speed relay, to the low speed control circuit of the windshield wiper motor.

Redundant high speed switch pass through. The BCM provides redundant circuitry which places battery power on its wiper motor on/off relay output with activation of its low assertion high speed wiper switch input. The BCM shall be capable of doing this, even if the module has lost all microprocessor control. This redundant circuit shall supply power while in the RUN and CRANK power modes. however; while in the CRANK power mode, the pass through shall only be active if the BCM is NOT in a computer operating properly state.

To initiate high speed operation, the BCM energizes both the Windshield Wiper Motor on/off relay and the wiper high/low speed relay. This allows battery voltage from the wiper fuse to be applied through the switched contacts of the wiper motor on/off relay, through the switched contacts of the wiper high/low speed relay, to the high speed control circuit of the windshield wiper motor.

Parking the wiper motor. In order to perform an accurate read of the park switch and to ensure the wipers will come to rest while still in the park position, parking of the wipers only occurs while in a low speed wiper mode. This requires that if the wipers are performing a high speed wiper operation at the time they are required to park, the BCM shall transition the Wipers to low speed by deactivating the wiper high/low relay before attempting to park. In order to park the wipers, the BCM monitors the park circuit until the park switch pulls the park circuit to ground. At this time, the BCM will immediately deactivate the wiper motor on/off relay. The relay contacts will switch back to their normally closed position and will apply ground to the wiper motor power inputs through the normally closed contacts of the wiper high/low relay. This deactivates and dynamically brakes the wiper motor in the park position. When the wiper switch is turned to the OFF position while the wiper motor is somewhere in mid-cycle, the BCM will continue to operate the motor until the wipers reach the park position. If the BCM is running the wiper motor and does not see a state transition of the park switch after 8 s, the wipers will stop immediately when the wiper switch is turned to OFF. If the ignition is turned OFF while the wipers are in mid-cycle, the wipers will stop immediately, regardless of position. The BCM will park the wipers next time the ignition is turned ON.

The windshield wiper system MIST operation is identical to LOW speed operation, except that the MIST switch is a press and release type switch. When the wiper switch is moved to the MIST position and released, low speed wiper motor operation is started and will continue until 1 cycle is complete. If the wiper switch is moved to the MIST position and held, the wiper motor will operate in the LOW speed mode until the switch is released.

Windshield wiper intermittent operation is a low speed wiper motor function with a variable delay interval between the wiper motor cycles. The duration of the delay is controlled by the front wiper control switches intermittent 1 through intermittent 5 settings. The wiper operation is as follows

1. The BCM will initiate a single wipe by activating its windshield wiper ON/OFF relay output.
2. At the completion of a single wipe, the BCM will park the wipers as described above.
3. The BCM will then pause the wipers in their park position for the time duration associated with intermittent delay switch setting.
4. When the delay time expires repeat Steps 1 and 3 until the system is turned off or taken out of intermittent mode. If the wiper switch is moved from a longer delay interval to a shorter delay interval, the BCM will command an immediate wipe cycle and reset the delay timer to the shorter delay interval.

Intermittent wiper operation may be vehicle speed sensitive. When enabled, the speed compensated intermittent feature causes the intermittent wiper delay intervals to become shorter as a function of increased speed. As vehicle speed is reduced the intervals will become closer to the predetermined

Fig. 20: Windshield Wiper System
Courtesy of GENERAL MOTORS COMPANY

Windshield Washer System

The BCM controls the windshield wash operation and windshield wash activated wiper operation. When the BCM detects the activation of the momentary windshield wash control switch, it activates its washer pump relay drive output which supplies battery power to the coil of the washer pump relay. This energizes the relay, which switches battery power to the pump motor. The BCM will also activate continuous low speed windshield wipes as described above. Upon deactivation of the windshield wash control switch, the body control module (BCM) shall deactivate the wash motor and will also park the wiper motor as described above unless the drip wipe feature is enabled. On some vehicles the drip wipe feature will be enabled and cause the system to provide additional wiping of the windshield after the switch has been released and fluid is no longer being applied. The windshield washer switch feature may attempt to detect a stuck switch. When enabled, activation of the wash feature shall be limited to 10 seconds.

On vehicles with the Rear Wash feature a single reversing wash motor may be utilized for both the front and rear wash operation. In this system the wash motor is operated in one direction to spray fluid on the front windshield and then operated in the reverse direction to spray fluid on the rear window. The BCM Controls the reversing wash motor through two High Side Drive outputs. One controls the Windshield Wiper Motor Relay and one controls the Rear Wiper Relay.

Fig. 21: Wiper/Washer System Description
 Courtesy of GENERAL MOTORS COMPANY

Rear Wiper System

On vehicles equipped with a Rear Wiper, the BCM determines of the Rear Wipe/Wash System Mode of Operation by monitoring the multiplexed output of the Windshield Wiper/Washer Switch. The Rear Wiper Relay uses a reference ground signal from the BCM. The BCM provides a switched Battery pull-up for the Rear Wiper Relay switch output signal it receives. All the BCM inputs are recognized as active when the Rear Wiper Relay switch provides a path to the referenced ground signal. The Rear Wiper/Washer signal received by the BCM is the result of 3 resistors in the Windshield Wiper/Washer Switch configured as a resistor ladder network. This signal is connected to a BCM Analog to Digital Input which also provides a switched Battery pull-up for the circuit. Depending on the function selected (Low, Intermittent, Off, Wash), the Rear Wiper Control Switch connects a different set of resistors into the circuit resulting in different voltages appearing on the BCM A/D input. By monitoring this voltage, the BCM determines how to control the Rear Wiper Relay and the Rear Washer Relay.

The BCM Controls the single speed Rear Wiper Motor by its Active High output to the external Rear Wiper Relay. When the BCM activates its output and applies Battery to the coil of the relay, the relay energizes, allowing Battery voltage from the fuse to be applied through the switched contacts of the Rear Wiper Relay to the Rear Wiper Motors control input. The motor then operates continuously at low speed. The BCM does not control the parking of the Rear Wiper Motor, it is self parking. When the BCM deactivates its output, the contacts of the Rear Wiper Relay switch back to ground which will be used by the wiper for Dynamic Braking. The Rear Wipers internal park switch and circuitry will sustain motor operation until the wiper arm has returned to its Park position.

Fig. 22: Rear Wiper System Description
Courtesy of GENERAL MOTORS COMPANY

Rear Wash

When the Body Control Module detects that the Rear wiper/washer switch has activated the momentary Wash switch, it activates a High Side Drive output which supplies Battery to the coil of the Rear Washer Pump Relay. This energizes the Relay, which switches Battery Power to the Washer Pump Motor. The BCM will also activate continuous Low Speed Windshield Wipers as described above. The BCM software will attempt to detect a stuck Rear Wash Switch. A stuck Rear Wash Switch condition is detected if the Rear Wash Motor Relay Output has been continuously active for 10 seconds or more. Upon detecting this the BCM will fail soft the state of the Rear Wash Control to Inactive. This shall cause the System to perform as if the momentary Wash control had been released.

ACCESSORIES & EQUIPMENT

Wiring Systems and Power Management - Repair Instructions - Spark

REPAIR INSTRUCTIONS

GMLAN AND MEDIA ORIENTED SYSTEMS TRANSPORT (MOST) WIRING REPAIRS

Special Tools

- **EL-38125-10** Splice Sleeve Crimping Tool
- DuraSeal splice sleeves
- A wire stripping tool

For equivalent regional tools, refer to **Special Tools** .

The DuraSeal splice sleeves have the following 2 critical features:

- A special heat shrink sleeve environmentally seals the splice. The heat shrink sleeve contains a sealing adhesive inside.
- A cross hatched (knurled) core crimp provides necessary contact integrity for the sensitive, low energy circuits.

The GM Local Area Network (GMLAN) System requires special wiring repair procedures due to the sensitive nature of the circuitry. Follow the specific procedures and instructions when working on GMLAN connectors and terminals.

GMLAN Repairs

NOTE: **When making a repair to any GMLAN network, the original wire length after the repair must be the same length as before the repair. If the network is a twisted pair, the twist must be maintained after the repair is completed.**

GMLAN has 2 types of networks, low speed and high speed. Low speed GMLAN has a single wire and works at slow speeds. High speed GMLAN has 2 wires in a twisted pair and works at higher speeds. For more information on GMLAN, refer to **Data Link Communications Description and Operation** .

GMLAN Connector Terminal Repair

NOTE: **A terminated lead can be used to replace damaged connector terminals for both high speed and low speed GMLAN systems. When making a connector terminal repair on a GMLAN high speed system with twisted pair wires, do not untwist the wires more than necessary to make the repair.**

If the individual terminals are damaged on any GMLAN connection, use the appropriate connector repair procedure in order to repair the terminal. Refer to **Connector Repairs** for the appropriate connector repair

procedure.

GMLAN Wire Repair

NOTE: Refer to Wiring Repairs in the service information connector end views or the vehicle schematics in order to determine the correct wire size for the circuit you are repairing. You must obtain this information in order to ensure circuit integrity.

If any wire except the pigtail is damaged, repair the wire by splicing in a new section of wire of the same gauge size (0.5 mm² , 0.8 mm² , 1.0 mm² etc.). Use the DuraSeal splice sleeves and **EL-38125-10** tool. For wiring repair, refer to **Splicing Copper Wire Using Splice Sleeves** .

Media Oriented Systems Transport (MOST) Wiring Repair

NOTE: If harness repair/analysis is performed, MOST bus Twist Pair unshielded wire should be 0.22 mm gauge wire with at least one twist per each 1 45/64 inch (45 mm) and must not be untwisted for more than 3 15/16 of an inch (10 cm).

The following conditions need to be met to ensure a valid continuity:

- Untwisted length for all MOST 50 circuits at each wire harness connector should be no longer 50 mm max (25 mm preferred).
- When wire repairs are made, a minimum 25 twists/meter for all MOST 50 circuits.
- MOST 50 has specific receive and transmit I/O.

The transmit of one module is connected to receive of the next module in ring topology.

RELAY REPLACEMENT (ATTACHED TO WIRE HARNESS)

Removal Procedure

Fig. 1: Identifying Relay & Wire Harness Connector
Courtesy of GENERAL MOTORS COMPANY

1. Locate the relay. Refer to the **Master Electrical Component List** to locate the relay in the vehicle.
2. Remove any fasteners which hold the relay in place.
3. Remove any connector position assurance (CPA) devices or secondary locks.

NOTE: **Use care when removing a relay in a wiring harness when the relay is secured by fasteners or tape.**

4. Separate the relay (1) from the wire harness connector (2).

Installation Procedure

Fig. 2: Identifying Relay & Wire Harness Connector
Courtesy of GENERAL MOTORS COMPANY

1. Connect the relay (1) to the wire harness connector (2).
2. Install any connector position assurance (CPA) devices or secondary locks.
3. Install the relay using any fasteners or tape that originally held the relay in place.

RELAY REPLACEMENT (WITHIN AN ELECTRICAL CENTER)

Special Tools

EL-43244 Relay Puller Pliers

Removal Procedure

1. Remove the electrical center cover.

NOTE:

- Always note the orientation of the relay.

- If equipped with a notch style relay; observe the location of the notch on the old relay to verify the new relay is installed with the notch in the same location.
- Ensure that the electrical center is secure, as not to put added stress on the wires or terminals.

2. Locate the relay. Refer to **Electrical Center Identification Views** to locate the electrical center where the relay exists.

Fig. 3: Removing/Installing Relay
Courtesy of GENERAL MOTORS COMPANY

3. Using the EL-43244 (1) position the tool on opposing corners of the relay (2).

CAUTION: Use EL-43244 to pull the relay straight out from the electrical center terminals. The use of pliers or a flat bladed tool could damage the electrical center.

4. Remove the relay (2) from the electrical center.

Installation Procedure

Fig. 4: Removing/Installing Relay
Courtesy of GENERAL MOTORS COMPANY

1. Install the relay (2) in the same position as removed.
2. Install the electrical center cover.

FUSE BLOCK REPLACEMENT

Removal Procedure

1. Disconnect the negative battery cable. Refer to Battery Negative Cable Disconnection and Connection .

Fig. 5: Positive Battery Cable Nut

Courtesy of GENERAL MOTORS COMPANY

2. Unlock the retaining tabs on the fuse block and open the cover.
3. Remove the positive battery cable nut (1) and the positive battery cable (2) from the battery.

Fig. 6: Fuse Plate

Courtesy of GENERAL MOTORS COMPANY

4. Remove fuse plate (1) from fuse block.

Fig. 7: Fuse Plate And Bolts

Courtesy of GENERAL MOTORS COMPANY

5. Remove the bolts (1) retaining the wiring harness to the fuse plate and remove wiring harness.

Fig. 8: Fuse Block Housing Fasteners
Courtesy of GENERAL MOTORS COMPANY

6. Remove fuse block housing fasteners (1, 2) and fuse block housing (3).

Installation Procedure

Fig. 9: Fuse Block Housing Fasteners
Courtesy of GENERAL MOTORS COMPANY

1. Install fuse block housing.

CAUTION: Refer to Fastener Caution .

2. Install the fuse block housing fasteners (1, 2) and tighten to 7 (62 lb in).

Fig. 10: Fuse Plate And Bolts

Courtesy of GENERAL MOTORS COMPANY

3. Install wiring harness and tighten the bolts (1) to 6 (53 lb in).

Fig. 11: Fuse Plate

Courtesy of GENERAL MOTORS COMPANY

4. Install fuse plate (1) to the fuse block housing.

Fig. 12: Positive Battery Cable Nut

Courtesy of GENERAL MOTORS COMPANY

5. Install the positive battery cable nut (1) and the positive battery cable (2) and tighten to 10 (89 lb in).
6. Close fuse block.
7. Connect the negative battery cable. Refer to **Battery Negative Cable Disconnection and Connection** .

IGNITION LOCK CYLINDER REPLACEMENT (TYPE B)

Fig. 13: Ignition Lock Cylinder (Type B)
 Courtesy of GENERAL MOTORS COMPANY

Ignition Lock Cylinder Replacement (Type B)

Callout	Component Name
Preliminary Procedure Remove the steering column lower trim cover. Refer to <u>Steering Column Lower Trim Cover Replacement</u> .	
1	Ignition Lock Cylinder Procedure 1. Ignition switch is ON. 2. Remove ignition lock cylinder after pressing the spring of ignition lock housing hole by suitable tool.

IGNITION LOCK CYLINDER REPLACEMENT (TYPE A)

Fig. 14: Ignition Lock Cylinder (Type A)

HOW TO USE ELECTRICAL SCHEMATICS

Information Overview

The following explains some of the key parts of the GM wiring diagrams. Included are:

- Color Abbreviations

Color Abbreviations

The following sequence is used when depicting wire colors:

1. Color modifier of the wire, such as light or dark (if applicable)
2. Primary color of the wire
3. Secondary color of the wire (tracer/stripe)

Wire insulation and connector body colors in schematic information are abbreviated with a two character code as listed below.

Abbreviation	Color	Abbreviation	Color
AM	Amber	OG	Orange
BARE	Bare	PK	Pink
BG	Beige	PU	Purple
BK	Black	RD	Red
BN	Brown	RU	Rust
BU	Blue	SR	Silver
CL	Clear	TL	Teal
CR	Cream	TN	Tan
CU	Curry	TQ	Turquoise
GD	Gold	VT	Violet
GN	Green	WH	White
GY	Gray	YE	Yellow
NA	Natural	-	-
Color Modifiers			
L	Light	D	Dark

Additionally, industry standard cable types are not identified by color, but are listed by cable type as follows:

Abbreviation	Cable Type
COAX	Coax Cable
FW	Flat Wire
HDMI	High Definition Multimedia Interface
TWINAX	Twinax Cable
USB	Universal Serial Bus

technician that
the system
contains SIR/SRS
components that
require certain
precautions
before servicing.

Information Icon

This icon is used to alert the technician that there is additional information that will aid in servicing a system.

Danger Icon
This icon is intended to alert the technician that a component within the system

contains labeling with the same icon.

This icon is used when a source component has potential for 60 volts DC or greater or has potential for 42 volts AC or greater.

High Voltage
Icon

This icon is intended to alert the technician that a component

within the system contains labeling with the same icon.

This icon is used when a component/circuit has potential for 60 volts DC or greater or has potential for 42 volts AC or greater.

Caution Icon
This icon is used to advise the technician to use

caution when servicing this component. This icon may be used when a component/circuit has a voltage range potential between 30-60 volts DC or 15-42 volts AC.

Functional Serial Data Communication
This icon is used to show the

technician that the serial data circuit detail is shown incomplete. It also provides an active link to the Data Communication Schematics where the circuit is shown complete.

VEHICLE ZONING STRATEGY

All grounds, in-line connectors and splices have identifying numbers that correspond to where they are located in the vehicle. The following table explains the numbering system.

Fig. 14: Passenger Car Zoning View
 Courtesy of GENERAL MOTORS COMPANY

Vehicle Zoning Strategy

Callout Numbers	Zone Description
100-199	Engine compartment (all forward of the instrument panel)
200-299	Within the instrument panel area (between the bulkhead and the front plane of the instrument panel)
300-399	Passenger compartment (from instrument panel to the back of the rear seats)
400-499	Luggage compartment (from the back of the rear seats to the rear of the vehicle)
500-599	Inline harness connectors to or within the driver door
600-699	Inline harness connectors to or within the front passenger door
700-799	Inline harness connectors to or within the left rear

	door
800-899	Inline harness connectors to or within the right rear door
900-999	Inline harness connectors to or within the luggage compartment lid or hatch

MASTER ELECTRICAL SCHEMATIC ICONS

Master Electrical Schematic Icons

Icon	Icon Definition
	WARNING: When performing service on or near the SIR components or the SIR wiring, the SIR system must be

disabled. Refer to SIR Disabling and Enabling. Failure to observe the correct procedure could cause deployment of the SIR components, personal injury or unnecessary SIR system repairs.

NOTE:

Twisted wires provide an effective shield that helps protect sensitive electronic components from electrical interference.

In order to prevent electrical interference from degrading the performance of the connected components, you must maintain the proper specification when making any repairs to the twisted wires shown :

- The wires must be twisted a minimum of 10 turns per 31 cm (12 in) as measured anywhere along the length of the wires.
- The outside diameter of the twisted wires must not exceed 6.0 mm (0.25 in).
